I believe that my study has more than esoteric interest. First, it provides an alternative semantic account of what Charles Kahn has called the 'is' of truth, thereby shedding light on a number of issues in Greek ontology, including an Eleatic paradox of change and Aristotle's response to it. Second, it finds in the semantics of Greek a basis for admitting what have been called 'non-substantial individuals' or 'immanent characters' into accounts of Greek ontology. Third, it yields an interpretation of Aristotle's talk of 'unities' which is crucial to his treatment of substance in the central books of the *Metaphysics*."

43. Mendelsohn, Richard L. 1987. "Frege's Two Senses of 'Is'." *Notre Dame Journal of Formal Logic* no. 28:139-160.

"It is widely believed that there are two senses of 'is', the 'is' of identity and the 'is' of predication, and that this distinction was clearly drawn by Frege in *On Concept and Object*, although it was anticipated by others, perhaps, e.g., by Plato in the *Sophist*. As opposed to this received view, I will argue that Frege had not successfully distinguished two senses of 'is', indeed that his argument leads to precisely the opposite conclusion; on the other hand, the distinction Plato had supposedly drawn in the *Sophist*, which seems to rest on a semantics Frege was explicitly rejecting, is, given that semantic framework, viable.

Frege had introduced this distinction in order to buttress his view that proper names could not serve as genuine predicates: a proper name occupying ostensible predicate position could not be functioning as a predicate because the 'is' in such a statement would have to be the 'is' of identity, not the 'is' of predication.

I will argue that Frege had been mistaken on this point as well. More generally, I will argue that Frege's theoretical analysis of language is not, as he had thought, incompatible with proper names being allowed to play a genuinely predicative role.

My remarks are prompted by Michael Lockwood's stimulating article, *On Predicating Proper Names* (1975), which contains an extensive and detailed criticism of Frege's position."

45. Morscher, Edgar. 1986. "Was existence ever a predicate?" *Grazer Philosophische Studien* no. 25/26:269-284.
- "The question "Was 'existence' ever a predicate?" in a way already suggests its own answer, that this is really the wrong question to ask, because 'existence' has always been a predicate. Even those, such as Kant, who supposedly opposed this view, in fact held it. They merely denied that 'existence' is a "normal" first-order predicate. Not only Kant, but also Bolzano, Frege and Russell claimed that it is a second-order predicate. There is substantive disagreement between Kant and Bolzano on the one hand and Frege and Russell on the other over two issues: the former claim that this second-order predicate applies to no concept analytically and that it can be properly ascribed to a singular concept, whereas the latter deny both of these claims."

48. Nijenhuis, John. 1994. "'Ens' described as 'Being or Existent'." *American Catholic Philosophical Quarterly* no. 68:1-14.

"A recent article in this quarterly about 'Aquinas on 'Exists', opens with the statement, 'At the outset of *On Being and Essence* Aquinas distinguishes two senses of 'ens' (being or existent).' (1) Here, this reader stops 'At the outset' and reflects: is it justifiable-speaking linguistically and metaphysically -- to offer two seemingly alternative if not even synonymous renderings of the one Latin word 'ens,' viz., 'being' or (and/or) 'existent'?"

The present writer belongs to the small chorus of language-sensitive medievalists who feel pressed to sing *extra chorum* because they have conclusive evidence that the translation of the Latin *esse* (as also of the Greek *einai*) by the usual existence-terminology leads to a flawed interpretation of the 'onto-logical' thought world where use is made of the 'being'-term *ens* (and its Greek equivalent).

(...)

The basic issue is simple enough, but precisely because it is so simple and obvious it runs the risk of being overlooked. All I can do here is present a series of brief pointers toward the fateful bifurcation of the Latin *esse* (and the Greek *einai*) into 'be(ing)' and 'exist(ence)'. In doing this, I hope that an objective listing of the pertinent facts which, in their roots, are of an unambiguous linguistic nature, will constitute an instance of that philosophical rhetoric which in the same issue of *American Catholic Philosophical Quarterly* was called a 'technique of persuasion.' "In classical Latin, the verb *esse*, incompletely rendered by today's 'to be,' was the word expressing what today is divided over the verbs 'be' and 'exist.' As I quoted Vlastos in reference to the similar situation in Greek (*'Ens' described as 'Being or existent'* 13), 'This kind of knowledge ... even a Greek child would have had. I invited our contemporary philosophers 'to crawl under the linguistic thought-skin of adult Greek and Latin philosophers,' not perhaps in order to agree but at least to understand what they were saying (and then, if they see fit, to disagree). When, by some mysterious process, the verb *existere* began to be used as the participle of *esse*, the inevitable apparently happened: the fuller meaning of *esse*, was gradually and uncritically-transferred to *existere*. The etymology of *ex(s)istere* yields a simple sense, namely, 'come out of,' 'appear' and 'be there,' indicating yes-or-no situations; consequently, the richer meaning of Aquinas's *esse* (the verb) was fated to become flattened to indicate (rather than 'signify') the plain fact of 'exist(ence)' (often referred to by the new late-Latin noun *existentia*, see n. 4). The mountainous landscape where Aquinas saw a rich variety of interconnected 'beings' was leveled to the flatland of isolated, barren existents; the various depths of the existing beings came to be viewed as a conglomerate of unrelated, juxtaposed existents."

"Our aim is to explain as briefly as we can (1) why there is good reason to use 'existence-terminology,' and (2) why some considerations against it, including what we take to be Professor Nijenhuis's main reasons, should not deter us. In the course of discussing these points we also will indicate why any of this matters for the future of Thomistic studies.

The first reason to permit oneself to use 'existent' or 'existing thing' for 'ens' is that fine dictionaries such as *The New Shorter Oxford* and *The American Heritage* (to take a couple at hand) give 'existence' as the first entry under 'being.' That, no doubt, is why translators commonly use 'existence-terminology.' Professor Nijenhuis acknowledges that dictionaries inter-define being and existence and that translators follow suit, but he thinks that both err. Maybe so, but it seems quite clear who bears the *onus probandi*.

The second reason, often neglected by proponents of 'being-terminology,' is that if we refuse to allow that when Aquinas talks in terms of 'ens' and 'esse' he is talking in one way or another about existing things and about existence, we have no way of comparing Aquinas on existence with anyone who talks about existence. To insist that Aquinas is not talking about the same topic as Frege, Russell, Quine and others because 'ens,' 'esse' and the like are to be translated only in terms of 'being' is

to beg some pretty big questions and to seal off Aquinas's thought from the contemporary world of ideas. No doubt some feel that it is more important to understand Aquinas in light of predecessors such as Clarenbald of Arras than Frege, but it seems to us that unless at some point we are willing to consider how Aquinas's thought holds up when examined with the best contemporary work in mind, we will certainly not have served Aquinas or philosophy well." Abstract: "This paper presents an immanent critique of Heidegger's consignment of "existensia" to the "metaphysical" category of "Vorhandenheit". Past scholarship has been by and large uncritical of this tenet of Heidegger, thereby thwarting a potentially fruitful dialogue between continental thinkers and those sympathetic to medieval ontology. The paper (1) argues

that the account in "Basic Problems of Phenomenology" is marred by essentialism and thus overlooks a depth-dimension in "existentia"; (2) examines key passages in the 1941 Nietzsche lectures where Heidegger appears to flirt with the possibility of a more primordial sense of "existensia"; and (3) reads the 1936 text "The Origin of the Work of Art" as providing further evidence for reading Heidegger's ontology as a phenomenological recovery of the existential contingency of beings."

"An initial consideration is given of the tensions involved in the perspective of the historian of philosophy. Thereafter, Greek, medieval and early modern positions on being or existence are discussed. Beginning with Parmenides and terminating with Plotinus, the dominant refrain of Greek philosophy is that being is form. With Avicenna, an aspect of being beyond form is isolated -- the existential dimension. However, metaphysics still focuses on the formal; existence remains untapped. In a singular departure from tradition, existence for Thomas Aquinas is no longer a "topping off" of an autonomous essence. It is the primordial, most basic dimension of anything that is "really other than and different from essence". However, this

has always been interpreted with Avicennian or Aristotelian spectacles on. This has led to the position of Suarez affirming the identity of essence and existence. The stage is set for appreciating the concept of existence as completely empty and vacuous."

3. Hadot, Pierre. 1969. "Zur Vorgeschichte des Begriffs 'Existenz'. *Hyparchein* bei den Stoikern." *Archiv für Begriffsgeschichte* no. 13:115-127.

"Das Wort *exsistentia* erscheint erstmalig im Lateinischen in den theologischen Werken des Marius Victorinus, in denen es fast immer zur Übersetzung von *hyparxis*; dient, im Gegensatz zu dem Wort *substantia* das *ousia* übersetzt, und zu *subsistentia*, das *hypostasis* wiedergibt. (1) *Exsistentia* ist abgeleitet von *exsistere*, das in der philosophischen Sprache oft für *esse* eintrat, zumal in der Form des Partizips. (2) *Exsistere* seinerseits wurde auch zur Übersetzung von *hyparkein* verwendet, wie aus der *Timaios*-Übersetzung des Calcidius ersichtlich. (3)

Für das Verständnis der Vorgeschichte des Begriffes Existenz ist es daher unerlässlich, sorgfältig die Bedeutung zu präzisieren, die das Wort *hyparkein* innerhalb des technischen Wortschatzes der griechischen Philosophie aufweist, und die vorliegende Studie möchte einen Beitrag zu einer derartigen Untersuchung liefern. Zunächst soll zu zeigen versucht werden, daß das Wort *hyparkein* innerhalb der Stoa eine Seinsweise bezeichnet, die dem Geschehen, dem Akzidenz, dem Prädikat zukommt und der Seinsweise des Subjektes gegenübergestellt

wird. Danach soll diese Bedeutung des *hyparkein* einerseits mit dem aristotelischen, andererseits mit dem neuplatonischen, Gebrauch dieses Wortes verglichen werden." (p. 115)

Key Terms in Ontology: *Nonexistence*. History of the Problem of Nonexistent Objects

Introduction

"The totality of what exists, including what has existed and will exist, is infinitely small in comparison with the totality of the objects of knowledge. This fact easily goes unnoticed, probably because the lively interest in reality which is part of our nature tends to favor that exaggeration which finds the non-real a mere nothing (...) or, more precisely, which finds the non-real to be something for which science has no application or at least no application of any worth." (p. 79)

From: Alexius Meinong, "On the Theory of Objects", in: Roderick M. Chisholm (ed.), *Realism and the Background of Phenomenology*, Translated by I. Levi, D. B. Terrell, R. M. Chisholm, Glencoe, Ill: Free Press 1960, pp. 76-117.

"Whether or not there are non-existent objects seems to be one of the more mysterious and speculative issues in ontology. To affirm that there are non-existent objects is to affirm that reality consists of two kinds of things, the existing and the non-existing. The existing contains all of what is in our space-time world, plus all abstract objects, if there are any. Most people, it seems fair to say, would think that this is all there is. For the only real question in ontology can be what kinds of existing things there are. However followers of Meinong maintain that this isn't all there is. There is also another kind of things, those that do not exist. And to say this, the Meinongians continue, is to accept that reality is divided into two basic kind of things, the existing and the non-existing. Whether or not reality contains two basic categories of things, existing and non-existing, or

only one, existing, is what the debate about non-existent objects is all about. And as such it seems to be the most speculative of the debates in ontology." (p. 249)

Thomas Hofweber, "Quantification and Non-Existent Objects", in: Anthony Everett and Thomas Hofweber (eds.), *Empty Names, Fiction and the Puzzles of Non-Existence*, Stanford: CSLI Publications 2000, pp. 249-278.

"In this book I consider the ancient problem of nonbeing, the problem whether there are non-existent objects. Holding that there are seems to imply the contradiction that there exist things that do not exist. On the other hand, in common parlance we very often speak of things that do not exist. Sherlock Holmes does not exist, he is a fictional character. Pegasus is mythical and hence non-existent. Phlogiston has turned out not to exist. Extinct species no longer exist, future items do not exist yet, there are all sorts of possible things that do not exist. Atheists certainly believe that God does not exist. So we employ the notion of nonexistence widely and quite comfortably. Furthermore, non-existent things seem to have properties: Sherlock Holmes is a detective who plays the violin, he is not a banker; Pegasus is a winged horse, not a flying fish. The appearance is that ordinary discourse is committed to items that are somehow there and have properties, and yet are said not to exist. Does common language then assume contradictory entities? Surely there cannot be such things. But if not, what are we talking about in these cases? This is a tangle indeed; my purpose in this book is to sort through the strands wound together here and to use the resulting clarifications to deal with various philosophical issues." (p. 1)

Charles Crittenden, *Unreality: the Metaphysics of Fictional Objects*, Ithaca: Cornell University Press 1991.

"I think that it would be useful to have a detailed study of the history of non-existent objects, but I am sure that this would be the culmination of a life's work if done well. (...) One must be aware of the dangers which await one who enters the treacherous waters between the Scylla of ignorance of the history of philosophy and the Charybdis of simplicistic formulations of that history." (p. 68)

Kenneth J. Perszyk, *Non-existent Objects: Meinong and Contemporary Philosophy*, Dordrecht: Kluwer 1993.

"Non-existence theories first arose in the early Stoa. A doctrine of non-things, detailed in Chrysippus' discussion of the four Stoic categories, might well be traced back to Zeno. Among these non-existent 'things' were immaterial grammatical causes (lekta) which acted semantically as the verification principles of existential propositions (axiomata). In his critique of Aristotle in the in the [Logica] Ingredientibus, Abaelard arrived at a similar theory in his discussion of propositional dicta.

Infrequent classical references to the Stoic theory, coupled with misinterpretations, point to the pervasive influence of the Aristotelian association of the categories with things." (p. 80)

Daniel F. Blackwell, *Non-Ontological Constructs: The Effects of Abaelard's Logical and Ethical Theories on His Theology: A Study in Meaning and Verification*, Bern: Peter Lang 1988.

Divisions of being in Stoic philosophy

"The Stoics want to place above this [the existent] yet another, more primary genus... Some Stoics consider 'something' the first genus, and I shall add the reason why they do. In nature, they say, some things exist, some do not exist. But nature includes even those which do not exist -- things which enter the mind, such as Centaurs, giants, and whatever else falsely formed by thought takes on some image despite lacking substance."

Sextus Empiricus, *Against the professors* 10.218 (SVF 2.331, part)

"They [the Stoics] say that of something some are bodies, others incorporeals, and they list four species of incorporeals -- sayable (lekton), void, place and time."

Simplicius *On Aristotle's Categories* 66,32-67,2 (SVF 2.369, part)

"The Stoics see fit to reduce the number of the primary genera, and others they take over with minor changes. For the make their division a fourfold one, into substrates, the qualified, the disposed, and the relatively disposed."

"In Stoic usage, just as in Epicurean, the ordinary Greek verb 'to be' (einai) can with relative safety be rendered 'exist', despite its vexed earlier history in Greek philosophy. This translation is further justified by some of the Stoic conceptual distinction discussed below.

(...)

The Stoics avoid the common Platonist assumption (...) that to be something is already to exist. To be something is rather, it seems, to be a proper subject of thought and discourse. Most such things do also exist, in that they are bodies. But an incorporeal like a time, or a fictional object like a Centaur, does not. Since, however, expressions like 'Centaur' and 'today' are taken to name something, even though that something has no actual or independent existence (independent, that is, of the world's motion in the case of time, or of someone's mental image, in the case of the Centaur), Although they deny themselves the term 'exist' for such cases, the Stoics have recourse to the broader term under which it falls, 'subsist' (huphistasthai) This latter term, in its Stoic usage, seems to capture the mode of being that Meinong called bestehen and Russell rendered by 'subsist' (in his 1904 articles on Meinong in *Mind* 13 [reprinted in: Douglas Lackey (ed.) - *Essays in Analysis* - pp. 21-93]. For Meinong, similarity or Pegasus, for instance, subsist but does not exist. With existing things, however, they share the fact that they have a character (Sosein), just as in Stoicism both a real horse and a Centaur are 'something'. We could render the Stoic distinction between 'exist' and 'subsist' by saying 'There's such a thing as a rainbow, and such a character as Mickey Mouse, but the don't actually exist'."

'Something' is the highest genus, including as it does incorporeals and fictional entities as well as bodies (see stemma above)."

6. Baldwin, Thomas. 1996. "There Might Be Nothing." *Analysis* no. 56:231-238.

"In recent papers Peter van Inwagen (1996) and Jonathan Lowe (1996) have discussed the 'fundamental' (1) question of metaphysics 'Why is there anything at all?'. In different ways they argue that the *nihilist* hypothesis that there might be just nothing can be set aside, either because it is impossible for there to be nothing (Lowe 1996: 118) or because this hypothesis is 'as improbable as anything can be' (van Inwagen 1996: 99). By contrast I shall here defend the nihilist hypothesis. r

The point at issue does not simply concern the metaphysics of existence. It also connects with debates concerning modal concepts. David Lewis explicitly declares 'there isn't any world where there's nothing at all. That makes it necessary that there is something' (1986: 73). The reason for this, as Lewis explains, is that because he conceives a world as a maximal mereological sum of spatiotemporally interrelated things, there cannot be an empty world, since mereology does not permit 'empty sums'. A little surprisingly, David Armstrong, whose combinatorial theory of possibility is in many respects opposed to that of Lewis, also embraces this conclusion, because 'the empty world is not a construction from our given elements (actual individuals, properties and relations)' (1989: 93). Armstrong takes this view despite the fact that his theory permits the construction of representations of 'contracted worlds' which lack actual individuals, properties and relations because he conceives of worlds as maximal states of affairs and holds that where there is nothing at all, there is no state of affairs. Thus for both Armstrong and Lewis the nihilist hypothesis is to be rejected because the conception of a possibility (or world) has sufficient substance, as a mereological sum or a state of affairs, to demand the existence of something *as a part or constituent*."

(1) This is how Heidegger describes the question in Heidegger *Introduction to Metaphysics*, 1959. It is characteristically unclear what, if any, answer to it Heidegger offers.

"There are genuine references to non-existent objects, as can be seen through elucidating reference in common language and applying the criteria enumerated to expressions used in writing and speaking about fiction. The concept of a fictitious entity is simply accepted in the adoption of the language-game' of fiction and has no undesirable ontological consequences. To think otherwise is to fail to attend to the conceptual status of such talk. Accounts of fictional discourse by Russell, Ryle, and Chisholm are found objectionable. The concept of existence is touched on, and consequences concerning reference to abstract and other objects and also concerning method in ontology mentioned."

The volume contains 13 new papers concerning the semantic and metaphysical issues arising from empty names, non-existence, and the nature of fiction. The contributors include some of the most important researchers working in these fields. Some of the papers develop and defend new positions on these matters, while other papers offer some important new perspectives and criticisms of the existing approaches. The book contains a comprehensive introductory essay by the editors which provides a survey of the philosophical issues concerning empty names, the various responses to these issues, and the literature to date. The book is composed by three parts: I. Empty names; II. Pretense; III. Ontology.

36. Fine, Kit. 1982. "The Problem of Non-Existents. I: Internalism." *Topoi* no. 1:97-140.

Contents: A. Introduction. 1. Outline 97; 2. Methodology 99; B. Preliminaries, 1. Contexts and Objects 101; 2. Identity and Being 102; 3. The Identity of Non-existents 104; c. An Internalist Theory. 1. The Rudiments 106; 2. The Extended Theory 108; D. Refinements. 1. Implicit /Explicit Copula 110; 2. Diagonal Difficulties 115; 3. Dual Diagonal Difficulties 120; 4. Correlates 123; 5. Modal Matters 129; E. Criticisms. 1. Against Platonism 130; 2. Against Internalism 132; 3. Other Theories 136; Notes 137; References 139.

"The main philosophical question about non-existents is whether there really are any. My own view is that there are none. But even if this is granted, we may still ask what they are like, just as the materialist may consider the nature of sensations or the nominalist the nature of numbers.

On this further topic, there seem to be three main divisions of thought, which may be respectively labelled as:

- (i) platonism /empiricism;
- (ii) literalism /contextualism;
- (iii) internalism / externalism.

Let me attempt a rough characterization of these divisions. More refined formulations will come later. On a platonic conception, the non-existent objects of fiction, perception, belief and the like do not depend for their being upon human activity or upon any empirical conditions at all; they exist, or have being, necessarily.

Under an empirical conception, on the other hand, these objects are firmly rooted in empirical reality; they exist, or have being, contingently. On an extreme conception of this sort, these objects are literally created and are brought into being by the appropriate activity either of or within the agent.

(...)

All in all, the three divisions provide for 8 ($= 2^3$) combinations of positions. Each, I think, is coherent, but some are more natural than others. For example it is natural, though not

necessary, for the 'platonist' to accept internalism and for the 'empiricist' to accept externalism; for the means by which the objects are individuated will naturally be taken to provide conditions for their existence or being.

My own view on these questions is given by empiricism, contextualism and externalism, not that this is a common combination in the literature. This view will be defended in the second part of this paper. In the present part, I am concerned to discuss a view that combines internalism with contextualism and platonism; and in the third part, I shall discuss the literalist position, mainly in association with platonism and internalism. I have not attempted systematically to consider all of the possible combinations of position. I have only looked at the more prominent or plausible of the views, though what I say on them should throw light on what is to be said of the others.

The plan of the present part is as follows. In section A2, I discuss general methodological issues facing any philosophical study of nonexistents and, in particular, defend the claim that one can say what they are like without presupposing that there really are any. In section B, I try first to delineate more precisely the subjectmatter of our theories and then to describe the problems of providing identity and existence conditions with which any such theory should deal. In section C, I give an initial formulation of an internalist theory, which is successively refined in section D. Finally, in section E, I give two major criticisms of the theory as thus developed. A more detailed account of each section is given in the list of contents.

It is of the greatest importance to note that the present part does not contain my own views on the subject. It is only in the last section of this part that the internalist position is criticized, and it is only in the second part of this paper that my own, more positive, views are developed." (pp. 97-99)

37. ——. 1984. "Critical Review of Parsons' '*Nonexistent Objects*'." *Philosophical Studies* no. 45:95-142.

Review of: Terence Parsons, *Nonexistent Objects*, New Haven: Yale University Press, 1980.

"There has recently been a rebellion within the ranks of analytic philosophy. It has come to be appreciated that, in the debate between Russell and Meinong, Russell was perhaps mistaken in his criticisms and Meinong was perhaps correct in his views. As a consequence, an attempt was made to rehabilitate the Meinongian position, to defend it against the most obvious attacks and to develop it in the most plausible ways. T. Parsons was among the first of the contemporary philosophers to make this attempt, (1) and so it is especially appropriate that his views should now be set out in a book.

I should say, at the outset, that I thoroughly approve of the Meinongian project. As Parsons makes clear (pp. 32— 38), we refer to non-existents in much the same way as we refer to other objects. It is therefore incumbent upon the philosopher to work out the principles by which our discourse concerning such objects is governed. Not that this is necessarily to endorse a realist position towards the objects of the resulting theory. Nominalists and Platonists alike may attempt to set out the principles that govern arithmetical discourse; and it is in the same spirit that the realist or anti-realist may attempt to set out the principles of our fictional discourse.

Despite my approval of the project, I must admit to some misgivings as to how Parsons has carried it out. These misgivings are of two kinds. There are first some internal criticisms, requiring only change within Parsons' basic approach. There are then some external criticisms, requiring change to the basic approach.

These criticisms, though, should not be thought to detract from the merits of Parsons' book. It is, in many ways, an admirable contribution to the field.

It gives weight both to the interest and the legitimacy of the Meinongian enterprise; it pinpoints the difficulties which any satisfactory theory must deal with; and in its solution to those difficulties, it sets up a theory with a degree of rigour and systematicity that should serve as a model for years to come. As a well worked-out and accessible contribution to object theory, there is no better book." (pp. 95-96)

Abstract: "Many who think that some abstracta are artefacts are fictional creationists, asserting that fictional characters are brought about by our activities. Kripke (1973), Salmon (1998, 2002), and Braun (2005) further embrace mythical creationism, claiming that certain entities that figure in false theories, such as phlogiston or Vulcan, are likewise abstracta produced by our intentional activities. I here argue that one may not reasonably take the metaphysical route travelled by the mythical creationist. Even if one holds that fictional characters are artefact one ought not further hold that mythical objects are, too."

43. ———. 2017. "On Inadvertently Created Abstracta, Fictional Storytelling, and Scientific Hypothesizing." *Res Philosophica* no. 94 (1):177-188.

Abstract: In my "Creatures of Fiction, Objects of Myth" (2014), I present and defend an argument for thinking that mythical creationism—the view that mythical objects like phlogiston and Vulcan are abstract artifacts—is false. One intriguing sort of objection to my argument has been recently put forth by Zvolenszky (2016); she claims that a crucial premise is seen to be unjustified once one considers the phenomena of inadvertently created abstracta—specifically, inadvertently created fictional characters. I argue here that even if we admit inadvertently created abstracta into our ontology, my argument survives. I ultimately defend a view on which fictional characters (if real) may be countenanced as created abstracta whether purposefully created or not, yet mythical objects are best taken to be discoverable, Platonic abstracta (if real). We can see that such a hybrid ontology is justified once we take proper note of the nature of the sorts of authorial activities involved in fictional storytelling and scientific hypothesizing."

45. Grossmann, Reinhardt. 1984. "Nonexistent Objects versus Definite Descriptions." *Australasian Journal of Philosophy* no. 62:363-377.

"Some years ago, I published an article about Meinong's theory of objects. (1) I listed there four main theses of Meinong's view:

(1) The golden mountain (and other nonexistents) has no being at all.

(2) Nevertheless, it is a constituent of the fact that the golden mountain does not exist.

(3) Furthermore, it has such ordinary properties as being made from gold.

(4) Existence is not a constituent of any object.

And I argued in that paper that only thesis (1) is true. In particular, I insisted that (3), which I consider to be the most characteristic feature of Meinong's view, is false.

Since then, there have been quite a few discussions of Meinong's view. I would like, in response to some of these works, to reiterate my earlier criticism of Meinong. My purpose is threefold. Firstly, I would like to state once more my own view, which is a version of Russell's theory of definite descriptions, as clearly as possible. Secondly, I shall defend my past contention that the golden mountain is not golden against some recent objections. And thirdly and most importantly, I want to describe the dialectic of the philosophical problem as I perceive it. It seems to me to be an exasperating shortcoming of the discussion that most participants do not clearly state the basic options and their reasons for preferring some to others."

50. Hunter, Daniel. 1981. "Reference and Meinongian Objects." *Grazer Philosophische Studien* no. 14:23-36.

Abstract: "Terence Parsons has recently given a consistent formalization of Meinong's Theory of Objects. The interest in

this theory lies in its postulation of nonexistent objects. An important implication of the theory is that we commonly refer to nonexistent objects. In particular, the theory is committed to taking fictional entities as objects of reference. Yet it is difficult to see how reference to fictional entities can be established if Parsons' theory is correct. This difficulty diminishes the attractiveness of the theory and also raises questions as to the ability of the theory to give a satisfactory account of intentional attitudes towards fictional entities."

"What follows is not an historical exercise. The basic concern is neither with Meinong's nor his disciples' and advocates' reasons for thinking the theory of nonexistent objects (= nonsubsistent objects in Meinong's sense of the word 'nonsubsistent') important. Instead I shall try to set aside preexisting reasons — there are lots of these — on behalf of the importance of the theory of nonexistent objects, and adduce a couple of unbiased reasons — what Hugues Leblanc sceptically calls "excuses" — aimed at vindicating the development of theories of such objects. It will not follow from this discussion that one must believe in nonexistent objects anymore than one must believe in ideal objects important as the latter are (in the minds of many) to the interpretation of the theory of classical mechanics.

The reasons on behalf of the importance of the theory of nonexistent objects to be advanced are not mutually exclusive, the first having to do with utility or applications of the theory of nonexistent objects, and the second with the smoothness of essentially classical logical theory with identity." Abstract: "In Thomistic metaphysics, the domain of ens rationis pertains to a hazy region of “non-real” being, laying outside of the proper scientific subject of metaphysics. In addition to negations and privations, a very important domain of entia rationis pertains to that of relationes rationis, especially such relationes as play a role in human reasoning. Logic, studying these “non-real” relations, thus focuses on a unique, if hazy, realm of “non-being.” While this particular type of ens rationis receives the lion’s share of attention among Thomists, there is evidence that similar reflection should be given to two additional domains of experience, namely that of “moral being” and “artificial being” (i.e., the being of artifacts). This paper

lays out the general metaphysical concerns pertaining to each of these domains, providing an outline of topics pertinent to a Thomistic discussion of the intentional existence involved in logic, moral realities, and artifacts."

Abstract: "Towards Non-Being gives a noneist account of the reference of words which do not refer to existent objects—in the context, in particular, of intentional states. The account is a realist one, in the sense that the domain of objects is the same at each world, and so does not depend on the behaviour of objects which exist there. In this paper, I discuss an anti-realist version of the theory. What non-existent objects are available at a world supervenes on the behaviour of the existent—and, particularly, sentient—beings at that world. An appropriate formal semantics is given; and its philosophical ramifications—notably, with respect to the naming of non-existent objects—are explored."

"It is my contention (which I shall try to defend in what follows) that the text of the dialogue contains thoughts and ideas that closely correspond to those characteristic of modern logical semantics. The difficulties which Plato is coping with and the solutions proposed by him find their explicit counterparts in the discussions of contemporary logicians and semanticists.

This statement, however, needs some qualification. The text of the dialogue is comprehensive and indefinite enough to allow for different readings and interpretations. It is only some interpretation of some of its fragments that may be said to yield that version of its problems which is suggested below. I would,

however, contend that the interpretation advanced is a warranted one and the fragments so interpreted essential for the author's standpoint. One more point should be explicitly stated beforehand. Referring to what I call modern logical semantics, I mean by this a definite semantic theory: model theoretic semantics in its standard version, which might be regarded as a "classical" form of contemporary logical semantics. Some deviations from this use will be indicated in what follows.

The most important philosophical content of the dialogue is contained in its second part (esp. in the paragraphs 237-264). The main problem concerns the semantic characteristic of falsehood and, involved in it, notion of not-being." (p. 123)

"This essay examines the role of non-existent objects in "epistemological ontology" - the study of the entities that make thinking possible. An earlier revision of Meinong's Theory of Objects is reviewed, Meinong's notions of Quasisein and Aussersein are discussed, and a theory of Meinongian objects as "combinatorially possible" entities is presented."

91. Rast, Erich. 2010. "Classical Possibilism and Fictional Objects." In *Fiction in Philosophy*, edited by Lihoreau, Franck.

Abstract: "An account of non-existing objects called 'classical possibilism', according to which objects that don't actually exist do exist in various other ways, is implemented in a two-dimensional modal logic with non-traditional predication theory. This account is very similar to Priest's, but preserves bivalence and does not endorse dialethism. The power of classical possibilism is illustrated by giving some examples that makes use of a description theory of reference. However, the same effect could also be achieved in a more Millian fashion. It is argued that classical possibilism is ontologically more neutral than is commonly thought, because it allows for the formulation of various forms of reductionism within the object language."

Abstract: "Alexius Meinong advocated a bold new theory of nonexistent objects, where we could gain knowledge and assert true claims of things that did not exist. While the theory has merit in interpreting sentences and solving puzzles, it unfortunately paves the way for contradictions. As Bertrand Russell argued, impossible objects, such as the round square, would have conflicting properties. Meinong and his proponents had a solution to that charge, posing genuine and non-genuine versions of the Law of Non-Contradiction. No doubt, they had a clever response, but it may not adequately address Russell's concern. Moreover, as I argue, genuine contradictions are inherent to the set of all nonexistent objects. And such contradictions lead to even further absurdities, for example, that nonexistent objects have and lack every property. Unfortunately, such implications of the theory make it too treacherous to adopt."

"Non-existence provides big problems for ontology and modest for logic. Logical problems of non-existence consist in licensing inferences in which sentences with empty terms are involved. The standard predicate logic solves this question by presupposing that every individual constant has an object to which it refers. This means that empty domains are excluded from semantics for the first-order logic. However, there is a temptation to consider logic without existential presuppositions.

The ontological problem of non-existence leads to the question of the meaning of 'nothing'. We encounter "various conceptions of nothing" in the history of philosophy from Parmenides to our times. However, nothing (or nothingness) is always a negation of being.

Since we have distributive and collective (mereological) concepts of being, we also should distinguish nothing in the distributive and mereological meaning. This difference is important because only the former leads to the paradox of nothing of all nothings, analogical to the paradox of all sets. A closer analysis of the nothing in the distributive sense shows that any meaningful talk about non-existence requires a relativisation to a fixed domain of discourse. This seems to entail that the empty set is the formal model of nothing what

means that the concept of absolute nothing in the distributive sense is simply inconsistent. To some extent, being and nothing are mutually dual. This motivates that the concept of nothing is governed by so-called dual logic connected with processes of rejection. More specifically, statements on “nothing” are not asserted but rejected."

"The authors develop precise statements of the conditions under which there are nonexistent objects and of the conditions under which any two such objects are identical. Essentially, for any describable condition on properties, there is a nonexistent object which includes (but doesn't necessarily exemplify) just the properties satisfying the condition. The logic of inclusion is developed in detail. It is shown how these nonexistent objects can serve as the denotations of the names of fictional characters."

119. Zvolenszky, Zsófia. 2016. "Fictional Characters, Mythical Objects, and the Phenomenon of Inadvertent Creation." *Res Philosophica* no. 93:311-333.

Abstract: "My goal is to reflect on the phenomenon of inadvertent creation and argue that—various objections to the contrary—it doesn't undermine the view that fictional

characters are abstract artifacts. My starting point is a recent challenge by Jeffrey Goodman that is originally posed for those who hold that fictional characters and mythical objects alike are abstract artifacts. The challenge: if we think that astronomers like Le Verrier, in mistakenly hypothesizing the planet Vulcan, inadvertently created an abstract artifact, then the “inadvertent creation” element turns out to be inescapable yet theoretically unattractive. Based on considerations about actually existing concrete objects featured in fictional works (as Napoleon is in Tolstoy’s *War and Peace*), I argue that independently of one’s stand on mythical objects, admitting fictional characters as abstract artifacts is enough to give rise to the challenge at hand; yet this very point serves to undermine the challenge, indicating that inadvertent creation is not nearly as worrisome as Goodman suggests. Indeed, the inadvertent creation phenomenon’s generality extends far beyond objects of fiction and myth, and I will use this observation to counter a further objection. Taking fictional characters (and mythical objects) to be abstract artifacts therefore remains a viable option.”

"This paper provides a critical edition of Francis of Prato's *Treatise on Being of Reason (Tractatus de ente rationis)*. It is prefaced by a historico-philosophical introduction. Francis's *Treatise* is one of the first Italian reactions to the diffusion of William of Ockham's philosophy of language and logic. Francis argues here against Ockham's reduction of being of reason to acts of cognition, accounted for as items existing 'subjectively' (subjective) in the mind. By contrast, following Thomas Aquinas and Hervaeus Natalis, he proposes a relational and 'objective' account of being of reason."

"I. Prefatory Note.

In the following paper I shall be discussing a particular problem of meaning and reference as it was formulated by a group of logicians who studied and/or taught at the University of Paris in the early sixteenth century.(1) In alphabetical order they are: Johannes Celaya (d. 1558) who was in Paris from 1500 or 1505 until 1524; Ferdinandus de Enzinas (d. 1528) who was in Paris from about 15x8 until 1522; John Major (1469-1550) who was in Paris from 1492 or 1493 until 1517 and again from 1525 to 1531; William Manderston who taught at Sainte-Barbe from about 1514 and returned to Scotland in or shortly before 1530; Juan Martinez Siliceo (1486-1556) who left Paris in about 1516; Hieronymus Pardo (d. 1502 or 1505); Antonius Silvester who taught at Montaigu; and Domingo de Soto (1494-1560) who left Paris in 1519. I shall also discuss the work of the Spaniard Augustinus Sbarroya and the Germans Jodocus Trutvetter (d. 1519) and Johannes Eckius (1486-1543). Both Sbarroya and Eckius were well acquainted with the works of the Paris-trained logicians. Further material is drawn from the fifteenth-century Johannes Dorp and the anonymous author of *Commentum emendatum et correctum in primum et quartum tractatus Petri Hyspani*. The work of the medieval authors

Robert Holkot, John Buridan and Marsilius of Inghen will appear as it was described by early sixteenth-century authors.

II. *Introduction.*

One of the main features of late medieval semantics was the attempt to formulate a unified theory of the reference of general terms. It is true that this attempt was not explicitly discussed, but many of the problems which arose in the context of such topics as signification, supposition, ampliation, appellation, and the logical relations between sentences clearly owed their existence to the assumption that general terms always referred to spatio-temporal individuals; and in the solutions offered to these problems, much ingenuity was employed to ensure that this assumption was modified as little as possible, if at all. I have already shown in two earlier papers how some logicians dealt with reference in the modal context "For riding is required a horse" and in the intentional context "I promise you a horse." (2) At the end of this paper, I shall discuss another intentional sentence, "A man is imaginarily an ass", which was thought to present a difficulty. However, it would be a mistake to think that context was the only complicating factor, for there were general terms which placed an obstacle in the path of those seeking a unified theory, not only by virtue of the contexts in which they appeared, but by virtue of their meaning. The favourite example of such terms was "chimera", but "irrational man", "braying man", and "golden mountain" also served as illustrations. The problem was not merely that they failed to refer, but rather that they were thought to be incapable of referring because the objects which they apparently denoted were impossible just as, for the modern reader, a round square is impossible. The main purpose of the present paper is to explore the way in which the problem was presented, and some of the solutions which were offered." (pp. 57-58)

(...)

"VI. *Conclusion.*

This survey of the way some early sixteenth century logicians treated the problem of chimeras reveals very clearly the alternatives faced by any philosopher who wants to give a unified theory of the reference of general terms. If one adopts a purely extensionalist interpretation of propositions, and allows only ordinary spatio-temporal entities into one's universe of discourse, then one is faced with the choice between rejecting as false many sentences, such as "I imagine a chimera", which one would wish to accept as true, and accepting as true many sentences, such as "Chimera" signifies an ass", which one would wish to reject as false. If one extends one's universe of discourse to include imaginary objects which are not just ordinary objects regarded in a certain way, one faces grave ontological problems. On the other hand, to appeal to appellation theory is to acknowledge that no purely extensionalist interpretation of all propositions can be given and that no unified theory of reference is possible; and to adopt Holkot's solution is to admit that sentences which seem to be structurally similar are not in fact similar and that some sentences which appear to be about objects in the world are in fact about the contents of our own minds. On the whole my sympathies lie with those who abandoned the belief that both general terms and subject-object sentences can be given a uniform treatment, but I have great respect for the subtlety and sophistication with which arguments for a uniform treatment were presented. Post-medieval logicians were by no means mindless followers of their medieval predecessors." (p. 79)

Abstract: "One of the most widespread claims combining epistemology and metaphysics in post-Avicennian Islamic philosophy was that every object of thought is real. In Mu'tazilite reading, it was endorsed due to a theory of knowledge which states that knowledge is a connection or relation between the knower and the object known. Avicennists accepted it due to the rule that in a proposition "s is p" if p is something positive s has to be positive and real too. Hence, insofar as one can conceptually distinguish between two non-existent items, they have to be real. In this article, the author presents significant consequences of this theory: the acceptance and denial of non-existent yet real extramental objects; the concept of mental existence as an alternative solution; the conceivability of paraconsistent ideas and their reality or reducibility to some real objects."

13. Bostock, David. 1984. "Plato on 'Is Not' (*Sophist*, 254-9)." *Oxford Studies in Ancient Philosophy* no. 2:89-119.

"According to the received doctrine, which I do not question, the uses of the Greek verb 'to be' may first be distinguished into

those that are complete and those that are incomplete. In its incomplete uses the verb requires a complement of some kind (which may be left unexpressed), while in its complete uses there is no complement, and it may be translated as 'to exist' or 'to be real' or 'to be true' or something of the kind. What role the complete uses of the verb have to play in the *Sophist* as a whole is a vexed question, and one that I shall not discuss. For I think it will be generally agreed, at least since Owen's important article of 1971, (1) that in our central section of the *Sophist* it is the incomplete uses that are the centre of Plato's attention. Anyway, I shall confine my own attention to these uses, and accordingly my project is to elucidate and evaluate Plato's account of 'is not' where the 'is' is incomplete. I might also add here that, for the purposes of the *Sophist* as a whole, I am in agreement with Owen's view that what Plato himself took to be crucial was the account of 'not', and what he has to say about 'is' is, in his own eyes, merely ancillary to this. But I do not argue that point, partly because Owen has already done so, and partly because it is not needed for my main contentions. As we shall see, one cannot in fact understand what Plato does say about 'not' without first considering his views on the incomplete 'is'.

Reverting to the received doctrine once more, the incomplete uses of 'is' may be divided into two. In one sense the verb functions as an identity sign, and means the same as 'is the same as', while in the other it functions merely as a sign of predication, coupling subject to predicate, and cannot be thus paraphrased. The vast majority of commentators on the *Sophist* seem agreed that Plato means to distinguish, and succeeds in distinguishing, these two different senses of the verb.(2) This I shall deny. In fact I shall argue not only that Plato failed to see the distinction, but also that his failure, together with another ambiguity that he fails to see, wholly vitiates his account of the word 'not'. The central section of the *Sophist* is therefore one grand logical mistake." (pp. 89-90)

"Beings of reason or non-existent objects have always been a source of mind-boggling paradoxes that have vexed

philosophers and thinkers in the past and present. Consider Bertrand Russell's paradox: 'if A and B are not different, then the difference between A and B does not subsist. But how can a non-entity be the subject of a proposition?' Or Meinong's paradox: 'There are objects of which it is true that there are no such objects.' At the root of these troubling conundrums are two basic questions: What are beings of reason? What kind of existence do they have? Francisco Suárez was well aware that a solution to the metaphysical questions concerning the essential character of beings of reason and their ontological status would serve as the key to solving the puzzles and paradoxes just described. A solution to these metaphysical questions would also bring about an understanding of how we talk about beings of reason and other problems that they give rise to in the philosophy of language. In this paper, I present Suárez's view on the nature and ontological status of beings of reason and clarify some of the following questions: What kind of beings (*entia*) are beings of reason? What kind of being (*esse*) do beings of reason have? This latter concern is related to the following metaphysical issues: What are real beings? What is the nature and ontological status of possible beings? What is the distinction between real beings, actual beings, and possible beings?"

17. Carson, Scott. 2000. "Aristotle on Existential Import and Non Referring Subjects." *Synthese* no. 124:343-360.

Abstract: "Much contemporary philosophy of language has shown considerable interest in the relation between our linguistic practice and our metaphysical commitments, and this interest has begun to influence work in the history of philosophy as well.(1) In his *Categories* and *De interpretatione*, Aristotle presents an analysis of language that can be read as intended to illustrate an isomorphism between the ontology of the real world and how we talk about that world. Our understanding of language is at least in part dependent upon our understanding of the relationships that exist among the enduring πράγματα that we come across in our daily experience. Part of the foundations underlying Aristotle's

doctrine of categories seems to have been a concern, going back to the Academy, about the problem of

false propositions: language is supposed to be a tool for communicating the way things are, and writers in antiquity were often puzzled by the problem of how we are to understand propositions that claim that reality is other than it is.(2)

Aristotle's analysis of propositions raises a particular problem in this regard: if the subject of a proposition does not refer to anything, how can the proposition be useful for talking about a state of the world?

The problem falls into two separate but related parts: propositions whose subjects are singular terms and hence make claims about some particular thing, and propositions whose subjects are general terms and hence make claims about classes. In this paper I will explain Aristotle's treatment of each kind, focusing in particular on what has widely been perceived as a problem in his treatment of singular terms. My discussion of his treatment of general terms will be more brief, but will show that his treatment of them is consistent with his treatment of singular terms."

(1) An interesting treatment of this topic that illustrates how such concerns intersect with issues in the history of philosophy can be found in Diamond (1996), Introduction II (pp. 13–38). Whittaker (1996) also touches on these themes.

(2) On the treatment by ancient philosophers of the problem of falsehood see Denyer (1991).

"Contemporary philosophy is in a rut, according to Terence Parsons in his recent book *Nonexistent Objects*, ([NO]), and it is one that stems from the (post-1905) work of Bertrand Russell. The main characteristic of this "Russellian rut" ([NO], 1) is strict adherence to the thesis that being, or being something, amounts to being something that exists—or equivalently that 'there is' is to be equated with 'there exists' ([NO], 6). This view is now so well entrenched, according to Parsons, that it is a main stay of what he also calls the orthodox tradition.

Now the orthodox view is in a rut, according to Parsons, "because it's a view in which most of us are so entrenched that it's hard to see over the edges" ([NO], 1). Naturally, if we want "to look over the edge and see how things might be different" ([NO], 8), as any objective seeker of truth would, then "we need to encounter an actual theory about nonexistent objects" (ibid.). It is the construction and presentation of such a theory that is Parsons's concern in *Nonexistent Objects*.

(...)

"Now we do not object to Parsons's choice of Meinong's theory here, nor for that matter to his elegant reconstruction and presentation of that theory. We do think, however, that a more balanced recognition of Russell's overall view is called for and that perhaps the best way to make the Meinongian notion of a concrete object understandable to the orthodox tradition is to compare it with the general Russellian notion of a concrete individual, i.e., the Russellian notion of an individual that can exist but which might in fact not exist. Indeed, on the basis of the analysis and comparison we shall give here, it is our position that the Meinongian notion of a concrete object, at least as reconstructed by Parsons, is parasitic upon, though in a beneficent way, the Russellian notion of a concrete individual, existent or otherwise." 26. David, Marian. 1986. "Nonexistence and Reid's Conception of Conceiving." *Grazer Philosophische Studien* no. 25/26:585-599.

Abstract: "Brentano's famous thesis of the Intentionality of the Mental was already formulated by Thomas Reid who used it in his campaign against the Locke-Berkeley-Hume Theory of Ideas. Applied to the case of conceiving the thesis says that to conceive is to conceive something. This principle stands in apparent conflict with the common-sensical view, defended by Reid, that we can conceive what does not exist. Both principles, it is argued, are plausible and should be retained. The problem is how to resolve the apparent contradiction. Reid's way out of the dilemma is clarified by contrasting it with less satisfactory solutions."

"The sixth essay after the introduction ("Suárez on Beings of Reason and Truth"), against a background view of truth as a function of being, considers Suárez's response to the question of truth where there is no real being independent of the mind. If truth consists in a conformity between the mind and reality, how can there be any truth where there is no independent reality? Most of all, how can there be any truth where something would be impossible of realization? In last analysis, Suárez's reply turns upon the significant cast of the words involved in the expression of beings of reason, especially so called impossible objects. Because, unlike mere nonsense words such as "*Blytiri*" or "*scyndapsus*," words like "*goat-stag*" or "*chimera*" have signification, there is in their regard, and in regard to the beings of reason they express, the possibility of some statements being true even as others are false." (*CSS* p. XIII).

29. ———. 1988. "Suárez on Beings of Reason and Truth (Second part)." *Vivarium* no. 26:51-72.

Reprinted as Chapter 7 in *CSS* and as Chapter 2 in *BBK*.

"From Parmenides on, it has been a commonplace in the Western philosophical tradition that truth is a function of being. One need only remember the general Platonic doctrine of Forms, which are at once 'really real' and the locus of intelligibility of truth. Francis Suarez has passed on the common teaching of the Schoolmen that truth is threefold. (1) There is a truth in words, in writing, and in what he calls 'non-ultimate concepts' which is termed truth 'in signifying'. (2) There is a truth in the intellect knowing things, which is called truth 'in knowing'. And (3) there is a truth in things, which is a truth 'in being'."

"This is the completion of a two-part article which considers Suarez's reply to the question of truth where there is no real being independent of the mind. That reply turns upon the significative cast of the words expressing beings of reason, especially "impossible" beings. Because such words, unlike nonsense syllables, have signification, there is in their regard, and in regard to the beings of reason they express, the possibility of some statements being true even as others are false."

30. ———. 1994. "Poinset on the Knowability of Beings of Reason." *American Catholic Philosophical Quarterly* no. 68:337-362.

"John Poinset (a.k.a. Joannes a sancto Thoma (1589-1644) was heir to a common division of beings into these that are in themselves real and those which are entirely dependent upon human reason. Those division went back to Aristotle's split between being as found in the categories and being as true. In the Middle Ages and thorough the period of the Spanish Revival, it was found, *mutatis mutandis*, in Averroes (d. 1198), St. Thomas Aquinas (1225-1274), Henry of Ghent (1217?-1293), John Duns Scotus (1266-1308), Francisco Suárez (1548-1617), and just about everyone else in the Scholastic tradition.

One of the very few exceptions that I know to this general rule was Francis of Mayronnes, O.F.M. (d. ca. 1325), who denied the existence of beings of reason. Not only an heir, Poincot himself embraced and transmitted the common view. For him, beings were either real or rational. Real beings (*res extra animam*) were those which exist, or can exist, independently of the human mind and which belong in the Aristotelian categories. Rational beings, or beings of reason, in the sense which contrasts with this, were those which do not belong to the categories, and which cannot exist outside human understanding. That there are such beings of reason was not for Poincot a matter of doubt."

31. ———. 1995. "Another God, Chimerae, Goat-Stags, and Man-Lions: a Seventeenth Century Debate About Impossible Objects." *Review of Metaphysics* no. 48:771-808.

Reprinted as Chapter 4 in *BBK* and as Post-Scriptum in: Victor M. Salas (ed.), *Hircocervi & Other Metaphysical Wonders. Essays in Honor of John P. Doyle*, Milwaukee, Marquette University Press, 2013, pp. 329-367.

"This article concerns a 17th Century debate over whether there are self-contradictory impossible objects of understanding or whether there is no intellectual object which is not some actual or possible being. The debate, which has its roots in the Greek and Scholastic traditions, is presented especially between two Jesuits: Thomas Compton Carleton and John Morawski, respectively, a proponent and an opponent of impossible objects. The article itself does not take sides in the debate, but, inasmuch as he wrote later, Morawski is presented as espousing his own view and answering arguments in support of Carleton's position."

32. ———. 2006. "Mastri and Some Jesuits on Possible and Impossible Objects of God's Knowledge and Power." In *Rem in seipsa cernere: saggi sul pensiero filosofico di Bartolomeo Mastri (1602-1673)*, edited by Forlivesi, Marco, 439-468. Padova: Il Poligrafo.

"Why are some things possible while others are not? Is possibility and/or impossibility ultimately from God Himself?"

If so, how can this be understood? Is it, as St Thomas Aquinas (1225-1274) thought, stemming from God's intellect in such way that creatures are possible inasmuch as the divine essence is thought by God to be imitable in various ways? Accordingly, God's intellect rather than possible creatures would be the cause of their multiplicity. But further obstacles are posed by the Divine simplicity. St Thomas himself has addressed the question of how can the absolutely simple Divine intellect understand at once many things? Or how can what is simple be imitable in various ways? How can what is perfectly one be the last ground of plurality? This last difficulty was highlighted in the time between Plato and St. Thomas by those to whom it seemed, at best, that from what is simply one, necessarily only one thing could proceed.

Contrasted with this, perhaps the final ground for things being many as well as possible or impossible might be that God has freely willed them so. This seems to have been the view of Henry of Ghent (1217-1293) when he said that the passive potency of creatures and the active power of God are correlative. It was also the thought of William of Ockham (ca. 1290-1349), whose disciple, Gabriel Biel (1410?-95), has gone even more decidedly along this path. Are possibilities themselves, then, creatures of God, depending on His will to make them as they are? If yes, is it in God's power to make other things possible and then to create them - things which are now impossible? Could God make square circles or a second God? Without restraint from what is beforehand possible, could God abrogate the present moral order and substitute another in its place?

(Or can there be a third, on its face more Platonic, position which would find the source of multiplicity, possibility, and impossibility in other beings which are equally independent with God? Other Gods or "Semi-gods"? Like Plato's Demiurge, could the Christian God be bound by a set of antecedent possibilities which are not other Gods and which are not His creatures but which are simply "there", governing His action? We might recoil from such a position, but that won't solve problems.

2. Some sources

The 17th century Conventual Franciscan, Bartolomeo Mastri, (1602-1673), came to such problems chiefly as a continuator and an interpreter of Duns Scotus (1266-1308), for him “the Doctor”. (17) But between Mastri and the Subtle Doctor centuries had intervened, during which there were other interpreters and different lines of thought about possibles and impossibles. The present paper is confined to Mastri’s views both personal and as an interpreter; and it will try to relate these views to those of some 17th-century Jesuit thinkers whose works were known to him.

Primary sources for Mastri’s doctrine will be in his (so posthumously called) *Cursus integer* of philosophy, the first three volumes of which he co-authored with his friend and fellow Franciscan, Bonaventura Belluto (1601-1678), (18) whereas the last two, which contain his metaphysical disputations, he afterwards produced alone. (19) My emphasis will be on his metaphysical Disputation 8 (On the Essence and Existence of Finite Being) and, from their joint logic, Disputation 3, question 6 (On Beings of Reason). I will also draw on Mastri’s later *Disputationes theologicæ* which contain his mature doctrine. (20) The remote source for Mastri’s views will be the writings of his master, Duns Scotus, especially the *Ordinatio*, most particularly, Book I, distinctions 35, 36, and 43. (21) Someone always present will be the Irish Franciscan, John Punch (Poncius, 1603-1672/3), who was over decades Mastri’s principal opponent. (22)". (pp. 440-443, many notes omitted).

(17) On Mastri, see M. Forlivesi, “*Scotistarum princeps*”. *Bartolomeo Mastri (1602-1673) e il suo tempo*, Padova: Centro studi antoniani, 2002. In English, cf. B. Crowley, “The Life and Works of Bartholomew Mastrius, O.F.M. Conv. 1602-1673”, in *Franciscan Studies*, 8 (1948), pp. 97-152.

(18) I have used the following edition: Mastrius - Bellutus, *Philosophise ad mentem Scoti cursus integer*, Venetiis: Apud Nicolaum Pezzana, 1727.

(19) Here I have used Mastrius, *Disputationes in XII Aristotelis Stagiritæ libros Metaphysicorum*, 2 vols., Venetiis: Typis Marci Ginammi, 1646-1647.

(20) For this I have used: Mastrius, *Disputationes theologicæ, I In primum librum Sententiarum*, Venetiis: Apud Ioannem Iacobum Hertz, 1675 (archetypal edition Venetiis: Apud Ioannem Iacobum Hertz, 1655). In addition, I have had access to: Mastrius, *Disputationes theologicæ, I In primum lihrum Sententiarum*, Venetiis: Ex Typographia Balleoniana, 1719. From what I have seen, I would judge the 1675 edition to be better.

"Sylvester Mauro, S.J. (1619-1687) noted that human intellects can grasp what is, what is not, what can be, and what cannot be. The first principle, 'it is not possible that the same thing simultaneously be and not be,' involves them all.

The present volume begins with Greeks distinguishing 'being' from 'something' and proceeds to the late Scholastic doctrine of 'supertranscendental being,' which embraces both. On the way is Aristotle's distinction between 'being as being' and 'being as true' and his extension of the latter to include impossible objects. The Stoics will see 'something' as the widest object of human cognition and will affirm that, as signifiable, impossible objects are something, more than mere nonsense. In the sixteenth century, Francisco Suárez will identify mind-dependent beings most of all with impossible objects and will also regard them as signifiable. By this point, two conceptions will stand in opposition. One, adumbrated by Averroes, will explicitly accept the reality and knowability of impossible objects. The other, going back to Alexander of Aphrodisias, will see impossibles as accidental and false conjunctions of possible objects. Seventeenth-century Scholastics will divide on this line, but in one way or another will anticipate the Kantian notion of 'der Gegenstand überhaupt.' Going farther, Scholastics will see the two-sided upper border of being and knowing at God and the negative theology, and will fix the equally double lower border at 'supertranscendental being' and 'supertranscendental nonbeing,' which non-being, remaining intelligible, will negate the actual, the possible, and even the impossible."

Reprinted in: S. Ebbesen, *Greek-Latin Philosophical Interaction. Collected Essays*, Volume 1, Aldershot: Ashgate, 2008, pp. 35-57.

"My feelings towards philosophers are mixed. For centuries they have used me as an experimental animal, keeping me on a minimum of being. In a way I may owe them my "life", but their experiments have weakened me so much that the end may be drawing near. If my weakness proves fatal, please inform the Centaur, Goat-Stag and Pegasus, who are my next of kin. If the philosophers kill me, I expect them to keep at least one of my relatives alive in order to continue the experiments. If we are all doomed, I would like to secure us a place in man's memory. This is why I have put together these extracts from my diary, recording the sufferings to which I and my tribe have been subjected." (*)"

(*) "This paper reproduces the manuscript left by the chimera, but I have added references to books and manuscripts, plus a few notes which appear in square brackets. The reader will notice that the chimera has wisely disregarded accidental changes of philosophers' choices of example when they need a composite animal. The chimera takes remarks about, e.g., the goat-stag as remarks aimed at itself. As a matter of fact, Aristotle and the Greek Aristotelian commentators prefer the goat-stag (τραγελαφος) and the centaur (ἵπποχένταυρος). In the Hellenistic period, the centaur, the scylla and the chimera are the standard examples. In Latin medieval texts the chimera (inherited from Manlius Boethius) is vastly more popular than any of the other composite animals."

35. Ebbesen, Sten, and Pinborg, Jan. 1982. "Thott 581 40, or de ente rationis." In *English Logic in Italy: 14th and 15th Centuries*, edited by Maierù, Alfonso, 111-146. Napoli: Bibliopolis.
36. Eck, Job van. 2002. "Not-Being and Difference: on Plato's *Sophist* 256 d 5-258 e 3." *Oxford Studies in Ancient Philosophy* no. 23:63-84.

"Plato's analysis of falsity at *Sophist* 263 is given in terms of not being and difference. 'Theaetetus flies' is false because what is

different is stated as the same, and what is not as what is, (263 D 1-2), things that are different from what is the case concerning him (viz. flying) are described as the same (as what is the case about him). That there are indeed many 'not-beings' in the sense of things different from the things that are, the Eleatic Stranger (ES) and Theaetetus remarked some lines above, 'for we said there are many things that are with regard to each thing and many things that are not (263 B 11-12), referring to 256 E 6-7, 'so, with regard to each of the forms, being is many and not-being is indefinite in quantity'. In this way they had been disobedient to Parmenides, who had stated, 'Never shall it force itself on us that things that are-not are.' But they had gone even further in their disobedience: 'but we have not merely shown that the things that are-not are, but also brought to light the form not-being happens to have' (258 D 5-7).

The context of both points has caused commentators a lot of problems. The main question is, how is it that something (i.e. a form) is called an *ouk on* in 256 D 8-257 A 6? Is it because it is different from the form of being; or is it because it is different from any thing (i.e. any form) it is not identical with? And on which of the two lines is the form of not-being defined as it is introduced in the section that follows, in 258 A 11-B 8 and 258 D 7-E 3? Only a few commentators have tackled the problems systematically, and as far as I know no interpretation has been reached that is both coherent and sound. Nevertheless, such an interpretation is possible, as I shall argue in the following. I shall discuss the passages at issue, criticize commentaries that have been given, and present the interpretation intended." (pp. 63-64, Greek omitted)

38. Folescu, Marina. 2016. "Thinking About Different Nonexistents of the Same Kind: Reid's Account of the Imagination and its Nonexistent Objects." *Philosophy and Phenomenological Research* no. 93:627-649.

Abstract: "How is it that, as fiction readers, we are nonplussed by J. K. Rowling's prescription to imagine Ronan, Bane, and Magorian, three different centaurs of the Forbidden Forrest at Hogwarts? It is usually held in the philosophical literature on fictional discourse that singular imaginings of fictional objects are impossible, given the blatant nonexistence of such objects. In this paper, I have a dual purpose: (i) on the one hand, to show that, without being committed to Meinongianism, we can explain the phenomenon of singular imaginings of different nonexistents of the same (fictional) kind; (ii) while, at the same time, to attribute this position to Thomas Reid, thus correcting some misunderstandings of his view on imagination."

Abstract: "According to several late medieval logicians, the use the universal quantifier 'omnis' creates the requirement that the sentence refers to at least three items—the principle of *sufficiencia appellatorum*. The commitment is such that, when

the quota is not fulfilled, one has to import the missing items from the realm of the nonexistent. While the central argument for this principle, whose origin is Aristotle's *De Caelo*, stems from the contrast between unrestricted universal quantifiers and binary quantifiers, the discussion is often mixed with another issue, concerning the requirement of a plurality of referents for universals. In this paper, we try to distinguish those different issues and map the reactions of xiiiith authors to the principle of *sufficiencia appellatorum*."

Abstract: "This paper analyzes the theories of three representatives of Second Scholasticism, namely Francisco Suárez, SJ, John Poinsot, OP, and Francisco de Oviedo, SJ, on the issue of the intuitive and abstractive cognition of the external senses. Based on a comparison of their theories, linked to the historical starting point of the debate in the first decades of the fourteenth century (Peter Auriol, John Duns Scotus, Francis

of Meyronnes, William of Ockham and Walter Chatton), the paper argues that the doctrinal and argumentative matrix of

these authors' texts is significantly 'present' in the Second Scholastics as well. 1) As far as naturally produced sensation is concerned, all these authors, including Poinset, follow the Scotistic justification of the natural infallibility of the external senses; 2) regarding the possibility of supernaturally

caused objectless perception, Poinset's position can be labelled, surprisingly, Scotistic; 3) Suárez's theory, although partly similar to the doctrine of the late Ockham, is an idiosyncratic stance; 4) Oviedo's conception, even more distant from that of Ockham, can be characterized as 'Auriolian' and 'Chattonian'."

48. Hübner, Karolina. 2016. "Spinoza on Essences, Universals, and Beings of Reason." *Pacific Philosophical Quarterly* no. 97:58-88.

Abstract: "The article proposes a new solution to the long-standing problem of the universality of essences in Spinoza's ontology. It argues that, according to Spinoza, particular things in nature possess unique essences, but that these essences coexist with more general, mind-dependent species-essences, constructed by finite minds on the basis of similarities ('agreements') that obtain among the properties of formally-real particulars. This account provides the best fit both with the textual evidence and with Spinoza's other metaphysical and epistemological commitments. The article offers new readings of how Spinoza understands not just the nature of essence, but also the nature of being, reason, striving, definitions, and different kinds of knowledge."

49. Jacquette, Dale. 1982. "Meinong's Theory of Defective Objects." *Grazer Philosophische Studien* no. 15:1-19.

"In his difficult work *On Emotional Presentation*, Meinong introduces the concept of defective objects. These are meant to provide part of the solution to Mally's paradox about self-referential thought. But the discussion of defective objects is ambiguous in ways which give rise to a dilemma.

It is not clear whether defective objects are supposed to be a special kind of intentional object on Meinong's theory, or whether they are not really supposed to be intentional objects

at all. If defective objects are a special kind of intentional object, then it is possible to put forward a strengthened version of Mally's paradox which cannot be solved by the theory of defective objects. The strengthened paradox represents a counter-example to the intentionality thesis, according to which every psychological experience is directed toward an object of intention. But if defective 'objects' are not really intentional objects at all, then psychological experiences which have defective objects will themselves constitute counter-examples to the intentionality thesis. In either case, the thesis cannot be consistently maintained." (p. 1)

52. ———. 1995. "Meinong's Concept of Implexive Being and Nonbeing." *Grazer Philosophische Studien* no. 50:233-271.

"Meinong introduces the concept of implexive being and nonbeing to explain the metaphysics of universals and as a contribution to the theory of reference and perception. Meinong accounts for Aristotle's doctrine of the inherence of secondary substances in primary substances in object theory terms as the implection of incomplete universals in complete existent or subsistent objects. The derivative notion of implexive so-being is developed by Meinong to advance an intuitive modal semantics that admits degrees of possibility. A set theoretical interpretation of Meinong's mereological concept of the implection of incomplete beingless objects in existent or subsistent complete objects is proposed. The implications of Meinong's concept of implection are exploited to answer extensionalist objections about "Meinong's jungle," defending the ontic economy of an extraontological neo-Meinongian semantic domain that supports individual reference and true predication of constitutive properties to beingless objects."

Bibliography 269; Index 285.

"Alexius Meinong and his circle of students and collaborators at the Philosophisches Institut der Universität Graz formulated the basic principles for a general theory of objects.(1) They developed branches and applications of the theory, outlined programs for further research, and answered objections from within and outside their group, revising concepts and sharpening distinctions as they proceeded. The object theory that emerged as the result of their efforts combines important advances over traditional systems of logic, psychology, and semantics.The fate of object theory in the analytic philosophical community has been unfortunate in many ways. With few exceptions, the theory has not been sympathetically interpreted. It has often met with unfounded resistance and misunderstanding under the banner of what Meinong called "The prejudice in favor of the actual". (2) The idea of

nonexistent objects has wrongly been thought to be incoherent or confused, and there are still those who mistakenly believe that the theory inflates ontology with metaphysically objectionable quasi-existent entities.' These criticisms are dealt with elsewhere by object theory adherents, and are not considered here. In what follows, the intelligibility of an object theory such as Meinong envisioned is assumed, and ultimately vindicated by the construction of a logically consistent version. The inadequacies of extensionalist theories of ontological commitment and definite description, hallmarks of the Russell-Quine axis in recent analytic philosophy, justify an alternative intentional Meinongian object theory logic. Analytic philosophy survives the rejection of extensionalist treatments of definite description and ontological commitment, since analytic methods are not inherently limited to any particular set of extensional or intentional assumptions.

A comprehensive historical treatment of Meinong's philosophy is not attempted in these chapters, though some historical issues are addressed. Some of Meinong's most important philosophical writings have now been translated or are expected to appear in the near future, and there are several recent commentaries on Meinong's work, including Richard Routley's *Exploring Meinong's Jungle and Beyond*, Terence Parsons' *Nonexistent Objects*, and Karel Lambert's *Meinong and the Principle of Independence*. These studies have contributed to renewed interest in and unprejudiced reappraisal of object theory. Analyses of the subtle turnings in Meinong's thought over several decades may be found in J. N. Findlay's *Meinong's Theory of Objects and Values*, Reinhardt Grossmann's *Meinong*, Robin Rollinger's *Meinong and Husserl on Abstraction and Universals*, and Janet Farrell Smith's essay "The Russell-Meinong Debate". These works trace the complex development of Meinong's early nominalism or moderate Aristotelian realism in the *Hume-Studien* to his mature realistic interpretation of relations and factual objectives or states of affairs as subsistent entities, the theory of objects of higher order, and the doctrine of the *Aussersein* of the pure object. I have relied on these among other sources, I cannot hope to

improve on them in some respects, and my topic in any case is somewhat different. I am concerned exclusively with the logic, semantics, and metaphysics or ontology and extraontology of Meinong's theory. Accordingly, I shall not discuss Meinong's epistemology, theory of perception, or value theory, which I nevertheless regard as essential to an understanding of his philosophy as a whole. The logic, semantics, and metaphysics of object theory are in a sense the most fundamental aspects of Meinong's thought, and therefore require the most careful preliminary investigation.

The formal system I develop is a variation of Meinong's vintage *Gegenstandstheorie*, refined and made precise by the techniques of mathematical logic. The proposal offers an integrated three-valued formalization of Meinongian object theory with existence-conditional abstraction, and modal and non-Russellian definite description subtheories. The logic is motivated by considerations about the need for an object theory semantics in the correct analysis of ontological commitment and definite description. Applications of the logic are provided in phenomenological psychology, Meinongian mathematics and metamathematics, criticism of ontological proofs for the existence of God in rationalist theodicy, the interpretation of fiction and scientific law, and formal resolutions of Wittgenstein's private language argument and the paradox of analysis. In some areas it has been necessary to depart from Meinong's official formulation of the theory. But I have tried to make these differences explicit, justifying them by argument and evaluating alternative interpretations. This I believe is in keeping with the spirit of the first exponents of object theory, who did not advance their views as a fixed body of doctrine, but maintained an openminded scientific attitude, and continually sought to achieve a more accurate approximation of the truth.

(1) I refer to Meinong's *Gegenstandstheorie* as a theory of objects, but alternative English equivalents have been proposed which should also be considered. Reinhardt Grossmann argues that the theory must be called a theory of entities because it includes not merely objects (*Objekte*), but objectives or states of affairs (*Objektive*). Grossmann, Meinong [1974], pp. 111-12: "If

we keep in mind that Meinong will eventually divide all entities (other than so-called dignitives and desideratives) into objects on the one hand and objectives on the other, we cannot speak of a theory of objects as the all-embracing enterprise, but must speak -- as I have done and shall continue to do -- of a theory of entities." This argument is inconclusive, since objectives are also objects of a kind, which Meinong describes as objects of higher order (*höherer Ordnung*), superiora founded on inferiora or lower order objects. An objective in any case can be as much an object of thought as any other nonobjective object, as when someone thinks about the fact that Graz is in Austria, and thereby makes that state of affairs an object of thought. In this sense, the theory of objects, of lower and higher order, is already all-embracing in the way Grossmann thinks Meinong's *Gegenstandstheorie* is meant to be. Nicholas Griffin identifies a further difficulty in Grossmann's terminological recommendation. In "The Independence of *Sein* from *Sein*" [1979], p. 23, n. 2, Griffin writes: "Grossmann standardly uses the term 'entity' for Meinong's '*Gegenstand*', which is usually translated as 'object'. Since the Oxford English Dictionary defines 'entity' as 'thing that has real existence', this switch is unsatisfactory. Accordingly I have switched back either to 'object' or to the even more neutral term 'item'." Griffin's choice of translation agrees with Richard Routley's in *Exploring Meinong's Jungle and Beyond* [1981], where Routley refers to a theory of items distinct in some respects from but directly inspired by Meinong's theory of objects. Routley's 'theory of item' is perhaps better used to designate his own special version of object theory, which he also denotes 'noneism'. Neither Grossmann's nor Routley's terminology carries the intentional force of '*Gegenstand*', which as Meinong explains is etymologically related to '*gegenstehen*', to stand against or confront, as objects of thought are supposed to confront and present themselves to the mind.

(2) Alexius Meinong, "The Theory of Objects" ("Über *Gegenstandstheorie*") [1904], pp. 78-81.

(3) In his early work, Meinong expressed the belief that nonexistent objects have what he then called *Quasisein*. "The Theory of Objects", pp. 84-5. Meinong here refers to the first edition of his *Über Annahmen* [1902], p. 95. See J. N. Findlay, *Meinong's Theory of Objects and Values* [1963], pp. 47- 8. Routley, *Exploring Meinong's Jungle and Beyond* [1981], pp. 442, 854. Routley reports that Meinong renounced the theory of *Quasisein* in favor of the *Aussersein* thesis by 1899 (presumably with the publication in that year of his essay "*Über Gegenstände höherer Ordnung und deren Verhältnis zur inneren Wahrnehmung*"). As a statement of the frequent misinterpretations of Meinong's object theory that persist today, see P.M. S. Hacker, *Insight and Illusion: Themes in the Philosophy of Wittgenstein*, revised edition [1986], p. 8: "The Theory of Descriptions ... enabled Russell to thin out the luxuriant Meinongian jungle of entities (such as the square circle) which, it had appeared, must in some sense subsist in order to be talked about ..."

56. Klima, Gyula. 1993. "The Changing Role of *Entia rationis* in Mediaeval Semantics and Ontology: A Comparative Study with a Reconstruction." *Synthese* no. 96:25-58.

"In this paper I want to argue for two theses concerning entia rationis. My first thesis is that entia rationis, in what I would call the *via antiqua* (1) sense, are objects of thought and signification, required by a certain kind of semantics, but undesirable as objects simpliciter in ontology. My second thesis is that this systematic role of entia rationis in the *via antiqua* tradition of mediaeval thought was simply eliminated by the advent of Ockhamist semantics, which opened the way towards

a radical reinterpretation of the concept of entia rationis and towards a new research programme for ontology.

In the next section of this paper, therefore, I start my discussion with a case study of the systematic role played by entia rationis in the Philosophy of St. Thomas Aquinas, a typical representative of the *via antiqua* tradition, occasionally drawing parallels with and taking illustrations from the works of other mediaeval thinkers, too. (2) In the third section I give a systematic account of all kinds of entia rationis against the background of a comprehensive semantic theory constructed in the spirit of the *via antiqua* tradition. In the fourth section I describe the ways William Ockham's approach changed this semantic background, and examine how these changes influenced the concept of entia rationis. In the concluding section of the paper I present a simple formal reconstruction of what I take to be Ockham's basic innovations in semantics, and discuss briefly the new ontological programme it initiated."

(1) One of course has to be very cautious when applying such an expression so much involved in scholarly debate. In the rest of this paper I want to use it in a very restricted, technical sense, referring to a particular way of constructing semantic theory, sharply distinguishable from Ockham's and his followers' way (both to be described later). What

I think may justify such a usage is the clear connection of these ways of doing semantics with the manners in which broader philosophical, theological, and methodological issues were treated in the two great trends getting separated later in mediaeval thought. Indeed, this paper may perhaps serve as a modest contribution to the characterisation of the two *viae* from the point of view of the connections between semantics and ontology. As to the debates concerning the proper characterisation of *via antiqua* vs. *via moderna*, see, e.g., Moore (1989).

(2) To be sure, by presenting Aquinas's views as representative of what I call '*via antiqua* semantics' I do not want to deny the immense variety of semantic views in mediaeval philosophy even before Ockham. I take Aquinas's views as typical, however,

as contrasted with Ockham's, precisely in those of their features that rendered the *via antiqua* framework unacceptable for Ockham.

Abstract: "The aim of this article is twofold: to provide a valid account of Spinoza's theory of fictitious ideas, and to demonstrate its coherency with the overall modal metaphysics underpinning his philosophical system. According to Leibniz, in fact, the existence of romances and novels would be sufficient to demonstrate, against Spinoza's necessitarianism, that possible entities exist and are intelligible, and that many other worlds different from ours could have existed in its place. I argue that Spinoza does not actually need to resort to the notion of possible entities in order to explain the incontrovertible existence of fictions and fictitious ideas. In order to demonstrate this, I will first show how, according to Spinoza, true ideas of nonexistent things need not be regarded as fictitious ideas. Then I will show by which means Spinoza can justify the real existence of fictions and fictitious ideas in the human mind through our present knowledge of actually existing things, to conclude that fictitious ideas neither add anything to what we already know of things, nor do they increase the extent of the existing conceivable reality by demanding the existence of possible non-actualised entities."

62. McDowell, John. 1982. "Falsehood and Not-Being in Plato's *Sophist*." In *Language and Logos. Studies in Ancient Greek Philosophy Presented to G. E. L. Owen*, edited by Schofield, Malcolm and Nussbaum, Martha, 115-134. Cambridge: Cambridge University Press.

"For me, G. E. L. Owen's 'Plato on Not-Being' (1971) radically improved the prospects for a confident overall view of its topic. Hitherto, passage after passage had generated reasonable disagreement over Plato's intentions, and the disputes were not subject to control by a satisfying picture of his large-scale strategy; so that the general impression, as one read the *Sophist*, was one of diffuseness and unclarity of purpose. By focusing discussion on the distinction between otherness and contrariety (257B1-C4), Owen showed how, at a stroke, a mass of confusing exegetical alternatives could be swept away, and the dialogue's treatment of not-being revealed as a sustained and tightly organised assault on a single error. In what follows, I take Owen's focusing of the issue for granted, and I accept many of his detailed conclusions. Where I diverge from Owen - in particular over the nature of the difficulty about falsehood that Plato tackles in the *Sophist* (§§5 and 6 below) -it is mainly to press further in the direction he indicated, in the interest of a conviction that the focus can and should be made even sharper." (p. 115)

65. Mié, Fabian. 2011. "Plato's *Sophist* on Negation and Not-Being." In *Parmenides, 'Venerable and Awesome' (Plato, *Theaetetus* 183e)*, edited by Cordero, Néstor-Luis, 363-372. Las Vegas: Parmenides Publishing.

Summary: "This brief paper develops an interpretation of Plato's theory of negation understood as an answer to

Parmenides' paradoxes concerning not-being. First, I consider some aspects that result from an analysis of *Sophist* 257b–259d, formulating some general theses which I then go on to unfold in more detail in the following section. Finally, I show what exactly Plato's so-called overcoming of the Eleatic problem related to negation and falsehood is; and I outline some of the main semantic and metaphysical consequences that are entailed by this overcoming."

"It has often been noticed that Plato, and before him Parmenides, assimilates "what is not" (μηδέν or ουδέν). (1) Given that the central use of "nothing" has important ties with the existential quantifier ("Nothing is here" = "It is not the case that there is anything here"), it has widely been assumed that contexts that document this assimilation also count as evidence that both within them and in cognate ontological contexts the relevant sense of "being" or "to be" is that of existence. That this assumption is not to be granted easily, has been compellingly argued by G. E. L. Owen. (2) His main concern was to show that the assumption is particularly mischievous in the interpretation of the *Sophist*, where he found it totally unwarranted. My own concern is to attack the assumption on a broader plane. "Nothing" in English has uses that do not depend on a tie with the existential quantifier. So too in Greek:

meden or *ouden* can be glossed as "what does not exist," but it can also be glossed as "not a something," or in Owen's formulation, "what is not anything, what not in anyway is': a subject with all the being knocked out of it and so unidentifiable, no subject." (3) In effect, the assimilation of "what is not" to "nothing" may—in certain contexts—work in the opposite direction: not from "nothing" to "non-being" in the sense of non-existence; rather from "non-being" as negative specification or negative determination to "nothing" as the extreme of negativity or indeterminacy. To convey the sense involved in this reverse assimilation I borrow Owen's suggestive translation "not-being" for $\mu\acute{\epsilon}\ \text{ov}$, a rendering which makes use of an incomplete participle, rather than the complete gerund, of the verb "to be." (p. 59 of the reprint).

"In 1597 Francisco Suárez published a comprehensive treatise on beings of reason (*entia rationis*) as part of his *Disputationes metaphysicae*. Subsequent scholastic philosophers vigorously debated various aspects of Suárez's theory. The aim of this paper is to identify some of the most controversial points of these debates, as they developed in the first half of the seventeenth century. In particular, I focus on the intension and the extension of 'ens rationis', its division (into negations,

privations and relations of reason) and its causes. Additionally, I will discuss how Suárez's views sparked a number of debates within the classical view, debates which ultimately led to the emergence of various alternative theories, especially among the Jesuits. These non-classical views radically revise the previous classical conception of beings of reason."

"Here I must omit detailed argument (which I have published elsewhere) (11) and limit myself to a simple outline of the structure of the whole.

Esti does not mean "being is" (Cornford's emendation) at the beginning of the poem. But the *esti* of the first path does acquire a subject in the course of the argument. For the goddess does later claim as a development of the first way the proposition *eon emmenai* (fr. 6.1): "it is necessary to say this, and to think this, namely that being is", or ". . . that there is being".(12)

That is not the case however for the path which is opposed to the path of persuasion, a path "from which we can learn nothing" (fr. 2.5-8). This path is expressed by the negation of *esti* (fr. 2.5): " 'is not' and it is necessary not to be". This path has no subject and never acquires one, for the substantivized participle, "what is not" (*to me eon*, fr. 2.7-8), proves to be as unknowable as the simple indicative statement: "is not".

Hence a crucial difference between the first and second way.

"Being" or "what is" (*eon*) can be added as a development of the first way (*esti*) whereas "is not" (*auk esti*) and "what is not" (*to me eon*) are never joined to form a proposition; both expressions are equally impossible and equally unknowable statements of the second way.

It is true that, in the course of the poem, the goddess does produce a composite statement where the negative participle is added to the positive verb (*einai me eonta*, fr. 7.1): "things that are not, are". That composite statement does not represent either of the two paths introduced at the beginning of the argument. It is, instead, an impossible combination of the two ways, a combination which is not only false, but contradictory (cf. fr. 6).

The false and contradictory combination of "is" and "is not" (fr. 7.1: "things that are not, are") represents the "opinions of mortals in which there is no true conviction" (fr. 1.30; cf. fr. 8.38-41).

Thus the whole poem turns upon the opposition between "is" and "is not" (fr. 2), on the development of "is" into "being is" (fr. 6.1-2) and the recognition which this will bring of a being that is "unborn" and "imperishable" (fr. 8.1-21), and finally on the impossible conjunction of "is" and "is not" which underlies the whole of our belief in a world where things are not unborn and are not imperishable, the world where "things that are not, are" (fr. 7.1).

An impossibly rapid survey of an unconventional interpretation of Parmenides, but one which will allow me to turn to the criticism made of Parmenides by Plato in the *Sophist*."

(11) Mainly in my contributions to the two volumes of the work quoted in n. 2 above. [*Études sur Parménide*, Paris: Vrin 1987]

(12) Fr. 6.1: *khre to legein to noein t' eon emmenai*. This text is not the same as that printed in Diels-Kranz (d. n. 1 above). For the repetition of the article (to), see *Etudes sur Parménide*, vol. I, p. 24.

75. ———. 2000. "Parmenides and Plato on What is Not." In *The Winged Chariot: Collected Essays on Plato and Platonism in Honour of L.M. de Rijk*, edited by Kardaun, Maria and Spruyt, Joke, 19-104. Leiden: Brill.

"Plato, in writing the *Sophist*, "did not consider it beneath his dignity to return to the great Parmenides" . Any reader of Plato's dialogue must therefore do likewise. But whose Parmenides should we return to? If modern interpretations of the *Sophist* are legion, so too are the reconstructions that are currently on offer, from modern scholars, of the fragments of Parmenides.

Which one should we take on board?

Two names in particular stand out. Miss G. E. M. Anscombe was a close associate of Wittgenstein, and is generally

acknowledged as one of the leading philosophers of her day. Professor W. K. C. Guthrie was a pupil of F. M. Cornford, and is the only historian of ancient philosophy who has had both the knowledge and the ambition to undertake a history of Greek philosophy that would rival the great work of Eduard Zeller.(2) Both scholars therefore have impeccable credentials. Both have written on Parmenides.(3)

One or other or both, one might surely think, will have been able to recover from the extant fragments ideas that will make sense of the criticisms of Parmenides that loom so large in Plato's *Sophist*." (p. 19)

(2) See Guthrie (1962-1981). Sadly, Guthrie did not live to complete his majestic enterprise; the last volume takes us only as far as Aristotle. Cf. Zeller (1844) and (1919-1920). Gomperz (1896-1909) is too chatty to be a serious rival.

(3) Guthrie (1965) 1-80. Anscombe (1969), reprinted in Anscombe (1981) 3-8. Cf O'Brien (1987) 206 n. 25. Miss Anscombe goes so far as to entitle the first volume of her *Collected papers* (1981) *From Parmenides to Wittgenstein*. Obviously therefore she does not consider her contribution on Parmenides to be a mere *πάρπεργον*."

78. Parsons, Terence. 1975. "A Meinongian Analysis of Fictional Objects." *Grazer Philosophische Studien* no. 1:73-76.

"Meinong is best known as the loser of the Russell-Meinong debate of 1905. Russell had the last word then, and (unfortunately) most of us know only his version of Meinong's views.' But there is more to be said on Meinong's side. In an earlier paper I tried to develop a version of Meinong's ontology which is clear, consistent, and immune to Russell's attacks. Most importantly, that theory preserves - rather than analyses away - Meinong's radical and exciting ontological views: that there are non-existent objects; that there are impossible objects; etc.

So what? We want more of a theory than clarity and consistency; we also want reason to believe that it's true. How might we offer evidence in favor of such a theory? I think that the only evidence that we ever have in favor of a general metaphysical theory is that it has many interesting applications. The Meinongian theory agrees with more orthodox theories in its treatment of existing objects, so any

evidence in its favor will consist of applications to issues concerning non-existent objects. The present paper contains one of these; it's an application of the Meinongian theory to an analysis of fictional objects.

By "fictional" I do not mean "non-existent", but rather "occurring in fiction". Many fictional objects are indeed non-existent, and it is their non-existence that in some sense causes all the problems, but fictional works also abound in reference to real objects, and this fact must be taken into account.

I will begin by giving an exposition of the Meinongian ontology." (p. 73)

79. Pasniczek, Jacek. 1995. "Are Contradictions Still Lurking in Meinongian Theories of Objects?" *Grazer Philosophische Studien* no. 50:293-303.

"Contemporary formalizations of Meinong's theory of objects prove that Russell's accusation of inconsistency of the theory is not valid.

However, in the same formalizations there has appeared a new source of potential inconsistency. Theories of objects inspired by Meinong's ontology usually include, in addition to basic principles of the ontology, abstraction-axioms for defining objects and properties (relations). Although these axioms seem to be perfectly acceptable, they lead to paradoxes when adopted without any restrictions. These paradoxes may be understood as paradoxes of size (not of self-referentiality): too many objects or too many properties are defined by the axioms. We can avoid them at the cost of counterintuitive stipulations, some of them similar to those applied in set theory or in higher-order logics (like a stratification of formulas). We need, however, to look for phenomenologically well-grounded protections against paradoxes. This search can deepen our understanding of the nature of Meinongian objects."

Spinoza in Twenty-First-Century American and French Philosophy: Metaphysics, Philosophy of Mind, Moral and Political Philosophy, edited by Ramond, Charles and Stetter, Jack, 231-250. London: Bloomsbury Press.

"Although in his early works Spinoza is critical of "beings of reason" (*entia rationis*), nonetheless he thinks that they are useful in certain contexts. This paper discusses the metaphysical and epistemological status of "beings of reason"—such as universals, measurements, and value terms—and tries to explain how, even if they are problematic, they can be useful. I shall argue that Spinoza borrows from Suarez and other neo-scholastics the idea that beings of reason are analogical. The regulatory function of beings of reason depends upon the possibility—a possibility that is most often not realized—of the similarity of the imaginative entity to an actual being. I discuss the role of beings of reason in Spinoza's conception of the part-whole relation and the construction of an imaginative sign. I shall claim that the case of beings of reason sheds light on the nature of the imagination itself in the *Ethics*. "

90. Suárez, Francisco. 1995. *On Beings of Reason (De Entibus Rationis). Metaphysical Disputation LIV by Francisco Suárez*. Milwaukee: Marquette University Press.

Translated from the Latin with an introduction and notes by John P. Doyle.

"Suárez's *Disputationes metaphysicae* is to this day the most comprehensive and systematic treatise on metaphysics written from an Aristotelian perspective. It addresses every metaphysical issue raised by medieval and Renaissance scholastics and discusses the views of all important figures who preceded Suárez. As such it is a treasure-trove not only for the metaphysician but also for the historian and has exercised enormous influence on early modern philosophy, particularly in Continental Europe. (...) The Disputation deals with mental entities and, therefore, contains relevant discussions to the philosophy of mind and the ontological status of intensional objects."

Jorge J. E. Gracia - State University of New York at Buffalo.

"In a finely wrought and philosophically intelligible translation of this 54th Disputation of Suárez, John P. Doyle has documented with care the ancient Greek and Medieval sources of Suárez's discussion, its influence upon many hitherto unknown late Scholastic writers and the relevance of Suárez's intentionality theory to such prominent figures in early, middle and late Modern thought as Descartes, Berkeley, Leibniz, Kant, Brentano, Husserl, Meinong, B. Russell, Heidegger and others."

Abstract: "In Plato's *Statesman*, the Eleatic Stranger explains that the division of all human beings into Greek and barbarian is mistaken in that it fails to divide reality into genuine classes or forms (*eide*). The division fails because "barbarian" names a privative form, that is, a form properly indicated via negation: non-Greek. This paper examines how the Stranger characterizes privative forms in the *Sophist*. I argue that although the Stranger is careful to define privative forms as

fully determinate, he nevertheless characterizes them as having a structure unlike that of their non-privative counterparts. A privative form, in contrast to a non-privative form, is indifferent to the specificity of its members."

Repris dans: D. O' Meara, *The structure of Being and the search for the Good. Essays on ancient and early medieval Platonism*, Aldershot: Ashgate Variorum, 1998 Essay XV.

Résumé: "Cet article traite du statut ontologique des objets mathématiques dans l'interprétation qu'en ont donné les néoplatoniciens Plotin et Jamblique.

Tous deux réalistes, ils témoignent de l'influence d'Aristote et du stoïcisme.

Plotin manifeste ainsi une tendance nominaliste dans le cadre de son réalisme, tendance critiquée par Jamblique qui, tout en décelant la présence des nombres à chaque niveau de la réalité, semble concevoir les

objets mathématiques comme la projection par l'esprit humain de principes supérieurs."

17. Philippe, Marie-Dominique. 1975. "Originalité de "l'ens rationis" dans la philosophie de saint Thomas." *Angelicum* no. 52:91-124.

"Si Aristote a eu le mérite de distinguer avec beaucoup de netteté *l'art de la logique* de la philosophie elle-même, considérant cet art comme un *organon*, un instrument de la pensée, saint Thomas, commentateur d'Aristote, continue son effort; et dans une perspective critique il précise que si la philosophie regarde *l'ens naturae*, *l'ens extra animam*, la logique, elle, considère *l'ens rationis*, ce qui ne peut naître que dans notre connaissance intellectuelle (1).

Examinons ici les principaux textes où saint Thomas expose sa pensée sur ce point, pour essayer d'en saisir toute la signification et, à partir de là, mieux comprendre le réalisme de sa métaphysique. Car si *l'ens naturae* ne se définit pas par *l'ens rationis* - c'est plutôt l'inverse qui a lieu, puisque *l'ens per se* est *l'ens extra animam*, il peut cependant être mieux manifesté, pour nous, grâce à *l'ens rationis*. Il y a là quelque chose d'analogue à ce qui a lieu entre *l'ens naturae* et *l'ens artificiale* (qui peut, lui aussi, être appelé *ens rationis* en un sens élargi): *l'ens artificiale* se définit en fonction de *l'ens naturae*, et non l'inverse; mais la comparaison des deux nous aide à mieux saisir ce qu'est *l'ens naturae* au sens fondamental et premier." Abstract: "In this paper I shall show the relevant role which the beings of reason play in Suarez's philosophy, namely, the role of being the guarantee of the scientific validity. For this thesis it is basic to discover the difference between the chimera and other beings of reason: the negation, the relation of reason and the privation. In this way, Suarez sets the basis of the properly baroque way of understanding the world as an extra-mental reality which is only cognoscible through the artful device of the being of reason. Suarez conceives the science from the Aristotelean perspective, that is why he does not appreciate the mathematical beings of reason. Nevertheless, we do believe that the notion of being of reason is helpful in the comprehension of the singularity of the baroque metaphysics in comparison to the posterior ontologism. We enter, therefore, in discussion with the marked tendency to interpret the metaphysics of Suarez in an ontological way."

Key Terms in Ontology: *Substance*. History and Definitions by Major Philosophers

The traditional concept of 'Substance'

"The term 'substance' is one of the most confusing terms in philosophy. For Aristotle, at least some of the time, the paradigm cases of substances were, as he put it, 'this man, this horse', i.e. particular things of that kind. For complicated historical reasons, however, substance has sometimes come to be equated with what Aristotle called 'matter'; thus iron and sulphur, and other stuffs, have come to be called 'substances'. For further complicated historical reasons substance came to be regarded by e.g. Locke as the underlying something or other which is supposed to give support to the properties that inhere in it. Indeed the Latin etymology of the term 'substance' will suggest to anyone having a sensitivity to it that notion of something standing beneath the properties. Locke thus called it a 'something I know not what' -- a suggestion that is not conveyed by either of the other two usages. The situation is complicated still further by the fact that the Latin etymology is relevant only to those modern discussions which rely on the term 'substance'. The Greek word which Aristotle used -- 'ousia' -- and which is traditionally translated 'substance' has none of the suggestions that the Latin etymology of 'substance' provides, but has additional suggestions of its own, particularly a connexion with being. (The feminine present participle of the verb 'to be' in Greek is ousia; ousia has the form of an abstract noun and is for that reason naturally to be translated 'being' or 'beingness', but Aristotle often uses the word with an article to indicate a particular kind of being, a particular kind of thing.)" (p. 60)

From: David Hamlyn, *Metaphysics*, Cambridge: Cambridge University Press 1984.

"For Aristotle, 'substances' are the things which exist in their own right, both the logically ultimate subjects of predication and the ultimate objects of scientific inquiry. They are the unified material objects, as well as the natural stuffs, identifiable in sense-experience, each taken to be a member of a natural species with its 'form' and functional essence. Entities in other categories -- qualities, actions, relations and so forth -- are treated as dependent on, if not just abstracted aspects of, these independent realities. With the rise of mechanistic physics in the seventeenth century, the Aristotelian multiplicity of substances was reduced to universal matter mechanically differentiated. This move sharpened the issue of the relation of mind to the physical world. The consequent variety of ways in which the notion of substance was manipulated by materialists, dualists, immaterialists and anti-dogmatists encouraged later scepticism about the distinction between independent realities and human abstractions, and so idealism. Twentieth-century conceptualism, like some earlier versions of idealism, rejects the distinction altogether, commonly ascribing the logical priority of material things in natural language to the utility of a folk physics, as if they were the theoretical entities of everyday life. As such, their identity and existence are determined only through applications of a theory outdated by modern science. Yet this 'top-down', holistic philosophy of language is belied by the detailed insights of traditional logic, which point clearly to a 'bottom-up' account of classification and identity, that is an account which recognizes the possibility of perceptually picking out material objects prior to knowledge of their kind of nature, and of subsequently classifying them. The idea that material things are theoretical entities, and that their individuation is accordingly kind-dependent, is a hangover from an atomistic approach to perception which calls on theory to tie sensory information together. A more accurate understanding of sensation as the already integrated presentation of bodies in spatial relations to one another and to the perceiver is consonant with the possibility denied by the idealist - namely, that, with respect of its primitive referents, language and thought are shaped around reality itself, the independent objects given in active sense-experience. That

the coherence or discrete unity of material objects has a physical explanation does not mean that physics explains it away." (p. 205)

"Among the many still unsolved problems of Aristotelian exegesis is that concerning the relationship between the three types of substance which are distinguished in book XII of the *Metaphysics*, that is to say, terrestrial (mobile and corruptible), celestial (mobile and incorruptible), and supracelestial (incorruptible and immobile) (1). In fact some scholars supposed they could regard this relationship as an instance of *pros hen* homonymy (2), involving a priority of the immobile substance which is not only ontological but also logical (3); some identified it with the relationship of succession (*to ephexes*), understood as a particular sort of *pros hen* homonymy and therefore as implying logical priority as well

(4); finally, some identified it with the relationship of succession itself, without specifying whether this should be regarded as implying not only ontological, but also logical priority (5). In spite of this variety of solutions, it seems to me that the problem has not been discussed with sufficient thoroughness and, especially, that the following issues have not been definitively clarified : a) whether in fact the three above-mentioned types of substance are irreducible to a common genus, and therefore give rise to a true and proper homonymy or equivocity of the notion of substance; b) whether this homonymy, if it subsists, allows some sort of logical unification, i.e. a priority of a genus in relation to the others which is not only ontological but also logical; also, what would be the precise nature of this logical priority.

An answer to these questions seems important for the general interpretation of Aristotle's philosophy. As a matter of fact, since substance, for Aristotle, is what gives unity to all being, a decision concerning the type of unity which it possesses determines the conception which we must have of the very unity of being; and since, furthermore and that of the other types of substance, that is to say, the problem of the unity, and therefore of the possibility, of the science of being qua being, i.e. of philosophy itself.

The present investigation does not claim, of course, to provide a definitive reply to the questions enumerated above, but merely offers itself as a contribution to their discussion, by analyzing some passages in Aristotle which have not been sufficiently taken into account in this connexion." pp. 55-56

(1) Cf. Aristot., *Metaph.* XII 1, 1069a33-34; 6, 1071b3-4. For convenience I mention the former under the denomination of terrestrial substances, though they occupy the whole sphere under the sky of the moon, and the latter under the denomination of supracelestial substances, though, to be exact, they, being immaterial, could not be localized spatially.

Patzig, *Ontologie und Theologie in der "Metaphysik" des Aristoteles*, Kant-Studien 52, 1960-61, 199-201.

(3) By "ontological priority" (*physei* or *ousiai*) I mean the possibility that some things have of existing independently of others, while the latter cannot exist without them (cf. *Metaph.* VII, 1019a1-4); by "logical priority" (*logoi*) I mean the fact that the notion of some things is necessarily contained in the notion, or definition, of others, while the notion of these others is not contained in the definition of the former (*Metaph.* V 11, 1018b30-36). On this distinction cf. G. E. L. Owen, *Logic and Metaphysics in some earlier works of Aristotle*, in: *Aristotle and Plato in the mid-fourth century*, Goteborg 1960, 170-72.

- "Basil is somewhere in between Stoic and Aristotelian doctrines of substance, while his mind is also guided on these matters by his theological predecessors and contemporaries. It is possible to see evidence in Basil of deeply ingrained habits of thought which he carries into his writings from his early training in Stoic dialectic. One outstanding example of this may be seen in his insistence that the ousia of God must have its being securely rooted in a hypostasis, while the Stoics would say that nothing can exist without the possession of ousia (their first category) as a qualified thing (*poion*). What one does not find in Basil is a doctrine of divine substance and persons which can support a consistent conceptuality derived from Stoic logic."

"The Ages of Reason and Enlightenment aimed not only to advance knowledge but also tried to distinguish carefully between things which can and cannot be known. Characteristic of those ages is the manner in which metaphysical speculation was reduced by the sciences or brushed aside by the leading philosophical schools.

The general problem of the *limits of human understanding* became one of the leading philosophical themes of the seventeenth and eighteenth centuries. Doubts about the possible scope of human reasoning concerned not only God, the spirits, and the nature of the human soul, (1) but also went to the very core of that reality which man was then trying to subdue intellectually; several conceptual elements were discovered whose nature many thinkers found mysterious and inaccessible to the mind. In fact, beside a clear awareness of the limits of human understanding in general, the notions of *mathematical infinity*, (2) *force*, (3) and *substance* were considered by many philosophers to be above man's reason. The purpose of the present paper is to study the criticisms which were directed against the last of these notions, criticisms which played a rather important role in the famous "Copernican revolution" of 1769 at the start of Kant's critical period. (4) We shall consider not only criticisms of the notion of substance itself, but also those of the closely related notions of *essence* and *materia prima*; these often include the notion of substance, or serve as a foundation for." (pp. 285-286)

"During the past twenty years or so, I have been working on ontological questions. What are universals, laws of nature, dispositions and powers, possibilities and necessities, classes, numbers? The present essay tries to bring all these topics together in a unified metaphysical scheme, an ontology. As a result, there is a certain amount of recapitulation of earlier writing. But putting the pieces together turned out to be quite difficult. A good deal of further work was necessary. Many mistakes, as I now think of them, had to be corrected. So what follows is not a mere sum of past thinking." (From the Preface)

"The hypothesis of this work is that the world, all that there is, is a world of states of affairs. Others, Wittgenstein in particular, have said that the world is a world of facts and not a world of things. These theses are substantially the same, though differently expressed.

The general structure of states of affairs will be argued to be this. A state of affairs exists if and only if a particular (at a later point to be dubbed *athin* particular) has a property or, instead, a relation holds between two or more particulars. Each state of affairs, and each constituent of each state of affairs, meaning by their constituents the particulars, properties, relations and, in the case of higher-order states of affairs, lower-order states of affairs, is a contingent existent. The properties and the relations are universals, not particulars. The relations are all external relations.

It is useful to admit *molecular* states of affairs. These, however, are mere conjunctions (never negations or disjunctions) of the original states of affairs. Molecular states of affairs constitute no ontological addition to their conjuncts. But in one special case, to be mentioned in a moment, they become very important.

For first-order states of affairs, that is, states of affairs that do not have states of affairs as constituents, the Tractarian thesis of Independence is somewhat speculatively, but nevertheless hopefully, advanced. No such state of affairs entails or excludes the existence of any other wholly distinct state of affairs. Given Independence, a rather simple and straightforward Combinatorial theory of what possibilities there are, can be put forward. If Independence fails, things get more complicated.

The present theory is not biased towards Atomism nor is it biased against Atomism. An *epistemic* possibility that requires to be noted is the possibility that every (first-order) state of affairs is molecular, that is, analysable into a conjunction of states of affairs. (A simple if to a degree controversial example: a ' being F may be equivalent to a 's being G & a ' being H, with $F=G \& H$. The pattern may be repeated for G and H, and so for ever.) Every first-order state of affairs may be a nest

of first-order states of affairs: states of affairs all the way down. To allow for this epistemic possibility, a Combinatorial theory of what possibilities there are requires further elaboration." pp. 1-2.

3. Ayers, Michael. 1991. "Substance: Prolegomenon to a Realist Theory of Identity." *Journal of Philosophy* no. 88:69-90.

"The aim of the present paper is to show how traditional realist doctrines, suitably interpreted, have an explanatory force that pragmatism or any other form of conceptualism cannot hope to match. The explanations it supplies are of structural features of our thinking to which considerations drawn from the philosophy of physics are simply irrelevant.

Although preconceptualist realists disagreed over what things are paradigm substances, as well as over the details of what it is to be a substance, it is not difficult to extract from the tradition at least a rough list of the category's leading characteristics. Such a list of properties should even help us to map and understand the disagreements and divergences. Yet orthodoxy and broad principles are more relevant to the immediate purpose than heresy and idiosyncratic variations. The present argument will therefore assume that such things as horses and plane trees are paradigm substances, whereas homoeomerous substances such as gold and water call for special, but integrally related treatment (treatment sketched out below under the heading "materiality"). Attributes, such as a thing's redness or squareness, and events, actions, or processes, such as walks, walking, thunderstorms, and the like, exemplify nonsubstances or (for the sake of a single name) "modes."

Most of the claims embodied in the following list have on occasion been impatiently brushed aside, or simply ignored, by modern philosophers arguing on behalf either of empiricism or of conceptualism. Some of them, however, have been reinterpreted and absorbed into this or that version of conceptualism. One aim of the present argument is to reveal the coherence of the list, which will emerge in so far as each item can be explained, and needs to be explained, by reference to the others. Some effort will be made, of course, to present

the principles as tenable, although more than one principle will be modified after consideration of the motives for which it has been held.

1. Substances are the ultimate subjects of predication, and therefore the only beings with independent existence.
2. Substances are real unities (both natural and logical).
3. Substances are material. Individual substances are distinguished from one another at any one time by their matter.
4. Substances exist all at once, and exist through time, or endure. (Events, in contrast, take time or unfold.)
5. Substances are active, the ultimate sources of change. Their underlying natures or essences are the ultimate principles of explanation.
6. Only substances fall into true natural kinds, and every truly individual substance is a member of a natural kind.

Let us consider these candidate properties of the category *seriatim*." (pp. 69-70).

4. Bastit, Michel. 2012. *La Substance. Essai Métaphysique*. Les Plans sur Bex (Suisse): Les Presses Universitaires de l'IPC.

Sommaire: Introduction 11; I. Comment pratiquer la métaphysique? 19; II. Substance et intuitions premières 57; III. La substance et ses accidents 67; IV. Propriétés ou tropes? 109; V. Pur individu, pur substrat, ou individuation? 151; VI. Indépendance et identité de la substance 187; VII. La substance forme en acte et cause de l'existence 229; Conclusion. Consistance ontologique et fécondité métaphysique 287; Bibliographie 293; Index nominum et rerum 303-308.

"La question de la substance s'impose au philosophe, en dépit des dénégations de certains ou en raison de ces dénégations.

Les expériences les plus naïves semblent bien nous présenter le monde sous forme d'êtres relativement autonomes dont dépendent d'autres réalités moins autonomes. Peut-être ces expériences premières sont-elles illusoire et doivent-elles être remises en cause par une connaissance mieux informée,

notamment par les acquis des sciences naturelles. En tout état de cause, il est nécessaire et important de prendre position sur cette question. Bien des raisons militent en faveur de l'inscription de la substance à l'ordre du jour de la philosophie. Si toute la réalité doit se diviser en réalités autonomes et réalités non autonomes, la description et la compréhension de l'ensemble de la réalité est engagée dans cette problématique. La substance s'impose plus encore à la réflexion si l'on considère que la philosophie doit énumérer les êtres. Pour compter, il faut en effet catégoriser et donc distinguer à quel type d'êtres on a à faire. Mais la catégorisation implique à son tour de préciser les relations de dépendance entre les catégories et donc aussi entre les êtres. Le mot de réalité désigne ici l'être, l'ensemble des étants, de sorte qu'en mettant en relation ceux-ci entre eux il soit possible de parvenir à savoir quels sont ceux qui dépendent les uns des autres et quelles sont les causes de cette dépendance. Le terme de la recherche sera ainsi une connaissance des relations qui constituent la réalité et de ce fait mènera à la connaissance de cette réalité considérée elle-même comme un effet de ces relations de dépendance." (p. 11)

(...)

"Le premier chapitre de cet ouvrage est consacré à déterminer et justifier la méthode adoptée pour l'étude de la substance. Nous commençons par argumenter en faveur du réalisme, après quoi nous justifions naturellement l'utilisation d'une méthode descriptive et analytique, par décomposition et résolution, à condition de pousser cette analyse descriptive jusqu'à une analyse causale faisant ressortir les dépendances ontologiques inscrites dans la réalité. Sans recourir en permanence aux instruments formalisés, l'analyse est formelle au sens où elle ne vise pas à l'analyse d'une substance particulière mais à celle de la substance comme telle.

Le second chapitre essaie de saisir les intuitions les plus élémentaires qui conduisent vers la substance à partir d'une analyse du langage le plus ordinaire et de l'expérience sensible élémentaire. Il semble important, dans le cadre de l'option réaliste défendue et adoptée, de pouvoir demeurer en lien avec

ces données primitives, même aux cours des analyses les plus abstraites.

Le troisième chapitre établit la réalité des accidents en montrant qu'il existe une partie de la réalité, accessible aux sens, qui est plus contingente et fluctuante que d'autres. Il précise que cette partie de la réalité n'existe que dans et grâce à l'existence d'une seconde partie de la réalité moins contingente et plus permanente, les substances. La question de l'existence de réalités intermédiaires entre ces deux-ci est traitée en distinguant des substances et des accidents concrets les propriétés et les accidents abstraits. Au terme, la division entre les substances et les accidents est largement justifiée et la confusion entre les deux types d'être apparaît contestable et dommageable à une description fidèle du monde.

Le chapitre quatre entame l'analyse de la substance elle-même et examine si elle peut se comprendre comme un ensemble de propriétés ou de tropes. La réponse est négative en raison de l'universalité des propriétés, de leur caractère abstrait et enfin du risque de défaut d'unité, que leur compréhension comme ce dont est faite la substance - fait courir à la substance. La discussion des tropes, tout en saluant leur caractère actuel, montre que leur notion est contradictoire et que leur mode d'unité ne permet pas non plus de rendre compte de la substance. On conclut à la nécessité d'une forme individuelle actuelle où se réalisent l'unité et l'actualisation des propriétés.

Le chapitre cinq discute l'identification de la substance soit avec un pur individu soit avec un pur substrat. Ces identifications s'avèrent impossibles en raison de l'indétermination des purs individus ou du substrat. Tout en acceptant le rôle fondamental du substrat pour certaines substances, il est démontré que seule la forme peut rendre compte de la détermination et de l'appartenance du substrat aux substances.

Le chapitre six exhibe les caractères fondamentaux de la substance et montre qu'ils résistent aux mises en cause dont ils sont l'objet sur la base soit des théories de la quadridimensionalité, soit de la non-localité, les unes et les

autres inspirées par une interprétation discutable et nullement nécessaire des données scientifiques contemporaines. La discussion de l'individualité, de la distinction des endurements et des perdurants permet de conclure à la nécessité, pour préserver l'identité et l'indépendance de la substance, d'une partie substantielle première informante et déterminante. A partir de ces acquis est présentée une table des catégories qui place la substance actuelle au premier rang et dont dépendent les autres catégories d'êtres.

Le chapitre sept rejette la conception modale de la substance. Puis il examine un certain nombre de conceptions de la substance comme essence, comme famille de parties, comme individu existant et en retient certains éléments: partie première, dépendance et indépendance ontologiques, causalité. Enfin il montre comment la substance conçue comme forme, partie première de la substance, actuelle, est seule capable de rendre compte complètement de la substance et de la manière dont elle existe." (pp. 14-16).

5. Boutot, Alain. 1998. "Les Théories De La Morphogenèse Et Le Dilemme De La Substance." *Revue de Métaphysique et de Morale* no. 2.

"Les théories de la morphogenèse, à travers une approche tout-à-fait originale, c'est-à-dire structurale des morphologies, mettent un terme à cet idéalisme des relations. Dans ces théories, les formes empiriques ne sont pas de simples accidents de la matière, des épiphénomènes sans consistance, des configurations aléatoires dues au jeu des forces internes ou externes en présence, mais le reflet de structures mathématiques bien déterminées. Grâce à cette analyse, elles parviennent à concilier — dans une certaine limite bien évidemment — les deux points de vue que nous venons d'opposer: la thèse substantialiste et l'antithèse relationniste. Elles réussissent à conjuguer d'une manière qui pourra paraître paradoxale à première vue le primat des relations sur la substance, et le primat des substances sur les relations. Elles relativisent tout autant qu'elles substantialisent les relations. (35)" (p. 199)

(35) Afin de prévenir tout malentendu, il convient de lever dès à présent une ambiguïté concernant le sens que nous donnons ici au mot « substance ». Dans le chapitre 5 des *Catégories*, Aristote distingue deux acceptions de la substance: la substance peut désigner d'une part l'individu, le composé de matière et de forme (la substance première), et d'autre part l'essence (la substance seconde). Lorsque nous parlons d'une « relativisation » des substances, nous prenons le mot « substance » dans le premier de ces deux sens (individu), mais lorsque nous parlons d'une substantialisation des relations, nous le prenons dans le second (essence). La raison d'être de cette ambiguïté apparaîtra par la suite.

"On dit quelquefois que la philosophie moderne a substitué la question du sens à la vieille question de l'essence. Pour les modernes, à la différence des anciens, les choses n'ont pas d'essence, pas de nature, mais un sens, et ce sens leur vient du sujet ou de l'esprit. « C'est (...) nous-mêmes, dit Kant, qui introduisons l'ordre et la régularité dans les phénomènes que nous appelons nature, et nous ne pourrions les y trouver s'ils n'y avaient pas été mis originairement par la nature de notre esprit »(41). Cet antagonisme du sens et de l'essence est au fond une nouvelle formulation du dilemme de la substance dont nous sommes parti. Les théories de la morphogenèse réussissent à réduire cet antagonisme en concevant l'essence comme sens, c'est-à-dire comme structure et réciproquement. Elles amorcent ce faisant la constitution de ce que Thom appelle une sémiophysique. une physique du sens. La nature a un sens qu'il s'agit de découvrir. Ce sens est contenu dans des structures typiques, qui ne sont pas des constructions axiomatiques plus ou moins arbitraires, des systèmes formels, mais possèdent une objectivité fondamentale. Elles constituent la raison d'être de la chose, et abritent son essence. Cette sémiophysique nous reconduit d'une certaine manière dans les parages de la pensée aristotélicienne de l'être naturel comme composé d'une matière et d'une forme. Elle ne la reproduit certes pas purement et simplement, mais la renouvelle en profondeur en substituant à la vieille notion de forme le concept moderne de structure, réalisant ainsi l'alliance

apparemment improbable de la substance et de la relation." (p. 204)

6. Brennan, Sheilah O'Flynn. 1977. "Substance within Substance." *Process Studies* no. 7:14-26.

"It is undoubtedly true that Whitehead's conception of the presence of one actual entity in another plays a key role in his metaphysics. On it, indeed, he bases such central themes of his philosophy as his concepts of organism, internal relations, universal relativity, process, and time. Nevertheless, not all Whiteheadian scholars have been convinced that he has successfully accounted for the immanence of substance within substance.(1) The following study will undertake an investigation of Whitehead's metaphysics in order to determine whether it provides adequate support for his claim. At the same time, since Whitehead supposes his position to traverse directly an Aristotelian thesis, the article will also attempt to establish in what manner and to what extent Whitehead is in fact in opposition to the Greek philosopher." (p. 14)

(1) 1 Cf. Dorothy Emmet, *Whitehead's Philosophy of Organism* (New York: 1966), pp. xxii-xxvi. After reading her hook, Whitehead expressed appreciation, but took her to task for stressing the transmission of form to the neglect of his theory of immanence. You seem to me at various points," he writes, "to forget my doctrine of 'immanence' which governs the whole treatment of objectification. Thus at times you write as the connection between past and present is merely that of a transfer of character." In the preface of the second edition, Emmet confesses that she is at a loss to explain what Whitehead meant. "I do not know," she says, "that anyone has really elucidated it. Professor Christian had a try at it in his *An Interpretation of Whitehead's Metaphysics* but came down on the view that what are repeated from one actual occasion to another are characteristics. '[his is undoubtedly the view which is easiest to make plausible, and I was inclined to it myself; but we have Whitehead's emphatic statement that it is not what he meant.'" Victor Lowe also testifies to the fact that "many

philosophers laid down *Process and Reality* unconvinced that the author had said clearly how one actual entity can be present in another" (Understanding Whitehead [Baltimore, 1966], p. 360). Quoting Whitehead, he indicates what he thinks might be the reason for this lack of understanding: "The truism that we can only conceive in terms of universals has been stretched to mean that we can only feel in terms of universals." However, even if one admits on the basis of experience alone that one feels individuals, and that by this very fact one is inclined to the view that somehow individuals are immanent, the question still remains: Does Whitehead's metaphysics provide an adequate philosophical account of this fact of experience?

7. Broackes, Justin. 2006. "Substance." *Proceedings of the Aristotelian Society* no. 106:131-166.

"The Aristotelian notion of a First Substance (like Fido the dog), an enduring thing with perhaps changing properties, became ridiculed and rejected in the period from Locke to Hume. I clarify the idea and explain how, when separated from some unnecessary accretions, it emerges as a notion to which we are all committed, perhaps, indeed, innocently. One standard objection (that the substance ends up, absurdly, having 'no properties') involves the misconception that the Aristotelian subject of Fido's properties needs to be some extra item, other than, literally, Fido. The main rival view treats things as 'bundles' of properties or 'tropes'; I explore some difficulties in conceiving the components of the bundles. The root of the trouble, I think, lies in the Humean view that if two things are non-identical, they must also be capable of existing separately: this immediately, and disastrously, makes it impossible to recognize ontological dependence between non-identical objects. I end by replying to two special worries: that if substances existed at all, they would be imperceptible and unknowable."

8. Bunge, Mario. 1977. *Treatise on Basic Philosophy. Iii: Ontology: The Furniture of the World* . Dordrecht: Reidel.

"This book and its companion, namely Volume 4 of our *Treatise*, concern the basic traits and patterns of the real

world. Their joint title could well be *The Structure of Reality*. They constitute then a work in ontology, metaphysics, philosophical cosmology, or general theory of systems. Our work is in line with an old and noble if maligned tradition: that of the pre-Socratic philosophers, Aristotle, Thomas Aquinas, Descartes, Spinoza, Leibniz, Hobbes, Helvetius, d'Holbach, Lotze, Engels, Peirce, Russell, and Whitehead. But at the same time it departs from tradition in the matter of method. In fact our aim is to take the rich legacy of ontological problems and hints bequeathed us by traditional metaphysics, add to it the ontological presuppositions of contemporary scientific research, top it with new hypotheses compatible with the science of the day, and elaborate the whole with the help of some mathematical tools.

The end result of our research is, like that of many a metaphysical venture in the past, a conceptual system. It is hoped that this system will not be ridiculously at variance with reason and experience. It is intended moreover to be both exact and scientific: exact in the sense that the theories composing it have a definite mathematical structure, and scientific in that these theories be consistent with and moreover rather close to science - or rather the bulk of science. Furthermore, to the extent that we succeed in our attempt, science and ontology will emerge not as disjoint but as overlapping. The sciences are regional ontologies and ontology is general science. After all, every substantive scientific problem is a subproblem of the problem of ontology, to wit, *What is the world like?*

After a long period underground, talk about metaphysics has again become respectable. However, we shall not be talking at length about ontology except in the Introduction. We shall instead do ontology. In the process we shall attempt to exhibit the mathematical structure of our concepts and we shall make the most of science. Being systematic our ontology may disappoint the historian. Being largely mathematical in form it will be pushed aside by the lover of grand verbal (but sometimes deep and fascinating) systems - not to speak of the lover of petty verbal matters. And being science-oriented it will fail to appeal to the friend of the esoteric. Indeed we shall be

concerned with concrete objects such as atoms, fields, organisms, and societies. We shall abstain from talking about items that are neither concrete things nor properties, states or changes thereof. Any fictions entering our system will be devices useful in accounting for the structure of reality. (Constructs were dealt with in Volumes 1 and 2 of this work.)" pp. XIII-XIV.

"Many philosophers have held, explicitly or implicitly, that any comprehensive survey of the world's constituents would include the casts of qualities and relations that occur at particular places and times as the qualities and relations of particular objects. It is not so common to affirm that such cases are themselves particulars in their own right, rather than deriving their particularity from their association with a substance, but this was G. F. Stout's distinctive claim (Stout, 1905).

D. C. Williams took another step: these cases, or tropes as he called them, not only form a distinct and independent category of existent, they are the very alphabet of being, the simple, basic, primal items from which all else is built or otherwise derives (Williams, 1966). In presenting his view, Williams acknowledged that it 'calls for completion in a dozen directions at once'. This work is my attempt to press ahead towards that completion. The great, liberating insight which Stout and Williams offer us is this: properties can be particulars, so the

denial of universals need not be the denial of properties. In other words. Particularism (which is economical, plausible and appealing) does not have to take the form of Nominalism (which is economical, but neither plausible nor appealing).

While the principal inspiration for this book is Williams' work, I have also gained a great deal from discussions with David Armstrong, who remains a Realist about Universals, but whose successive publications in this area provide sympathetic treatments of the trope or abstract particularist view (Armstrong, 1978, 1989).

Another colleague, John Bacon, has pursued the trope idea in a more formal way (Bacon, 1988, 1989), while David Lewis treats it as a serious option for dealing with certain intractable problems facing Realism over universal (Lewis, 1983, 1986). Wilfrid Sellars recognized tropes by another name, although not, I think, as the sole fundamental category.

Frank Ramsey counselled that when a philosophical dispute presents itself as an irresolvable oscillation between two alternatives, the likelihood is that both alternatives are false and share a common false presupposition. It is my contention that Realism and Nominalism in the problem of universals exhibit precisely this pattern, their common, false presupposition being that any quality or relation must be a universal.

This book explores the implications of this position. It also argues for theses about relations (Foundationism) and basic physical properties (field theory), which are particularly congenial to a trope philosophy, but are in large measure independent of it. They have merits irrespective of the truth about properties in general." (from the *Preface*).

"Some methodological points have to be made clear from the start. It is not my intention in this work to claim, for instance, that such and such entities are actually existentially dependent, in whichever sense, upon such and such entities, e.g. that mental phenomena depend on brain phenomena, accidents on substances, or again wholes on parts. I am not here interested in how the world is—not even in how the world must be or might be, if 'must' and 'might' are understood as expressing metaphysical necessity and possibility, respectively. My investigation is a conceptual one: I am interested in the notions of existential dependence, not in their extensions, be it in the actual world or in other metaphysically possible worlds. That is to say, this work is not one of metaphysics, if we agree to take metaphysics to be specifically concerned with what there is and how the things there are relate to one another—in this world alone, or in arbitrary metaphysically possible worlds.

It may rather be called a work of meta-metaphysics, or of ontology if one wishes; for it is primarily concerned with the concepts which may be used by the metaphysician in his attempt to propose a picture of the universe. (1)

Such ontological investigations are of central importance, of course. For insofar as he wants to provide us with a satisfactory picture of the world, the metaphysician must as clearly as possible explain the basic concepts he uses.

He may then play the role of the ontologist; or alternatively, he may invoke some already available ontological study." (p. 13)

(1) There is no well established terminology which we can rely on here. The terms 'metaphysics' and 'ontology' have been both used in various ways, sometimes even as synonymous.

"Defining the category of substance is normally not taken to be giving a mere stipulative definition of the predicate 'is a substance'. One usually starts with a certain view as to what belongs to the category (paradigmatic substances) and as to what is outside of the category (paradigmatic nonsubstances), and one then tries to find necessary and sufficient conditions for belonging to the category which respect the initial view. This is how I shall understand the activity of defining substances."

16. Denby, David A. 2007. "A Note on Analysing Substancehood." *Australasian Journal of Philosophy* no. 85:473-484.

"I propose an analysis of the notion of a substance. I define two 'quasi-logical' independence relations, and state the analysis in terms of the distribution of these relations among substances and properties generally. This analysis treats the categories of substance and property as mutually dependent. To show that it (probably) states a sufficient condition for substance, I argue that it is in a certain kind of equilibrium. This illustrates a promising general approach to analysing fundamental metaphysical notions."

Properties, particularity and objecthood 153; 7. Essence and individuality 195; 8. Causation and particular properties 228; Works cited 248; Index 258.

"The present study concerns the nature of object, change and property. I propose to introduce my discussion of these issues by an informal sketch of the development of some of the earliest attempts made in the same direction. I am interested in looking into the way in which the relevant fundamental problems of ontology and the principal rational attempts to solve them first emerged. My descriptions are not intended to be historically complete (or perhaps even fully accurate), and I will allow myself some freedom of interpretation." (p. 1)

"Below I formulate a more explicitly ontological version, often used in current philosophical debates. The argument begins by observing

that the sensible world of particular entities is full of repetitions and recurrences. It looks as though the same colour, the same pattern, is here, there, and scattered all over the universe. This shirt, that pencil, the sea and the sky are all blue. Many particulars

share the same thing; they all have blue as a common aspect.

There seem to be identities, therefore, amongst non-identical particulars. This fact is neither something we create, nor a mere appearance. It reflects the truth, and hence the existence of universals must be acknowledged.

If plausible, this argument establishes that there exist universal entities shared by a multiplicity of particulars. As such, however, it does not demonstrate that universals reside in a world different from that of the concrete particulars of perception. Thus there is an open choice between placing them in an independent transcendent reality, or within manifest things. Plato took the former alternative, and Aristotle opted for the latter, each choice being made at a certain cost.

I have tried to trace some of the main lines of the ancient background of the philosophical debate concerning change, object and property. Some later historical material and contemporary contributions will be supplied as the main discussion develops. Thus parts of chapters 2, 5 and 6 will be concerned with properties and universals; parts of chapters 2, 3, 4 and 5 will treat objecthood.

Change will be among the principal topics of chapters 4 and 7." (p. 9)

"This article aims to expound the ontological theory of Xavier Zubiri in order to come up with a «theory of substantivity» capable of incorporating the classical theory of substance. An even more fundamental difference than classical theory's distinction between substance and accidents is the distinction between whole and parts: the independent or autonomous parts that structure the real are not principally «substances» but «substantivities» or wholes. But defending a theory of substantivity does not presuppose rejecting the theory of

substance. In the theory of substantivity, substance continues to play an important ontological role for two reasons. First, because we cannot descriptively do away with the substance-accident relation: a substantivity has to be considered a substance (not in the strict sense) insofar as it supports accidents and the same is true with the «independent parts», since their independence is precisely the expression of their substantiality. Second, we cannot give up the theory of substance because we have to admit at least the existence of a substance in the strict sense, of a simple substance (simplicity in the strict sense), which is the «I» as pure subject (the «soul» of classical theory). And it is at this point that the article definitely distances itself from the later Zubiri."

22. Fine, Kit. 1994. "Essence and Modality." *Philosophical Perspectives* no. 8:1-16.

"The concept of essence has played an important role in the history and development of philosophy; and in no branch of the discipline is its importance more manifest than in metaphysics.

Its significance for metaphysics is perhaps attributable to two main sources. In the first place, the concept may be used to characterize what the subject, or at least part of it, is about.

For one of the central concerns of metaphysics is with the identity of things, with what they are.

But the metaphysician is not interested in every property of the objects under consideration. In asking 'What is a person?', for example, he does not want to be told that every person has a deep desire to be loved, even if this is in fact the case.

What then distinguishes the properties of interest to him? What is it about a property which makes it bear, in the metaphysically significant sense of the phrase, on what an object is?

It is in answer to this question that appeal is naturally made to the concept of essence. For what appears to distinguish the intended properties is that they are essential to their bearers."

p. 1.

It is my aim in this paper to show that the contemporary assimilation of essence to modality is fundamentally misguided and that, as a consequence, the corresponding conception of metaphysics should be given up. It is not my view that the modal account fails to capture anything which might reasonably be called a concept of essence. My point, rather, is that the notion of essence which is of central importance to the metaphysics of identity is not to be understood in modal terms or even to be regarded as extensionally equivalent to a modal notion. The one notion is, if I am right, a highly refined version of the other; it is like a sieve which performs a similar function but with a much finer mesh.

I shall also argue that the traditional assimilation of essence to definition is better suited to the task of explaining what essence is. It may not provide us with an analysis of the concept, but it does provide us with a good model of how the concept works. Thus my overall position is the reverse of the usual one. It sees real definition rather than de re modality as central to our understanding of the concept." p. 3

23. ———. 1994. "Compounds and Aggregates." *Noûs* no. 28:137-158.

"Some objects appear to be composed of parts: a quantity of sand of its grains, a throbbing pain of its throbs, a set of its members, and a proposition of its constituents.

There seem to be two fundamentally different ways in which an object can be composed of parts. One is nonstructural in character; the parts just merge. The other is structural; the parts hang together within a structure. Thus of the examples above, the first two, the sand and the pain, are composed from their parts in a nonstructural fashion, while the last two, the set and the proposition, are composed in a structural manner.

The notion of a nonstructural method of composition may be taken to be one which conforms to certain structure-obliterating identity conditions. These are as follows: order and repetition among the composing objects is irrelevant to the result; the composition of a single object is the object itself; and the composition of compositions of objects is the composition

of those very objects'. Thus the first of these conditions excludes concatenation as a nonstructural method of composition; while each of the remaining conditions excludes the set-builder (the operation which composes a set from its members).

Let us agree to call any nonstructural method of composition a method of fusion. There is a particular such method, I call it aggregation, which has been very prominent in the literature on part-whole. It may be characterized as a method of composition which conforms to the identity conditions above and which also conforms to the following existence conditions: the aggregate of objects which exist in time exists at exactly those times at which one of the objects exists; and an aggregate of objects which are located in space occupies, at any given time at which it exists, exactly those places which are occupied by one of the objects.

It has often been supposed that aggregation is a legitimate method of composition, that objects may be composed from others in conformity with the conditions set forth above. What has made aggregation so attractive, apart from any intuitive appeal it may have, are two main factors (which will be discussed in more detail later in the paper). The first, and most important, is the identification of a thing with the content of its spatio-temporal extension. The second is the identification of a thing with the fusion of its time-slices. Both of these forms of identification require that the objects fuse in the manner of aggregation.

It has also often been supposed that aggregation is the only legitimate method of fusion. Part of the appeal of this further position may arise from a general hostility to different methods of composition, whether they be methods of fusion or not. Under the form of nominalism championed by Goodman, for example, there can be no difference in objects without a difference in their parts; and this implies that the same parts cannot, through different methods of composition, yield different wholes.

However, I suspect that many of those who would be open to structural methods of composition would still not be open to

distinct nonstructural methods of composition. For it is hard to see, especially given the identification of a thing with its spatio-temporal content, what other methods of fusion there might be; and it is hard to see how there could be alternative conceptions of a fusion, of a whole at the same level as its elements and formed without regard to their order or repetition.

Let us call the extreme position, that there is only one method of composition, mereological monism; let us call the less extreme position, that there is only one method of fusion, fusion monism; and let us call that particular version of fusion monism according to which aggregation is the sole method of fusion aggregation monism.

The main purpose of this paper is to show that the last of these three positions is mistaken. I want to show that there is a method of fusion which is not aggregative, i.e. which does not conform to the characteristic existence conditions for aggregates. However, my attack on this position may be relevant to the two other positions as well. For granted that aggregation is itself a legitimate method of fusion, it follows that fusion monism should be dropped in favour of a pluralist position. And to the extent that the adoption of monism depended upon a general hostility to structural considerations, the way is then open to the admission of structural methods of composition.

It is also my intention to attack two related forms of monistic doctrine. For just as we can single out the aggregative method of nonstructural composition, so we can single out the aggregative way of being a nonstructural part and the aggregative kind of nonstructural whole. One might then maintain that not only does aggregation constitute the only nonstructural method of composition, but that it also constitutes the only nonstructural way of being a part and the only nonstructural way of being a whole. We therefore have three forms of monism, one with respect to composition, another with respect to part, and a third with respect to whole. As will later become clear, the two further forms of monism are successively weaker than the original; and so their denials

might be taken, in mimicry of Quine, to comprise three grades of mereological involvement.

From the discussion of monism will emerge objections to two other prominent doctrines: extensionalism and mereological atomism. According to the first of these, things are the same when their extensions (spatial, spatio-temporal, or modal-spatio-temporal) are the same; and according to the second, parts are prior to their wholes.

For the purposes of attacking the aggregation monist, I have assumed that aggregation is a legitimate method of fusion. Towards the end of the paper, I suggest that there is no such method and propose a form of fusion monism in which some other method of fusion takes the place of aggregation. However, my tentative endorsement of fusion monism is not meant in any way to lend support to a general monist position."

24. ———. 1994. "Senses of Essence." In *Modality, Morality and Belief. Essays in Honor of Ruth Barcan Marcus*, edited by Sinnott-Armstrong, Walter, 53-73. Cambridge: Cambridge University Press.

"One may distinguish between the essential and accidental properties of an object. A property of an object is essential if it must have the property to be what it is; otherwise the property is accidental.

But what exactly is meant by this account? It has been common to give a further explanation in modal terms. A property is taken to be essential when it is necessary that the object have the property or, alternatively, when it is necessary that it have the property if it exist. For reasons that I have already given in my paper "Essence and Modality," I doubt whether this or any other modal explanation of the notion can succeed. Indeed, I doubt whether there exists any explanation of the notion in fundamentally different terms. But this is not to deny the possibility of further clarification; and it is the aim of the present paper to provide it.

What I shall do is to distinguish some of the closely related ways in which the notion may be understood. This will be

important for getting clearer both on which claims can be made with its help and on which concepts can be defined with its help. In particular, we shall see that several different senses of ontological dependence correspond to the different senses of essence. The task is also important for the purpose of developing a logic of essentialist reasoning; for most of the different senses of essence that we distinguish will make a difference to the resulting logic. My main concern in this paper has been with making the distinctions, and not with drawing out their implications; but I hope it is clear from the examples what some of these implications are." (p. 53)

25. ———. 1994. "Ontological Dependence." *Proceedings of the Aristotelian Society* no. 95:269-290.

"The usual account of ontological dependence in terms of necessity is criticized; and an alternative account of terms of essence is proposed. Different notions of dependence are seen to correspond to different notions of essence."

26. ———. 1995. "The Logic of Essence." *Journal of Philosophical Logic* no. 24:241-273.

27. ———. 1999. "Things and Their Parts." *Midwest Studies in Philosophy* no. 23:61-74.

"I wish to sketch a theory of the general nature of material things. It is a theory on which I have been working for some time; and what I present here is the merest sketch. Details are slid over, significant questions not raised, and controversial assumptions left undefended. But I hope, all the same, that enough is said to indicate the relevance of the theory to questions concerning the nature of material things and the plausibility of its answers.

One way into the theory is through consideration of part-whole. Things have parts; and so we are led to consider how they are capable of having the parts that they do. What in their nature accounts for their division into parts? It has often been supposed that we may give an adequate answer to this question by conceiving of a material thing as the material content of a space-time region or as a successive stream of matter. But I

believe that there are enormous difficulties with these positions and that, once they are taken into account, we are led to adopt a very different conception of a material thing and of its relationship to its parts.

Central to the paper is a distinction between two different ways in which one thing can be part of another. It can, in the first place, be apart in a way that is relative to a time. It is in this way, for example, that a newly installed carburetor is now apart of my car, whereas earlier it was not, or that certain molecules are now parts of my body though later, through the exercise of natural bodily functions, they no longer will be.

In the second place, one object can be a part of another in a way that is not relative to a time. For something that is a part in this way, it is not appropriate to ask when, or for how long, it is a part; it just is a part. It is in such a way that the pants and the jacket, for example, are parts of a suit or various atoms are parts of a water molecule, or two particular pints of milk are parts of a quart of milk, or various time-slices, if there are such things, are parts of a persisting individual." p. 61

28. ———. 2000. "Semantics for the Logic of Essence." *Journal of Philosophical Logic* no. 29:543-584.

"This paper provides a possible worlds semantics for the system of the author's previous paper *The Logic of Essence*. The basic idea behind the semantics is that a statement should be taken to be true in virtue of the nature of certain objects just in case it is true in any possible world compatible with the nature of those objects. It is shown that a slight variant of the original system is sound and complete under the proposed semantics."

29. ———. 2003. "The Non-Identity of a Material Thing and Its Matter." *Mind* no. 112:195-234.

"Many philosophers have thought that a material thing is, or may be, one and the same as its matter - that a statue, for example, may be the same as the clay from which it is made or a river the same as the water which flows through it. There appears to be a powerful argument against such views, for the

thing in each of these cases would appear to have properties not possessed by its matter.

Thus the clay of a statue may exist even though the statue itself has ceased to exist and the river may be composed of different water at different times even though this cannot be true of the water that composes it at any given time. However, these philosophers have responded to this argument by claiming that the apparent difference in properties represents, not a difference in the objects themselves, but a difference in the descriptions under which they may be conceived. We may conceive of a given thing as a statue or some clay or as a river or a body of water, for example, and, depending upon how the object is conceived, we will say one thing about it rather than another.

It is the aim of this paper to show that this counter-response cannot be sustained and that the original argument against identity should therefore be allowed to stand. This is no easy task since there would appear to be nothing in the immediate linguistic data to settle the question one way or the other.

However, by working through the consequences of the counter-response for the rest of our language, I think it may be shown to be extremely implausible. The paper is in two main parts. The first (§§1-4) is largely concerned with setting up the problem. We characterize the different forms the identity theory can take (§1), explain how the argument in favor of non-identity might in principle break down (§2), present the most plausible versions of such arguments (§3), and then consider the most plausible counter-response to them (§4). The second part (§§5-8) embarks on a detailed investigation of the difficulties with the counter-response. It is shown to be unable to account for a wide variety of different linguistic data, that is loosely classified according as to how reference to a material thing might be achieved. Four main kinds of case will be considered: those in which a sort is explicitly invoked (§5); those in which it is implicitly invoked (§6); those in which the very notion of reference is itself used in securing reference (§7); and those in which there is reference to a plurality of things (§8)." "Descartes claims that God is a substance, and that mind and body are two different and separable substances. This paper provides some background that renders these claims intelligible. For Descartes, that something is real means it can exist in separation, and something is a substance if it does not depend on other substances for its existence. Further, separable objects are correlates of distinct ideas, for an idea is distinct (in

an objective sense) if its object may be easily and clearly separated from everything that is not its object. It follows that if our idea of God is our most distinct idea, as Descartes claims, then God must be a substance in the Cartesian sense of the term. Also, if we can have an idea of a thinking subject which does not in any sense refer to bodily things, and if bodily things are substances, then mind and body must be two different substances."

"Im ersten Hauptteil habe ich versucht, Grundzüge einer Alltagsontologie von Dingen zu entwerfen und gegen einige grundlegende Einwände zu verteidigen. In diesem zweiten Teil

möchte ich einen Schritt weiter-, wenn man so will, in die Kategorie der Dinge „hineingehen“, und untersuchen, ob es nicht innerhalb dieser Kategorie weitere ontologisch signifikante Differenzen gibt, die es rechtfertigen, innerhalb der Dinge eine Gruppe mit genau umschreibbaren Besonderheiten anzugeben.

Dabei wird der Begriff „Substanz“ eine wichtige Rolle spielen. Um es vorwegzunehmen, werde ich Substanzen als „Subspezies“ oder „Genus“ innerhalb der umfassenden Kategorie der Dinge einführen. Das mag vom Gebrauch von „Substanz“ bei manchen AutorInnen abweichen. Und zwar insofern, als bei manchen „Ding“ und „Substanz“ als Synonyme aufgefasst werden. Auch von der klassischen Ontologie unterscheide ich mich, insofern nämlich, als ich „Substanz“ eben nicht als Bezeichnung einer Kategorie im ontologisch technischen Sinne verstehe. Ich werde nun im zweiten Hauptteil versuchen, diese Abweichungen möglichst umfassend einzuführen und auch ontologisch zu begründen. Der Weg dazu weist einige Parallelen auf zu jenem im ersten Teil. Dort habe ich Dinge als eine Kategorie im Bereich der Partikularien bestimmt, und zwar so, dass ich zunächst nicht-dingliche Partikularien ins Auge gefasst habe, das sind Ereignisse und Zustände. Dinge aber wurden durch den Verweis auf die Unterschiede zu Ereignissen und Zuständen charakterisiert. Hier werde ich mit Artefakten beginnen, um die nicht-artifiziellen Dinge über Differenzen zu den ersteren ontologisch zu bestimmen. Ich verrate dem/der LeserIn wohl kein großes Geheimnis, dass allein damit, nämlich mit nicht-artifiziellen Dingen

oder Vorkommnissen natürlicher Arten, Substanzen gemeint sein können.

Dass Substanzen Lebewesen sind, steht ebenfalls schon hier zu vermuten, muss jedoch begründet werden; v.a. meine These, dass „Substanz“ und „Lebewesen“, bzw. „Lebewesen“ und „Vorkommnis natürlicher Arten“ extensionsgleich zu verstehen sind. Es gibt m.a.W. keine nicht-lebendigen Substanzen, natürlich auch keine Lebewesen, die keine Substanzen sind.

- Über all dies soll in diesem zweiten Hauptteil gehandelt werden." (p. 125)

"How should we define physicalism or minimal physicalism? In my view, this question calls for stipulation because these are theoretical terms without a uniform use. Different views of psychophysical relations are physicalistic in different ways and to different degrees, and there is an obvious interest in clarifying and distinguishing these views and determining which are true. My aim in this chapter will be to do some of the clarifying and distinguishing. Stipulation of a unique thesis as physicalism or minimal physicalism must come with a rationale, and as I have none to offer I shall not pursue this."
(p. 152)

(...)

"Ontological physicalism for concrete particulars is the view that both substance physicalism and concrete event physicalism hold. I have argued that this is equivalent simply to the view that the world is governed by laws with purely physical antecedents. And from this definition its close ties to the principle of physical closure can be seen.

The basic idea behind physical closure is that the best explanations of physical phenomena are physical. Ontological physicalism can now be seen to entail physical closure, because

a world governed by laws with purely physical antecedents will be one in which every physical phenomenon is fully explained by physical laws and prior physical conditions. But the converse is false. Physical closure does not entail ontological physicalism, because it holds in the noninteractive substance dualistic world we considered in which minds can perceive and think but cannot influence the physical world. However, physical closure does entail that the effecting of physical states is governed by purely physical laws, and this can indeed be taken as an equivalent formulation of the principle.

In conclusion, I have argued that ontological physicalism for concrete particulars is best regarded not as some primitive thesis but as the thesis that the world is governed by laws of succession with purely physical antecedents. In coming to understand in what ways the world is physicalistic, we are interested in whether all first-order properties instantiated in the spatiotemporal world are physical (on the various plausible interpretations of this),²³ whether there is libertarian choice, and whether there is downward causation. I have argued that these questions absorb the question whether there are nonphysical particulars." (p. 168)

From the Preface: "My overall objective in this book is to help to restore metaphysics to a central position in philosophy as the most fundamental form of rational inquiry, with its own distinctive methods and criteria of validation. In my view, all other forms of inquiry rest upon metaphysical presuppositions thus making metaphysics unavoidable-so that we should at least endeavour to do metaphysics with our eyes open, rather than allowing it to exercise its influence upon us at the level of uncritical assumption. I believe that this is beginning to be acknowledged more widely by philosophers as various research programmes for instance, in the philosophy of mind and in the philosophy of quantum physics-are being seen to flounder through inadequacies in their metaphysical underpinnings. For that reason, I hope that a book like this will prove to be a timely one.

Because Chapters 1 and 2 partly serve to introduce themes explored in greater detail later in the book, I have not written an Introduction as such. Doing so would have involved unnecessary repetition. However, it may help the reader if I supply here a brief synopsis of the book's contents. In Chapter 1, I attempt to characterize the distinctive nature of metaphysics as an autonomous intellectual discipline and defend a positive answer to Kant's famous question, 'How is metaphysics possible?', distinguishing my own answer from that of various other schools of thought, including some latter-day heirs of Kantianism. A key ingredient in my defence of metaphysics is the articulation of a distinctive and, in my view, indispensable notion of *metaphysical possibility-conceived* of as a kind of possibility which is not to be identified with physical, logical, or epistemic possibility.

Chapter 2 is devoted to an examination of two of the most fundamental and all-pervasive notions in metaphysics-the notion of an *object* and the notion of *identity* and explores their interrelationships. In the course of this exercise a central ontological distinction-that between *concrete* and *abstract*

- objects is brought to the fore, my contention being that this is at bottom a distinction between those objects that do, and those that do not, *exist in time* ." (from the Preface).

On the basis of a greater range of linguistic data and with the support of some ancient and medieval philosophical views, I argue that such terms do not stand for objects, but rather for kinds of tropes, entities that do not have the status of objects, but only play a role as semantic values of terms and as arguments of predicates. Such 'non-objects' crucially differ from objects in that they are not potential bearers of properties. "

"The question of substance in the philosophy of physics has three branches: logical, physical, and epistemological. The first is a problem in pure philosophy: is the notion of "substance" in any sense a "category," i.e. forced upon us by the general nature either of facts or of knowledge? The second is a question of the interpretation of mathematical physics: is it (a) necessary, or (b) convenient to interpret our formulae in terms of permanent entities with changing states and relations? The third concerns the relation of perception to the physical world."

- "The article is a critical examination of Joshua Hoffman's and Gary Rosenkrantz' approach to the traditional category of individual substance. On several places they offered an analysis of the concept of a substance in terms of some highly sophisticated notion of generic independence. Though ingenious, and even though it might be extensionally adequate, their account cannot provide an informative analysis of the concept in question, because it exhibits a peculiar kind of circularity. It is shown that one cannot establish, on the basis of their analysis, that a given entity is a substance, if one does not already know that it is one in advance. The circularity of their account is examined in detail, and it is explained how it could have arisen."

Key Terms in Ontology: *Mathesis Universalis*. The Search for a Universal Science

Introduction

"Preliminary remark: It is never quite clear what (the modern concept of *mathesis universalis* as such exactly signifies, let alone how it may be defined. The expression itself (1) is a composite of the Greek μάθησεως latinized by transcription to *mathesis*, and the Latin *universalis*. The latinized *mathesis*, generally meaning, according to the dictionaries, learning / knowledge / science (= *disciplina* or *scientia*), (2) more specifically designates *mathematic* (= *scientia mathematica*), though it can even mean astrology. Hence the first and general sense of *mathesis universalis* signifies no more than universal science (*disciplina universalis* or *scientia universalis*). However – and this will be very important – since this "science" has a rather mathematical ring to it, we should on second thoughts take it to be an equivalent of *scientia mathematica universalis* (3) (or *generalis* or *communis*: due to the underlying Greek terminology, there is no difference between universal, general, or common in antiquity – things will have changed by Leibniz' time at the latest, of course).

This more specific meaning, i.e., universal (or general or common) mathematical science or universal mathematic, is essential, and more or less the bottom line for most occurrences of the expression, though it still remains very vague. However, the emphasis of this paper lies, with regard to the concept of *mathesis universalis* not so much on the historical details as on the more general systematical outlines. Therefore it should suffice to begin our work with an understanding of *mathesis universalis* that implies not much more

than universal (or general or common) mathematical science, which of course still allows for a range of diverse meanings. What matters is to remain true to the sense of *mathesis universalis* while not confusing the two very different notions somehow inherent in the Latin, i.e., that of universal mathematic on the one hand and that of universal science on the other. A clear line should be drawn between these two concepts, of which the former is mathematical (even though sometimes in a wider sense), the latter not. I trust that it will become clear in this paper that both for historical and systematical reasons it is not only justified, but even necessary, to draw this general distinction between universal mathematic and universal science in this way." (pp. 129-130)

Notes

(1) The major work of reference with regard to the Renaissance and Early Modern history of *mathesis universalis* (mainly in the context of Paduans, Jesuits, and Humanists/Ramists) remains G. Crapulli, *Mathesis universalis*. Genesi di un'idea nel XVI secolo, Roma 1969 (as his focus is on the sixteenth century, Crapulli treats neither Descartes nor Leibniz, but only their predecessors). For the history of the term as such cf. R. Kauppi, "Mathesis universalis", in: J. Ritter/K. Gründer (ed.), *Historisches Wörterbuch der Philosophie*, vol. 5: L-Mn, Basel/Stuttgart 1980, col. 937-938 and also J. Mittelstrass, "Die Idee einer Mathesis universalis bei Descartes", *Perspektiven der Philosophie: Neues Jahrbuch* 4 (1978), 177-178.

(2) Descartes himself was clear about the fact that not much can be gained from the word itself: hic enim vocis originem spectare non sufficit; nam cum Matheseos nomen idem tantum sonet pod disciplina (*Regula IV, Oeuvres X*, 377,16-18).

(3) D. Rabouin, "La 'mathematique universelle' entre mathematique et philosophie, d'Aristote a Proclus", *Archives de Philosophie* 68 (2005), 249-268, discusses the concept's ambiguous character between philosophy and mathematics. Cf. also his paper "Les interpretations renaissantes de la 'mathematique generale' de Proclus", to be published in the proceedings (ed. A. Lernould and B. Vitrac) of the International Conference on *Le Commentaire de Proclus au premier livre des Elements d'Euclide*, forthcoming from Septentrion (Presses Unversitaires de Lille) [Alain Lernould (ed.),

Études sur le Commentaire de Proclus au premier livre des Éléments d'Euclide, Lille: Presses Universitaires du Septentrion, 2010].

From: Gerald Bechtle, "How to Apply the Modern Concepts of *Mathesis Universalis* and *Scientia Universalis* to Ancient Philosophy. Aristotle, Platonisms, Gilbert of Poitiers, and Descartes". In Kevin Corrigan and John D. Turner (eds.), *Platonisms: Ancient, Modern, and Postmodern*, Leiden: Brill 2007, pp. 129-154.

"The design of *mathesis universalis*, for short MU, was stated in the 17th century as part of the rationalistic philosophy of this time including a program of mathematization of sciences (see Weingartner, 1983). However, the significance of MU is not restricted to that period. It belongs to main ideas of Western civilization, its beginnings can be traced to Pythagoreans and Plato.

Immediate sources of the 17th century MU are found in the 15th century revival of Platonism whose leading figure was Marsilio Ficino (1433-1499), the author of "Theologia Platonica". He was accompanied by Nicholas of Cusa (1401-1464), Leonardo da Vinci (1452-1519), also by Nicolaus Copernicus (1473-1543). All of them may have taken as their motto the biblical verse, willingly quoted by St. Augustine, *Omnia in numero et pondere et mensura disposuisti*, Sap. 11, 21. The core of their doctrine was expressed in Ficino's statement that the perfect divine order of the universe gets mirrored in human mind due to mind's mathematical insights; thus mathematics proves capable of the role of an universal key to the knowledge; hence the denomination *mathesis universalis*.

This line of thought was continued in the 16th century by Galileo Galilei (1564-1642) and Johannes Kepler (1571-1630); it penetrated not only mechanics and astronomy but also medical sciences as represented by Teophrastus Paracelsus of Salzburg (1493-1541). No wonder that in the 17th century the community of scholars was ready to treat the idea of MU as something obvious, fairly a commonplace, before Descartes made use of this term in his "Regulae ad directionem ingenii". "Regulae" did not appear in print until 1701, hence the term itself could not have been taken from this source. In fact, it was used earlier by Erhard Weigel, a professor of mathematics

in Jena (Leibniz's teacher) who wrote a series of books developing the program of universal mathematics: "Analysis Aristotelis ex Euclide restituta", 1658 (an interpretation of Aristotle's methodological theory in the light of Euclid's practice); "Idea Matheseos Universae", 1669; "Philosophia Mathematica: universae artis inveniendi prima stamina complectens", 1693 (see Arndt, "Einführung des Herausgebers", in: Christian Wolff, *Vernünfftige Gedanken*, Halle (1713) edited by H. W. Arndt, Hildesheim: Georg Olms 1965).

The last of the listed titles involves one of the key concepts of the MU program: *ars inveniendi*, i.e. the art of discovering truths in a mathematical way. There were two approaches to this art, differing from each other by opposite evaluations of formal logic. According to Descartes, formal logic of Aristotle and schoolmen was useless for the discovery of truth; according to Leibniz, *ars inveniendi* was to possess the essential feature both of formal logic and of mathematical calculus, viz. the finding of truths in *formae* (in virtue of form)." (pp. 525-526)

From: Witold Marciszewski, "The principle of Comprehension as a Present-Day Contribution to *mathesis universalis*", *Philosophia Naturalis* 21, 1984, pp. 523-537.

Mathesis universalis in Husserl

"Husserl finds in Gottfried Wilhelm Leibniz's notion of *mathesis universalis* the first systematic attempt to unify the formal apophansis of Aristotle with the formal mathematical analysis deriving from Franciscus Vieta. According to Husserl, Leibniz saw the possibility of combining the formalized scholastic logic with other formal disciplines devoted to the forms that governed, for example, quantity or spatial relations or magnitude. Leibniz distinguished between a narrower and a broader sense of *mathesis universalis*. In the narrower sense, it is the algebra of our ordinary understanding, the formal science of quantities.

But since the formalization at work in algebra already makes conceivable a purely formal mathematical analysis that abstracts from the materially determinate mathematical disciplines such as geometry, mechanics, and acoustics, we arrive at a broader concept

emptied of all material content, even that of quantity. When applied to judgments, this formal discipline yields a syllogistic algebra or mathematical logic. But, according to Leibniz, this formal analysis of judgment ought to be combinable with all other formal analyses. Hence, the broader mathesis universalis would identify the forms of combination applicable in any science, whether quantitative or qualitative. Only thereby would it achieve the formality allowing it to serve as the theory-form for any science, whatever the material region to which that science is directed.

According to Husserl, however, Leibniz does not give an adequate account of how this unity is achieved. Husserl's development of Leibniz's notion of mathesis universalis recognizes the identity of apophantic logic and mathematical logic insofar as both apply to the forms of judgments and of arguments at different levels of abstraction. Moreover, when the principles of a mathematical logic are applied to any object whatever, it becomes clear, given the identity of the judgment as posited and the judgments as supposed, that mathematical logic can also be understood as formal ontology. Formal ontology as the formal theory of objects is characterized in the first instance by its contrast with formal apophantic logic. Formal ontology investigates a set of forms – correlative to those we find in apophantic logic – forms that Husserl calls "object-categories" (*Gegenstandskategorien*). These categories include object, state of affairs, unity, plurality, number, relation, set, ordered set, combination, connection, and the like. Formal ontology, however, is united with formal logic, for logic concerns the state of affairs just as supposed in the judgment. This means that meaning-categories (*Bedeutungskategorien*) and object-categories are the same forms, but they are considered differently and named differently in the natural and critical attitudes." (pp. 129-130)

From: John J. Drummond, *Historical Dictionary of Husserl's Philosophy* Lanham: Scarecrow Press 2007.

"*Apophantics as a doctrine of sense and a logic of truth.* From the above said it emerges that formal logic, as classically conceived, reflects the attitude of that person who performs the critique but whose judging is not a direct one but a judgement about judgements. Formal logic is constituted like an apophantic logic, whose object is

the predicative judgement. This should not constitute a limitation for logic - as in fact has been the case so far - says Husserl - for apophansis contains all the categorical intentional entities. In other words, classical formal logic kept on the apophantic level, abandoning the very aim of knowledge comprised in the "intentionality" of the judgement. However, says Husserl, judgements conceived of as "intentional entities" pertain to the region of sense. The phenomenological analysis of the sense-directed attitude leads Husserl to the following conclusions: there is a region of sense wherein a judgement is meaningful irrespective of whether or not it is exact. This shows that sense transcends the act of referring to the given subjects, sense is "transcendental" and senses are ideal poles of unity (*Formale und Transzendente Logik*, p. 119). Hence it follows that pure logic has the following divisions: the doctrine of sense and the doctrine of truth, for we have seen that the sense of a judgement and its truth are two different things.

Having thus examined the whole content of classical analytics, a content which though implied is yet not explicit, in his opinion, Husserl concludes that analytics, thus conceived, represents that *Mathesis Universalis* i.e. that universal science dreamt of by Leibniz which has four levels:

(a) as *Mathesis Universalis*, the systematic form of theories; (b) as pure *Mathesis*, of non-contradiction; (c) as *Mathesis* of the possible truth; (d) as *Mathesis* of pure senses." (p. 367)

From: Anton Dumitriu, *History of Logic*, Volume III, Tubridge Wells: Abacus Press 1977.

"Husserl's analyses of the *mathesis universalis*, in keeping with their detailed presentation in *FTL* [*Formal and Transcendental Logic* 1929], continue to offer a durable foundation for more extensive phenomenological investigations of the formal sciences. Here Husserl makes a particularly important distinction, one of exemplary significance for the whole of phenomenological description. In the first place, the *mathesis universalis* understood as objectively existing science -- in Husserl's terminology as objective logic (26) -- is to be phenomenologically-descriptively analyzed. In the second place, these investigations directed toward objective logic are to be

supplemented through a subjective logic i. e., (27) through analyses of the cognitive structures of mathematical or logical knowing. The problems Husserl takes on in *FTL* according to these terms are particularly, (i) the relation between formal logic and mathematics (their co-extension and distinguishability), and (ii) the inner structure of the mathesis universalis. Both problems will be briefly addressed in what follows.

The conception of the mathesis universalis that Husserl clearly grasps for the first time in the *Prolegomena* is barely altered in the *FTL* of 1928, which describes mathesis universalis as a science in which formal logic and mathematics blend together in the sense of *co-extension*. (28) In their respective traditional formal logic and mathematics possessed a clear thematic orientation, on the basis of which they were "undoubtedly separate sciences" [*FTL*, 80]. Since the "breakthrough of algebra" however, abstract mathematics is no longer the science of number and quantity, and abstract logic is no longer the science of the structures of content-related language that orients itself toward the grammar of natural language (a characterization that applies equally to the Brentanian understanding of logic as a general theory of correct [natural-language] reasoning). It would already have been problematic enough if the traditional logic now in the form of Boolean algebra had, as "apophantic mathematics" [*FTL*, 77], become a field of abstract mathematics. But it proved additionally to be the case that ever further sectors of mathematics could themselves be seen as a (Boolean) algebra, which dissolved even the traditional division of disciplines within mathematics. What was left over was thus a comprehensive formal science on the basis of a comprehensive (algebraicized) methodology.

However, it is due not only to a methodological alignment that, after the "breakthrough of algebra," formal logic and mathematics blended together. The formula " $a \rightarrow b = b \rightarrow a$ " can, for example, be easily reformulated in a first-order language, whereby the transition to formal logic is achieved. Yet the form-variables a, b, \dots are maintained in this transition, and consequently the logician has the same region of abstract objects in front of him, objects whose constitutive laws were initially considered by the mathematician. Thus the question arises whether and (when yes) in what sense

formal logic is distinguishable from mathematics *at all*, (29) from the mathematics Husserl refers to as *formal ontology* -- is e., the science "of the possible categorial forms in which substrate objectivitis can truly exist." [*FTL*, 145].

It is one of the most notable results of *FTL* that Husserl developed precisely the sense in which the two sciences are finally distinct from one another. In keeping with the two-fold character of phenomenological analysis, this distinction is based upon the results of subjectively as well as objectively directed phenomenological descriptions. The first direction leads to the concept of "critical attitude" [*FTL*, 45, 46], which permits a distinction between the attitude (*Einstellung*) of the logician from that of the mathematician. The critical attitude of the logician is tantamount with an act of reflection, which is the necessary condition for encountering a judgment as judgment. The mathematician, on the other hand, remains for the most part in an objectively-directed attitude even after he has carried out the abstraction from the material determinations of the object. In his characteristic reflective attitude, the logician directs his attention to the speaking about (abstract) objects, which makes it possible to isolate the structures of this speech. Thus even when logic, in a fashion analogous to formal ontology, speaks about an object-sphere, it refers to the objects and relations in this sphere through the judgment [*FTL*, 54].

Objectively this distinction in attitude reveals itself to the extent that the judgment is the fundamental concept of formal logic. In the reformulation of the group-axioms in a first-order language, the axioms stand before us as judgments that are grammatically well formulated in the sense of inductive definitions. An introductory text-book on group-theory, for example, will normally introduce neither the syntax of formalized mathematical language nor a formal concept of proof. In other words, in contrast to formal logic, whose fundamental conceptual inventory includes "judgment" or "judgment-set", these concepts are never even issues in mathematics [cf. *FTL*, 24]. Mathematics (in its traditional and abstract form) remains in an unreflective attitude which does not in principle thematize the speaking about objects [cf. *FTL*, 546]. It is occasionally necessary of course, to adopt the critical attitude for the purpose of the fundamental mathematical activity of proof. For the

mathematician, this "methodological exception" from the unreflective attitude is motivated by a methodical modalization of the judgment carried out in the direct attitude. We shall return to this in the last two sections.

Since the delimiting of formal logic and mathematics will play a decisive role in the understanding of mathematical incompleteness, this must be treated in somewhat more detail. In the *LI* [*Logical Investigations*] of 1900/01, Husserl draws a concise distinction between state of affairs (*Sachverhalt*) and judgment.(31) States of affairs are experienced as being in the world; they are the objective truth-maker of the judgment, hence an analogon to the objects of perception, to which the psychic acts of perceiving are directed. With this distinction; Husserl clears up a problem that many thinkers toward the end of the 19th century struggled to resolve.(32) Husserl belongs for this reason alone among Bolzano and Frege as one of the pioneers of modern logic.(33) It is therefore very much in the spirit of Husserl when Tarski remarks in his 1935 essay that he intends to do justice, to the intentions expressed in the following dictum: "To say of what is that it is not, or of what is not that it is, is false, while to say of what is that it is, or of what is not that it is not, is true."(34) Logic in the period after Husserl lost sight, however, of what Brentano and Husserl called "descriptive psychology"(35)" (pp. 105-108)

Notes

(26) Husserl's concept of logic (in the objective sense) is at least two-fold. On the one hand Husserl speaks of a "fully developed formal logic" [*EJ= Experience and Judgment 2*], which, as *mathesis universalis*, would encompass abstract formal logic as well as abstract mathematics. On the other hand he speaks of formal logic as a special science, in which case it is up to the reader to distinguish on every occasion whether Husserl is referring to traditional (Aristotelian) formal logic or to modern mathematicized logic as discipline within the *mathesis universalis*.

(27) Husserl deals with the distinction between the objective and subjective aspects of logic in, for example, the *Introduction to FTL*.

(28) In and of itself, the idea of coextension is already present in the *Prolegomena*. In the *Ideen* it is made explicit, in *FTL* analyzed in detail.

(29) On formal ontology *FTL*, 24; III/1, 10. The problem here exposed was aptly described by Kleene 24 years later in the following way: "In a mathematical theory, we study a system of mathematical objects. How can a mathematical theory itself be an object for mathematical study?" (Stephen Cole Kleene, *Introduction to metamathematics*, Amsterdam, North-Holland, 1952, 59).

(30) Husserl distinguishes between judgments and the spoken or written expression of judgments (on this see *FTL*, 5). His concept of judgment not so far away from what is commonly referred to as "proposition" in the terminology of analytic philosophy. At the same time, it is important that the judgment (i. e., the proposition) be opposed not to the expression, but rather that the judgment (as proposition) be opposed to the object of the judgment (where of course the judgment itself can also be made into the object of a higher-level judgment through a particular act of reflection.) Since the judgment can only be given together with an expression (in phenomenological parlance: the judgment is founded on the expression), the presumption of 'Platonic' metaphysics is here unjustified. Dealing with the constitution of judgments would call for detailed phenomenological-psychological investigations into the phenomenology of spoken and written language, analyses that cannot be carried through within the confines of this essay.

(31) The talk of states of affairs can be found in Husserl's work wherever the question is one of truth and its subjective correlate evidence, thus, for example, in the fourth *LI*, 39. The term "Sachlage", however, should -- even when this expression is employed in the *LI* (e.g. iv *.LI*, 28) -- be regarded with a view to its decisive formulation in 59 of *EJ*. It is not to be confused with state of affairs.

(32) This is the result of the thoroughgoing historical investigation in Barry Smith "Logic and the *Sachverhalt*", *The Monist* 72 (1989), 52-69. On this see also the remarks on the roll of Stumpf, Brentano, Meinong, Twardowski, or Reinach in the development of the concept of *Sachverhalt*.

(33) Best known is of course the influence of Husserl's concept of "pure logical grammar" in Leśniewski and his followers (on this Yehoshua Bar-Hillel, "Husserl' conception of a Purely Logical Grammar." *Philosophy and Phenomenological Research* 17 (1955-57) 362-9).

(34) Adam Tarski (Der Wahrheitsbegriff in den formalisierten Sprachen." *Studia Philosophica* 1 (1935), 261-465. English translation: H. Feigl, and W. Sellars, *Readings in Philosophical Analysis*. New York (NY): Appleton-Century-Crofts, 1949.

1. Knobloch, Eberhard. 2004. "Mathesis - The Idea of a Universal Science." In *Form, Zahl, Ordnung. Studien zur Wissenschafts- und Technikgeschichte. Festschrift für Ivo Schneider zum 65. Geburtstag*, edited by Seising, Rudolf, Folkerts, Menso and Hashagen, Ulf, 77-90. Stuttgart: Franz Steiner.

" "I know much, it is true, yet I'd like to know everything": Obviously Wagner, the self-confident servant of Goethe's *Faust* (verse 601) wanted to compare with God whereas in universal topic of humanism and baroque times - the historical Faust died in the 1530ies - should only enable men to participate in God's universal knowledge. The epoch overflowed with universalisms, like universal arithmetic, art, characteristic, harmony, instruments, language, magic, mathematics, method, science, symbolism. By all means, universality or at least generality corresponding to unity ranked above diversity corresponding to plurality. "Pluralitas num quam est ponenda sine necessitate", Ockham had already said, "plurality must never be assumed without necessity".

Evidently this attitude corresponded to the political situation of the 17th century. It was the time of absolutism, of absolute monarchs. Yet, we must be careful not to rush to conclusions. 19th and 20th centuries physicists of democratic societies liked and like reductionist unifications: the Grand Unified Theory (GUT) and even the hypothetical Theory Of Everything (TOE) are taking shape.

Harmony instead of controversy, certainty instead of uncertainty, evidence instead of obscurity: Since Platonic times mathesis was the discipline which seemed to be especially appropriate to guarantee these ideals. The better if it even seems to grant immortality: For "Archimedes will be

remembered when Aeschylus is forgotten because languages die and mathematical ideas do not. 'Immortality' may be an inappropriate word, but probably a mathematician has the best chances of whatever it may mean", as the English mathematician Godefrey Harold Hardy asserted (1993, 81). (*)

No wonder that mathesis played a crucial role in the history of the idea of a universal science. I would like to discuss five essential aspects of this history:

1. Capstone; 2. Tree of science; 3. Human reason; 4. Ocean of sciences; 5. Theory with practice; Epilogue." (p. 77)

3. Mittelstrass, Jürgen. 1979. "The philosopher's conception of "Mathesis Universalis" from Descartes to Leibniz." *Annals of Science* no. 36:593-610.

"In Descartes, the concept of a 'universal science' differs from that of a 'mathesis universalis', in that the latter is simply a general theory of quantities and proportions. Mathesis universalis is closely linked with mathematical analysis; the theorem to be proved is taken as given, and the analyst seeks to discover that from which the theorem follows. Though the analytic method is followed in the *Meditations*, Descartes is not concerned with a mathematisation of method; mathematics merely provides him with examples. Leibniz, on the other hand, stressed the importance of a calculus as a way of representing and adding to what is known, and tried to construct a 'universal calculus' as part of his proposed universal symbolism, his 'characteristica universalis'. The characteristica universalis was never completed-it proved impossible, for example, to list its basic terms, the 'alphabet of human thoughts'-but parts of it did come to fruition, in the shape of Leibniz's infinitesimal calculus and his various logical calculi. By his construction of these

calculi, Leibniz proved that it is possible to operate with concepts in a purely formal way."

4. Poser, Hans. 1998. "Mathesis universalis and Scientia Singularis. Connections and Disconnections between Scientific Disciplines." *Philosophia Naturalis* no. 35:3-21.

"Introduction.

Since Einstein sought a unification of relativity theory and quantum theory, two generations of physicists have tried to establish such a theory in order to unify the most efficient macroscopic theory with the extremely powerful microscopic one, but up to now they have not managed it. In many disciplines we are confronted with competing models that are successful within different and even overlapping areas, but which are at the same time incompatible with each other, seen from a more universal standpoint. To develop a unifying theory, is thus one of the greatest challenges.

Why do we take this as a challenge at all? In a historical perspective, this is far from evident: for nearly two thousand years, nobody felt disturbed by the fact that, to locate the position of a planet by means of the Ptolemaic system, one had to make three different mathematical calculations with no theory in common. The method developed by Copernicus, was by no means more precise in its results, nor was it simpler in its calculations, it had only one advantage, not belonging to physics, but to metaphysics, as it proposed one uniform procedure! Differing from the methodology of the School, which, for each quaestio postulated its correspondent appropriate method, and which, therefore, could not lead to universal theory, we are now confronted with the idea of unity, corresponding to an absolutely different image of science, the idea there should be a unity of science or even a unified science! At the beginning, reasons for this had been vague, they hinted at the unity of Gods creation; and its echo might be seen in a secularized version in C. Fr. v. Weizsäcker's *Unity of Nature* (*). The first theoretical approach is developed in the rationalistic tradition, more precisely, in Descartes and his embracing *Mathesis universalis*. The same aim is to be found

in Leibniz and his proposal of a *Scientia generalis*, as well as in the intention of Rudolf Carnap and the Vienna circle in postulating a Unified science. In all these cases we are confronted with the question how this all-embracing universal science is related to the singular and diverging sciences, and what the borders of the principles of subordination are."

(...)

"Our search for a link among changing and mutual exclusive sciences shall take the way from Descartes to Leibniz and Neurath on the one hand and Collingwood and Kuhn on the other. It leads to a discussion of Toulmin's thesis of an evolutionary character of all scientific development, a thesis which is taken as support for the post-modern worldview. Against all these attempts, the guiding thesis of this paper is to show that we have to accept truth as a regulative idea behind each scientific undertaking." (pp. 3-5)

2. Bechtle, Gerald. 2007. "How to Apply the Modern Concepts of *Mathesis Universalis* and *Scientia Universalis* to Ancient Philosophy. Aristotle, Platonisms, Gilbert of Poitiers, and Descartes." In *Platonisms: Ancient, Modern, and Postmodern*, edited by Corrigan, Kevin and Turner, John D., 129-154. Leiden: Brill.

Abstract: "This chapter concentrates on applying modern concepts like *mathesis universalis* and *scientia universalis* to the Ancient Philosophy of Aristotle, Platonisms, Gilbert of Poitiers and Descartes and to reconsider the available evidence so as to view seemingly well-known doctrines in a new light. To do this one needs to find an appropriate instrument for this, as Napolitano (*) undoubtedly has; the new conceptual tool should not only be some kind of gadget, but should also be made to do real work. In the present case, a distinction between, rather than a conscious conflation of, *mathesis universalis* (common or universal mathematic) and *scientia universalis* (universal science), might help us to consider some well-known (though obviously often uncertain) doctrinal facts about well-known philosophers from a new perspective. It has surprising shifts of emphasis and the introduction of new distinctions may eventually cause us to ask new systematic questions."

"However, the emphasis of this paper lies, with regard to the concept of *mathesis universalis* not so much on the historical details as on the more general systematical outlines. Therefore it should suffice to begin our work with an understanding of *mathesis universalis* that implies not much more than *universal* (or *general* or *common*) *mathematical science*, which of course still allows for a range of diverse meanings. What matters is to remain true to the sense of *mathesis universalis* while not confusing the two very different notions somehow inherent in the Latin, i.e., that of *universal mathematic* on the one hand and that of universal science on the other. A clear line should be drawn between these two concepts, of which the former is *mathematical* (even though sometimes in a wider sense), the latter not. I trust that it will become clear in this paper that both for historical and

systematical reasons it is not only justified, but even necessary, to draw this general distinction between *universal mathematic* and *universal science* in this way." (p. 130)

3. Cantù, Paola. 2010. "Aristotle's prohibition rule on kind-crossing and the definition of mathematics as a science of quantities." *Synthese* no. 174:225-235.

"The article evaluates the Domain Postulate of the Classical Model of Science and the related Aristotelian prohibition rule on kind-crossing as interpretative tools in the history of the development of mathematics into a general science of quantities. Special reference is made to Proclus' commentary to Euclid's first book of *Elements*, to the sixteenth century translations of Euclid's work into Latin and to the works of Stevin, Wallis, Viète and Descartes. The prohibition rule on kind-crossing formulated by Aristotle in *Posterior analytics* is used to distinguish between conceptions that share the same name but are substantively different: for example the search for a broader genus including all mathematical objects; the search for a common character of different species of mathematical objects; and the effort to treat magnitudes as numbers."

English Studies

1. Bockstaele, Paul. 2009. "Between Viète and Descartes: Adriaan van Roomen and the *Mathesis Universalis*." *Archiv for History of Exact Sciences* no. 63:433-470.

"Adriaan van Roomen published an outline of what he called a *Mathesis Universalis* in 1597. This earned him a well-deserved place in the history of early modern ideas about a universal mathematics which was intended to encompass both geometry and arithmetic and to provide general rules valid for operations involving numbers, geometrical magnitudes, and all other quantities amenable to measurement and calculation. '*Mathesis Universalis*' (MU) became the most common (though not the only) term for mathematical theories developed with

that aim. At some time around 1600 van Roomen composed a new version of his MU, considerably different from the earlier one. This second version was never effectively published and it has not been discussed in detail in the secondary literature before. The text has, however, survived and the two versions are presented and compared in the present article. Sections 1-6 are about the first version of van Roomen's MU the occasion of its publication (a controversy about Archimedes' treatise on the circle, Sect. 2), its conceptual context (Sect. 3), its structure (with an overview of its definitions, axioms, and theorems) and its dependence on Clavius' use of numbers in dealing with both rational and irrational ratios (Sect. 4), the geometrical interpretation of arithmetical operations multiplication and division (Sect. 5), and an analysis of its content in modern terms. In his second version of a MU van Roomen took algebra into account, inspired by Viète's early treatises; he planned to publish it as part of a new edition of Al-Khwarizmi's treatise on algebra (Sect. 7). Section 8 describes the conceptual background and the difficulties involved in the merging of algebra and geometry; Sect. 9 summarizes and analyzes the definitions, axioms and theorems of the second version, noting the differences with the first version and tracing the influence of Viète. Section 10 deals with the influence of van Roomen on later discussions of MU, and briefly sketches Descartes' ideas about MU as expressed in the latter's *Regulae*."

2. Cifoletti, Giovanna. 2006. "From Valla to Viète: The Rhetorical Reform of Logic and Its Use in Early Modern Algebra." *Early Science and Medicine* no. 11:390-423.

"Lorenzo Valla's rhetorical reform of logic resulted in important changes in sixteenth-century mathematical sciences, and not only in mathematical education and in the use of mathematics in other sciences, but also in mathematical theory itself. Logic came to be identified with dialectic, syllogisms with enthymemes and necessary truth with the limit case of probable truth. Two main ancient authorities mediated between logical and mathematical concerns: Cicero and Proclus. Cicero's 'common notions' were identified with Euclid's axioms, so that mathematics could be viewed as core

knowledge shared by all human kind. Proclus' interpretation of Euclid's axioms gave rise to the idea of a universal human natural light of reasoning and of a *mathesis universalis* as a basic mathematics common to both arithmetic and geometry and as an art of thinking interpretable as algebra. "

1. Vieira Oliveira, Zaqueu. 2011. "Vida e Obra de Adriaan van Roomen (1561-1615)." *Anais do IX Seminário Nacional de História da Matemática*:1-12.

English Abstract: "Adriaan van Roomen (Louvain, 1561 – Mainz, 1615) was mathematician and physician. He studied mathematics and philosophy in Cologne, then studied medicine in this city and then in Louvain and Italy. In 1585, on a trip to Rome, received the degree of *medicinae licenciatus*.

From 1586 to 1592 was professor of mathematics and medicine at the University of Louvain and in 1593 became the first professor of medicine at the newly founded University of Wurceburgo. In 1594 received the degree of doctor of medicine in Bologna. Between 1596 and 1603 was the Chapter mathematician's Cathedral of Wurceburgo [Würzburg]. Many of his works are medical theses defended his students who taught classes at universities. Already some of his work in astronomy, botany, meteorology and fireworks are just compilations of works by ancient authors or their period. Already in mathematics, some of his works also contain references to ancient authors, but his ideas about *mathesis universalis* and trigonometry, show the originality of van Roomen and present it as a big calculator. The most important mathematical works of van Roomen are: *Idea Mathematicae pars prima* (1593), *Problema Apolloniacum* (1596) and *In Archimedis circuli dimensionem* (1597) and astronomy *Ouranographia sive caeli descriptio* (1591) and *Speculum Astronomicum* (1606). Van Roomen also communicated with various scholars of his time through correspondence. The Jesuit Priest Christoph Clavius was the most correspondent goals, however we find letters to the astronomers Johannes Kepler and Christoph Grienberge."

"My talk will have three moments. In a *first moment*, I will try to identify the main determinations of encyclopaedic project in its whole. Since Varro (116-24 b.c.), *Rerum Divinorum et Humanorum Antiquitates*, St. Isidorus (560-636) *Etimologies*, Alsted *Encyclopaedia Omnia Scientiarum* (1630), or Diderot and D'Alembert *Encyclopédie ou Dictionnaire Raisonné des Sciences, des Arts et des Métiers* (1751-1765), to the *Internet* - which constitutes (I will argue) the most recent and eloquent development of the history of encyclopaedism - the aim will be to look for what is common to all this kind of excessive works. In a *second moment*, I will attempt to understand how Leibniz's idea of encyclopaedia inserts itself in that project of all times, what specific place Leibniz occupies within those many attempts. In the *third moment*, I will try to estimate the presence of Leibniz's idea of encyclopaedia in subsequent developments of encyclopaedism, namely in the XX / XXI century. This will be my humble contribution to this Congress whose major purpose is to think out the actuality of Leibniz."

7. Rabouin, David. 2012. "Interpretations of Leibniz's *Mathesis universalis* at the beginning of the XXth Century." In *New Essays on Leibniz Reception. In Science and Philosophy of Science 1800-2000*, edited by Krömer, Ralf; and Chin-Drian, Yannick, 187-201. Dordrecht: Springer.

"In his doctoral dissertation, completed in 1922 under the direction of Edmund Husserl and published in 1925 in the *Jahrbuch für Philosophie und Phänomenologische Forschungen*, Dietrich Mahnke proposed a very valuable overview of the so-called "Leibniz Renaissance". As indicated by the choice of his title: *Leibnizens Synthese von Universalmathematik und Individualmetaphysik*, this renaissance was seen by Mahnke as marked by a tension between two Leibnizian programs: that of a "universal mathematics" and that of a "metaphysics of individuation". His agenda was to propose a way of reconciling these two programs through a point of view inspired by the development of Husserlian phenomenology. In this paper, I will concentrate on the first program, "universal mathematics" or *mathesis universalis*, and see how the interpretation of this Leibnizian theme was indeed a key point in the demarcation between different ways of articulating logic, mathematics and philosophy at the beginning of the XXth century. I will pay particular attention to the way in which commentators carefully selected their texts in the Leibnizian corpus. It will be an occasion to exhibit certain postulates lurking behind classical interpretations of Leibniz in the studies by Russell, Couturat, Cassirer, or Brunschvicg. I will then contrast these readings with another interpretation of Leibniz's *mathesis universalis*, permitted by a better access to the texts and a somewhat calmer discussion around the relationship between logic, mathematics and philosophy. " (p. 187)

English Abstract: "Leibniz' approach towards a "*characteristica universalis*", a "universal art of signs" (Zeichenkunst), as an essential instrument of human knowledge is rooted both in the Cartesian ideal method of a universal mathesis and in the *ars magna* as a universal language comprising all the simple concepts and their combinations. The *signum* (sign vehicle) expresses a *notio* (concept) based on an idea fundamental to the *res* (object). The assumption here is that an isomorphic relationship between the logical and ontological areas is the precondition enabling denotation. However, the deficiency of human thought prevents characterization in its entirety; a multitude of sign systems - "Bereichscharakteristiken", area-specific characteristics - take the place of this ideal. Under these conditions it is also possible to transpose ordinary language into a *lingua rationis*. Beyond that, the importance of ordinary language consists in its correlating sign and meaning."

"Dans cet article, l'auteur essaie de montrer qu'on trouve chez Leibniz une "mathesis", c'est-à-dire une conception du savoir et de l'organisation des savoirs, originale, laquelle est entièrement discernable d'autres "mathesis" qui ont été proposées par ses contemporains du XVIIe siècle. Du point de vue thématique, l'auteur croit que cette "mathesis" reçoit son intelligibilité de la relation que Leibniz établit entre la métaphysique et les mathématiques. Sous ce rapport, on constate des vraies transformations dans la pensée de Leibniz, dès le moment où il fait son adhésion au mécanisme (1668) jusqu'à la formulation de sa dernière pensée. Dans cette évolution, la correspondance avec de Volder joue un rôle décisif."

1. Jesseph, Douglas M. 2010. "The "merely mechanical" vs. the "scab of symbols": seventeenth century disputes over the criteria of mathematical rigor." In *Philosophical Aspects of Symbolic Reasoning in Early Modern Mathematics* edited by Heeffer, Albrecht and Van Dyck, Maarten, 273-288. London: College Publications.

"This paper deals with seventeenth-century understandings of rigorous demonstration. Although there was a widely-shared concept of rigor that has its origins in classical Greek sources, philosophers in the early modern period were divided over how to characterize the ultimate foundation for mathematics. One group (whom I term the "geometric foundationalists") held that seeming physical concepts such as space, body and motion, were properly foundational. The other group (whom I call "algebraic foundationalists")

claimed that the true foundations of mathematics must be abstract notions of quantity which were the subject of algebra, or even a more general *mathesis universalis* that encompassed all reasoning about number and measure.

The geometric foundationalists faced the objection that they had introduced "merely mechanical" or insufficiently abstract principles into the foundations of mathematics. In contrast, the algebraic foundationalists needed to rebut the accusation that they based mathematics on a "scab of symbols", or empty notation divorced from anything real or substantial. I argue that this episode offers some useful insights into general questions about foundations, and can help us understand what is at stake in disputes over foundational issues, as well as how such disputes rise to prominence and then fade away."

2. ———. 1979. "Die Semiotik Christian Wolffs als Propädeutik der *ars characteristica combinatoria* und der *ars inveniendi*." *Zeitschrift für Semiotik* no. 1.

English Abstract: "The central thesis in Wolff's approach towards semiotics is that a semiotically classified representation of philosophical sciences is a prerequisite to the development of an *ars inveniendi*. Assuming that an isomorphic relationship between concepts, signs, and things as well as between their differences and relations exists, Wolff develops a system of concepts resulting in a real *Organon* for philosophy. Wolff's method follows the ideal of explicating concepts originating in ordinary language, which, because of this origin, become lexicographically applicable, even independently of the theoretical context. While here (and this is true to Daries) all content of consciousness is assumed to be accessible to an analysis notionum and to be solely conveyed by signs, later on, language and signs are regarded as media capable of evoking their own effects."

Edmund Husserl

Études en Français

1. Gagné, Gilles. 1971. *L'idée de la "Mathesis universalis". Essai sur la doctrine de la science d'Edmund Husserl.*

Thèse inédite présentée à l'Université d'Ottawa.

2. Gérard, Vincent. 2001. *Mathématique universelle et métaphysique de l'individuation. L'élaboration de l'idée de mathesis universalis dans la phénoménologie de Husserl.*

Thèse inédite.

Résumé: "La *mathesis universalis* est-elle l'ontologie formelle ? Telle est la question à laquelle nous nous proposons de répondre dans ce travail. Dans la première partie, on trouve la genèse de l'idée de *mathesis universalis* comme ontologie formelle. Dans la deuxième, les délimitations ontologiques de la *mathesis universalis* par rapport à la géométrie et l'axiologie formelle. dans la troisième, l'élucidation phénoménologique de la *mathesis universalis* comme théorie des sens apophantiques purs. Dans la quatrième, son articulation sur une métaphysique formelle ou théorie de l'individuation: la *mathesis universalis* est alors réarticulée sur l'ontologie formelle, mais en un autre

sens de l'ontologie formelle. Les résultats auxquels nous sommes parvenu sont les suivants : 1) Husserl emprunte son concept de *mathesis universalis*, non pas à la Règle IV-b de Descartes, soit pour en accomplir le sens, soit pour la détourner de son sens, mais à la tradition arithmétisante de Van Schooten, Wallis, Newton et du Leibniz de 1695; 2) l'élaboration husserlienne de l'idée de *mathesis universalis* est une tentative pour identifier un ensemble de noyaux régulateurs (principe de permanence de Hankel, etc.) qui norment les possibilité d'admission d'objets dans le champ analytique formel; 3) la géométrie comme science de l'espace est exclue de ce champ; 4) il existe en revanche une analogie radicale entre l'axiologie formelle et la *mathesis universalis*; 5) Husserl n'est pas seulement redevable à Leibniz de l'idée de *mathesis universalis*, mais également de sa conversion philosophique; 6) la *mathesis* philosophique pensée à la lumière de la théorie de la connaissance telle qu'elle est élaborée par Leibniz vers 1684 n'est, ni ne veut être, une théorie de l'être, mais une théorie pure de la signification; 7) cette théorie de la signification s'articule sur une métaphysique formelle dont Husserl emprunte le concept à Lotze. Elle a pour tâche de décrire les formes idéales auxquelles doivent correspondre les relations entre les éléments d'un monde, quel qu'il soit."

4. ———. 2012. "Mathesis universalis et géométrie: Husserl et Grassmann." In *Philosophy, Phenomenology, Sciences. Essays in Commemoration of Edmund Husserl*, edited by Ierna, Carlo, Jacobs, Hanne and Mattens, Filip, 255-300. New York: Springer.
5. Ierna, Carlo. 2012. "La notion husserlienne de multiplicité : au-delà de Cantor et Riemann." *Methodos [en ligne]* no. 12.

"En raison du rôle changeant qu'il joue dans les différents ouvrages de Husserl, le concept de *Mannigfaltigkeit* a fait l'objet de nombreuses interprétations. La présence de ce terme a notamment induit en erreur plusieurs commentateurs, qui

ont cru en déterminer l'origine dans les années de Halle, à l'époque où Husserl, ami et collègue de Cantor, rédigeait la *Philosophie de l'arithmétique*. Mais force est de constater qu'à cette époque Husserl s'était déjà ouvertement éloigné de la définition cantorienne de *Mannigfaltigkeit* en s'approchant plutôt de Riemann, comme le montrent les nombreuses études et leçons qui lui sont consacrées. La *Mannigfaltigkeitslehre* de Husserl semble donc plus proche de la topologie que de la théorie des ensembles de Cantor. Ainsi, dans les *Prolégomènes*, Husserl introduit l'idée d'une *Mannigfaltigkeitslehre* pure en tant qu'entreprise méta-théorique dont le but est d'étudier les relations entre théories, à savoir la manière par laquelle une théorie est dérivée ou fondée à partir d'une autre. Dès lors, lorsque Husserl affirme que le meilleur exemple d'une telle théorie pure des multiplicités se trouve dans les mathématiques, cela risque donc de prêter à confusion. En effet, la théorie pure des théories ne saurait être simplement identifiée aux mathématiques qui relèvent de la topologie, mais considérée en tant que *mathesis universalis*. Bien qu'une telle position ne fût sans doute pas entièrement claire en 1900-01, Husserl ne tardera pas à relier explicitement théorie des multiplicités et *mathesis universalis*. En ce sens, la *mathesis universalis*, théorie des théories en général, est une discipline formelle, apriori et analytique qui a pour but l'analyse des catégories sémantiques suprêmes et des catégories d'objets qui leur sont corrélées. Dans cet article j'essaierai de comprendre le développement de la notion de *Mannigfaltigkeit* au sein de la pensée de Husserl (de ses débuts mathématiques jusqu'au rôle central qu'elle jouera plus tard) à partir de l'arrière-fond et du contexte mathématique du développement de la philosophie de Husserl lui-même."

See in particular § 2. *Husserl's phenomenological analysis of the mathesis universalis*, pp. 105-111.

"Husserl's analyses of the mathesis universalis, in keeping with their detailed presentation in FTL [Formal and Transcendental Logic 1929], continue to offer a durable foundation for more extensive phenomenological investigations of the formal sciences. Here Husserl makes a particularly important distinction, one of exemplary significance for the whole of phenomenological description. In the first place, the mathesis universalis understood as objectively existing science -- in Husserl's terminology as objective logic (26) -- is to be phenomenologically-descriptively analyzed. In the second place, these investigations directed toward objective logic are to be supplemented through a subjective logic i. e., (27) through analyses of the cognitive structures of mathematical or logical knowing. The problems Husserl takes on in FTL according to these terms are particularly, (i) the relation between formal logic and mathematics (their co-extension and distinguishability), and (ii) the inner structure of the mathesis universalis. Both problems will be briefly addressed in what follows." p. 105

"The author's aim is to point out interpretations of modal logic which are compatible with the phenomenological approach to mathematics. The book consists of three parts with ten chapters. In the first part (pp. 19-77) the author presents E. Husserl's conception of a "mathesis universalis". For Husserl,

the mathesis universalis contains both, formal mathematics and formal (symbolic) logic. It has a hierarchical structure consisting of a pure logical grammar, a logic of consequences and a logic of truths. The author pays special attention to the differences between formal logic and formal mathematics which can be observed despite their extensional identity. \par In the second part (pp. 81--143) the author presents what he calls "phenomenological semantics", i.e. the phenomenological theory of modalization being a general analysis of intentions. The author distinguishes three levels of modalization, the level of protological passive synthesis, the level of protological active synthesis, and the level of (logical) predication. \par The third part (pp. 147--194) combines the results of the preceding parts in a phenomenological criticism of modern modal logic, especially its interpretation as possible worlds semantics. The problems of applying this semantics to natural language are seen as anchor points of phenomenological criticism. The provability interpretation of modal logic is proposed as a genetic interpretation, notwithstanding the problems which Hilbert's program and Husserl's closely related idea of definite manifolds had with Gödel's and Church's results. (Volker Peckhaus)".

"Les trois disciplines théorétiques, métaphysique, mathématique et physique constituent le lieu essentiel d'intervention de la philosophie de Descartes dans les discussions de l'âge classique, et encore dans les nôtres, mais trop souvent de manière séparée. Il s'agit dans cet essai de comprendre comment l'une des tâches que Descartes assigne à la philosophie première, au-delà de la validation extérieure des sciences contre le scepticisme, est d'en redéfinir les objets et d'en retracer les frontières, de manière à assurer l'intelligibilité intégrale du réel qui se présente à l'esprit comme phénomène, et ce jusqu'aux passions de l'âme. Cette discussion concerne au

premier chef les concepts cartésiens de mathématique et la manière dont Descartes, en particulier dans les Méditations, recompose la mathématique pure à partir de la figure et du mouvement pour identifier l'essence des corps, et donc la possibilité d'une physique, à son objet. Sont concernées les positions fondamentales de Descartes en philosophie naturelle: rapport entre physique et mathématique, lois de la nature, atomisme, théorie des substances individuelles, et, en contrepoint, les instruments de connaissance, particulièrement la sensation et l'imagination."

"À bien des égards, la *Règle IV* paraît être formée de deux textes distincts, ce que devrait justifier la différence entre la *mathesis universalis* et la méthode cartésienne. Cette interprétation conventionnelle est remise en cause en montrant que la révision qui s'opère au sein de la mathématique fait de celle-ci une méthode qui contraint les sciences à instituer l'ordre et la mesure dans leurs recherches. Ainsi, la discussion sur la *mathesis universalis* ne vise pas une science mathématique d'un niveau supérieur, mais a eu pour but la mise en œuvre d'une universalisation des méthodes menant à la découverte de la vérité."

18. Israel, Giorgio. 1999. "Des *Regulæ* à la *Géométrie*." *Revue d'Histoire des Sciences* no. 51:183-236.

"Décrire la *Géométrie* comme un « essai » illustrant la méthode cartésienne, ou comme une application des règles formulées dans le *Discours de la Méthode*, conduit, à notre avis, à sousestimer le lien entre ce brillant « essai » et l'œuvre philosophique de Descartes. Certes, une telle description de la *Géométrie* fait état d'une dépendance entre l'unique application mathématique de la méthode cartésienne et les principes métaphysiques sur lesquels elle se fonde. Mais il faut bien noter que le lien entre la *Géométrie* et la méthode cartésienne que l'on suggère par là paraît faible. La conséquence est que les études consacrées à ce texte se divisent en analyse « philosophique » et en analyse « mathématique ». En fait, lorsqu'on prend en compte l'ensemble de l'œuvre cartésienne dans son rapport avec la *Géométrie*, la situation paraît toute différente. Les *Regulae ad directionem ingenii*, en particulier, permettent d'établir un lien plus étroit entre la méthode cartésienne et la *Géométrie*.

L'objet de cet article est de mettre en évidence tous ces rapports; nous examinons les questions historiographiques soulevées ci-dessus et, en particulier, les conséquences de la séparation entre une approche philosophique et une approche purement mathématique. Nous prétendons que cette séparation est sans fondement dans le cas de l'œuvre cartésienne et qu'elle est susceptible de conduire à des conclusions discutables."

" Cet article confirme l'idée heideggerienne, repensée par J.-L. Marion, selon laquelle les *Regulae* ont une portée ontologique. Pour ce faire, Il effectue une comparaison de la dialectique de La Ramée et de la *Mathesis Universalis* de Descartes. Il se développe en trois thèses : 1) La *Mathesis Universalis* et la dialectique déterminent l'essence du penser à partir du mathématique (compris radicalement); 2) Elles consistent en un savoir «ontologique», c'est-à-dire un savoir à partir duquel nous pouvons expérimenter les choses comme choses en général; 3) Leur portée « ontologique» naît de leur proximité avec la mathématique." "La signification de la *mathesis universalis* des *Regulae* se confond avec la question historiquement disputée de la priorité de la méthode sur la métaphysique. Cette difficulté, exemplairement consignée dans l'interprétation husserlienne de Descartes, est levée lorsqu'on constate que Descartes n'a cessé - du *Discours* jusqu'aux *Meditationes* - d'affirmer la primauté constitutive de la méthode sur les sciences, métaphysique comprise, conformément au projet de la *mathesis universalis*. Ainsi se trouve institué un écart définitif entre le commencement méthodique (de l'évidence) et le fondement métaphysique dont le sens strictement non-méthodologique de la *Regula generalis* est l'indice." 35. ———. 1996. "Le référent "dialectique" dans les *Regulae*." *Études Philosophiques*:3-15.

"L'œuvre de Descartes, et notamment les *Regulae*, a été interprétée dans son rapport avec la philosophie ancienne ou médiévale. Un vaste domaine de recherche est aujourd'hui ouvert qui lie les *Regulae* à leur environnement immédiat. Plus de 20.000 ouvrages portant le titre *dialectica* voient le jour de 1520 à 1630 qui traitent de l'invention, de l'intuition, de la déduction, de la méthode, de l'ordre, de la série et de l'application de ces concepts dialectiques aux autres savoirs, notamment mathématiques. Ces logiques d'inspiration variée se heurtent entre courants dont la typologie est repérable. Les *Regulae* se réfèrent à l'un d'entre eux par leur plan d'ensemble, par leurs disposition de détail, par leurs concepts et par leur philosophie. Cette appartenance ramiste est commandée par la *Dialectique* de La Ramée de 1555. Cet article analyse le concept de dialectique dressé contre l'*Organon*, son fondement dans l'intuition des natures simples, son développement en *mathesis universalis* au travers des cent années de travaux qui précèdent l'élaboration cartésienne des *Regulae*. Or ces dispositions ne cesseront pas d'avoir cours dans l'œuvre cartésienne." (p. 3)

Repris dans: André Robinet, *Aux sources de l'esprit cartésien: L'axe La Ramée-Descartes: de la Dialectique des 1555 aux Regulae*, Paris: Vrin, 1996.

"Le quatrième des concepts de la dialectique présentée dans les "Regulae" de Descartes répond a une lourde histoire au cours de laquelle il est considéré comme étant la suite naturelle du recours à la méthode. Depuis Dasypodius jusqu'a Romanus, ces concepts, issus des travaux de La Ramée sur la dialectique et sur Euclide, ont été longuement travaillés et discutés, notamment par les auteurs du courant ramiste. Le choix particulier fait par Descartes répond a une disposition ordinaire dans la logique du XVIème siècle et se propage par lui a travers le XVIIème siècle."

39. Serfati, Michel. 1994. "*Regulae* et mathématiques." *Theoria. Revista de Teoría, Historia y Fundamentos de la Ciencia* no. 9:61-108.

"L'histoire du texte des *Règles pour la Direction de l'Esprit (Regulae)* de Descartes est un peu singulière: non publié du vivant de Descartes, il n'a paru qu'en 1701, dans les *Opera Posthuma* d'Amsterdam. De façon plus significative, et contrairement aux autres traités cartésiens perdus, ce texte secret n'est jamais explicitement évoqué par Descartes, fût-ce au détour d'une correspondance. Par leur étroite dépendance vis à vis des mathématiques, les *Regulae* sont cependant un texte majeur, constitutives de la pensée de leur auteur dans ses années de jeunesse (1619-1628), et par là de toute la philosophie moderne. Descartes avait jugé le texte suffisamment important pour l'emporter à Stockholm, où il a été découvert après sa mort, dans ses papiers. Entre les mathématiques et les *Regulae*, ce texte "éclatant et obscur"

(J.P. Weber), il est ces trois types principaux de rapports croisés que nous tâcherons d'analyser: historiquement d'abord, quelles furent la formation et l'expérience mathématique du jeune Descartes, qui constituerent, à notre sens, l'armature conceptuelle du texte. Quelles sont ensuite les voies par lesquelles, dans les *Regulae*, Descartes a pu transmuier cette expérience mathématique première à la fois en une pratique, une méthode, une théorie de la connaissance, enfin en une épistémologie assez radicalement neuve. Enfin, et prenant Descartes au sérieux nous examinerons à l'occasion cette question: quel est le sort réservé, de nos jours, à cette épistémologie cartésienne, en particulier confrontée aux mathématiques contemporaines?"

- Unpublished Ph.D. Dissertation, available at ProQuest Dissertations & Theses.

Summary: "This dissertation attempts to locate the origins of Descartes' concept of mind in his early, unfinished treatise on scientific method, the *Regulae ad directionem ingenii*. It claims that one can see, in this early work, Descartes' commitment to substance dualism for methodological reasons. In order to begin an analysis of the *Regulae*, one must first attempt to resolve textual disputes concerning its integrity and one must understand the text as a historical work, dialectically situated in the tradition of late sixteenth and early seventeenth century thought. The dissertation provides this historical backdrop and textual sensitivity throughout, but it focuses on three main themes. First, the concept of *mathesis universalis* is taken to be the organizing principle of the work. This methodological principle defines a workable technique for solving mathematical problems, a means for applying mathematics to natural philosophical explanations, and a claim concerning the nature of mathematical truth. In each case, the *mathesis universalis* is designed to fit the innate capacities of the mind and the objects studied by *mathesis* are set apart from the mind as purely mechanical and geometrically representable objects. Second, Descartes' account of perceptual cognition, the principles of which are found in the *Regulae*, is examined. In this account, Descartes describes perception as a mechanical process up to the moment of conscious awareness. This point of awareness and the corresponding actions of the mind are, he claims, independent from mechanical principles; they are incorporeal and cannot be explained reductively. Finally, when Descartes outlines the explanatory bases of his natural science, he identifies certain "simple natures." These are the undetermined categories according to which actual things can be known. Descartes makes an explicit distinction between material simples and intellectual simples. It is argued that this distinction suggests a difference in kind between the sciences of the material world and the science or pure knowledge of the intellectual world. Though the *Regulae* is focused on physical or material explanations, there is a clear commitment to distinguishing this type of explanation from the explanation of mental content and mental acts. Hence, the *Regulae*

- demonstrates Descartes' early, methodological commitment to substance dualism."

 33. ———. 1991. "The Dating of Rule IV-B in Descartes' *Regulae ad directionem ingenii*." *Journal of the History of Philosophy* no. 29:375-395.

"A careful analysis of *Rule IV* requires the acceptance of a later dating for this fragment -- probably as late as 1639-1640, when the *Meditations* were uppermost in Descartes's thought. It also permits a clarification of his terminology: *Mathesis* is a science of necessary relations. '*Mathesis universalis*', rather than a mere extension of '*mathesis*', is a distinct discipline which transforms systems of necessary relations into genuine '*scientia*' by providing the underlying conditions for the very possibility of knowledge. Thus, Descartes provides not a simple mathematical method, but a very profound methodology."

English Abstract: "A particular aspect of the confrontation between modern philosophy and the Aristotelian tradition relates to the so-called psychology of faculties. On this basis, it is much harder for modern thought, in comparison to the field of natural sciences, to separate itself from the concepts, theories, and terminologies which characterize the still deriding traditional approach. Focusing on the *Regulae ad directionem ingenii* -- in which the young Descartes, first writing about method, attempted to lay the foundation of a "mathesis generalis" -- these problems are discussed as far as the role of imagination is concerned. There are two main questions: the

presence of mental images in thought processes, and the cognitive functions of the imagination. In the *Regulae* he proposes some examples of intuitive, not-imaginative knowledge, a thorough analysis of which shows important difficulties in young Descartes' approach. Different solutions were to be proposed by Descartes himself and by most cartesians, on one hand, and by Tschirnhaus on the other hand. Finally Leibniz's peculiar solution is considered. "

2. Amijee, Fatema. 2021. "Something from Nothing: Why Some Negative Existentials are Fundamental." In *Non-Being: New Essays on the Metaphysics of Nonexistence*, edited by Bernstein, Sara and Goldschmidt, Tyron, 50-68. Oxford: Oxford University Press.

"I proceed as follows. In section 1, I discuss motivations and arguments for the view—a view that I ultimately reject—according to which there can be no negative existentials at the fundamental level. In section 2, I show that there is good reason to include a totality fact in the explanans for any contingent negative existential.

But totality facts are themselves contingent negative existentials, which makes it difficult to see how we might be able to avoid positing at least some negative existentials at the fundamental level. As part of my argument for the claim that some negative existentials are fundamental, in section 3 I argue against candidate alternative accounts for eliminating the tension between the claim that no negative existential is fundamental and the claim that every negative existential is partially explained by a negative existential. Finally, in section 4, I show that the arguments for not positing negative facts—and specifically totality facts—at the fundamental level are inadequate. This completes my case for the view that totality facts are fundamental." (pp. 52-53)

3. Babic, Joshua, and Cocco, Lorenzo. 2020. "A note on Dasgupta's Generalism." *Philosophical Studies* no. 177:2153–2162.

Abstract: "Dasgupta (*Philos Stud Int J Philos Anal Tradit* 145(1):35–67, 2009) has argued that material individuals, such as particles and laptops, are metaphysically objectionable and must be eliminated from our fundamental theories of the world.

He proposes to eliminate them by redescribing all the fundamental facts of the world in a variant of predicate functor logic. We study the status, on this theory, of a putative fact particularly recalcitrant to a formulation within predicate

functor logic: his own claim that there are no fundamental or primitive material individuals. We consider three regimentations of the denial of primitive individuals and show that—under some plausible hypotheses about fundamental truths and the fundamentality operator—they cannot be consistently translated in predicate functor logic by Dasgupta's usual strategy. We conclude by discussing two approaches to salvage Generalism, in the absence of such a translation."

"An increasing amount of twenty-first century metaphysics is couched in explicitly hyperintensional terms: concepts such as grounding, fundamentality and metaphysical priority can draw distinctions between necessarily equivalent propositions and properties.(1) While hyperintensionality in the philosophy of language is often taken to be merely a feature of our representations of the world, a prerequisite of hyperintensional metaphysics is that reality itself be hyperintensional. At the metaphysical level, propositions, properties, operators, and other elements of the type hierarchy, must be at least more fine-grained than functions from possible worlds to extensions. In this paper I develop, in the setting of type theory, a general framework for reasoning about the granularity of propositions and properties."

5. ———. 2020. "Logical Combinatorialism." *Philosophical Review* no. 129:537-589.

Abstract: "In explaining the notion of a fundamental property or relation, metaphysicians will often draw an analogy with languages. The fundamental properties and relations stand to reality as the primitive predicates and relations stand to a language: the smallest set of vocabulary God would need in order to write the 'book of the world'. In this paper I attempt to make good on this metaphor. In order to do this I introduce a modality that, put informally, stands to propositions as logical truth stands to sentences. The resulting theory, formulated in higher-order logic, also vindicates the Humean idea that fundamental properties and relations are freely recombinable and a variant of the structural idea that propositions can be decomposed into their fundamental constituents via logical operations. Indeed, it is seen that, although these ideas are seemingly distinct, they are not independent, and fall out of a natural and general theory about the granularity of reality."

6. Bader, Ralf M. 2020. "Fundamentality and Non-Symmetric Relations." In *The Foundation of Reality: Fundamentality, Space, and Time*, edited by Glick, David, Darby, George and Marmodoro, Anna, 15-45. Oxford: Oxford University Press.

"The first part of this chapter argues that there are no non-symmetric relations at the fundamental level (Sections 1.2 and 1.2). The second part identifies different ways in which asymmetry and order can be introduced into a world that only contains symmetric but no non-symmetric fundamental relations (Section 1.4).

The third part develops an account of derivative relations and puts forward identity criteria that establish that derivative non-symmetric relations do not have distinct converses. Instead of a plurality of relations, there are only different ways of picking out the same relation (Section 1.5). The final part provides an account of how generative operations can induce order and argues for a reconceptualisation of grounding as an operation rather than as a relation (Section 1-6)." (p. 16)

7. Barker, Jonathan. 2022. "Against Purity." *Ergo: An Open Access Journal of Philosophy*:1-43.

Not yet published, preprint available at PhilArchive.

Abstract: "A fundamental fact is "pure" just in case it contains no grounded entity—ex. entities like Tokyo, President Biden, the River Nile, {Socrates}, and so on—among its constituents. Purity is the thesis that every fundamental fact is pure. Purity is popular among defenders of ground. Indeed, an entire corner of the grounding literature is devoted to one of Purity's implication that every grounding fact has a ground.

Nevertheless, I argue that Purity is false. I argue that if every grounding fact has a ground, then at least one fundamental fact has a grounded constituent. Thus, if Purity is true, then it is false. Purity's falsity therefore follows via reductio. Moreover, in seeing why Purity is false, we will also be uncovering a powerful reason to think that at least some grounding facts are fundamental rather than grounded. I close by arguing that the facts about what grounds composition's occurrence are particularly good candidates for fundamental grounding facts."

8. Barnes, Elizabeth. 2012. "Emergence and Fundamentality." *Mind* no. 121:873-901.

Abstract: "In this paper, I argue for a new way of characterizing ontological emergence.

I appeal to recent discussions in meta-ontology regarding fundamentality and dependence, and show how emergence can be simply and straightforwardly characterized using these notions. I then argue that many of the standard problems for emergence do not apply to this account: given a clearly specified meta-ontological background, emergence becomes much easier to explicate. If my arguments are successful, they show both a helpful way of thinking about emergence and the potential utility of discussions in meta-ontology when applied to first-order metaphysics."

9. ———. 2014. "Fundamental Indeterminacy." *Analytic Philosophy* no. 55:339–362.

"In what follows, I will argue that a defender of indeterminacy needs to show that indeterminacy can be fundamental, but that her standard arguments, even if they work, only establish derivative indeterminacy (§1). I then move on to the case for fundamental indeterminacy, first giving a brief explanation of

different ways we might characterize the idea that there is fundamental indeterminacy (§2) and then examining arguments for indeterminacy which (unlike standard arguments) if successful can establish fundamental indeterminacy (§3). I argue that the best strategy for motivating fundamental indeterminacy is to focus on its ability to increase theoretical expressiveness." (pp. 339-340)

10. Barnes, Eric. 1994. "Explaining Brute Facts." *PSA: Proceedings of the Biennial Meeting of the Philosophy of Science Association* no. 1:61-68.

Abstract: "I aim to show that one way of testing the mettle of a theory of scientific explanation is to inquire what that theory entails about the status of brute facts. Here I consider the nature of brute facts, and survey several contemporary accounts of explanation vis a vis this subject (the Friedman-Kitcher theory of explanatory unification, Humphreys' causal theory of explanation, and Lipton's notion of 'explanatory loveliness'). One problem with these accounts is that they seem to entail that brute facts represent a gap in scientific understanding. I argue that brute facts are non-mysterious and indeed are even explainable by the lights of Salmon's ontic conception of explanation (which I endorse here). The plausibility of various models of explanation, I suggest, depends to some extent on the tendency of their proponents to focus on certain examples of explananda - I ponder brute facts qua explananda here as a way of helping us to recognize this dependency."

11. Baron, Sam, and Le Bihan, Baptiste. 2022. "Composing Spacetime." *Journal of Philosophy* no. 119:33-54.

Abstract: "According to a number of approaches in theoretical physics, spacetime does not exist fundamentally. Rather, spacetime exists by depending on another, more fundamental, non-spatiotemporal structure. A prevalent opinion in the literature is that this dependence should not be analyzed in terms of composition. We should not say, that is, that spacetime depends on an ontology of non-spatiotemporal entities in virtue of having them as parts. But is that really right? On the contrary, we argue that a mereological approach to dependent spacetime is not only viable, but promises to enhance our understanding of the physical situation."

12. Baron, Sam, and Tallant, Jonathan. 2016. "Monism: The Islands of Plurality." *Philosophy and Phenomenological Research* no. 93:583-606.

Abstract: "Priority monism (hereafter, 'monism') is the view that there exists one fundamental entity —the world—and that all other objects that exist (a set of objects typically taken to include tables, chairs, and the whole menagerie of everyday items) are merely derivative.

Jonathan Schaffer has defended monism in its current guise, across a range of papers.

Each paper looks to add something to the monistic picture of the world. In this paper we argue that monism—as Schaffer describes it—is false. To do so we develop an 'island universe' argument against Schaffer's monistic theory."

13. Baysan, Umut. 2015. "Realization Relations in Metaphysics." *Minds and Machines* no. 25:247-260.

Abstract: " "Realization" is a technical term that is used by metaphysicians, philosophers of mind, and philosophers of science to denote some dependence relation that is thought to obtain between higher-level properties and lower-level properties. It is said that mental properties are realized by physical properties; functional and computational properties are realized by first-order properties that occupy certain causal/functional roles; dispositional properties are realized by categorical properties; so on and so forth.

Given this wide usage of the term "realization", it would be right to think that there might be different dependence relations that this term denotes in different cases. Any relation that is aptly picked out by this term can be taken to be a realization relation. The aim of this state-of-the-field article is to introduce the central questions about the concept of realization, and provide formulations of a number of realization relations. In doing so, I identify some theoretical roles realization relations should play, and discuss some theories of realization in relation to these theoretical roles."

14. Bennett, Karen. 2011. "Construction Area (No Hard Hat Required)." *Philosophical Studies* no. 154:79-104.

Abstract: ""A variety of relations widely invoked by philosophers—composition, constitution, realization, micro-basing, emergence, and many others—are species of what I call 'building relations'. I argue that they are conceptually intertwined, articulate what it takes for a relation to count as a building relation, and argue that—contra appearances—it is an open possibility that these relations are all determinates of a common determinable, or even that there is really only one building relation."

Contents: 1. Introduction 1; 2. Building I: Breaking Ground 6; 3. Building II: Characterizing the Class 30; 4. Causing 67; 5.

Absolute Fundamentality 102; 6. Relative Fundamentality 137; 7. Building Building? 187; 8. In Defense of the Nonfundamental 214; Appendix: Objections to the Second Grade of Causal Involvement 239; References 247; Name Index 257; Subject Index 259-260.

"In Chapters 5 and 6, I investigate the nature of fundamentality. In Chapter 5, I distinguish three different notions of absolute fundamentality in the contemporary literature, and argue that the primary notion is that of being unbuilt. In Chapter 6, I argue that relative fundamentality—relations like *being more fundamental than* and *being just as fundamental as*—must also be understood in terms of building. I further claim that this fact goes a long way towards demystifying fundamentality talk. Indeed, that is one of the central claims of the book: there is nothing more to relative fundamentality than the obtaining of certain patterns of building. Along the way, I investigate various related questions, such as whether anything is absolutely fundamental at all, and whether everything is comparable with respect to relative fundamentality." (p. 3)

16. ———. 2019. "Précis of *Making Things Up*." *Philosophy and Phenomenological Research* no. 98:478-481.

"The goal of *Making Things Up* is to get clearer about what building relations are, how they are related to each other, and how they are related to fundamentality and causation. More generally, the goal is to articulate a detailed picture of a structured world.

Soon, I will sketch the book chapter by chapter. But I want to start by flagging three core commitments that color the project in a variety of ways, and by frontloading what I suppose are the two biggest claims in the book. The first core commitment is agnosticism about whether there is a single most fundamental building relation. Throughout the book, I instead talk in terms of a plurality of building relations, and intend talk of 'building' in the singular as shorthand for quantificational or generic claims. The second core commitment is agnosticism about metaphysical foundationalism: agnosticism, that is, about the

claim that the world has a bottom level, that all chains of building terminate in something fundamental. The third core commitment is what I hereby call 'content neutrality', though I do not use that label in the book. I do not intend to assert substantive claims about what in fact builds what, or what is in fact fundamental, if anything is. My goal is instead to sketch a kind of framework view that can be shared by people who disagree with me, and with each other, about particular building claims." (p. 478)

17. Benocci, Matteo. 2017. "Priority Monism and Essentiality of Fundamentality: A Reply to Steinberg." *Philosophical Studies* no. 174:1983-1990.

Abstract: "Steinberg has recently proposed an argument against Schaffer's priority monism. The argument assumes the principle of Necessity of Monism, which states that if priority monism is true, then it is necessarily true. In this paper, I argue that Steinberg's objection can be eluded by giving up Necessity of Monism for an alternative principle, that I call Essentiality of Fundamentality, and that such a principle is to be preferred to Necessity of Monism on other grounds as well."

18. Berker, Selim. 2019. "The Explanatory Ambitions of Moral Principles." *Noûs* no. 53:504-536.

Abstract: "Moral properties are explained by other properties. And moral principles tell us about moral properties. How are these two ideas related? In particular, is the truth of a given moral principle part of what explains why a given action has a given moral property? I argue "No." If moral principles are merely concerned with the extension of moral properties across all possible worlds, then they cannot be partial explainers of facts about the instantiation of those properties, since in general necessitation does not suffice for explanation. And if moral principles are themselves about what explains the moral properties under their purview, then by their own lights they

are not needed in order to explain those moral properties' instantiation—unless, that is, the principles exhibit an objectionable form of metaphysical circularity. So moral principles cannot explain why individual actions have moral properties. Nor, I also argue, can they explain why certain other factors explain why those actions have the moral properties that they do, or in some other way govern or mediate such first-order explanations of particular moral facts. When it comes to the explanation of an individual action's specific moral features, moral principles are explanatorily idle."

19. Bernstein, Sara. 2014. "Two Problems for Proportionality about Omissions." *Dialectica* no. 68:429-441.

"Theories of causation grounded in counterfactual dependence face the *problem of profligate omissions*: numerous irrelevant omissions count as causes of an outcome. A recent purported solution to this problem is *proportionality*, which selects one omission among many candidates as the cause of an outcome. This paper argues that proportionality cannot solve the problem of profligate omissions for two reasons. First: the determinate/determinable relationship that holds between properties like aqua and blue does not hold between negative properties like *not aqua* and *not blue*. Negative properties are those at stake in omissive causation. Second: proportionality misconstrues the nature of the problem to be solved."

20. ———. 2021. "Could a Middle Level Be the Most Fundamental?" *Philosophical Studies* no. 178:1065-1078.

Abstract: "Debates over what is fundamental assume that what is most fundamental must be either a "top" level (roughly, the biggest or highest-level thing), or a "bottom" level (roughly, the smallest or lowest-level things). Here I sketch an alternative to top-ism and bottom-ism, the view that a middle level could be the most fundamental, and argue for its plausibility. I then suggest that this view satisfies the desiderata of asymmetry, irreflexivity, transitivity, and well-foundedness of fundamentality, that the view has explanatory power on par with that of top-ism and bottom-ism, and that it has a unique connection to the Principle of Sufficient Reason."

21. Bertrand, Michael. 2017. "Fundamental Ontological Structure: An Argument Against Pluralism." *Philosophical Studies* no. 174:1277-1297.

Abstract: "In recent years, a hierarchical view of reality has become extremely influential. In order to understand the world as a whole, on this view, we need to understand the nature of the fundamental constituents of the world. We also need to understand the relations that build the world up from these fundamental constituents.

Building pluralism is the view that there are at least two equally fundamental relations that together build the world. It has been widely, though tacitly, assumed in a variety of important metaphysical debates. However, my primary aim in this paper is to argue that this has been a mistake. I will show that serious problems concerning the relationship between building and fundamentality afflict pluralism and are likely fatal to it. I claim that, for better or worse, our best hope is building singularism, the view that there is a single most fundamental building relation. I conclude by examining the advantage that singularist accounts enjoy over their pluralist rivals."

22. Bliss, Ricki. 2019. "What Work the Fundamental?" *Erkenntnis* no. 84:359-379.

Abstract: "Although it is very often taken for granted that there is something fundamental, the literature appears to have developed with little to no careful consideration of what exactly it is that the fundamentalia are supposed to do. If we are to have a good reason to believe that there is something fundamental, we need not only to know what exactly it is that the fundamentalia are invoked for, but why it is that nothing else is available for the task to hand. A good argument in defense of fundamentality, then, will contain an assumption that stipulates an explanatory target; along with a second, crucial, assumption that tells us that no dependent entity is available to do the work that needs to be done. In this paper, I explore both of these assumptions."

23. ———. 2020. "Fundamentality." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 336-347. New York: Routledge.

"The notion of fundamentality has, in more recent times, come not only to be associated with the thought that there is something ultimate, basic or at the bottom, but also with the thought that some things are nearer or further from or equidistant with that bottom. Thus, we have at our disposal, in fact, not only a notion of absolute fundamentality but also one of relative fundamentality.

This chapter is focused largely upon absolute fundamentality. Although the notion of relative fundamentality is an important one, it is commonly thought to be captured by the asymmetry, transitivity and irreflexivity of the grounding relation to which it is intimately related. Although, as we will see, this supposition is questionable, our discussion of relative fundamentality will be relegated to a cursory and brief portion of the chapter—§1. More extensive discussions of relative fundamentality can be found in Saenz [Chapter 25], Tahko [Chapter 27] and Thompson [Chapter 17] in this volume. In §2, I move onto a discussion of absolute fundamentality proper. In §2.1, I consider the common ways in which the notion has been captured, and in §2.2, the ways in which it has been characterised. In §3, I present what the most common arguments in defence of the view are. And in §4, I offer a brief discussion of whether we need grounding in order to cash out accounts of fundamentality." 25. ———. 2018. "The Geography of Fundamentality." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 1-33. New York: Oxford University Press.

"The kind of view, or cluster of views, that appear to dominate the contemporary

analytic debate can be thought of broadly as, or as species of, metaphysical foundationalism.

As will become clearer in due course, there are, in fact, a variety of ways in which one can be a metaphysical foundationalist; with different species of foundationalism involving different core commitments. Although this list is by no means exhaustive, we assume the following to be amongst the core commitments of metaphysical foundationalism as commonly endorsed in the contemporary literature.

1. The hierarchy thesis: Reality is hierarchically structured by metaphysical dependence relations that are anti-symmetric, transitive, and anti-reflexive.
2. The fundamentality thesis: There is some thing(s) which is fundamental.
3. The contingency thesis: Whatever is fundamental is merely contingently existent.
4. The consistency thesis: The dependence structure has consistent structural properties.

Strictly speaking, in order to be considered a species of foundationalism, a view needs only commit to the the fundamentality thesis: 2., then, is both necessary and sufficient for a view to count as a kind of foundationalism. For proponents of what we can think of as the standard view, however, all four theses are necessary, with no one of them being sufficient.(3)

(3) The idea that the world is ontologically ‘flat’, with everything being fundamental—a rejection of 1—has been described by Bennett 2011 as ‘crazy pants’, for example. Just as many philosophers balk at the suggestion that the fundamentalia are necessary beings.

26. Borghini, Andrea, and Lando, Giorgio. 2016. "Mereological Monism and Humean Supervenience." *Synthese* no. 197:4745-4765.

Abstract: "According to Lewis, mereology is the general and exhaustive theory of ontological composition (mereological monism), and every contingent feature of the world supervenes upon some fundamental properties instantiated by minimal entities (Humean supervenience). A profound analogy can be drawn between these two basic contentions of his metaphysics, namely that both can be intended as a denial of emergentism. In this essay, we study the relationships between Humean

supervenience and two philosophical spin-offs of mereological monism: the possibility of gunk and the thesis of composition as identity. In a gunky scenario, there are no atoms and, thus, some criteria alternative to mereological atomicity must be introduced in order to identify the bearers of fundamental properties; this introduction creates a precedent, which renders the restriction of the additional criteria to gunky scenarios arbitrary. On the other hand, composition as identity either extends the principle of indiscernibility of identicals to composition or is forced to replace indiscernibility with a surrogate; both alternatives lead to the postulation of a symmetric kind of supervenience which, in contrast to Humean supervenience, does not countenance a privileged level. Both gunk and composition as identity, thus, display a tension with Humean supervenience."

27. Brenner, Andrew. 2022. "Metaphysical Foundationalism and Theoretical Unification." *Erkenntnis*:1-21.

First online 21 July 2021.

Abstract: "Some facts ground other facts. Some fact is fundamental iff there are no other facts which partially or fully ground that fact. According to metaphysical foundationalism, every non-fundamental fact is fully grounded by some fundamental fact(s).

In this paper I examine and defend some neglected considerations which might be made in favor of metaphysical foundationalism. Building off of work by Ross Cameron, I suggest that foundationalist theories are more unified than, and so in one important respect simpler than, non-foundationalist theories, insofar as foundationalist theories allow us to derive all non-fundamental facts from some fundamental fact(s). Non-foundationalist theories can enjoy a similar sort of theoretical unification only by taking on objectionable metaphysical laws."

28. Brown, Christopher. 2017. "Minds Within Minds: An Infinite Descent of Mentality in a Physical World." *Erkenntnis* no. 82:1339-1350.

Abstract: "Physicalism is frequently understood as the thesis that everything depends upon a fundamental physical level. This standard formulation of physicalism has a rarely noted and arguably unacceptable consequence—it makes physicalism come out false in worlds which have no fundamental level, for instance worlds containing things which can infinitely decompose into smaller and smaller parts. If physicalism is false, it should not be for this reason. Thus far, there is only one proposed solution to this problem, and it comes from the so-called *via negativa* account of physicalism. *Via negativa* physicalism identifies the physical with the non-mental, such that if everything in the world ultimately depends only on nonmental things, then physicalism is true. To deal with the possibility of worlds without a fundamental level, this account says that physicalism is false in worlds with either a fundamental mental level or an infinite descent of mental levels. Here I argue that there could be a world with an infinite descent of all-mental levels, yet in which physicalism might plausibly be true—thus contradicting the sufficient-for false condition meant to save physicalism from the threat of infinitely decomposable worlds. This leaves the need for a new dependence-based account of physicalism."

29. ———. 2021. "Fundamental Mentality in a Physical World." *Synthese* no. 199:2841-2860.

Correction in *Synthese*, 199, 2021, p. 2861.

Abstract: "Regardless of whatever else physicalism requires, nearly all philosophers agree that physicalism cannot be true in a world which contains fundamental mentality. I challenge this widely held attitude, and describe a world which is plausibly all-physical, yet which may contain fundamental mentality. This is a world in which priority monism is true—which is the view that the whole of the cosmos is fundamental, with dependence relations directed from the whole to the parts—and which contains only a single mental system, like a brain or computer. Because some properties of the whole are fundamental under priority monism, it follows that that the mental properties of a cosmos-encompassing brain or computer system may be fundamental in a priority monist world. Yet such a world need

not contain anything physically unacceptable: the mental properties of the cosmos-encompassing brain or computer can be characterized in a physicalism-friendly functionalist or identity-theoretic way. Thus, as I see it, physicalism need not be false in such a world. This constitutes a challenge to those who hold the view that physicalism is inconsistent with the existence of fundamental mentality."

30. Brown, Joshua D. K. 2016. "Natural Objects." *Journal of the American Philosophical Association* no. 2:254-271.

Abstract: "This paper introduces a framework for thinking about ontological questions—in particular, the Special Composition Question—and shows how the framework might help support something like an account of restricted composition. The framework takes the form of an account of natural objects, in analogy with David Lewis's account of natural properties. Objects, like properties, come in various metaphysical grades, from the fundamental, fully objective, perfectly natural objects to the nomologically otiose, maximally gerrymandered, perfectly non-natural objects. The perfectly natural objects, I argue, are the mereological simples, and (roughly) a collection composes an object of degree- n naturalness if and only if its members are arranged F-wise, for some property F that appears in the degree- n natural laws. Arbitrary composites turn out to be perfectly non-natural objects and are metaphysical bystanders.

Ordinary composite objects fall in between. Some—e.g., atoms—are very (though not perfectly) natural; others—e.g., tables—are highly non-natural."

31. Brown, Robin, and Ladyman, James. 2009. "Physicalism, Supervenience and the Fundamental Level." *Philosophical Quarterly* no. 59:20-38.

Abstract: "We provide a formulation of physicalism, and show that this is to be favoured over alternative formulations. Much of the literature on physicalism assumes without argument that there is a fundamental level to reality, and we show that a consideration of the levels problem and its implications for physicalism tells in favour of the form of physicalism proposed

here. Its key elements are, first, that the empirical and substantive part of physicalism amounts to a prediction that physics will not posit new entities solely for the purpose of accounting for mental phenomena, nor new entities with essentially mental characteristics such as propositional attitudes or intentions; secondly, that physicalism can safely make do with no more than a weak global formulation of supervenience."

32. Brzozowski, Jacek. 2008. "On Locating Composite Objects." *Oxford Studies in Metaphysics* no. 4:193-222.

"Composite objects (at least some of them, in our world) are located in space-time. The question I will pose is the following: does the location of a composite object derive from the location of its proper parts, or not? I will argue that either way, there are unappealing consequences. We face a dilemma. Either:

1. If the location of composite objects is derived from their proper parts, we must deny the possibility of spatio-temporal gunk objects: composite objects each of whose parts is itself composite, or,

2. If the location of composite objects is not derived from their proper parts, we must posit brute metaphysical necessities connecting the location of composite objects with the locations of their proper parts." (p. 193, a note omitted)

33. ———. 2016. "Monism and Gunk." In *Reality Making*, edited by Jago, Mark, 57-74. Oxford: Oxford University Press.

"One of the main arguments put forward in favour of monism is that it can accommodate the possibility of gunk worlds—worlds where each part divides into further parts without end—while the view of their pluralist opponents cannot.

It's argued that as gunk worlds are possible, and that as a pluralist metaphysics does not allow for the possibility of such worlds while a monist metaphysics does, monism has an important advantage over pluralism.(4)

While I do think that the possibility of gunkworlds (if they are indeed possible) is a problem for the pluralist, I aim to show

that the possibility of gunk worlds is similarly problematic for the monist.

(...)

I conclude that the argument from the possibility of gunk does not offer the monist the clear cut advantage over the pluralist that one may have originally thought it had." (pp. 57-58)

(4) The argument from the possibility of gunk is put forward by Schaffer (2007, 2010).

(...)

Trenton Merricks (forthcoming) presents a dilemma against Pluralism. He argues that both horns of the dilemma are unacceptable, and so Pluralism must be false. The purpose of this paper is two-fold. First, I will argue that one particular horn of Merricks's dilemma is unproblematic for the contemporary version of Pluralism defended by Turner (2010) and McDaniel (2009, 2010, 2017), and so Merricks's argument against Pluralism, as stated, is unsound. However, my second task is to provide a new dilemma against Pluralism, which, when combined with Merricks's arguments, constitutes a powerful new challenge to every form of Pluralism." (p. 394)

35. Callender, Craig. 2001. Why Be a Fundamentalist: Reply to Schaffer.

Unpublished, available at PhilSci Archive.

Abstract: "This is my commentary on Jonathan Schaffer's paper "Evidence for Fundamentality?"; both the paper and comments were presented at the Pacific APA, San Francisco, March 2001. Schaffer argues against the view that there is an ultimate fundamental level to the world. Seeing that quarks and leptons may have an infinite hierarchy of constituents, he claims, empowers and dignifies the whole of nature (15). Like Kant he holds that there are as good reasons for believing matter infinitely divisible as composed of fundamental simples. I'm afraid that Schaffer's provocative arguments have not convinced me. In the paper, I criticize the idea that fundamentalism 'weakens' and 'denigrates' the whole of nature and try to show that an infinite hierarchy can not do the work Schaffer needs it to. I then argue that we should not in fact be agnostic between the two rival hypotheses."

36. Calosi, Claudio. 2020. "Priority Monism, Dependence and Fundamentality." *Philosophical Studies* no. 177:1-20.

Abstract: "Priority monism (PM) is roughly the view that the universe is the only fundamental object, that is, a concrete object that does not *depend* on any other concrete object. Schaffer, the main advocate of PM, claims that PM is compatible with dependence having two different directions:

from parts to wholes for subcosmic wholes, and from whole to parts for the cosmic whole. Recently it has been argued that this position is untenable. Given plausible assumptions about dependence, PM entails that dependence has only one direction, it always goes from wholes to parts. One such plausible assumption is a principle of Isolation. I argue that, given all extant accounts of dependence on the market, PM entails No Isolation.

The argument depends upon a particular feature of the dependence relation, namely, *necessitation* and *its direction*. In the light of this, I contend that the argument is important, insofar as it suggests that we should distinguish dependence from other cognate notions, e.g. grounding. Once this distinction is made, I suggest we should also distinguish between two different notions of fundamentality that might turn out to be not-coextensive."

37. Cameron, Ross P. 2008. "Turtles All the Way Down: Regress, Priority and Fundamentality in Metaphysics." *The Philosophical Quarterly* no. 58:1-14.

Abstract: "I address an intuition commonly endorsed by metaphysicians, that there must be a fundamental layer of reality, i.e., that chains of ontological dependence must terminate: there cannot be turtles all the way down. I discuss applications of this intuition with reference to Bradley's regress, composition, realism about the mental and the cosmological argument. I discuss some arguments for the intuition, but argue that they are unconvincing. I conclude by making some suggestions for how the intuition should be argued for, and discussing the ramifications of giving the justification I think best."

"The Humean is a resister of mysterious brute necessity; when there is necessity, she claims, we must be able to give an explanation of the necessity.

(...)

Connections have been drawn between truthmaker theory and priority monism. Jonathan Schaffer—who has been largely responsible for the recent resurgence of interest in priority monism—has argued that one of the benefits of priority monism is that it allows for a neat and parsimonious theory of truthmakers which solves the problem of negative facts.⁽³⁾ That gives us one way of arguing from truthmaker theory to priority monism: priority monism affords an advantageous theory of truthmaking, so the truthmaker theorist has good reason to be a priority monist. In this paper I intend to offer a different argument from truthmaker theory to priority monism: the truthmaker theorist has to be a priority monist, provided she doesn't want to be committed to objectionable necessary connections between distinct contingent existents." (p. 178)

39. ———. 2012. "Composition as Identity Doesn't Settle the Special Composition Question." *Philosophy and Phenomenological Research* no. 84:531-554.

Abstract: "Orthodoxy says that the thesis that composition is identity (CAI) entails universalism: the claim that any collection of entities has a sum. If this is true it counts in favour of CAI, since a thesis about the nature of composition that settles the otherwise intractable special composition question (SCQ) is desirable. But I argue that it is false: CAI is compatible with the many forms of restricted composition, and SCQ is no easier to answer given CAI than otherwise. Furthermore, in seeing why this is the case we reveal an objection to CAI: that it allows for the facts concerning what there is to be settled whilst leaving open the question about what is identical to what."

40. ———. 2019. "Comments on Karen Bennett's *Making Things Up*." *Philosophy and Phenomenological Research* no. 98:482-488.

"Karen Bennett's original and intriguing book *Making Things Up* is about building relations: relations by which you get some things from others. Relations such as composition, where you

get a whole from some parts; set formation, where you get a set from some members; grounding, where you get a derivative fact from a more fundamental one; realization, where you get a higher-level state from a lower-level one; etc.

Philosophers like the smallest toolbox possible, so it's tempting to try to reduce some building relations to others. David Lewis, e.g., attempts to reduce class-formation to composition: the class of Xs is simply the mereological sum of all of X's subclasses.(2) We might hope, indeed, that there is ultimately only one building relation, to which all others can be reduced. Bennett thinks not. She is a building pluralist.(3) I'm going to tackle her case for this, and argue that monism remains a contender." (p. 482)

(2) Lewis (1991).

(3) More carefully, she prefers building pluralism because she takes her arguments to show not that monism is false but rather that we shouldn't gamble on it being true (p24). I will argue that the arguments don't even make the case for preferring pluralism.

41. Chen, Gang. 2009. "Hierarchy, form, and Reality." *Frontiers of Philosophy in China* no. 4:437-453.

Abstract: "Scientific progress in the 20th century has shown that the structure the world is hierarchical. A philosophical analysis of the hierarchy will obvious significance for metaphysics and philosophy in general. Jonathan Schaffer's paper, "Is There a Fundamental Level?", provides a systematic of the works in the field, the difficulties for various versions of fundamentalism, and the prospect for the third option, i.e., to treat each level as ontologically equal. The purpose of this paper is to provide an argument for the third option. The author will apply Aristotle's theory of matter and form to the discussion of the hierarchy and develop a theory of form realism, which will grant every level with "full citizenship in the republic of being." It constitutes an argument against

ontological and epistemological reductionism. A non-reductive theory of causation is also developed against the fundamental theory of causation."

Abstract: "I offer an account of fundamentality for facts in terms of metaphysical grounding.

The account does justice to the idea that whether a fact is absolutely fundamental, and whether a fact is more fundamental than, or as fundamental as, another fact, are a matter of where in a grounding-induced hierarchy of kinds of facts these facts appear."

44. ———. 2021. "Fundamentality from Grounding Trees." *Synthese* no. 199:5965-5994.

Abstract: "I provide and defend two natural accounts of (both relative and absolute) fundamentality for facts that do justice to the idea that the "degree of fundamentality" enjoyed by a fact is a matter of how far, from a ground-theoretic perspective, the fact is from the ungrounded facts."

45. Cowling, Sam. 2014. "Instantiation as Location." *Philosophical Studies* no. 167:667-682.

Abstract: "Abstract Many familiar forms of property realism identify properties with *sui generis* ontological categories like universals or tropes and posit a fundamental *instantiation* relation that unifies objects with their properties. In this paper, I develop and defend locationism, which identifies properties

with locations and holds that the occupation relation that unifies objects with their locations also unifies objects with their properties. Along with the theoretical parsimony that locationism enjoys, I argue that locationism resolves a puzzle for actualists regarding the ontological status of uninstantiated properties. I also note some promising applications of the locationist framework to the metaphysics of quantities and possible worlds."

46. Crowther, Karen. 2019. "When Do We Stop Digging? Conditions on a Fundamental Theory of Physics." In *What is Fundamental?*, edited by Aguirre, Anthony, Foster, Brendan and Merali, Zeeya, 123-133. Cham (Switzerland): Springer.

Abstract: "In seeking an answer to the question of what it means for a theory to be fundamental, it is enlightening to ask why the current best theories of physics are not generally believed to be fundamental. This reveals a set of conditions that a theory of physics must satisfy in order to be considered fundamental. Physics aspires to describe ever deeper levels of reality, which may be without end. Ultimately, at any stage we may not be able to tell whether we've reached rock bottom, or even if there is a base level—nevertheless, I draft a checklist to help us identify when to stop digging, in the case where we may have reached a candidate for a final theory. Given that the list is—according to (current) mainstream belief in high-energy physics—complete, and each criterion well-motivated, I argue that a physical theory that satisfies all the criteria can be assumed to be fundamental in the absence of evidence to the contrary."

47. Cuffaro, Michael E., and Hartmann, Stephan. 2021. "The Open System View." 1-61.

Preprint available at <https://arxiv.org/abs/2112.11095>

Abstract: "There is a deeply entrenched view in philosophy and physics, the closed systems view, according to which isolated systems are conceived of as fundamental. On this view, when a system is under the influence of its environment this is described in terms of a coupling between it and a separate system which taken together are isolated. We argue against this

view, and in favor of the alternative open systems view, for which systems interacting with their environment are conceived of as fundamental, and the environment's influence is represented via the dynamical equations that govern the system's evolution. Taking quantum theories of closed and open systems as our case study, and considering three alternative notions of fundamentality: (i) ontic fundamentality, (ii) epistemic fundamentality, and (iii) explanatory fundamentality, we argue that the open systems view is fundamental, and that this has important implications for the philosophy of physics, the philosophy of science, and for metaphysics."

48. Dasgupta, Shamik. 2009. "Individuals: An Eessay in Revisionary Metaphysics." *Philosophical Studies* no. 145:35-67.

Abstract: "We naturally think of the material world as being populated by a large number of *individuals*. These are things, such as my laptop and the particles that compose it, that we describe as being propertied and related in various ways when we describe the material world around us. In this paper I argue that, fundamentally speaking at least, there are no such things as material individuals. I then propose and defend an individual-less view of the material world I call "generalism"."

49. ———. 2013. "Absolutism vs Comparativism about Quantity." *Oxford Studies in Metaphysics* no. 8:105-148.

"In this paper I discuss a question that arises for all quantities but which is best illustrated by the case of mass. The property of having mass is a determinable that appears to have two kinds of determinates. On the one hand, we naturally think that something with mass has a determinate intrinsic property, a property it has independently of its relationships with other material bodies.

But we also think that things with mass stand in various determinate mass relationships with one another, such as x being more massive than y or x being twice as massive as y. My question is: of the intrinsic masses and the mass relationships, which are fundamental?" (p. 105)

(...)

"Conclusion: The question of absolutism vs comparativism has received relatively little discussion, and I consider this a significant lacuna in our understanding of what the natural world fundamentally consists in. In this paper, I have tried to clarify what the issue amounts to and describe where I see the major battle lines as lying. I believe that comparativism is probably the correct view for mass, but if I have not convinced you of that I hope to have shown that the issue is important and that there is interesting further work to do in the area." (pp. 145-146)

50. De Rizzo, Julio. 2019. "How (not) to Argue Against Brute Fundamentalism." *Dialectica* no. 73:395-410.

Abstract: "This paper is a response to McKenzie (2017). I argue that the case she presents is not a genuine counterexample to the thesis she labels *Brute Fundamentalism*. My response consists of two main points. First, that the support she presents for considering her case a *metaphysical* explanation is misguided. Second, that there are principled reasons for doubting that partial explanations in Hempel's sense, of which her case is an instance, are genuinely explanatory in the first place.

Thus McKenzie's attack on Brute Fundamentalism fails."

51. Dorr, Cian. 2013. "Reading 'Writing the Book of the World'." *Philosophy and Phenomenological Research* no. 87:717-724.

"Analytic philosophy is suspicious of jargon words unless introduced by explicit definitions or for purposes of disambiguation. But this healthy suspicion must not be allowed to degenerate into a knee-jerk refusal to admit any conceptual innovations. The heart of *Writing the Book of the World* [by Ted Sider] is an extended plea for the intelligibility, and importance, of a certain technical use of 'structural' (a close

cousin of Lewis's technical use of 'natural'). In this central aim, the book is in my view almost entirely successful. Setting aside certain exotic constructions involving 'S' (the formal counterpart of 'structural') which even Sider recognises as straining intelligibility 'to the breaking point' (p. 257), I am convinced that 'structural' is not only intelligible, but a fruitful addition to the philosopher's idiolect, which allows us to raise questions that are interesting both intrinsically and for their bearing on other topics." (p. 717)

52. ———. 2016. "To Be F Is To Be G." *Philosophical Perspectives* no. 30:39-134.

"I am interested in a certain way of understanding claims of the form 'To be F is to be G', which I take to have played a central role in philosophy from its inception. Here are some examples where the target reading is natural:

- (1) a. To be a vixen is to be a female fox.
- b. To be square is to be rectangular and equilateral.
- c. To be just is to be such that each part of one's soul does its own proper work.
- d. To be a human being is to be a rational animal.
- e. To be a hydrogen atom is to be an atom whose nucleus contains exactly one proton.

As (1c) and (1d) illustrate, questions whose answers can be given in the form 'To be F is to be G' have been of central interest to philosophers since the beginning. (1e) illustrates that we cannot always tell whether to be F is to be G using "armchair" methods: sometimes, we need to do experiments. But not always, as witness (1b)."

53. Dorr, Cian, and Hawthorne, John. 2013. "Naturalness." *Oxford Studies in Metaphysics* no. 8:3-77.

"In the wake of David Lewis's seminal paper 'New Work for a Theory of Universals' (Lewis 1983b), a certain use of the word 'natural' has become widespread in metaphysics and beyond. In this usage, properties can be classified as more or less natural,

with perfectly natural properties as a limiting case. For example, Lewis would claim that being *negatively charged* is much more natural than being either *negatively charged or part of a spoon*, and may even be perfectly natural." (p. 3, a note omitted)

(...)

"Our aim in this paper is not to take sides in the debate between naturalness enthusiasts and naturalness sceptics, but to bring some structure to the terrain, replacing displays of contrasting nebulous attitudes with a range of relatively precise and independently debatable questions."

54. Duncan, Michael, Miller, Kristie, and Norton, James. 2021. "Ditching Dependence and Determination: Or, How to Wear the Crazy Trousers." *Synthese* no. 198:395-418.

Abstract: "This paper defends Flatland—the view that there exist neither determination nor dependence relations, and that everything is therefore fundamental—from the objection from explanatory inefficacy. According to that objection, Flatland is unattractive because it is unable to explain either the appearance as of there being determination relations, or the appearance as of there being dependence relations. We show how the Flatlander can meet the first challenge by offering four strategies—reducing, eliminating, untangling and omnizing—which, jointly, explain the appearance as of determination relations where no such relations obtain. Since, plausibly, dependence relations just are asymmetric determination relations, we argue that once we come mistakenly to believe that there exist determination relations, the existence of other asymmetries (conceptual and temporal) explains why it appears that there are dependence relations.""

55. ———. 2022. "Ontology without Hierarchy." In *The Question of Ontology: The Contemporary Debate*, edited by Cumpa, Javier. New York: Oxford University Press.

Not yet published; preprint available at [PhilPapers.org](https://philpapers.org)

Abstract: "It has recently become popular to suggest that questions of ontology ought be settled by determining, first, which fundamental things exist, and second, which derivative things depend on, or are grounded by, those fundamental things. This methodology typically leads to a hierarchical view of ontology according to which there are chains of entities, each dependent on the next, all the way down to a fundamental base. In this paper we defend an alternative ontological picture according to which there is no ontological hierarchy. Such a picture appears counterintuitive (at least to many), in part because in the absence of a hierarchical structure to our world, there would be no structure apt to back metaphysical explanations. There are two reasons to suppose this is so. First, there would be no structure apt to back metaphysical explanations because there would be a fatal mismatch between the formal features of metaphysical explanation, on the one hand, and the structure of the world, on the other hand. Second, in the absence of an ontological hierarchy there would be no structure apt to back metaphysical explanations because the only connections that would obtain between relevant facts are mere correlational connections. But mere correlations are not the right kinds of relations to back metaphysical explanations: explanation requires something more. This paper aims to show that neither of these is a good reason to prefer a hierarchical view of ontology."

56. Eddon, Maya. 2013. "Fundamental Properties of Fundamental Properties." *Oxford Studies in Metaphysics* no. 8:78-104.

"Two grams mass and 3 coulombs charge are examples of *quantitative properties*. Such properties have certain structural features that other sorts of properties lack. How should we account for the distinctive structure of quantity? The answer to this question will depend, in large part, on one's other

metaphysical commitments. In this paper I focus on the metaphysical framework offered by David Lewis."

(...)

"This paper proceeds as follows. In sections 2 and 3, I lay out some background assumptions, and sketch some of the structural features of quantity. In section 4, I assess several accounts of quantity, and argue that the one best suited to a Lewisian framework posits perfectly natural second-order relations. In section 5, I address worries that an account of the structural features of quantity, in terms of the perfectly natural, is not required. If such an account is not provided, I argue, then many accounts that make use of perfectly natural properties and relations are untenable. In section 6, I use the results of the previous sections to argue that the perfectly natural properties and relations do not comprise a minimal supervenience base." (pp. 78-79)

57. ———. 2017. "Parthood and Naturalness." *Philosophical Studies* no. 174:3163-3180.

Abstract: "Is *part of* a perfectly natural, or fundamental, relation? Philosophers have been hesitant to take a stand on this issue. One reason for this hesitancy is the worry that, if parthood is perfectly natural, then the perfectly natural properties and relations are not suitably "independent" of one another. (Roughly, the perfectly natural properties are not suitably independent if there are necessary connections among them.) In this paper, I argue that parthood is a perfectly natural relation. In so doing, I argue that this "independence" worry is unfounded. I conclude by noting some consequences of the naturalness of parthood."

58. Fahrbach, Ludwig. 2005. "Understanding Brute Facts." *Synthese* no. 145:449-466.

Abstract: "Brute facts are facts that have no explanation. If we come to know that a fact is brute, we obviously don't get an explanation of that fact. Nevertheless, we do make some sort of epistemic gain. In this essay, I give an account of that epistemic gain, and suggest that the idea of brute facts allows us to

distinguish between the notion of explanation and the notion of understanding.

I also discuss Eric Barnes' (1994) attack on Friedman's (1974) version of the unification theory of explanation. The unification theory asserts that scientific understanding results from minimizing the number of brute facts that we have to accept in our view of the world. Barnes claims that the unification theory cannot do justice to the notion of being a brute fact, because it implies that brute facts are gaps in our understanding of the world. I defend Friedman's theory against Barnes' critique."

Comments on Siders' 'Writing the Book of the World' [New York: Oxford University Press, 2011.]

"Ted Sider's 'Writing the Book of the World' is a bold and ambitious work, offering original and provocative answers to a wide range of questions within metaphysics and meta-metaphysics. The book is focused on the topic of fundamentality—of what is fundamental and of what it is to be fundamental and, although Sider is largely concerned to develop his own positive views on the topic, he does devote a couple of sections (§§8.1-2) to my views, as laid out in the paper, 'The Question of Realism'. (1) I hope I may therefore be forgiven for devoting my attention to some of the more critical points that he makes in these sections." (p. 725)

(1) *Imprint*, vol. 1, no. 1, 2001, reprinted in 'Individuals, Essence and Identity: Themes of Analytic Philosophy' (ed. A. Bottani, M Carrara, P. Giaretta), Dordrecht: Kluwer 2002, 3-41.

60. Fiocco, M. Oreste. 2019. "What Is a Thing?" *Metaphilosophy* no. 50:649-669.

Abstract: "Thing" in the titular question of this paper should be construed as having the utmost generality. In the relevant sense, a *thing* just is an *entity*, an *existent*, a *being*. The present task is to say what a thing *of any category* is. This task is the primary one of any comprehensive and systematic metaphysics. Indeed, an answer provides the means for resolving perennial disputes concerning the *integrity* of the structure in reality—whether some of the relations among things are *necessary* merely given those relata themselves—and the *intricacy* of this structure—whether some things are more or less *fundamental* than others. After considering some reasons for thinking the generality of the titular question makes it unanswerable, the paper propounds the methodology, *original inquiry*, required to answer it. The key to this methodology is adopting a singular perspective; confronting the world as merely the *impetus to inquiry*, one can attain an account of what a thing must be.

Radical ontology is a systematic metaphysics—broadly Aristotelian, essentialist, and nonhierarchical—that develops the consequences of this account. With it, it is possible to move past stalemate in metaphysics by revealing the grounds of a principled choice between seemingly incommensurable worldviews."

61. ———. 2019. "Each Thing Is Fundamental: Against Hylomorphism and Hierarchical Structure." *American Philosophical Quarterly* no. 56:289-301.

Abstract: "Each thing is fundamental. Not only is no thing any more or less *real* than any other, but no thing is *prior* to another in any robust ontological sense. Thus, no thing can explain the very existence of another, nor account for how another is what it is. This surprising conclusion is reached by undermining two important positions in contemporary metaphysics: *hylomorphism* and *hierarchical views* employing so-called building relations, such as *grounding*. The paper has three main parts.

First, it is observed that hylomorphism is alleged by its proponents to solve various philosophical problems. However, it is demonstrated, in light of a compelling account of

explanation, that these problems are actually demands to explain what cannot be but inexplicable. Second, it is shown how the argument against hylomorphism illuminates an account of the *essence* of a thing, thereby providing insight into what it is to exist. This indicates what a thing, in the most general sense, must be and a correlative account of the structure in reality. Third, it is argued that this account of *structure* is incompatible not only with hylomorphism, but also with any hierarchical view of reality. Although hylomorphism and the latter views are quite different, representing distinct philosophical traditions, it is maintained that they share untenable accounts of structure and fundamentality and so should be rejected on the same grounds."

62. Fisher, A. R. J. 2016. "Truthmaking and Fundamentality." *Pacific Philosophical Quarterly* no. 97:448-473.

Abstract: "I apply the notion of truthmaking to the topic of fundamentality by articulating a truthmaker theory of fundamentality according to which some truths are truth-grounded in certain entities while the ones that don't stand in a metaphysical-semantic relation to the truths that do. I motivate this view by critically discussing two problems with Ross Cameron's truthmaker theory of fundamentality. I then defend this view against Theodore Sider's objection that the truthmaking approach to fundamentality violates the *purity constraint*.

Truthmaker theorists can have a trouble-free theory of fundamentality."

63. French, Steven. 2022. "Fundamentality." In *The Routledge Companion to the Philosophy of Physics*, edited by Knox, Eleanor and Wilson, Alastair, 679-688. New York: Routledge.

"The idea that there is some fundamental "level" or "ground" where our description of the world bottoms out has acquired the status of 'the received view' in metaphysics (a classic statement of this view can be found in Oppenheim and Putnam (1958); for a more recent critical defense, see Cameron, 2008). Typically this view is cashed out in terms of some set of 'basic building blocks' populating this level, which sits at the bottom

of a hierarchy ordered according to some set of compositional principles. These fundamental building blocks are thus taken to have some form of “ultimate” ontological priority with regard to everything else in the hierarchy. In this chapter I shall consider two kinds of threats to this view: the first comes from arguments against the idea of such a level in general, whereas the second concerns the nature of these occupants. As we ’ll see, both these threats become entwined in the context of modern physics but I ’ll conclude with a suggestion as to how this “received view” may be maintained in this context.

(...)

In what follows the broad framework that I shall adopt with regard to this relationship will be that set out in (French and McKenzie, 2012, 2015): on the one hand, if metaphysics is to be understood as saying some thing about reality, then the implications of modern science and, in particular, physics need to be properly appreciated and this in turn will impact on certain “paradigmatic” metaphysical accounts, such as the received view, above; on the other, one does not have to accept that non-naturalistic metaphysics should be dismissed or even “discontinued” as some have pressed (Ladyman et al., op. cit.), since it can still serve as a kind of “toolbox” from which various devices and maneuvers can be extracted and put to use. In what follows I hope to illustrate both aspects of this framework." (p. 679)

64. Frugé, Christopher. 2021. "Joints and Basic Ways." *Inquiry: An Interdisciplinary Journal of Philosophy*.

First online 4 March 2021.

Abstract: "Metaphysicians often distinguish between *joints* and *basic ways*. Joints are the unified and joint-carving properties that trace the structure of the world. They are theorized under the ideology of *structural, perfectly natural, or sparse* properties. Basic ways are the ultimate and independent properties that give rise to all others. They are theorized under the ideology of *grounding*, where the ungrounded properties are the basic ways. While these notions are often seen as rivals, I argue that we need both, because the *joints* and the *basic ways* crosscut. For the sake being exhaustive and ecumenical, I distinguish between *natural* and *normative* sorts of joints and basic ways. I argue that, for either sort, *if* there is such a sort of joint and basic way, then there are joints that are not basic ways and there are basic ways that are not joints."

65. Funkhauser, Eric. 2022. "The Natural, the Fundamental, and the Perfectly Similar: Unraveling a Metaphysical Braid." *Metaphilosophy* no. 53:85-99.

Abstract: "Some of our most prominent metaphysicians have argued for a notion of naturalness that combines the roles of joint-carving, fundamentality, and perfect similarity. This paper argues that it is a mistake to think that there are select

properties fulfilling all these roles. Toward this end, epistemologically tractable diagnostic markers for naturalness are presented. From these it follows that there can be perfect naturalness and similarity at nonfundamental levels; and the fundamental need not be perfectly natural or yield perfect similarities. Metaphysicians of naturalness are encouraged to attend to insights from metaphysical property theory and the interdisciplinary study of patterns and complexity, both of which support these conclusions. Distinct metaphysical projects are distinguished."

66. Gang, Chen. 2009. "Hierarchy, Form, and Reality." *Frontiers of Philosophy in China* no. 4:437-453.

Abstract: "Scientific progress in the 20th century has shown that the structure the world is hierarchical. A philosophical analysis of the hierarchy will obvious significance for metaphysics and philosophy in general. Jonathan Schaffer's paper, "Is There a Fundamental Level?", provides a systematic of the works in the field, the difficulties for various versions of fundamentalism, and the prospect for the third option, i.e., to treat each level as ontologically equal. The purpose of this paper is to provide an argument for the third option. The author will apply Aristotle's theory of matter and form to the discussion of the hierarchy and develop a theory of form realism, which will grant every level with "full citizenship in the republic of being." It constitutes an argument against ontological and epistemological reductionism. A non-reductive theory of causation is also developed against the fundamental theory of causation"

67. Giannotti, Joaquim. 2021. "Fundamental Yet Grounded." *Theoria* no. 87:578-599.

Abstract: "Grounding is claimed to offer a promising characterization of the fundamental as that which is ungrounded. Detractors of this view argue that there can be fundamental and yet mutually grounded entities. Such a possibility undermines the definition of the fundamental as the ungrounded. I aim to show, however, that the possibility of fundamental mutually grounded entities does not force us to

renounce the prospects of characterizing fundamentality in terms of grounding.

To accomplish this aim, I defend a grounding-based view that accommodates fundamental mutually grounded entities straightforwardly. My definition of fundamentality is similar to, but importantly different from, one that Karen Bennett discusses. I conclude by resisting two objections raised by Jessica Wilson against the Bennettian framework that also target the proposed view."

68. ——. 2021. "The Fundamentality of Fundamental Powers." *Acta Analytica* no. 36:589-613.

Abstract: "Dispositional essentialism is the view that all or many fundamental properties are essentially dispositional, or *powers*. The literature on the dispositional essence of powers is abundant. In contrast, the question of how to understand the fundamentality of fundamental powers has received scarce interest. Therefore, the fundamentality of powers stands in need of clarification. There are four main conceptions of the fundamental, namely as that which is (i) *metaphysically independent*; or (ii) *belonging to a minimally complete basis*; or (iii) *perfectly natural*; or (iv) *metaphysically primitive*. Here, I present and discuss each of these approaches from the viewpoint of dispositional essentialism. I show that (i) is incompatible with the metaphysics of powers and (ii)–(iv) have more drawbacks than merits. Therefore, my conclusion is that the dispositional essentialist should seek an alternative. Although I offer no positive account, I pave the way to more fruitful views by identifying the shortcoming of these unpromising options."

Annotated bibliography on Metaphysical fundamentality (Gib - P)

Bibliography

1. Giberman, Daniel. 2015. "A Topological Theory of Fundamental Concrete Particulars." *Philosophical Studies* no. 172:2679-2704.

Abstract: "Fundamental concrete particulars are needed to explain facts about nonfundamental concrete particulars. However, the former can only play this explanatory role if they are properly discernible from the latter. Extant theories of how to discern fundamental concreta primarily concern mereological structure. Those according to which fundamental concreta can bear, but not be, proper parts are motivated by the possibilities that all concreta bear proper parts (mereological "gunk") and that some properties of wholes are not fixed by the properties of their proper parts ("emergence").

In response, theorists who hold that the fundamental concrete particulars can be proper parts may appeal to the possibility that every concrete particular is a proper part—that there is no mereologically maximal whole world (mereological "junk"), as well as to the intuition that fundamental concreta are qualitatively homogeneous "blocks" from which non-fundamental concreta are built. After motivating the plausibility of gunk and junk, the present essay proposes a constraint on fundamental concrete particulars based on topology instead of mereology: the fundamental concrete particulars must be appropriately connected. This constraint

has the unique advantage of consistency with each of gunk, emergence, junk, and the building block intuition."

2. Glazier, Martin. 2016. "Laws and the Completeness of the Fundamental." In *Reality Making*, edited by Jago, Mark, 11-37. Oxford: Oxford University Press.

"Any explanation of one fact in terms of another will appeal to some sort of connection between the two. In a causal explanation, the connection might be a causal mechanism or law. But not all explanations are causal, and neither are all explanatory connections.

(...)

I call these general noncausal explanatory connections laws of metaphysics.⁽¹⁾ In this chapter I argue that some of these laws are to be found in the world at its most fundamental level, forming a bridge between fundamental reality and everything else. It is only by admitting fundamental laws, I suggest, that we can do justice to the explanatory relationship between what is fundamental and what is not. And once these laws are admitted, we are able to provide a nice resolution of the puzzle of why there are any nonfundamental facts in the first place." (p. 11)

(1) The notion of a law of metaphysics has also been discussed by Sider (2011, § 12.4) and Wilsch (2015).

4. Goff, Philip. 2016. "Fundamentality and the Mind-Body Problem." *Erkenntnis* no. 81:881-898.

Abstract: "In the recent metaphysics literature, a number of philosophers have independently endeavoured to marry sparse ontology to abundant truth. The aim is to keep ontological commitments minimal, whilst allowing true sentences to quantify over a vastly greater range of entities than those which they are ontologically committed to. For example, an ontological commitment only to concrete, microscopic simples might be conjoined with a commitment to truths such as 'There are twenty people working in this building' and 'There are prime numbers greater than 5.' I argue that a significant challenge to this project comes from the philosophy of mind. As

Theodore Sider has pointed out, anti-physicalism is consistent with a sparse ontology. However, I will try to show that the premises of the standard anti-physicalist arguments can be used to form an argument to the conclusion that sentences which quantify over subjects of experience ontologically commit us to subjects of experience. Truths about consciousness cannot be bought more cheaply than their superficial grammar suggests."

5. ———. 2017. *Consciousness and Fundamental Reality*. New York: Oxford University Press.

Chapter 2.2 *The Nature of Fundamentality*, pp. 41-63.

"Now we have a grip on what physicality is, we turn to the question of what it would be for *fundamental reality* to be entirely physical. This calls for an account of *fundamentality*, of what it is for certain facts to entirely constitute fundamental reality. There has recently been a return to a very traditional understanding of fundamentality in terms of a distinctively metaphysical notion of *in rem* explanation, or "grounding" as it has become known. In what follows I will explain how I understand grounding, outline a conception of physicalism defined in terms of grounding, and then defend it against alternative accounts of fundamentality." (pp. 41-42)

6. Goldwater, Jonah. 2018. "Physicalism and the Sortalist Conception of Objects." *Synthese* no. 195:5497-5519.

Abstract: "Many hold an Aristotelian metaphysic of objects: fundamentally, objects fall under sortals and have persistence conditions befitting their sort. Though sometimes offered as a theory of material objects, I argue this view is in fact incompatible with physicalism. Call a 'sortal' a kind of object, a 'sortal identity' a particular's nature specified in sortal terms, and 'sortal properties' properties that are determined by an object's sortal identity, such as its persistence conditions. From here the argument runs as follows. Something is physical only if it is physically fundamental or is determined by what is physically fundamental (P1), but sortal identities and properties are neither physically fundamental (P2) nor determined by the physically fundamental (P3). I defend each

premise in turn. P1 falls out of the standard conception of physicalism. Rejecting P2 is tantamount to positing Aristotelian substantial forms and formal causes—which are themselves incompatible with physicalism. I defend P3 by showing that extant solutions to “the grounding problem”—the problem of showing how (nonfundamental) sortal properties are determined by (nonsortal) physical properties—are either physicalistically unacceptable, or else physicalistically acceptable but opposed to the sortalist metaphysic.”

7. Gorman, Michael M. 2014. "Essentiality as Foundationality." In *Neo-Aristotelian Perspectives in Metaphysics*, edited by Novotny, Daniel D. and Novák, Lukáš 119-137. New York: Routledge.

"In this essay, I propose a way of thinking about essence and accident that stands in the Aristotelian-scholastic tradition. At the core of my proposal will be the claim that a thing's accidental features are those of its features that are supported by other features it has, while its essential features are those that are foundational, that is, not supported by any other features it has.

First, I discuss an important basic question for the philosophy of essence, a question that needs to be answered before rival theories of essence can be adjudicated.

Second, I look at the received view in a bit more detail. Third, I look at some recently proposed alternatives. Fourth, I present my own view of essence.

Fifth, I raise and respond to an objection." (p. 119, a note omitted)

8. Hakkarainen, Jani. 2022. "The Fundamentality and Non-Fundamentality of Ontological Categories." In *E. J. Lowe and Ontology*, edited by Szatkowski, Mirosław, 123-142. New York: Routledge.

"As Bliss and Priest (2018) and Tahko (2018) document, there is a rapidly growing literature on metaphysical fundamentality and nonfundamentality or derivativeness. This literature focuses almost exclusively on the fundamentality and non-

fundamentality or derivativeness of entities: which entities are fundamental, which, in turn, are non-fundamental or derivative from the fundamental entities and what does derivation mean? The concern here is then no less than the ground of existence - if there is any. Therefore, this debate is a natural offspring of the literature on grounding and I propose that we call the fundamentality of entities "ontological fundamentality" (accordingly for their non-fundamentality or derivativeness).

The fundamentality and non-fundamentality of ontological categories ("categories", for short) is practically ignored by the theorists of ontological fundamentality, which is a deficit." (p. 123)

(...)

"My problem in the present chapter is to consider what this fundamentality is. Elaborating on what Lowe says, my proposed solution is that categorial fundamentality is having membership fully determined by a fundamental formal ontological relation or relations jointly in an order, whereas categorial non-fundamentality is having membership at least partly determined by a non-fundamental formal ontological relation in an order. Fundamentality of formal ontological relations is their simplicity and their non-fundamentality is their derivativeness in the senses specified below. In what follows, I will also tell what determination in the membership determination of categories means." (p. 124)

9. Heil, John. 2003. "Levels of Reality." *Ratio* no. 16:205-221.

Abstract: "Philosophers and non-philosophers have been attracted to the idea that the world incorporates levels of being:

higher-level items – ordinary objects, artifacts, human beings – depend on, but are not in any sense reducible to, items at lower levels. I argue that the motivation for levels stems from an implicit acceptance of a Picture Theory of language according to which we can ‘read off’ features of the world from ways we describe the world. Abandonment of the Picture Theory opens the way to a ‘no levels’ conception of reality, a conception that honors anti-reductionist sentiments and preserves the status of the special sciences without the ontological baggage."

10. ———. 2021. "Truthmaking and Fundamentality." *Synthese* no. 198:849-860.

Abstract: "Consider the idea that some entities are more fundamental than others, some entities ‘ground’ other, less fundamental, entities. What is it for something to be more fundamental than another, or for something to ‘ground’ something else? This paper urges the rejection of conceptions of grounding and fundamentality according to which reality has a hierarchical structure in which higher-level entities are taken to be distinct from but metaphysically dependent on more fundamental lower-level entities. Truthmaking is offered as an apt replacement for at least some of the many applications of grounding."

11. Heller, Mark. 2008. "The Donkey Problem." *Philosophical Studies* no. 140:83-101.

Abstract: "The Donkey Problem (as I am calling it) concerns the relationship between more and less fundamental ontologies. I will claim that the moral to draw from the Donkey Problem is that the less fundamental objects are merely conventional.

This conventionalism has consequences for the 3D/4D debate. Fourdimensionalism is motivated by a desire to avoid coinciding objects, but once we accept that the non-fundamental ontology is conventional there is no longer any reason to reject coincidence. I therefore encourage 4Dists to become even more radical—embrace the Donkey Problem’s conventionalism and deflate the debate between 3Dists and 4Dists."

12. Hildebrand, Tyler. 2016. "Natural Properties, Necessary Connections, and the Problem of Induction." *Philosophy and Phenomenological Research* no. 96:668-689.

Abstract: "The necessitarian solution to the problem of induction involves two claims: first, that necessary connections are justified by an inference to the best explanation; second, that the best theory of necessary connections entails the timeless uniformity of nature. In this paper, I defend the second claim. My arguments are based on considerations from the metaphysics of laws, properties, and fundamentality."

13. Hofweber, Thomas. 2009. "Ambitious, Yet Modest, Metaphysics." In *Metametaphysics: New Essays on the Foundations of Ontology*, edited by Chalmers, David, Manley, David and Wasserman, Ryan, 260-289. New York: Oxford University Press.

"I have enough doubts about the glorious history of philosophy to not take Aristotle's word for 'priority' to be a clear enough notion on which metaphysics can be based. In a sense, of course, priority is a clear notion. There are many things that are prior or more fundamental than other ones, but they are so in many senses of these words. What is disputed and controversial is whether there is a special metaphysical sense of priority or fundamentality.

This I deny.(7)" (p. 271)

(7) In conversation, as well as in [Schaffer, [*On What Grounds What*] this volume, p. 375], the *Euthyphro* contrast is often mentioned as a clear case of metaphysical priority: is something good because the Gods love it, or do the Gods love it because it is good. But this is not at all clear. There are two counterfactual dependencies here which are not metaphysical priority: if the Gods loved something else then that would be good, vs. if something else were good then the Gods would love that. And there are causal readings of the contrast (which are not a case of metaphysical priority), and so on. Metaphysical priority is supposed to be another sense of priority, distinct from counterfactual and causal ones. When undergraduates get

the contrast it is not at all clear that this gives them the notion of metaphysical priority, as Schaffer holds.

14. ———. 2016. *Ontology and the Ambitions of Metaphysics*. New York: Oxford University Press.

Chapter 13: *Esoteric and Egalitarian Metaphysics*, § 13.4.2 *Fundamentality and Explanation*, pp. 328-330.

"Do we have a substantial, egalitarian, notion of priority available? As it turns out, there is good reason to think that we do. In the following we will have a critical look at some of the best arguments that we have such a notion available. We will start with one widely used notion in the present neo-Aristotelian context: fundamentality. After that we will consider various considerations which suggest that we have an egalitarian notion of ground that goes beyond the uncontroversial cases."

15. Hüttemann, Andreas. 2021. *A Minimal Metaphysics for Scientific Practice*. Cambridge: Cambridge University Press.

Chapter 6: *Reduction and Physical Foundationalism*, pp. 159-185.

"Conclusion: Foundationalism is not implied by what classical mechanics and quantum mechanics have to say about the part-whole relation.(8) Not even those cases in classical and quantum mechanics that are most favourable to the foundationalist – namely, cases of part-whole explanation of the dynamics of compound systems – commit us to the claim that the behaviour of the compound is ontologically posterior to the behaviour of the parts (and some further facts about how the parts interact and how they are related). The reductive practices we have discussed in Chapter 5 [*Reductive practices*] do not commit us to Foundationalism." (p. 185)

(8) McKenzie comes to a similar conclusion: 'it seems that the layered structure that (those who identify as) metaphysicians are primarily concerned with is a structure that is oriented in some sense "orthogonally" from that relating the ontologies of the different sciences' (McKenzie 2019, 56). See also McKenzie (2011).

Chapter 2: *Grounding and Essence*, pp. 53-74.

"In the previous chapter, I outlined and argued for a version of serious essentialism that glossed the notion of essence in non-modal terms and is captured by real definition.

(...)

I now want to turn to the topic of metaphysical grounding or dependence, yet another pillar upon which I will rely in developing the notion of fundamental mereology in the sequel.

The present chapter will proceed as follows. In §2.1 I introduce the notion of metaphysical grounding as a robust form of (non-causal) metaphysical dependence as well as several general background assumptions about grounding that I draw from in the sequel. I explicate a host of axioms and operative assumptions about the formal and structural features of a species of grounding, viz. ontological dependence, that is ubiquitous in the context of mereological metaphysics. I make no claim to originality nor to have argued for my preferred understanding of metaphysical grounding.

(...)

In § 2.2 I take a closer look at the diverse family of ontological dependence relations. I employ the serious-essentialist framework developed in the previous chapter to specify a species of grounding that employs a non-modal view of essence and that is well suited to generate relations of metaphysical priority and posteriority."

17. Jenkins, C. S. 2013. "Explanation and Fundamentality." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 211-241. Munich: Philosophia Verlag.

"Setting aside some no-doubt-important differences, for current purposes I shall take it that metaphysical fundamentality is generally supposed to amount to something *reasonably similar* regardless of the ontological category of that to which it is being attributed. My purpose in this paper is to explore the question: what are metaphysicians doing when they describe something as 'metaphysically fundamental'?

There is influential recent work in metaphysics arguing about whether there exists anything fundamental (see e.g. Markosian 2005, Cameron 2008). The fundamentality or otherwise of particular things is also a rich source of metaphysical debate (see e.g. Schaffer 2010). And this work taps into a venerable tradition plausibly dating back at least to Aristotle." (p. 212)

18. Jenkins Ichikawa, Jonathan, and Jenkins, C. S. I. 2017. "On Putting Knowledge 'First'." In *Knowledge First: Approaches in Epistemology and Mind*, edited by Carter, Joseph Adam, Gordon, Emma C. and Jarvis, Benjamin, 113-131. Oxford: Oxford University Press.

"Introduction: There is a New Idea in epistemology. It goes by the name of 'knowledge first,' and it is particularly associated with Timothy Williamson's book *Knowledge and Its Limits* (Williamson [Oxford University Press] 2000). In slogan form,

to put knowledge first is to treat knowledge as basic or fundamental, and to explain other states—belief, justification, maybe even content itself—in terms of knowledge, instead of vice versa. The idea has proven enormously interesting, and equally controversial. But foundational questions about its actual content remain relatively unexplored. We think that a wide variety of views travel under the banner of ‘knowledge first’ (and that the slogan doesn’t help much with differentiating them). Furthermore, it is far from straightforward to draw connections between certain of these views; they are more independent than they are often assumed to be.(1)

Our project here is exploratory and clarificatory. We mean to tease apart various ‘knowledge first’ claims, and explore what connections they do or do not have with one another. Section 3 provides a taxonomy, and Section 4 explores connections.

The result, we hope, will be a clearer understanding of just what the Knowledge-First theses are. Section 5 concludes with some brief suggestions as to how we think the various theses might be evaluated.

Section 2 begins with a brief summary of the historical context in which the knowledge-first programme arose. It provides insights into what exactly the programme is by disentangling elements of the tradition to which it is a reaction" (p. 113)

19. Jones, Nicholas K. 2022. "Against Representational Levels." *Philosophical Studies* no. 36:1-20.

To be published in volume 36 of *Philosophical Studies*, preprint available PhilArchive.

Abstract: "Some views articulate reality’s hierarchical structure using relations from the fundamental to representations of reality. Other views instead use relations from the fundamental to constituents of non-representational reality. This paper argues against the first kind of view."

20. Khalidi, Muhammad Ali. 2011. "The Pitfalls of Microphysical Realism." *Philosophy of Science* no. 78:1156-1164.

Abstract: "Microphysical realism is the position that the only real entities and properties are found at the most fundamental level of nature. In this article, I challenge microphysical realism concerning properties and natural kinds. One argument for microphysical realism about entities, the "nothing-but argument," does not apply to properties and kinds. Another argument, the "causal exclusion argument," cannot be sustained in light of modern physics. Moreover, this argument leads to an objection against microphysical realism, based on the "illusoriness of macroproperties." Another objection is based on the possibility that there is no fundamental level but a "bottomless pit."

21. Kirilyuk, Andrei P. 2018. Objective Fundamental Reality Structure by the Unreduced Complexity Development. 1-7.

Paper submitted to the 2017-2018 FQXi Essay Contest, 19 January 2018.

Abstract: "We explain why exactly the simplified abstract scheme of reality within the standard science paradigm cannot provide the consistent picture of "truly fundamental" reality and how the unreduced, causally complete description of the latter is regained within the extended, probably complete solution to arbitrary interaction problem and the ensuing concept of universal dynamic complexity. We emphasize the practical importance of this extension for both particular problem solution and further, now basically unlimited fundamental science development (otherwise dangerously stagnating within its traditional paradigm)."

22. Kleinknecht, Reinhard. 1998. "Comments on U. Meixner's Lecture "Actual Existence, Identity and Ontological Priority"." *Erkenntnis* no. 48:227-231.

"The questions treated by Uwe Meixner (hereafter referred to as M) in his lecture are of fundamental importance as far as ontology is concerned.

He assumes the old distinction between epistemological and ontological priority. This distinction is intuitively justified. However, when it comes to the question as to what exactly is meant by that, philosophers are divided on their views. M deals exclusively with *ontological* priority. But since what is being dealt with here is priority in *ordine essendi*, one ought really to refer to "ontic" priority instead of "ontological". Having said that I will however adopt the terms used by M." (p. 227)

Abstract: "The relation of being more fundamental than, as well as the Finean notion of partial grounding, are widely taken to be irreflexive, transitive, and asymmetric. However, certain time-travel cases that have been used to raise worries about the irreflexivity, transitivity, and asymmetry of proper part of can also be used to argue that more fundamental than and partially grounds do not have these formal properties. I present this worry and discuss several responses to it, with the aim of showing that the problem is harder to address when applied to fundamentality and partial grounding than it was when merely applied to proper parthood."

Chapter 3: *Grounding, Ontological Dependence, and Fundamentality*, pp. 47-73.

"So, we must distinguish between two kinds of fundamental entities, namely, those whose existence is ungrounded, and those which are not ontologically dependent on any other entity. These are, respectively, G-fundamental and O-fundamental entities.

Def D3.5 G-Fundamentality. An entity x is G-fundamental if the existence of x is ungrounded.

Def D3.6 O-Fundamentality. An entity x is O-fundamental if and only if neither the quiddity (generic essence) nor the haecceity (individual essence) of x contains any entity other than x itself.

Something that isn't G-fundamental will be G-derivative, and, similarly, something that isn't O-fundamental will be O-derivative." (p. 59)

25. Korman, Daniel Z. 2015. "Fundamental Quantification and the Language of the Ontology Room." *Noûs* no. 49:298-321.

Abstract: "Nihilism is the thesis that no composite objects exist. Some ontologists have advocated abandoning *nihilism* in favor of *deep nihilism*, the thesis that composites do not exist_O, where to exist_O is to be in the domain of the most fundamental quantifier. By shifting from an existential to an existentialO thesis, the deep nihilist seems to secure all the benefits of a composite-free ontology without running afoul of ordinary belief in the existence of composites. I argue that, while there are well known reasons for accepting nihilism, there appears to be no reason at all to accept deep nihilism. In particular, deep nihilism draws no support either from the usual arguments for nihilism or from considerations of parsimony."

26. Korman, Daniel Z., and Carmichael, Chad. 2018. "Composition." In *Oxford Handbooks Online*, 1-40. Oxford: Oxford University Press.

Abstract: "This article is intended as an introduction to the central questions about composition and a highly selective overview of various answers to those questions. §1 reviews some formal features of parthood that are important for understanding the nature of composition. §2 examines the special composition question: which pluralities of objects together compose something? §§3–4 examines the argument from vagueness for unrestricted composition. §5 addresses questions concerning the uniqueness of composition, coincident objects, hylomorphism, and the so-called grounding

problem. §6 concerns the question of which composites exist fundamentally."

27. Koslicki, Kathrin. 2015. "Questions of Ontology." In *Ontology After Carnap*, edited by Blatti, Stephan and Lapointe, Sandra, 220-241. Oxford: Oxford University Press.

"In what follows, I will argue that some of the most interesting and important debates which properly belong to the study of being, whether we call it "metaphysics" or "ontology", do not concern existential questions at all; rather, such disputes may in some cases focus on non-existential disagreements over questions of fundamentality.

Fundamentality can be construed in either a relative or an absolute way.

Relative fundamentality is a comparative notion and one that comes in degrees: it allows us to assess an entity's status as fundamental (non-derivative) or non-fundamental (derivative) relative to that of another. When we encounter a pair of entities, such that one is allegedly more or less fundamental or derivative than the other, we should not immediately assume that we are also dealing with a phenomenon that can be correctly described as absolutely fundamental. For example, one might take moral facts to be less fundamental than mental facts, without taking either realm to be fundamental absolutely. Thus, we should take care, in what follows, to separate questions of relative fundamentality from those which concern absolute fundamentality." (p. 223)

28. Kovacs, David Mark. 2020. "What is Priority Monism?" *Philosophical Studies* no. 178:2873-2893.

Abstract: "In a series papers, Jonathan Schaffer defended priority monism, the thesis that the cosmos is the only fundamental material object, on which all other objects depend. A primitive notion of dependence plays a crucial role in Schaffer's arguments for priority monism. The goal of this paper is to scrutinize this notion and also to shed new light on what is at stake in the debate. I present three familiar arguments for priority monism and point out that each relies

on a connecting principle that ties dependence to other metaphysical relations. I then argue for two desiderata: the relation between dependence and other metaphysical relations needs to be strong enough to establish that other metaphysical relations are relevant to the direction of dependence but not so strong as to leave no room for revisionary versions of priority monism. I propose a particular way of meeting these desiderata, according to which the target notion of dependence is graded rather than all-or-nothing. One upshot is that we should be less preoccupied with priority monism itself and should instead focus on specific aspects of a broader monistic worldview."

29. Kreines, James. 2018. "Fundamentality without Metaphysical Monism: Response to Critics of *Reason in the World*." *Bulletin of the Hegel Society of Great Britain* no. 39:138-156.

Abstract: "This article is a reply to comments by Franz Knappik and Robert Stern on my book, *Reason in the World: Hegel's Metaphysics and its Philosophical Appeal*. Issues addressed include the systematicity of Hegel's philosophy, the prioritizing of metaphysical over epistemological questions in his arguments, Hegel's response to Kant's Antinomy of Pure Reason, and my conclusion that there are senses in which Hegel's own position is both ambitiously metaphysical and also monist, but that the monism present there is epistemological, and the ambitious metaphysics is non-monist."

30. Kriegel, Uriah. 2015. "Existence, Fundamentality, and the Scope of Ontology." *Argumenta* no. 1:97-108.

Abstract: "A traditional conception of ontology takes existence to be its proprietary subject matter—ontology is the study of what exists (§ 1). Recently, Jonathan Schaffer has argued that ontology is better thought of rather as the study of what is basic or fundamental in reality (§ 2). My goal here is twofold. First, I want to argue that while Schaffer's characterization is quite plausible for some ontological questions, for others it is not (§ 3). More importantly, I want to offer a unified characterization of ontology that covers both existence and fundamentality questions (§§ 4-5)."

31. Kutach, Douglas. 2016. "Ontology: an Empirical Fundamentalist Approach." In *Metaphysics in Contemporary Physics*, edited by Wüthrich, Christian and Bigaj, Tomasz, 55-80. Leiden: Brill Rodopi.

Abstract: "I apply the philosophical program Empirical Fundamentalism to the topic of ontology. My advice is to represent reality using two related components: a model of fundamental reality and a model of what we can observe in principle called an 'empirical surrogate'.

The empirical surrogate need not be fundamental but can abstract away from fundamental reality while reducing to fundamental reality. Our ideal guess at ontology is a model of fundamental reality that (1) is a reduction base for the appropriate empirical surrogate, (2) posits no conspiratorial structure, and (3) has no redundant structure. I contrast my approach to alternatives that appeal to beables or primitive ontology."

32. Le Bihan, Baptiste. 2018. "Space Emergence in Contemporary Physics: Why We Do Not Need Fundamentality, Layers of Reality and Emergence." *Disputatio* no. 10:71-95.

Abstract: " 'Space does not exist fundamentally: it emerges from a more fundamental non-spatial structure.'

This intriguing claim appears in various research programs in contemporary physics. Philosophers of physics tend to believe that this claim entails either that spacetime does not exist, or that it is derivatively real. In this article, I introduce and defend a third metaphysical interpretation of the claim: reductionism about space. I argue that, as a result, there is no need to subscribe to fundamentality, layers of reality and emergence in order to analyse the constitution of space by non-spatial entities. It follows that space constitution, if borne out, does not provide empirical evidence in favour of a stratified, Aristotelian in spirit, metaphysics. The view will be described in relation to two particular research programs in contemporary physics: wave function realism and loop quantum gravity.

33. Leuenberger, Stephan. 2020. "The Fundamental: Ungrounded or All-Grounding?" *Philosophical Studies* no. 177:2647-2669.

Abstract: "Fundamentality plays a pivotal role in discussions of ontology, supervenience, and possibility, and other key topics in metaphysics. However, there are two different ways of characterising the fundamental: as that which is not grounded, and as that which is the ground of everything else. I show that whether these two characterisations pick out the same property turns on a principle—which I call "Dichotomy"—that is of independent interest in the theory of ground: that everything is either fully grounded or not even partially grounded. I then argue that Dichotomy fails: some facts have partial grounds that cannot be complemented to a full ground. Rejecting Dichotomy opens the door to recognising a bifurcation in our notion of fundamentality. I sketch some of the far-reaching metaphysical consequences this might have, with reference to big-picture views such as Humeanism.

Since Dichotomy is entailed by the standard account of partial ground, according to which partial grounds are subpluralities of full grounds, a non-standard account is needed. In a technical "Appendix", I show that truthmaker semantics furnishes such an account, and identify a semantic condition that corresponds to Dichotomy."

34. Lipman, Martin A. 2018. "Against Fundamentality-Based Metaphysics." *Noûs* no. 52:587-610.

Abstract: "Metaphysical views typically draw some distinction between reality and appearance, endorsing realism about some subject matters and antirealism about others.

There are different conceptions of how best to construe antirealist theories. A simple view has it that we are antirealists about a subject matter when we believe that this subject matter fails to obtain. This paper discusses an alternative view, which I will call the fundamentality-based conception of antirealism. We are antirealists in this sense when we think that the relevant matter fails to be constitutive of fundamental reality. The following discussion will not rely on any particular understanding of fundamental reality, covering conceptions based on grounding, naturalness and truthmaking, to name three salient ones. This paper argues that there are serious issues with fundamentality-based metaphysics. It will be argued that: (1) the fundamentality-based approach shapes and restricts our realist and antirealist views in unsatisfying ways, (2) that it is unable to handle the conflicting facts that lie across the envisaged 'layers' of the metaphysically structured world, and (3) that the methodological reasons for adopting the fundamentality-based approach fail. The paper will conclude with a diagnosis of the discussed issues, identifying a common source."

35. List, Christian. 2019. "Levels: Descriptive, Explanatory, and Ontological." *Noûs* no. 53:852-883.

Abstract: "Scientists and philosophers frequently speak about levels of description, levels of explanation, and ontological levels. In this paper, I propose a unified framework for modelling levels. I give a general definition of a *system of levels* and show that it can accommodate descriptive, explanatory, and ontological notions of levels. I further illustrate the usefulness of this framework by applying it to some salient philosophical questions: (1) Is there a linear hierarchy of levels, with a fundamental level at the bottom? And what does the answer to this question imply for physicalism, the thesis that

everything supervenes on the physical? (2) Are there emergent properties? (3) Are higher-level descriptions reducible to lower-level ones? (4) Can the relationship between normative and non-normative domains be viewed as one involving levels? Although I use the terminology of “levels”, the proposed framework can also represent “scales”, “domains”, or “subject matters”, where these are not linearly but only partially ordered by relations of supervenience or inclusion.”

36. Loew, Christian. 2018. "Fundamentality and Time's Arrow." *Philosophy of Science* no. 85:483-500.

Abstract: "The distribution of matter in our universe is strikingly time asymmetric. Most famously, the Second Law of Thermodynamics says that entropy tends to increase toward the future but not toward the past. But what explains this time-asymmetric distribution of matter? In this paper, I explore the idea that time itself has a direction by drawing from recent work on grounding and metaphysical fundamentality. I will argue that positing such a direction of time, in addition to time-asymmetric boundary conditions (such as the so-called “past hypothesis”), enables a better explanation of the thermodynamic asymmetry than is available otherwise."

37. Loss, Roberto. 2021. "There Are No Fundamental Facts." *Analysis* no. 81:32-39.

"Introduction: Many facts appear to depend on, and thus to be grounded in, other facts: the fact that it is true that the Earth's climate is warming is grounded in the fact that the Earth's climate is indeed warming; the fact that { Socrates } exists is grounded in the fact that Socrates exists; the fact that the flag of the European Union is blue is grounded in the fact that it is reflex-blue etc.

Are there fundamental facts – namely, facts that are not grounded in other facts? In this paper I will present an argument showing that certain assumptions concerning the notion of metaphysical grounding entail that no fact is fundamental. In §2 I will briefly present the argument. In §3 I will attempt to defend its main assumptions and compare it with a similar argument recently proposed by Mark Jago. In §4

I will consider two possible objections. I will then conclude that the argument presented in this paper seems to provide at least some minimal support to the idea that (possibly excluding a restricted set of 'special' facts) there are indeed no fundamental facts." (p. 32 a note omitted)

"In Section 2 I will formulate and explain the relevant thesis – Ontological Fundamentalism – together with several related theses that are involved in the popular line of reasoning for it. In Section 3 I will spell out the popular line of reasoning for Ontological Fundamentalism, and show that no one should be convinced by it. Finally, in Section 4, I will consider the independent question of whether Ontological Fundamentalism is true, and I will argue that it is not." (pp. 69-70)

39. Mathers, David. 2019. "Against Sider on Fundamentality." *Erkenntnis* no. 84:823-838.

Abstract: "Sider's *Writing the Book of the World* gives an account of fundamentality in terms of his central ideological notion 'structure'. Here I first argue against Sider's claim that to be fundamental to a degree is to be structural to a degree. I argue there's a pair of properties, P1 and P2, such that P1 is the more fundamental, but Sider is committed to counting P2 as the more structural. I then argue that if relative structure and relative fundamentality can come apart in this way, then Sider is likely also wrong to identify being absolutely structural with being absolutely fundamental."

Chalmers, David, Manley, David and Wasserman, Ryan, 290-319. New York: Oxford University Press.

"In what follows, I develop a meta-ontological theory based on the work of Martin Heidegger circa *Being and Time*.

(...)

Most contemporary analytic metaphysicians believe that the idea that different kinds of beings can enjoy different ways of being is metaphysically bankrupt, and probably even meaningless.⁽⁵⁾ They are mistaken. In section 3, I discuss the doctrine that there are ways of being, and show how we can understand this doctrine in terms of the meta-ontological framework defended by Theodore Sider. I then contrast Sider's views on existence with the Heideggerian position developed here. In section 4, I compare and contrast this Heideggerian meta-ontological position with quantifier variance, a view inspired by Carnap (1956) and recently defended by Eli Hirsch (2002a).

In section 5, I abstract away from the particulars of Heidegger's theory and provide a general account for understanding what is for things to exist in different ways.

I conclude with a brief discussion of how accepting that there are different ways of being might impact ontological disputes, such as the dispute between nominalists and realists over mathematical entities and the dispute between actualists and possibilists over mere possibilia.⁽⁶⁾"

(5) See Quine (1960: 242). Van Inwagen (2001) is a prominent neo-Quinean.

(6) In what follows, I do not distinguish between "existence" and "being" and "what there is."

On the view to be articulated, everything that there is exists or has being, but existing things can exist in different ways or enjoy different modes of being. Any distinction lost by this terminological convenience can be recaptured in the framework defended in section 5.

41. ———. 2013. "Degrees of Being." *Philosophers' Imprint* no. 13:1-18.

"The view I mean to defend is the view rejected in the following passage:

A thing cannot be more or less real than another which is also real. It has been said that reality does admit of degrees. But this can ... be traced to one of two confusions.... Sometimes reality has been confused with power ... [but] a thing which asserts more power is not more real than one that asserts less.

Sometimes ... the possibility of degrees of reality is based on the possibility of degrees of truth. ... If, for example, it should be truer to say that the universe was an organism than that it was an aggregate, then it is supposed that we may say that an organic universe is more real than an aggregate-universe.

But this is a mistake. [McTaggart 1927: 4–5]

I grant that it would be a mistake to confuse power with reality and a mistake to accept degrees of truth. So let's not make these mistakes.

On the view that I am considering, being is not to be conflated with some other feature that comes in degrees. Being itself comes in degrees: to be simpliciter is to be to some degree or other, just as to have mass simpliciter is to have some determinate amount of mass. And just as not everything has the

same amount of mass, not everything that exists to the same degree." (p. 3)

42. ———. 2017. "Normative Accounts of Fundamentality." *Philosophical Issues* no. 27:167-183.

"In McDaniel (forthcoming: chapter 6), I noted that in contemporary discussions of fundamentality, normative and evaluative proclamations abound.

I also discussed antecedents to these proclamations in the history of western philosophy. Given the prevalence of normative or evaluative locutions in discussions of fundamentality, it is worth considering normative or evaluative accounts. Even if these accounts ultimately fail, exploring them will help us get clearer on whether there is any sort of normativity governing fundamentality.

Moreover, as suggested earlier, a successful normative account of joint carving would radically reorient meta-ethics and metaphysics, and this fact itself provides a reason to give them serious thought." (p. 169)

43. McKenzie, Kerry. 2011. "Arguing Against Fundamentality." *Studies in History and Philosophy of Science Part A* no. 42:244-255.

Abstract: "This paper aims to open up discussion on the relationship between fundamentality and naturalism, and in particular on the question of whether fundamentality may be denied on naturalistic grounds. A historico-inductive argument for an anti-fundamentalist conclusion, prominent within the contemporary metaphysical literature, is examined; finding it wanting, an alternative 'internal' strategy is proposed. By

means of an example from the history of modern physics—namely S-matrix theory—it is demonstrated that (1) this strategy can generate similar (though not identical) anti-fundamentalist conclusions on more defensible naturalistic grounds, and (2) that fundamentality questions can be empirical questions. Some implications and limitations of the proposed approach are discussed."

44. ———. 2017. "Against Brute Fundamentalism." *Dialectica* no. 71:231-261.

Abstract: "In metaphysics, the fundamental is standardly equated with that which has no explanation – with that which is, in other words, 'brute'. But this doctrine of brutalism is in tension with physicists' ambitions to not only describe but also explain why the fundamental is the way that it is. The tension would ease were science taken to be incapable of furnishing the sort of explanations that brutalists are concerned with, given that these are understood to be of a distinctively 'metaphysical sort'. But to assume this is to assume a sharp demarcation between physics and metaphysics that surely cannot be taken for granted. This paper sets out to examine the standing of brutalism from the perspective of contemporary fundamental physics, together with theories of explanation drawn both from the philosophy of science and metaphysics. Focusing on what fundamental kinds the world instantiates and how physicists go about determining them, I argue that a partial explanation, in Hempel's sense, may be given of this fundamental feature. Moreover, since this partial explanation issues, at least in part, from stipulations as to the essential nature of the kinds involved, I claim that it has as much right to be regarded as a metaphysical explanation as do grounding explanations. As such, my conclusion will be that the doctrine of brutalism can no longer be regarded as tenable: at least modulo certain plausible essentialist assumptions, it is no longer the case that no explanation can be given of the fundamental."

45. ———. 2017. "Relativities of Fundamentality." *Studies in History and Philosophy of Science Part B: Studies in History and Philosophy of Modern Physics* no. 59:89-99.

Abstract: "S-dualities have been held to have radical implications for our metaphysics of fundamentality. In particular, it has been claimed that they make the fundamentality status of a physical object theory-relative in an important new way. But What physicists have had to say on the issue has not been clear or consistent, and in particular seems to be ambiguous between whether S-dualities demand an anti-realist interpretation of fundamentality talk or merely a revised realism. This paper is an attempt to bring some clarity to the matter. After showing that even antecedently familiar fundamentality claims are true only relative to a raft of metaphysical, physical, and mathematical assumptions, I argue that the relativity of fundamentality inherent in S-duality nevertheless represents something new, and that part of the reason for this is that it has both realist and anti-realist implications for fundamentality talk. I close by discussing the broader significance that S-dualities have for structuralist metaphysics and for fundamentality metaphysics more generally."

46. ———. 2019. "Fundamentality." In *The Routledge Handbook of Emergence*, edited by Gibb, Sophie, Hendry, Robin and Lancaster, Tom, 54-64. New York: Routledge.

"The concept of metaphysical emergence is intimately tied up with our concept of fundamentality.

(...)

Fortunately, however, by now there exists an extensive literature on how to conceptualize fundamentality.

For if anything characterizes the last decade in metaphysics, it is surely the explosion of interest metaphysicians have shown in precisely this question. Although the reasons for this foregrounding of fundamentality issues are not easy to determine, in the last few years a number of philosophers in the a priori tradition have gone as far as to claim that metaphysics just is the study of the fundamental and its relation to the non-fundamental – some even more restrictively that it is that of the fundamental alone.(1)

(...)

This brief chapter will have something to say about all of these questions, and the labour will be divided as follows. In Section 2, we will introduce some of the idioms pertaining to ontological priority that are intended to help us get a grip on the notion of fundamentality. In Section 3, we will discuss whether priority ought to be conceptualized in terms of some kind of determination relation or rather in a form ontological dependence – a matter over which there seems to be a surprising amount of confusion in the literature. In Section 4, we will consider some issues pertaining to the level of ‘grain’ at which relations of priority ought to be conceptualized. In Section 5, we will consider the issue of whether we should believe that anything fundamental exists at all." (pp. 54-55)

Sider, Theodore (2011). *Writing the Book of the World*. Oxford: Oxford University Press.

47. ——. 2022. *Fundamentality and Grounding*. Cambridge: Cambridge University Press.

Abstract: "A suite of questions concerning fundamentality lies at the heart of contemporary metaphysics. The relation of

grounding, thought to connect the more to the less fundamental, sits at the heart of those

debates in turn. Since most contemporary metaphysicians embrace the doctrine of physicalism and thus hold that reality is fundamentally physical, a natural question is how physics can inform the current debates over fundamentality and grounding. This Element introduces the reader to the concept of grounding and some of the key issues that animate contemporary debates around it, such as the question of whether grounding is 'unified' or 'plural' and whether there exists a fundamental level of reality. It moves on to show how resources from physics can help point the way towards their answers - thus furthering the case for a naturalistic approach to even the most fundamental of questions in metaphysics."

48. Mehta, Neil. 2017. "Can Grounding Characterize Fundamentality?" *Analysis* no. 77:74-79.

Abstract: "It can seem incoherent to fully characterize fundamentality in terms of grounding, given that the fundamental is precisely that which cannot be fully characterized in terms of anything else. I argue that there is no such incoherence."

49. Miller, Elizabeth. 2014. "Schaffer on the Action of the Whole." *Proceedings of the Aristotelian Society* no. 114:365-370.

Abstract: "I argue that Schaffer's recent defence of Spinozan Monism—the thesis that the cosmos is the only substance, or the only fundamental and integrated thing—fails to establish that the universe is uniquely fundamental. In addition, Schaffer's own defence of his thesis offers the pluralist about fundamentality a model for responding to Schaffer's criticism of pluralism."

50. ——. 2020. "Two Notions of Holism." *Synthese* no. 197:4187-4206.

Abstract: "A simple argument proposes a direct link between realism about quantum mechanics and one kind of metaphysical holism: if elementary quantum theory is at least approximately true, then there are entangled systems with

intrinsic whole states for which the intrinsic properties and spatiotemporal arrangements of salient subsystem parts do not suffice. Initially, the proposal is compelling: we can find variations on such reasoning throughout influential discussions of entanglement. Upon further consideration, though, this simple argument proves a bit too simple. To get such metaphysically robust consequences out, we need to put more than minimal realism in.

This paper offers a diagnosis: our simple argument seems so compelling thanks to an equivocation. The predictions of textbook quantum theory already resonate with familiar holistic slogans; for realists, then, any underlying reality, conforming to such predictions, also counts as holistic in some sense or other, if only by association.

Such associated holism, though, does not establish the sort of specific, robust supervenience failure claimed by our simple argument. While it may be natural to slide to this stronger conclusion, facilitating the slide is not minimal realism per se but an additional explanatory assumption about how and why reality behaves in accordance with our theory: roughly, quantum theory accurately captures patterns in the features and behaviors of physical reality because some underlying metaphysical structure constrains reality to exhibit these patterns. Along with the diagnosis comes a recommendation: we can and should understand one traditional disagreement about the metaphysics of entanglement as another manifestation of a familiar and more general conflict between reductive and non-reductive conceptions of metaphysical theorizing.

Such reframing makes clearer what resources reductionists have for resisting the simple argument's challenge from quantum holism. It also has an important moral for their opponents. Traditional focus on whole-part supervenience failure distracts from a root disagreement about metaphysical structure and its role in our theorizing.

Non-reductionists fond of our simple argument would be better off tackling this root directly."

51. Morganti, Matteo. 2020. "Fundamentality in Metaphysics and the Philosophy of Physics. Part II: Physics." *Philosophy Compass* no. 15:1-10.

First online 29 August 2020.

Abstract: "This is the second part of an overview article on fundamentality in metaphysics and the philosophy of physics.

Here, the notion of fundamentality is looked at from the viewpoint of the philosophical analysis of physics and physical theories. The questions are considered (1) whether physics can be regarded as fundamental with respect to other sciences, and in what sense; (2) what the label 'fundamental physics' should exactly be taken to mean; (3) on what grounds a particular physical theory should be considered fundamental; (4) what should be regarded as fundamental according to particular theories of physics; and (5) what indications come from contemporary physics concerning the fundamental structure of reality."

52. ———. 2020. "Fundamentality in Metaphysics and the Philosophy of Physics. Part I: Metaphysics." *Philosophy Compass* no. 15:1-14.

First online 15 July 2020.

Abstract: "This is the first part of a two-tier overview article on fundamentality in metaphysics and the philosophy of physics.

It provides an introduction to the notion of fundamentality in metaphysics, as well as to several related concepts. The key issues in the contemporary debate on the topic are summarized, making systematic reference to the most relevant literature.

In particular, various ways in which the fundamental entities and the fundamental structure of reality may be conceived are illustrated and discussed. A final brief section looks at the methodological issue of naturalism, paving the way for the survey of fundamentality in the philosophy of physics which is carried out in the second part."

53. ———. 2020. "Ontic Structuralism and Fundamentality." In *The Foundation of Reality: Fundamentality, Space, and Time*, edited by Glick, David, Darby, George and Marmodoro, Anna, 69-86. Oxford: Oxford University Press.

"Ontic structural realism (OSR) is the view that (1) in spite of the discontinuities that characterise the historical development of science we can be realist about something, i.e., the concrete counterpart of certain theoretical structures that remain preserved across theory-change; and (2) such structure is all there is in the actual world, at least at the fundamental level." (p. 69)

"The structure of the chapter is as follows: in Section 3.2 I will concisely introduce the key notions employed in extant discussions of metaphysical fundamentality that will play a role here, and in Section 3.3 I will do the same with OSR, identifying with more precision the two fundamentality-related questions that arise in connection to it. In Section 3.4 I will present and discuss the various ontologies that can be and, partly, have been associated with OSR—with special attention to the quantum domain and the nature of space-time—bearing in mind the two different questions of fundamentality. In Section 3.5 I will critically assess these ontologies based on the indications coming from both a priori metaphysical reflection and current science. In particular, I will point out potential difficulties for structuralism as a metaphysical thesis. In Section 3.6 I will conclude by briefly presenting an alternative view, which arguably preserves the essential insights of structuralism while at the same time offering a different take on fundamentality." (p 70, a note omitted)

54. Ney, Alyssa. 2020. "Are the Questions of Metaphysics More Fundamental Than Those of Science?" *Philosophy and Phenomenological Research* no. 100:695-715.

Abstract: "When pursued naturalistically, metaphysics may seem forced to navigate a narrow path. So that it may be a worthwhile enterprise, it must have claim to discovery of a distinctive set of objective truths. Yet it must also avoid potential competition or conflict with the results of scientific theories. In response to this problem, some naturalistic metaphysicians have argued that properly understood, metaphysics is aimed at a set of truths distinct from those of science. Metaphysicians investigate a realm of truths more fundamental than those of even fundamental science. This paper examines what is required both in science and metaphysics for a theory to count as a fundamental theory. Several criteria are presented which suggest that metaphysics does not investigate a realm more fundamental than that of science."

55. O'Leary-Hawthorne, John, and Cortens, Andrew. 1995. "Towards Ontological Nihilism." *Philosophical Studies* no. 79:143-165.

"In this paper, we wish to motivate a radical cluster of metaphysical pictures that have tempted philosophers from a variety of traditions. These pictures share one important theme - they refuse to accord countable entities any place in the fundamental scheme of things. Put another way, they all suggest that the concept of an object has no place in a perspicuous characterization of reality. Such pictures suffer from a number of fairly obvious *prima facie* difficulties. They seem to fly in the face of common sense. They seem to suggest that just about everything we say is false. They seem to gesture at a noumenal reality that human language is unable to describe. And so on. Our aim is to meet such difficulties head on and, by doing so, vindicate this sort of radical picture as one that deserves to be taken seriously.

This paper is organised into four sections. In section one, we examine various forms of this radical metaphysic and discuss their historical precedents, both in this century and in previous ones. In section two, we consider how the most radical of these metaphysical pictures - what we call 'ontological nihilism' - might be fleshed out into a rich, articulate, theory. In section

three, we consider what the proponent of such a picture should say concerning the truth or falsity of ordinary discourse. In section four, we consider what the motivations for this apparently perverse metaphysic might be." (p. 143)

56. Oberle, Thomas. 2022. "Metaphysical Foundationalism: Consensus and Controversy." *American Philosophical Quarterly* no. 59:97-110.

Abstract: "There has been an explosion of interest in the metaphysics of fundamentality in recent decades. The consensus view, called metaphysical foundationalism, maintains that there is something absolutely fundamental in reality upon which everything else depends. However, a number of thinkers have challenged the arguments in favor of foundationalism and have proposed competing non-foundationalist ontologies. This paper provides a systematic and critical introduction to metaphysical foundationalism

in the current literature and argues that its relation to ontological dependence and substance should be qualified in important ways."

57. Paolini Paoletti, Michele. 2021. "A Brighter Shade of Categoricalism." *Axiomathes*:1-30.

First online 10 July 2021.

Abstract: "Categoricalism is a doctrine about properties according to which the dispositional aspects of properties are not essential to them. In opposition to categoricalism, dispositionalism holds that the dispositional aspects of properties are essential to them. In this article, I shall construct a new version of categoricalism that should be favoured over the other existing versions: Semi-Necessitarian Categoricalism. In Section 2 I shall elaborate on the distinction between categoricalism and dispositionalism and single out different 'shades' of both doctrines. I shall also illustrate the main advantages and problems that characterize categoricalism. In Section 3 I shall introduce Necessitarian Categoricalism – as it has been recently developed by Alexander Kelly and Deborah Smith, among others. Even if Necessitarian Categoricalism

solves the aforementioned problems of categoricism, it also loses its main advantages. In Section 4 I shall refine this version of Necessitarian Categoricism, thus developing Semi-Necessitarian Categoricism. In Section 5 I shall face some objections. Finally, in Section 6, I shall briefly draw some conclusions and compare my account with other accounts."

"In this paper, I argue that a popular way of modeling the fundamental constituents, structure and composition of the world, the *spatiotemporalist* approach to the world, has taken a wrong turn. Spatiotemporalist approaches to fundamental structure take the fundamental nature of the world to be spatiotemporal: they take the category of *spatiotemporal* to be fundamental. These approaches tend to start with questions about whether and how spatiotemporal parts and spatiotemporal composition interact, and try to build the entire physical world using spatiotemporal mereology.

Supersubstantivalism, the view that everything physical reduces to spatiotemporal regions, is spatiotemporalism taken to an extreme." (p. 222)

60. ———. 2013. "Categorical Priority and Categorical Collapse." *Proceedings of the Aristotelian Society* no. Supplementary Volume 87:89-113.

Abstract: "I explore some of the ways that assumptions about the nature of substance shape metaphysical debates about the structure of Reality. Assumptions about the priority of substance play a role in an argument for monism, are embedded in certain pluralist metaphysical treatments of laws of nature, and are central to discussions of substantivalism and relationalism. I will then argue that we should reject such assumptions and collapse the categorical distinction between substance and property."

"A central project of contemporary metaphysics is to understand the nature of the world as a whole. The traditional way to approach this project is to develop an account of the metaphysically basic kinds, that is, of the *fundamental ontological categories* of the world. But in addition to giving an account of what the fundamental ontological categories are, we need to give an account of how they and their members ground the overall structure of the world." (p. 89)

61. Pearson, Olley. 2018. "Emergence, Dependence, and Fundamentality." *Erkenntnis* no. 83:391-402.

Abstract: "In a recent paper Barnes proposes to characterize ontological emergence by identifying the emergent entities with those entities which are both fundamental and dependent. Barnes offers characterizations of the notions of fundamentality and dependence, but is cautious about committing to the specifics of these notions. This paper argues that Barnes's characterization of emergence is problematic in several ways. Firstly, emergence is a relation, and merely delimiting relata of this relation tells us little about it. Secondly, the group of entities delimited as dependent and fundamental do not appear to be the group of emergent entities. Rather, some entities appear to be dependent and fundamental and not emergent,

whilst other entities appear to be emergent and not dependent and fundamental. The moral drawn is that in order to provide a characterization of emergence one must go beyond what Barnes says explicitly. It is also shown that a potentially fruitful way of doing this would be to further specify the notion of dependence at issue revealing it to be asymmetric and perhaps merely nomological."

62. Pickel, Bryan. 2017. "Naming, Saying, and Structure." *Noûs* no. 51:594-616.

Abstract: "It is commonplace for philosophers to distinguish mere truths from truths that perspicuously represent the world's structure. According to a popular view, the perspicuous truths are supposed to be metaphysically revelatory and to play an important role in the accounts of law-hood, confirmation, and linguistic interpretation.

Yet, there is no consensus about how to characterize this distinction. I examine strategies developed by Lewis and by Sider in his *Writing the Book of the World* which purport to explain this distinction in terms of vocabulary: the truths that represent the world perspicuously have better, joint-carving vocabulary.

I argue that the distinction between a perspicuous and mere truth concerns both the vocabulary of the sentence and its grammar. I then show that the collective motivations for distinguishing perspicuous from mere truths do not allow Lewis and Sider to properly impose constraints on grammar."

63. Plate, Jan. 2016. "Logically Simple Properties and Relations." *Philosophers' Imprint* no. 16:1-40.

"Introduction: Metaphysicians generally agree that not all predicates are created equal. In the *Parmenides*, young Socrates affirms that there are Forms of the beautiful, the just, and the good, but denies that there is a Form of hair or of mud.

In classical Indian metaphysics, Udayana's followers distinguished 'real' universals (*jāti*) from those that are merely 'constructed' (*upādhi*).⁽¹⁾ And in recent Western philosophy, Goodman (1955) has distinguished projectible from non-projectible predicates, Armstrong (1978) predicates that correspond to universals from those that don't, Shoemaker (1980) genuine from 'mere Cambridge' properties, and David Lewis (1983; 1986) perfectly natural attributes from those that are less than perfectly natural.⁽²⁾ It is easy to notice that in each of these distinctions, one of the two respective classes of predicates (or universals, etc.) is in some way privileged. The distinction that this paper is concerned with also fits into this roster. I shall try to give an account of it, and offer the beginnings of an argument for the view that it would make for a viable substitute for Lewis's distinction between the perfectly and the less-than-perfectly natural attributes."

(1) 1. Bartley (2001, 543).

(2) For the sake of brevity, the term 'attribute' is here (following Carnap [1942]) used interchangeably with 'property or relation', practically regardless of context. So I shall speak of 'Lewis's concept of a perfectly natural attribute', irrespective of the fact that (i) Lewis himself tends not to use the word 'attribute', and (ii) the conception of attributes operative in this paper is markedly different from Lewis's.

Annotated bibliography on Metaphysical fundamentality (R - Z)

Bibliography

1. Raven, Michael J. 2009. *Ontology, From a Fundamentalist Point of View*.

PhD thesis, New York University, 2009, available at Academia.edu.

Abstract: "Ontology's attempt to uncover what is real can seem alternately profound, obscure, and empty. My aim is to clarify this project. I present and argue against the orthodox view that what is real is what there is. My proposed alternative is that what is real is what is fundamental. I develop this old idea in new ways, showing how it can resist standard difficulties, reshape some live ontological debates, and guide us towards a clearer understanding of whether ontology is as profound as it seems or as obscure or empty as skeptics allege."

2. ———. 2015. "Fundamentality without Foundations." *Philosophy and Phenomenological Research* no. 93:607-626.

Abstract: "A commonly held view is that a central aim of metaphysics is to give a fundamental account of reality which refers only to the fundamental entities. But a puzzle arises. It is at least a working hypothesis for those pursuing the aim that, first, there must be fundamental entities. But, second, it also seems possible that the world has no foundation, with each entity depending on others. These two claims are inconsistent with the widely held third claim that the fundamental just is the

foundational. It is tempting to resolve the puzzle by rejecting the first or second claim, perhaps because it is obscure how the third claim might plausibly be challenged. But I develop a new analysis of fundamentality which challenges the third claim by allowing for an entity to be fundamental without being foundational. The analysis, roughly, is that an entity is fundamental (or ineliminable, as I call it) just in case not all facts about it are grounded in facts about other entities. The possibility of fundamentality without foundations not only provides for a novel resolution to the puzzle, but has applications to some live debates: for example, it undermines Jonathan Schaffer's modal argument for priority monism."

3. Rayo, Agustin. 2015. "Essence Without Fundamentality." *Theoria: An International Journal for Theory, History and Foundations of Science* no. 30:349-363.

"In *Modality and Explanatory Reasoning*, Boris Kment argues that a single notion of essence can be used to play two different theoretical roles. He thinks there is an important connection between essence and metaphysical necessity, on the one hand, and between essence and metaphysical explanation, on the other.

It seems to me that there is a price to be paid for using a single notion of essence to play both of these roles. For the project of giving metaphysical explanations requires a notion of essence that distinguishes between truths that are more or less "fundamental", in a metaphysical sense. So the result of using that same notion of essence in an account of metaphysical necessity is that one ends up with a conception of metaphysical necessity that is tied up with distinctions of metaphysical fundamentality.

The main objective of this paper is to develop a notion of essence which steers clear of the notion of metaphysical fundamentality, and to suggest that it is well-suited to elucidate the notion of metaphysical necessity. I will also argue that the relevant notion of essence can be used to resolve a tension implicit in a famous argument of Kit Fine's for the conclusion

that the notion of essence cannot be adequately captured by the notion of metaphysical necessity."

4. Schaffer, Jonathan. 2003. "Is There a Fundamental Level?" *Noûs* no. 37:498-517.

"Talk about "the fundamental level of reality" pervades contemporary metaphysics. The fundamentalist starts with (a) a hierarchical picture of nature as stratified into *levels*, adds (b) an assumption that there is a bottom level which is *fundamental*, and winds up, often enough, with (c) an ontological attitude according to which the entities of the fundamental level are *primarily* real, while any remaining contingent entities are at best derivative, if real at all.

(...)

I find the hierarchical picture of nature in (a) plausible as reflected in the structure and discoveries of the sciences, and consider the ontological primacy of the fundamental entities in (c) a natural (though not inevitable) conclusion.

In any case I will not discuss these issues here. Rather I will discuss the assumption (b) that there exists a fundamental level; first because it is almost entirely neglected; second because, as I will argue, there is no evidence in its favor; and third because the hierarchical picture minus (b) yields a far more palatable metaphysic in which, *contra* (c), all entities are equally real.

So why believe that there is a fundamental level? Why not an infinite descending hierarchy of levels?

In discussing the evidence for fundamentality I will, on route, clarify the various senses of "levels", assess the epistemic standing of various fundamentalist doctrines such as physicalism, and present a rival metaphysic of infinite descent which is at home in the macroworld." (pp. 498-499)

5. ———. 2004. "Two Conceptions of Sparse Properties." *Pacific Philosophical Quarterly* no. 85:92-102.

Abstract: "Are the sparse properties drawn from all the levels of nature, or only the fundamental level? I discuss the notion of sparse property found in Armstrong and Lewis, show that there are tensions in the roles they have assigned the sparse properties, and argue that the sparse properties should be drawn from all the levels of nature. The issue has direct bearing on reductionism. If the sparse properties are drawn from all the levels of nature, then macro-scientific properties are just as primary as microscientific properties, and do not need to be reduced to them."

6. ———. 2008. "Truth and Fundamentality: On Merricks's Truth and Ontology." *Philosophical Books* no. 49:302-316.

Abstract: "*Truth and Ontology* is a lively book, brimming with arguments, and drawing the reader towards the radical conclusion that what is true does not depend on what there is. If there is a central line of argument, it is that the best account of truthmaking requires truths to be about their truthmakers, but negative existentials, modals, and claims about the past and future are not about what is, but rather about *what is not*, *what might be*, and *what was and will be*.

In §1 I will discuss this central line of argument, and invite Merricks to clarify his notion of aboutness. In §2 I will try to (re-)motivate truthmaking, and sketch a positive account that takes dependence seriously. Whether this account succeeds or fails, Merricks deserves credit for pushing us all to reconsider truthmaking and its motivations."

8. ———. 2010. "The Least Discerning and Most Promiscuous Truthmaker." *Philosophical Quarterly* no. 60:307-324.

Abstract: "I argue that the one and only truthmaker is the world. This view can be seen as arising from (i) the view that truthmaking is a relation of grounding holding between true propositions and fundamental entities, together with (ii) the view that the world is the one and only fundamental entity. I argue that this view provides an elegant and economical account of the truthmakers, while solving the problem of negative existentials, in a way that proves ontologically revealing."

9. ———. 2013. "The Action of the Whole." *Aristotelian Society Supplementary Volume* no. 87:67-87.

"I discuss an argument for the monistic idea that the cosmos is the one and only fundamental thing, drawing on the idea that the cosmos is the one and only thing that evolves by the fundamental laws."

(...)

"What are the fundamental blocks from which reality is built? The pluralist views the cosmos as pieced together from many tiny parts, while the monist holds that the entire scene is painted onto one vast unbroken whole. I provide an argument for monism—*the argument from nomic integrity*—which draws on the idea that the fundamental laws of nature govern the temporal evolution of the cosmos as a whole, applying at most approximately and derivatively to any merely partial subsystem:

(1) *Leibnizian Substance*: Something is a substance if and only if it evolves by the fundamental laws.

(2) *Russellian Laws*: The cosmos is the one and only thing that evolves by the fundamental laws.

(3) *Spinozan Monism*: The cosmos is the one and only substance (from 1 and 2).

To fix another image: the cosmos ticks like a single clockwork. To cast a slogan: reality acts as one." (p. 67)

10. ———. 2013. "Metaphysical Semantics Meets Multiple Realizability." *Analysis* no. 73:736-751.

"Sider's *Writing the Book of the World* is an outstanding work. In an earlier review (Schaffer forthcoming) I called it 'masterful' and 'required reading', while worrying about Sider's notion(s) of structure. Here I offer the further praise of further discussion, centred on a separate worry concerning whether Sider's metaphysical semantics can handle multiple realizability." (p. 736)

(...)

"Overview: In Section 1 I describe metaphysical semantics, and identify three conditions of adequacy. In Section 2 I propose three ways for metaphysical semantics to treat multiple realizability, and in Sections 3–5 I argue that none of these three ways can satisfy more than one adequacy condition. I conclude in Section 6 that the underlying problem lies with Sider's eliminativist attitude to the non-fundamental." (p. 737)

11. Schipper, Arthur. 2019. "Fundamental Truthmakers and Non-fundamental Truths." *Synthese* no. 198:3073-3098.

Abstract: "Recently, philosophers have tried to develop a version of truthmaker theory which ties the truthmaking relation (t-rel) closely to the notion of fundamentality. In fact, some of these *truthmaker-fundamentalists* (tf-ists), as I call them, assume that the notion of fundamentality is intelligible in part by citing, as central examples of fundamentals, truthmakers, which they understand necessarily as constituents of fundamental reality.

The aim of this paper is first to bring some order and clarity to this discussion, sketching how far tf is compatible with orthodox truthmaking, and then critically to evaluate the limits of tf. It will be argued that truthmaker theory cannot directly help with articulating the nature of fundamental reality and that t-rel does not necessarily relate truths with anything more fundamental, unless what is fundamental is what the

truthbearers in question are about. I shall argue that *tf* faces a rather thorny dilemma and some general problems. I shall present two exhaustive types of fundamentalism on which a version of *tf* can be based: deflationary and inflationary. It will be argued that each version of *tf* runs into significant troubles accounting for all truth, specifically ordinary truths and metaphysical truths about the relations between ordinary facts and fundamental facts. I shall not attempt to solve these problems, but rather, at the end, diagnose the issues with *tf* as lying in the difficulties with reconciling the manifest image with the scientific and metaphysical images of reality."

12. Schnieder, Benjamin. 2020. "Atomism and Fundamentality." *Erkenntnis* no. 85:551-574.

Abstract: "The paper focusses on two claims about metaphysical structure: Atomism and Fundamentalism.

The first of these claims says that there are mereological atoms, i.e. minimal elements in the mereological structure of reality. The second says that there are fundamental truths, i.e. minimal elements in the grounding structure of reality.

A philosopher who defended both of these claims was Bernard Bolzano; the present paper is an exploration of his views on the matter."

13. Schrenk, Markus. 2009. "Can Physics ever be Complete if there is no Fundamental Level in Nature?" *Dialectica* no. 63:205-208.

Abstract: "In their recent book *Every Thing Must Go*, Ladyman and Ross (2007) claim:

1. Physics is analytically complete since it is the only science that cannot be left incomplete (cf. p. 283).
2. There might not be an ontologically fundamental level (cf. p. 178).
3. We should not admit anything into our ontology unless it has explanatory and predictive utility (cf. p. 179).

In this discussion note I aim to show that the ontological commitment in (3) implies that the completeness of no science can be achieved where no fundamental level exists. Therefore, if claim (1) requires a science to actually be complete in order to be considered as physics, (1), and if Ladyman and Ross's "tentative metaphysical hypothesis [. . .] that there is no fundamental level" (p. 178) is true, (2), then there simply is no physics. Ladyman and Ross can, however, avoid this unwanted result if they merely require physics to ever strive for completeness rather than to already be complete."

14. Shumener, Erica. 2017. "The Metaphysics of Identity: Is Identity Fundamental?" *Philosophy Compass* no. 12:1-13.

"In this paper, I will first say more about what the question 'Are identity and distinctness facts fundamental?' means. Next, I will explore attempts to treat identity and distinctness facts as non-fundamental. Finally, I will examine two approaches that treat (at least some) identity and distinctness facts as fundamental.

Metaphysicians have different conceptions of fundamentality. As a result, discussion of the fundamentality status of identity and distinctness facts shifts depending on the characterization of fundamentality in play. In the first part of this paper (section 3), we will consider the question of whether identity and distinctness facts are fundamental in light of grounding-based characterizations of fundamentality. In section 4, we will also consider how a different account of fundamentality, one that appeals to the notion of 'joint-carvingness', bears on this question" (p.1, notes omitted)

15. ——. 2019. "Building and Surveying: Relative Fundamentality in Karen Bennett's Making Things Up." *Analysis* no. 79:303-314.

"One of the most important contributions of *Making Things Up* is Bennett's discussion of relative fundamentality, of one entity's being more fundamental than, less fundamental than, or equifundamental to another.(2) Bennett understands relative fundamentality in terms of building relations. Before delving into Bennett's account of relative fundamentality, we can first divide positions on relative fundamentality into two camps:

Builders: Facts about relative fundamentality are fixed solely by facts involving building relations and their patterns of instantiation.

Surveyors: Facts about relative fundamentality are not fixed solely by facts about building relations and their patterns of instantiation.

Bennett is a builder. Surveyors come in different varieties. Some surveyors understand relative fundamentality without an appeal to building relations.

While David Lewis did not provide a full account of relative fundamentality, we should probably think of him as this kind of surveyor." (pp. 303-304, a note omitted)

(2) I use 'entity' loosely to range over members of different ontological categories (objects, facts, properties, events and so on).

16. Sider, Theodore. 2008. "Monism and Statespace Structure." *Royal Institute of Philosophy Supplement* no. 62:129-150.

"An intriguing newcomer to the contemporary scene is the ancient doctrine of monism, the claim that "reality is one". I will argue that, contrary to initial appearances, monism can be made materially adequate. But the monist's reconstruction of common sense and science will reveal some troublesome commitments." (p. 130, a note omitted)

17. ———. 2011. *Writing the Book of the World*. Oxford: Oxford University Press.

"The central theme of this book is: realism about structure. The world has a distinguished structure, a privileged description.

For a representation to be fully successful, truth is not enough; the representation must also use the right concepts, so that its conceptual structure matches reality's structure. There is an objectively correct way to "write the book of the world".

Realism about predicate structure is fairly widely accepted. Many—especially those influenced by David Lewis—think that some predicates (like 'green') do a better job than others (like 'grue') at marking objective similarities, carving nature at the joints. But this realism should be extended, beyond predicates, to expressions of other grammatical categories, including logical expressions. Let "there schmexists an F" mean that the property of being an F is expressed by some predicate in some sentence of this book. 'Schmexists' does not carve at the joints; it is to the quantifier 'there exists' as 'grue' is to 'green'. Likewise, the question of joint-carving can be raised for predicate modifiers, sentential connectives, and expressions of other grammatical categories. (Structure is a generalization and extension of Lewisian naturalness.)

I connect structure to fundamentality. The joint-carving notions are the fundamental notions; a fact is fundamental when it is stated in joint-carving terms. A central task of metaphysics has always been to discern the ultimate or fundamental reality underlying the appearances. I think of this task as the investigation of reality's structure." (*Preface*, p. VII)

18. ———. 2013. "Précis of Writing the Book of the World." *Philosophy and Phenomenological Research* no. 87:706-708.

"My central thesis is that there *is* a ready-made world. Some concepts are objectively privileged: the "fundamental", or "joint-carving", or "structural" ones. A complete description of reality using these concepts—the "book of the world"—gives reality's fundamental structure. A description using cooked-up concepts can be true, and even equivalent (in a sense) to the book of the world, but is nevertheless representationally deficient since its structure does not match the world's structure.

Many traditional questions of metaphysics are about the nature of "ultimate reality". Is reality ultimately just physical, or is

there also a mental aspect? In my terms, this is the question of whether the book of the world mentions mentality—of whether mental concepts are structural." (p. 706)

19. ———. 2013. "Replies to Dorr, Fine, and Hirsch." *Philosophy and Phenomenological Research* no. 87:733-754.

"Reply to Kit Fine

Kit Fine's rich paper raises important issues about the metaphysics of fundamentality. Fine and I agree that fundamentality-theoretic concepts are not to be defined modally, that they are not to be understood in terms of ordinary meaning, and that some such concepts are to be adopted as conceptually primitive. But we differ over which such concepts to adopt.

Fine's (2001; 2012) primitive concepts are those of ground and reality.

One proposition grounds another if and only if the first accounts for the second in a certain metaphysically distinctive way; one proposition holds in reality if and only if it is part of "reality's intrinsic structure" (2001, section 8).

My primitive concept, on the other hand, is that of joint-carving.

Ground and reality apply at the level of entire propositions (or sentences, or facts), whereas joint-carving applies at the level of parts of propositions (or sentences, or facts). Mass, existential quantification, negation, and the like, rather than entire propositions, are candidates for joint-carving.

Thus my account is more atomistic than Fine's: the locus of fundamentality for me is sub-propositional whereas for Fine it is propositional." (pp. 738-739)

"Reply to Trenton Merricks

Trenton Merricks's illuminating paper begins by criticizing the first sentence of my book: 'Metaphysics, at bottom, is about the fundamental structure of reality'. Metaphysics isn't about any single thing 'at bottom', Merricks says, and anyway, plenty of it isn't about structure. He's largely right; I got a little carried away with my rhetoric. But I do think that fundamentality is more central to metaphysics than Merricks allows.

Questions about which concepts are fundamental are indeed just one part of metaphysics. But there are also questions that use fundamental concepts, which I also meant to count as being 'about the fundamental structure of reality'. If quantifiers carve at the joints, for instance, then ontological questions are about the fundamental structure of reality (see, e.g. p. viii)." (p. 754, notes omitted)

(...)

"Reply to Jonathan Schaffer

In addition to characterizing fundamentality itself, a theory of fundamentality must also account for the *connection* between fundamental and nonfundamental.

The fundamental 'underlies' everything else, but in what sense exactly? According to Jonathan Schaffer's kind yet deeply challenging critique, my account of the connection – metaphysical semantics – cannot handle multiply realizable non-fundamental facts. This is an important criticism, and I'll discuss it in a moment, but first I want to resist Schaffer's description of my account as being 'radically eliminativist' and implying that the non-fundamental is 'mere talk'." (p. 760)

"In this paper, I will defend what Peter van Inwagen calls nihilism: composite entities (entities with proper parts) do not exist.⁽¹⁾ This formulation will need to be refined, and, at the very end of the paper, softened a little. But let us stick to the simple, strong version for now." (p. 237)

(...)

"Since I accept the existence of the particles, my denial of an object composed of them isn't absurd. Denying that *T* exists *in addition to a, b, and c* is no more absurd than denying that holes exist in addition to perforated things, or denying that smirks exist in addition to smirking faces. Similarly, denying the existence of persons, animals, plants, and the rest is not absurd if one accepts subatomic particles that are "arranged personwise" (to use van Inwagen's phrase), animal-wise, plant-wise, and so on." (p. 238)

(1) van Inwagen (1990). "Proper parts" of *x* are parts of *x* other than *x* itself (it is customary to count entities as being parts of themselves). By "composition" I have in mind only mereological composition, i.e. composition by parts, though I do discuss sets in the final section. Other nihilists include Dorr (2002) and Cameron (2010 b); see also Dorr (2005). See Dorr and Rosen (2002) for a defense—partly overlapping mine—of nihilism against objections. For stylistic reasons I often speak of existence, but as a good Quinean I intend this to be recast in terms of quantification.

Abstract: “Elizabeth Barnes and Mari Mikkola raise the important question of whether certain recent approaches to metaphysics exclude feminist metaphysics. My own approach (from my book *Writing the Book of the World*) does not, or so I argue.

I do define “substantive” questions in terms of fundamentality; and the concepts of feminist metaphysics (and social metaphysics generally) are nonfundamental. But my definition does not count a question as being nonsubstantive simply because it involves nonfundamental concepts. Questions about the causal structure of the world, including the causal structure of the social world, are generally substantive because their answers are not sensitive to any alternate, equally good conceptual choices we could have made. I also argue that such questions are substantive regardless of the ontology of social kinds.”

Abstract: "In this article, I seek to assess the extent to which Theism, the claim that there is a God, can provide a true fundamental explanation for the existence of certain entities within the layered structure of reality. More precisely, I assume the cogency of Swinburne's explanatory framework and seek to resituate it within a new philosophical context—that of the field of contemporary metaphysics—which will enable me to develop a true fundamental explanation for the existence of the non-fundamental entities that fill up the various levels of the layered structure of reality. And thus, given the truth of this type of explanation, we will have one more good reason to believe in the existence of God."

Abstract: "The distinction between qualitative and non-qualitative properties should be familiar from discussions of the principle of the identity of indiscernibles: two otherwise exactly similar individuals, Castor and Pollux, might share all their qualitative properties yet differ with respect to their non-qualitative properties—for while Castor has the property *being identical to Castor*, Pollux does not. But while this distinction is familiar, there has not been much critical attention devoted to spelling out its precise nature. I argue that the class of non-qualitative properties is broader than it is often taken to be. When properly construed, it will not only include properties such as *being identical to Castor*, which somehow make reference to particular individuals, it will also include more

general properties such as identity, composition, set membership, as well as various peculiarly ontological properties. Given that some of these more general properties help to explain objective similarity, we have reason to believe that there are fundamental non-qualitative properties."

25. Skiles, Alexander. 2009. "Trogon on Monism and Intrinsicity." *Australasian Journal of Philosophy* no. 87:149-154.

Abstract: "Kelly Trogon [2009] argues that priority monism—here, the view that only the world as a whole has fundamental properties—conflicts with the best extant accounts of intrinsicity. He then proposes an alternative account that is designed to be not only compatible with this view, but also independently plausible. But his account conflicts with priority monism as well, and incorrectly classifies various non-intrinsic properties."

"The goal of this chapter is to explore the prospects of the view I shall call *primitivism about intrinsicity*, and offer a limited defense. A key component of this limited defense consists simply in clarifying what it could be, exactly, for intrinsicity to be "primitive". As we shall see, at least some *prima facie* decisive objections to primitivism seem less convincing once this has been done.

Doing so is the task of section 1. In section 2, I then consider several arguments for primitivism about intrinsicity. And finally, in section 3, I consider several arguments against it." (p. 222)

27. Sorensen, Roy. 2011. "Bottomless Determination: How Yablo Can Get Proportionality from Gunk." *Analysis* no. 71:637-630.

Abstract: "Consider the beginningless sequence: ... being less than 0.01 grams, being less than 0.1 grams, being less than 1 gram, being less than 10 grams ... There is no super-determinate in this chain. Just as the possibility of bottomless constitution shows that there may be no fundamental layer of reality with *respect to objects*, the possibility of bottomless determination shows that there may be no fundamental level of reality with *respect to properties*. This possibility supports Stephen Yablo's proportionality principle that the cause of an event is the most specific property *that makes a difference*."

Chapter 6: *Fundamentality and levels of reality*, pp. 120-150.

"This chapter concerns the view that reality comes with a hierarchical structure of 'levels'. This view has a long history and it remains very popular.

(...)

To express this in terms of ontological dependence we might say that a whole *depends for its existence* on its parts (although not everyone would agree that this is the correct direction of the dependence relation, as we will see). Fundamentality comes in when we consider whether there is an end to this chain of dependence: do we ever reach the smallest parts? That is, is there a fundamental, 'bottom level', or does the hierarchical structure of reality continue *ad infinitum*? The received view has long been that there indeed is a fundamental level that everything else 'stands on'. The fundamental level is usually thought to be at the *smaller* end of the spectrum: *atomism* suggests that there are certain (subatomic) indivisible simples, particles that are fundamental or ontologically independent. But we must immediately note that the fundamental level must not necessarily be at the bottom, the smaller end – the fundamental end could also be at the top; that is, the universe

as a whole could be considered fundamental, to be prior to its parts." (p. 120)

30. Tahko, Tuomas E. 2014. "Boring Infinite Descent." *Metaphilosophy* no. 45:257-269.

Abstract: "In formal ontology, infinite regresses are generally considered a bad sign. One debate where such regresses come into play is the debate about fundamentality. Arguments in favour of some type of fundamentalism are many, but they generally share the idea that infinite chains of ontological dependence must be ruled out. Some motivations for this view are assessed in this article, with the conclusion that such infinite chains may not always be vicious. Indeed, there may even be room for a type of fundamentalism combined with infinite descent as long as this descent is "boring," that is, the same structure repeats ad infinitum. A start is made in the article towards a systematic account of this type of infinite descent. The philosophical prospects and scientific tenability of the account are briefly evaluated using an example from physics."

31. ———. 2018. "Fundamentality and Ontological Minimality." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 237-253. New York: Oxford University Press.

"In particular, we should clarify the role of mereology in discussions of fundamentality, which we'll do in Section 2. In Section 3, a common objection to the possibility of metaphysical infinitism is outlined, with some critical remarks. In Section 4, a more general sense of fundamentality will be explicated with the help of the idea of ontological minimality—this more general approach to fundamentality considers it as an ontological minimality thesis. Section 5 examines the tension between the mereological, object-oriented ontology and structuralism. It is suggested that fundamentality understood as an ontological minimality thesis can accommodate both. Finally, in Section 6, we will briefly consider whether fundamentality understood as an ontological minimality thesis rules out metaphysical infinitism."

32. ———. 2021. "Bohmian Holism." In *Unfolding the Big Picture. Essays in Honour of Paavo Pylkkänen*, edited by Limnell, Petteri and Vadén, Tero. Helsinki: Philosophical Studies from the University of Helsinki

"I will take my cue from a recent paper, co-authored by Pylkkänen, Hiley, and Pattiniemi (2015). This paper focuses on Bohm's views about individuality and the possible reconciliation of individuality with the holistic aspects of quantum theory. These aspects have led some, like Ladyman and Ross (2007), to argue that there are no individuals, just relations- this is the upshot of their ontic structural realism (OSR). Taking this thought further, some authors (Ismael and Schaffer, forthcoming) have taken the holistic approach to its extreme and argued that the cosmos as a whole is the most fundamental thing (since it forms one vast entangled system); this is a form of priority monism. Pylkkänen, Hiley, and Pattiniemi examine where Bohm's view might fall among these options. The result is interesting: there is clearly an element of holism involved-let us call it Bohmian holism-but it does not appear to be of the eliminative type that some versions of OSR might promote, nor the priority monist's version of quantum holism."

"Priority monism is the claim that there is one fundamental entity, upon which all other entities are ontologically dependent (by 'entity', we mean any portion of the universe which can be distinguished from other portions by its identity conditions). The priority monism we shall address in this chapter regards the entire spatiotemporal cosmos as the fundamental entity.

Shoes, ships, sealing-wax and any other spatiotemporal entities are all parts of, and exist in virtue of, this entity.(1)" (p. 149)

(...)

"We have demonstrated that Schaffer's common sense argument in favour of priority monism cannot work, for both semantic and ontological reasons.

In the process of criticising this argument we have made some suggestions as to what a NCS [*Near-Complete Scheme*] could look like. We remain neutral as to the details of this scheme, but we believe that there are good reasons to think that one must exist.(21)" (p. 162)

(1) In this chapter, we shall be considering only spatiotemporal entities. We shall thus ignore the relation between the cosmos and abstract entities such as numbers or sets.

"Introduction: According to some views of reality, some objects are fundamental and other objects depend for their existence upon these fundamental objects. In this article, I argue that we have reason to reject these views." (p. 429)

(...)

"It is a common enough view in metaphysics that at least some objects are fundamental. Typically, the entities that are

fundamental are taken to be metaphysically basic and to not depend upon anything else for their existence. Further, on such views, non-fundamental objects exist. However, non-fundamental objects are derivative and depend for their existence upon the fundamental objects. Views with this structure take one of two forms: Priority Pluralism and Priority Monism. For the purposes of this article, I'll describe the union of these views as 'Priority Views' – or 'PVs'. In this article I argue against PVs." (p. 430)

35. Taylor, Elanor. 2018. "How to Make the Case for Brute Facts." In *Brute Facts*, edited by Vintiadis, Elly and Mekios, Constantinos, 28-44. Oxford: Oxford University Press.

"The view that there are ontologically brute facts is the view that certain facts are not like this, because those facts are not and never will be explained. Although ontologically brute facts appear to be suspiciously mysterious, some philosophers have argued that we should embrace them (Barnes 1994).

The possibility of ontologically brute facts generates a methodological question: what is an adequate basis for belief in ontological bruteness? When is it reasonable to think that some fact is not and never will be explained? In this chapter I explore this question.

I begin by introducing ontological bruteness, and distinguishing it from other types of bruteness and related notions of emergence and fundamentality. I then consider three hypothetical failed attempts to make the case for ontological bruteness. The first is an attempt to infer bruteness from fundamentality, the second an attempt to infer bruteness from the absence of a particular kind of scientific explanation, and the third an attempt to infer bruteness from the absence of a particular kind of philosophical explanation. I draw cautionary lessons from these failures, arguing that in each case the inference to bruteness is made too quickly. Finally, I offer a positive proposal according to which if a naturalistic, general metaphysical theory with strong abductive support posits ontologically brute facts, then this is an adequate (but defeasible) case for ontological bruteness." (p. 28)

36. Thalos, Mariam. 2011. "Two Conceptions of Fundamentality." *Philosophy of the Social Sciences* no. 41:151-177.

Abstract: "This article aims to show that fundamentality is construed differently in the two most prominent strategies of analysis we find in physical science and engineering today: (1) atomistic, reductive analysis and (2) Systems analysis.

Correspondingly, atomism is the conception according to which the simplest (smallest) indivisible entity of a certain kind is most fundamental; while systemism, as will be articulated here, is the conception according to which the bonds that structure wholes are most fundamental, and scale and/or constituting entities are of no significance whatsoever for fundamentality. Accordingly, atomists maintain that the basic entities—the atoms—are fundamental, and together with the “external” interactions among them, are sufficient for illuminating all the features and behaviors of the wholes they constitute; whereas systemists proclaim that it is instead structural qualities of systems, that flow from internal relations among their constituents and translate directly into behaviors, that are fundamental, and by themselves largely (if not entirely) sufficient for illuminating the features and behaviors of the wholes thereby structured.

Systemism, as will be argued, is consistent with the nonexistence of a fundamental “level” of nondecomposable entities, just as it is consistent with the existence of such a level. Still, systemism is a conception of the fundamental in quite different, but still ontological terms. Systemism can serve the special sciences—the social sciences especially—better than the conception of fundamentality in terms of atoms. Systemism is, in fact, a conception of fundamentality that has rather different uses—and importantly, different resonances. This conception of fundamentality makes contact with questions pertaining to natural kinds and their situation in the metaphysics of the

special sciences—their situation within an order of autonomous sciences.

The controversy over fundamentality is evident in the social sciences too, albeit somewhat imperfectly, in the terms of debate between methodological individualists and functionalists/holists. This article will thus clarify the difference between systemism and holism."

37. ———. 2013. *Without Hierarchy: The Scale Freedom of the Universe*. New York: Oxford University Press.

Chapter 3: *Multiple Conceptions of Fundamentality*, pp. 105-126.

Abstract: "A venerable tradition in the metaphysics of science commends ontological reduction: the practice of analysis of theoretical entities into further and further proper parts, with the understanding that the original entity is nothing but the sum of these. This tradition implicitly subscribes to the principle that all the real action of the universe (also referred to as its "causation") happens at the smallest scales—at the scale of microphysics. A vast majority of metaphysicians and philosophers of science, covering a wide swath of the spectrum from reductionists to emergentists, defend this principle. It provides one pillar of the most prominent theory of science, to the effect that the sciences are organized in a hierarchy, according to the scales of measurement occupied by the phenomena they study. On this view, the fundamentality of a science is reckoned inversely to its position on that scale. This venerable tradition has been justly and vigorously countered—in physics, most notably: it is countered in quantum theory, in theories of radiation and superconduction, and most spectacularly in renormalization theories of the structure of matter. But these counters—and the profound revisions they prompt—lie just below the philosophical radar. This book illuminates these counters to the tradition principle, in order to assemble them in support of a vaster (and at its core Aristotelian) philosophical vision of sciences that are not organized within a hierarchy. In so doing, the book articulates the principle that the universe is active at absolutely all scales

of measurement. This vision, as the book shows, is warranted by philosophical treatment of cardinal issues in the philosophy of science: fundamentality, causation, scientific innovation, dependence and independence, and the proprieties of explanation."

38. Thompson, Naomi. 2018. "Metaphysical Interdependence, Epistemic Coherentism, and Holistic Explanation." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 107-125. New York: Oxford University Press.

"This paper develops an argument for metaphysical interdependence; an alternative to orthodox foundationalist accounts of metaphysical structure as characterized by grounding relations. Friends of metaphysical interdependence take facts to be related in networks of grounding such that there might be no foundational facts, and that a given fact can appear in its own grounding ancestry. Grounding is an explanatory relation, and the need to recognize holistic explanations (and in particular, holistic metaphysical explanations) generates a requirement for an account of grounding with a holistic structure. Metaphysical interdependence is such an account.

After briefly introducing the notion of ground in §2, §3 outlines both the core of the foundationalist approach, and that of metaphysical interdependence. §4 develops an analogy between metaphysical interdependence and coherentism in epistemology.

§5 argues that grounding is to be thought of as an explanatory relation. In §6, the view that grounding is an explanatory relation is considered against the backdrop of different approaches to explanatory structure. In §7 I respond to some perceived objections to holistic explanation. §8 concludes this chapter." (p. 107)

39. Torza, Alessandro. 2017. "Ideology in a Desert Landscape." *Philosophical Issues* no. 27:383-406.

Abstract: "On one influential view, metaphysical fundamentality can be understood in terms of joint-carving.

Ted Sider has recently argued that (i) some first order quantifier is joint-carving, and (ii) modal notions are not joint-carving.

After vindicating the theoretical indispensability of quantification against recent criticism, I will defend a logical result due to Arnold Koslow which implies that (i) and (ii) are incompatible. I will therefore consider an alternative understanding of Sider's metaphysics to the effect that (i) some first order quantifier is joint-carving, and (iii) intensional notions are not joint-carving. Another result due to Koslow entails that (i) and (iii) are also incompatible. I will argue that this second result is inconclusive. Nevertheless, (iii) is incompatible with another tenet of Sider's metaphysics, namely that (iv) 'being joint-carving' is itself joint-carving. In order to resolve the inconsistency, I will tentatively argue that condition (iv) should be renounced."

40. ———. 2020. "Structural Indeterminacy." *Philosophy and Phenomenological Research* no. 101:365-382.

Abstract: "The threat of ontological deflationism (the view that disagreement about what there is can be non-substantive) is averted by appealing to realism about fundamental structure—or so tells us Ted Sider. In this paper, the notion of structural indeterminacy is introduced as a particular case of metaphysical indeterminacy; then it is argued that structural indeterminacy is not only compatible with a metaphysics of fundamental structure, but it can even safeguard it from a crucial objection; finally, it is shown that, if there are instances of structural indeterminacy, a hitherto unacknowledged variety of ontological deflationism will arise. Unless structure is shown to be determinate, ontological deflationism remains a live option. Furthermore, I will consider whether structural

indeterminacy could be challenged by adopting a naturalistic epistemology of structure; the question is answered in the negative on the basis of a formal result concerning theory choice. Finally, I submit a new way of articulating the epistemology of structure, which hinges on the very possibility of structural indeterminacy."

41. Trogon, Kelly. 2009. "Monism and Intrinsicity." *Australasian Journal of Philosophy* no. 87:127-148.

Abstract: "Central to the programme of sparse ontology is a hierarchical view of reality; the basic entities form the sparse structure of being, while the derivative entities form the abundant superstructure. Priority pluralism and priority monism are both theses of sparse ontology. Roughly speaking, the priority pluralist claims that wholes and their properties ontologically depend on parts and their properties, while the priority monist claims that it goes the other way around. In this paper I focus on Ted Sider's recent argument that priority monism is probably false because it is incompatible with our best account of intrinsicity. In response I propose an account of intrinsicity that is compatible with both priority monism and priority pluralism. I argue that the account, in addition to having the virtue of being neutral between priority monism and priority pluralism, is independently plausible."

42. ——. 2009. "Physicalism and Sparse Ontology." *Philosophical Studies* no. 143:147-165.

Abstract: "A major stumbling block for non-reductive physicalism is Kim's disjunctive property objection. In this paper I bring certain issues in sparse ontology to bear on the objection, in particular the theses of *priority monism* and *priority pluralism*. Priority pluralism (or something close to it, anyway) is a common ontological background assumption, so in the first part of the paper I consider whether the disjunctive property objection applies with equal force to non-reductive physicalism on the assumption that priority monism is instead true. I ultimately conclude that non-reductive physicalism still faces a comparable problem. In the second part, I argue, surprisingly enough, that what I call 'fine-grained

reductionism', a particular version of which Kim proposes as an alternative to non-reductive physicalism, may work better in the monist framework than the pluralist one. I conclude that issues in sparse ontology, therefore, are more relevant to the debate about physicalism than one may have thought."

43. ———. 2010. "Intrinsicity for Monists (and Pluralists)." *Australasian Journal of Philosophy* no. 88:555-558.

Abstract: "Two competing views in sparse ontology are monism and pluralism. In Trogdon [2009] I propose an account of intrinsicity that I argue is both compatible with monism and pluralism and independently plausible. Skiles [2009] argues that my account fails on both fronts. In this note I respond to his two objections."

44. ———. 2018. "Inheritance Arguments for Fundamentality." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki Leigh and Priest, Graham, 182-198. Oxford University Press.

"In this chapter I take up the question of how we might appeal to the notion of inheritance in arguing for metaphysical foundationalism. I first clarify Schaffer's inheritance argument sketched above, suggesting that it relies on a heavy-duty metaphysical principle I call the *inheritance principle*. I show that Schaffer's argument is unsuccessful even granting the principle. Then I explore what consequences the inheritance principle might have for metaphysical foundationalism granting for the sake of argument that the principle is true. I show how in this case we can deploy the notion of *causal capacity inheritance* in arguing for two special cases of metaphysical foundationalism, what I call *causal foundationalism* and *concrete foundationalism*. I conclude that if considerations involving inheritance are to provide a route to

metaphysical foundationalism, the route will be indirect—in this case we would need to argue for the thesis in a piecemeal fashion (say, by arguing for concrete foundationalism plus a corresponding thesis about abstract entities). There may indeed be plausible inheritance arguments for fundamentality—it’s just that we need to be careful to focus on the appropriate theses as well as the appropriate inherited properties." (p. 183)

45. Wang, Jennifer. 2016. "Fundamentality and Modal Freedom." *Philosophical Perspectives* no. 30:397-418.

"The notion of *fundamentality* has been much discussed recently. The picture is that there is a fundamental level of the world, and that non-fundamental, or derivative, features of the world depend upon the fundamental. My focus in this paper is on a specific question about the nature of fundamentality. Many agree that if an entity is fundamental, then it is in some sense ontologically independent.(1) This accompanied by intuitions that it is 'self-sufficient', or 'need not look outside itself'. It is commonly believed that as such, fundamental entities are modally free, in a sense to be clarified.(2) Intuitively, a mark of modal freedom is some form of free recombination: For each of the various ways modally free entities can individually be, they can be those ways with each other."

(1) I will be using the term 'entity' liberally to apply to the purported members of different ontological categories, which may include objects, properties, relations, facts, or states of affairs.

(2) This notion is borrowed and adapted from Schaffer (2010a).

46. Werner, Jonas. 2021. "A Grounding-Based Measure of Relative Fundamentality." *Synthese* no. 198:9721-9737.

Abstract: "Reality is hierarchically structured, or so proponents of the metaphysical posit of grounding argue. The less fundamental facts obtain in virtue of, or are grounded in, the more fundamental facts. But what exactly is it for one fact to be more fundamental than another? The aim of this paper is to provide a measure of relative fundamentality.

I develop and defend an account of the metaphysical hierarchy that assigns to each fact a set of ordinals representing the levels on which it occurs. The account allows one to compare any two facts with respect to their fundamentality and it uses immediate grounding as its sole primitive. In the first section, I will set the stage and point to some shortcomings of a rival account proposed by Karen Bennett. The second section will present my own proposal and the third section will discuss how it can be extended to non-foundationalist settings. The fourth section discusses potential objections."

"In particular, after fixing some preliminaries in Section 1, I'll discuss in Section 2 three reasons for taking the contingent fundamentality thesis seriously. I then evaluate some objections in Section 3 intended to show that taking fundamentality to be contingent is wrong-headed; I argue that these objections can be dealt with, leaving the contingent fundamentality thesis at least *prima facie* plausible. In Section 4, I then look at how the thesis relates to views about the possibility of contingently existing fundamentalia, pulling some of the various packages apart, and making the case for adopting what I call the Shifty Shaky view. I then conclude in Section 5

by indicating further areas about the thesis ripe for fruitful future exploration." (p. 275)

48. Williams, J. Robert G. 2010. "Fundamental and Derivative Truths." *Mind* no. 119:104-141.

Abstract: "This article investigates the claim that some truths are fundamentally or really true—and that other truths are not. Such a distinction can help us reconcile radically minimal metaphysical views with the verities of common sense. I develop an understanding of the distinction whereby *Fundamentality* is not itself a metaphysical distinction, but rather a device that must be presupposed to express metaphysical distinctions. Drawing on recent work by Rayo on anti-Quinean theories of ontological commitments, I formulate a rigorous theory of the notion. In the final sections, I show how this package dovetails with 'interpretationist' theories of meaning to give sober content to thought that some things—perhaps sets, or gerrymandered mereological sums—can be 'postulated into existence'."

Summary: "Horgan (1993) proposed that "superdupervenience" – supervenience preserving physicalistic acceptability – is a matter of robust explanation. I argued against him (1999) that (as nearly all physicalist and emergentist accounts reflect) superdupervenience is a matter of *Condition on Causal Powers* (CCP): every causal power bestowed by the supervenient property is identical with a causal power bestowed by its base property. Here I show that CCP is,

as it stands, unsatisfactory, for on the usual understandings of causal power bestowal, it is trivially satisfied or falsified. I offer a revision of CCP which incorporates the evident fact that causal powers are grounded in fundamental forces."

50. ———. 2012. "Fundamental Determinables." *Philosophers' Imprint* no. 12:1-17.

"Introduction: Contemporary philosophers commonly suppose that any fundamental entities there may be are maximally determinate. More generally, they commonly suppose that, whether or not there are fundamental entities, any determinable entities there may be are grounded in, hence less fundamental than, more determinate entities. So, for example, Armstrong takes the physical objects constituting the presumed fundamental base to be "determinate in all respects" (1961, 59), and Lewis takes the properties characterizing things "completely and without redundancy" to be "highly specific" (1986, 60). Here I'll look at the usually cited reasons for these suppositions as directed against the case of determinable properties, in particular, and argue that none is compelling (Sections 1 to 3). The discussion in Section 3 will moreover identify positive reason for taking some determinable properties to be part of a fundamental (or relatively fundamental) base. I'll close (Section 4) by noting certain questions arising from the possibility of fundamental determinables, as directions for future research."

51. ———. 2019. "Comments on *Making Things Up*." *Philosophy and Phenomenological Research* no. 98:497-506.

Making Things Up is a first-rate work of philosophy, that should be read by anyone interested in fundamentality and metaphysical dependence. Here I'll focus on the following components of Bennett's 'building'-based framework for understanding these notions:

I. There are diverse building relations, including but not limited to mereological composition, constitution, set formation, and realization, via which some goings-on are built out of others.

II. Though diverse, the building relations are unified in being members of a class of relations that are directed (irreflexive and antisymmetric), necessitating, and generative, in that building goings-on produce or generate built goings-on (32).

III. Though unified, there is no generic building relation (what I call 'big-'G' Grounding', for terminological clarity) of the sort advocated in Fine 2001, Schaffer 2009, and Rosen 2010, serving as a more natural or more fundamental core of the specific building relations.

IV. Building relations "connect entities that are in some sense more fundamental to entities that are in some sense less fundamental" in a way providing a reductive basis for relative fundamentality: "one of the central claims of the book [is] that there is nothing more to relative fundamentality than the obtaining of certain building relations".

V. The not-holding of building relations provides a reductive basis for absolute fundamentality, via a conception according to which "to be fundamental is to be unbuilt" (103), either relative to a building relation, or simpliciter.

VI. Causation is a building relation." (p. 497, notes omitted)

Abstract: "Ontic structural realists hold that structure is all there is, or at least all there is fundamentally.

This thesis has proved to be puzzling: What exactly does it say about the relationship between objects and structures? In this article, I look at different ways of articulating ontic structural realism in terms of the relation between structures and objects. I show that objects cannot be reduced to structure, and argue that ontological dependence cannot be used to establish strong forms of structural realism. At the end, I show how a weaker, but controversial, form of structural realism can be articulated on the basis of ontological dependence."

"It is fairly standard in contemporary metaphysics to distinguish between fundamental and non-fundamental properties. As I will be using these terms here, this distinction is meant to capture David Lewis' idea that some properties are *perfectly natural*, and that these elite properties are what make for objective similarity among objects, as well as doing all kinds of other metaphysical heavy lifting. In order to perform all these metaphysical duties, fundamental properties are usually said to be *intrinsic* and *undefined*; they are the properties in

terms of which less natural properties are defined, but not vice versa (Lewis 1983). In keeping with the aim of naturalistic metaphysics, the expectation is that science will reveal to us which properties are fundamental." (p. 87)

(...)

"I conclude that the distinction between fundamental and non-fundamental properties, at least as far as physical quantities are concerned, is less naturalistic than previously thought." (p. 88)

54. Yates, David. 2018. "Inverse Functionalism and the Individuation of Powers." *Synthese* no. 195:4525-4550.

Abstract: "Abstract In the pure powers ontology (PPO), basic physical properties have wholly dispositional essences. PPO has clear advantages over categoricist ontologies, which suffer from familiar epistemological and metaphysical problems. However, opponents argue that because it contains no qualitative properties, PPO lacks the resources to individuate powers, and generates a regress. The challenge for those who take such arguments seriously is to introduce qualitative properties without reintroducing the problems that PPO was meant to solve. In this paper, I distinguish the core claim of PPO: (i) basic physical properties have dispositional essences, from a hitherto unnoticed assumption: (ii) the dispositional essences of basic physical properties exclusively involve type-causal relations to other basic physical properties. I reject (ii), making room for structuralist ontology in which all basic physical properties are pure powers, individuated by their places in a causal structure that includes not only other powers, but also physically realized qualitative properties such as shapes, patterns and structures. Such qualities individuate pure powers in the way that non-mental input and output properties individuate realized mental properties in functionalist theories of mind, except that here it is the basic physical powers that are individuated by relations to realized non-powers. I distinguish

one Platonic and two Aristotelian version of this theory, and argue that the Aristotelian versions require that grounding is not always a relative fundamentality relation, because the powers ground the qualities that individuate them. I argue that symmetric grounding is the best way to make sense of the relational individuation common to all structuralist ontologies, and is therefore no additional commitment of the one proposed here."

55. Zylstra, Justin. 2014. "Dependence and Fundamentality." *Studia Philosophica Estonica* no. 7:5-28.

Abstract: "I argue that dependence is neither necessary nor sufficient for relative fundamentality.

I then introduce the notion of 'likeness in nature' and provide an account of relative fundamentality in terms of it and the notion of dependence. Finally, I discuss some puzzles that arise in Aristotle's *Categories*, to which the theory developed is applied."

"The primary concern of this chapter is to bring Dimensioned realization to the attention of both New Mechanists and "Grounders." For both New Mechanists and Grounders, recognizing compositional explanations involving Dimensioned realization is an important step in the development of more descriptively adequate accounts of non-causal, compositional explanations. More specifically, Dimensioned realization shows how New Mechanists might embrace compositional explanatory relations among properties. Moreover, Dimensioned realization suggests that, at least at times, one needs to move beyond bare grounding claims—claims such as "X Grounds Y"—in order to develop a (good) explanation. 3 In principle, the recognition of Dimensioned realization and its implications might be viewed as friendly additions to work on New Mechanism and Ground." "Aizawa and Gillett's exciting new collection focused on those metaphysical tools designed to capture 'vertical' relations between entities and systems of different kinds. One such device is 'grounding' which has become a ubiquitous umbrella term, covering relations between a variety of entities from the scientific to the social." (From the Series Editor's Preface, p. V)

6. Aizawa, Ken, and Gillett, Carl. 2016. "Introduction: Vertical Relations in Science, Philosophy, and the World: Understanding the New Debates over Verticality." In *Scientific Composition and Metaphysical Ground*, edited by Carl Gillett, Ken Aizawa, 1-38. London: Palgrave-Macmillan.

"Given our limited space, we cannot provide a detailed characterization of even one of the philosophical research traditions about verticality. Each of these traditions has a rich history, is sophisticated in its treatment of verticality, has numerous proponents offering distinct variants, and includes a range of competing versions of the relevant type of V-framework. Our focus is therefore simply to provide a minimal characterization of each research tradition for our purposes here, which are twofold. We simply seek, first, to give the reader an initial sense of the research tradition and, second, we seek to highlight one or two distinctive features of verticality as it is characterized under the particular kind of account offered by the research tradition." (p. 9)

7. Allen, Sophie R. 2020. "Intrinsicality, Independence and Grounding." *Metaphysica* no. 21:71-97.

Abstract: "This paper investigates the plausibility of Witmer, Butchard and Trogdon's proposal to distinguish intrinsic properties from extrinsic ones in terms of independence from accompaniment and grounding. I argue that the proposed criterion is not adequate to determine intrinsicality, since according to it some intuitively extrinsic properties turn out to be intrinsic. I suggest and evaluate two responses: first, one could characterize a conception of independence which is specific to the individual instantiating the property; and second, one could justify two assumptions about properties which entail that counterexample properties of the kinds I present do not exist, most importantly that there are no fundamental properties which are instantiated in an intrinsic fashion by some individuals and an extrinsic fashion by others. Although the latter seems prima facie plausible, I present some potential counterexamples to it from current physical theory. I conclude that the grounding- and independence-based criterion of intrinsicality can be defended from my objections, although the cost of doing so might make it more attractive to characterize intrinsicality in terms of independence, or in terms of grounding, alone."

8. Alvarado, José Tomas, and Tugby, Matthew. 2021. "A Problem for Natural-Kind Essentialism and Formal Causes." In *Neo-Aristotelian Perspectives on Formal Causation*, edited by Jansen, Ludger and Sandstad, Petter, 201-221. New York: Routledge.

"In the first section we will present some of the main characteristics of the relations of grounding and dependence, and what constraints must be respected when they interact. In the second section, we will introduce the main problem as it

occurs in natural-kind essentialism. The third and fourth sections will discuss some alternatives that may be attempted by defenders of natural-kind ontologies to assuage the problem presented, in particular, a theory of 'substantial forms' and a structuralist stance towards the connection between kinds and essential properties. What appears through this examination is a significant concern for all those enthusiastic about the prospects of 'formal causes' in metaphysics. The function attributed to these causes should be treated carefully to avoid incoherent structures of ontological explanation." (pp. 201-202)

9. Amijee, Fatema. 2021. "Explaining Contingent Facts." *Philosophical Studies* no. 178:1163-1181.

Abstract: "I argue against a principle that is widely taken to govern metaphysical explanation. This is the principle that no necessary facts can, on their own, explain a contingent fact. I then show how this result makes available a response to a longstanding objection to the Principle of Sufficient Reason—the objection that the Principle of Sufficient Reason entails that the world could not have been otherwise (i.e. that all facts are necessary)."

10. Assadian, Bahram, and Nassim, Jonathan. 2019. "Indeterminacy and Failure of Grounding." *Theoria* no. 85:276-288.

Abstract: "Cases of grounding failure present a puzzle for fundamental metaphysics. Typically, solutions are thought to lie either in adding ontology such as haecceities or in re-describing the cases by means of the ideology of metaphysical indeterminacy. The controversial status of haecceities has led some to favour metaphysical indeterminacy as the way to solve the puzzle. We consider two further treatments of grounding failure each of which, we argue, is a more plausible alternative. As such, the initial dichotomy is a false one, and these alternative options deserve consideration before resorting to the heavyweight machinery of metaphysical indeterminacy."

11. Atiq, Emad H. 2018. "On Ground as a Guide to Realism." *Ratio* no. 31:165-178.

Abstract: "According to Fine (among others), a nonbasic factual proposition must be grounded in facts involving those of its constituents that are both real and fundamental. But the principle is vulnerable to several dialectically significant counterexamples. It entails, for example, that a logical Platonist cannot accept that true disjunctions are grounded in the truth of their disjuncts; that a Platonist about mathematical objects cannot accept that sets are grounded in their members; and that a colour primitivist cannot accept that an object's being scarlet grounds its not being chartreuse. The Finean might try to defend these implications, but it generates further problems. Instead, the principle should be rejected. An important upshot is that the principle cannot be relied on to distinguish robust realism from anti-realism about a propositional domain, for the principle obscures ways of taking features to be both real and fundamental."

12. Audi, Paul. 2012. "Grounding: Toward a Theory of the *In-Virtue-of* Relation." *The Journal of Philosophy* no. 109:685-711.

"The phrase 'in virtue of' is ubiquitous in philosophy. Nearly as pervasive are the protestations that it is poorly understood and in need of clarification. Far less common are sustained attempts to elucidate this phrase and its philosophical significance.

I propose that it expresses a primitive, noncausal relation of determination, which I call *grounding*. Although my understanding of grounding fits well with many of the most interesting and important uses of the phrase 'in virtue of' (and related locutions), my account is not purely descriptive; my claim is that we should regiment our use of the phrase to achieve the best theoretical result." (pp. 685-686, notes omitted)

13. ———. 2012. "A Clarification and Defense of the Notion of Grounding." In *Metaphysical Grounding: Understanding the Structure of Reality* edited by Correia, Fabrice and Schnieder, Benjamin, 101-121. Cambridge: Cambridge University Press.

"This paper defends a particular version of the idea that there is a non-causal relation of determination, *grounding*, often expressed by the phrase "in virtue of ." This relation corresponds to certain non-causal explanations, including those philosophers give, e.g., in saying that a statue has its aesthetic properties in virtue of its physical properties, or that a thing has its dispositional features in virtue of its categorical features, or that a person has a reason to believe that *p* in virtue of her perceptual experiences. Indeed, it is the fact that there are such explanations, together with the fact that their correctness cannot be underwritten by any causal relation, that makes it incumbent on us to recognize grounding." (p. 101)

14. ———. 2016. "Property Identity." *Philosophy Compass* no. 11:829-840.

Abstract: "The question of how properties are individuated is extremely important. Consider the following proposals. To be in pain is to be in a certain neurological state. To be red is to appear red to normal observers in standard conditions. To be obligatory is to maximize the good. Each makes a claim of property identity. Each is a substantive metaphysical thesis of wide interest. None can be studied with due scrutiny in the absence of a general account of property identity. Here, I will survey existing accounts and suggest a new account in terms of grounding that has some advantages over the other candidates."

15. ———. 2020. "Why Truthmaking Is Not a Case of Grounding." *Philosophy and Phenomenological Research* no. 101:567-590.

Abstract: "Truthmaker theorists often express their core commitment by saying that truth is grounded in being, and grounding theorists often take truthmaking to be a paradigm case of grounding. But I will argue that truthmaking is not a case of grounding. What is crucial for understanding truthmaking is not grounding but rather meaning (in a broad sense including reference). Truth is still constrained by how things are, so even if (so-called) truthmakers don't play a role in grounding truths, the methodological program of truthmaker theory survives. Here I lay out my understanding of truth and

truthmaking, and distinguish two conceptions of grounding. I argue that truthmaking is not plausibly seen as a case of grounding on either conception. I argue further that treating truthmaking as grounding threatens to violate a plausible irreflexivity principle, and makes trouble for the view that grounding is transitive. I then suggest that there is no genuine relation of truthmaking (which there would have to be if it were a true case of grounding). Finally, I show how the core insights of truthmaker theory are preserved by the understanding of truthmaking that I favor."

16. Austin, Christopher J. 2021. "Form, Cause, and Explanation in Biology: A Neo-Aristotelian Perspective." In *Neo-Aristotelian Perspectives on Formal Causation*, edited by Jansen, Ludger and Sandstad, Petter, 238-268. New York: Routledge.

"Conclusion: In this chapter I have illustrated the ways in which the mechanization of the natural world in the aftermath of the Scientific Revolution was crystallised in the biological sciences with the formation of the Modern Synthesis—a conceptual framework for evolutionary theory in which the teleological prowess of formal causation is rendered both explanatorily impotent and ontologically otiose. I have argued, however, that the radical reframing of that theory implicit in the explanatory structure of evolutionary developmental biology suggests that the Aristotelian posit of a non-mechanistic ground of the modality of morphology need not be treated with suspicion. Form may yet prove a metaphysically and empirically powerful apparatus with which to comprehend the nature of organisms in the context of our post-Darwinian picture of the living world." (p. 258)

17. Azzano, Lorenzo, and Carrara, Massimiliano. 2021. "The Grounding of Identities." *Philosophia* no. 49:1943-1962.

Abstract: "A popular stance amongst philosophers is one according to which, in Lewis' words, "identity is utterly simple and unproblematic".[*] Building from Lewis' famous passage on the matter, we reconstruct, and then criticize, an argument to the conclusion that identities cannot be grounded. With the help of relatively uncontroversial assumption concerning

identity facts, we show that not all identities are equi-fundamental, and, on the contrary, some appear to be provided potential grounding bases using two-level identity criteria. Further potential grounding bases for identities are presented. Identity might be utterly simple and unproblematic, but this is not sufficient to conclude that identities are ungrounded, or fundamental."

[*] David Lewis, *On the Plurality of Worlds*, Oxford: Wiley-Blackwell, 1986, pp. 192-193.

18. Bader, Ralf. 2013. "Towards a Hyperintensional Theory of Intrinsicity." *The Journal of Philosophy* no. 110:525-563.

Abstract: "The distinction between intrinsic and extrinsic properties is an elusive distinction that has resisted precise formulation.

Some of the most promising accounts of this distinction take the form of combinatorial or duplication analyses. The former try to capture the patterns of independence amongst intrinsic and extrinsic properties in terms of logical, modal, mereological and spatiotemporal notions. The latter attempt to identify intrinsic properties as properties that never differ amongst duplicates. This paper argues in favour of a hyperintensional analysis of intrinsicity that appeals to 'in virtue of' claims. It will be shown that accounts of intrinsicity that appeal to combinatorial and duplication principles do not yield satisfactory results, even when they are supplemented with a notion of 'naturalness'. We need to appeal to 'in virtue of' claims rather than to 'naturalness' in order (i) to allow for cases whereby a property is possessed both intrinsically and extrinsically, (ii) to adequately classify modal properties when these are given a counterparttheoretic analysis, and (iii) to retain the idea that the set of intrinsic properties and the set of pure extrinsic properties are closed under Boolean operations. Moreover, the paper will argue in favour of treating the intrinsically/extrinsically distinction as more basic than the intrinsic/extrinsic distinction and explaining the latter in terms of the former."

19. ———. 2013. "Multiple-Domain Supervenience for Non-Classical Mereologies." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 347-367. Munich: Philosophia Verlag.

"Conclusion: Thus, we have seen that we can use co-ordinated multiple-domain supervenience relations to model determination and dependence relations between complex entities and their constituents. In particular, we developed two ways of making such supervenience claims, namely (i) by appealing to *R*-related pairs, and (ii) by making use of associated isomorphisms. Moreover, it was shown that suitable supervenience relations can be devised not only for classical mereological systems but also for non-classical ones, by modifying the domains and imposing various conditions on mappings that allow us to capture the additional structure of non-classical parthood relations. Additionally, we provided principles for cases in which wholes are taken to be prior to their parts that are applicable in settings in which one is dealing with dense parthood orderings and atomless gunk." (p. 366-367)

20. ———. 2017. "The Grounding Argument against Non-Reductive Moral Realism." *Oxford Studies in Metaethics: Vol. 12*:106-134.

Abstract: "Strong supervenience of normative properties on non-normative properties implies that for every normative property there is a necessarily co-extensive non-normative property, given that the set of non-normative properties is closed under infinitary disjunction and conjunction (cf. Kim 1993: chapter 3, Jackson 1998, Streumer 2008). This puts pressure on non-reductionist versions of moral realism, insofar as normative properties would seem to end up being identical to non-normative properties, thereby ruling out the existence of irreducibly normative properties." (Notes omitted)

22. Barker, Jonathan. 2021. "Grounding and the Myth of Ontological Innocence." *Australasian Journal of Philosophy* no. 99:303-318.

Abstract: "According to the Ontological Innocence Thesis (OIT), grounded entities are ontologically innocent relative to their full grounds. I argue that OIT entails a contradiction, and therefore must be discarded. My argument turns on the notion of 'groundmates', two or more numerically distinct entities that share at least one of their full grounds. I argue that, if OIT is true, then it is both the case that there are groundmates and that there are no groundmates. Therefore, I conclude, OIT is false. Moreover, in seeing why OIT is false, we will be left with three heterodox options about grounding and reality's structure. So this paper's second conclusion is that, even after we have discarded OIT, we are in for an additional surprise."

23. Barker, Stephen. 2012. "Expressivism about Making and Truth-Making." In *Metaphysical Grounding: Understanding the Structure of Reality* edited by Correia, Fabrice and Schnieder, Benjamin, 272-293. Cambridge: Cambridge University Press.

"The facts of truth are not primitive facts. Unless we accept the identity theory of truth – and equate truth and fact – the fact that a proposition is true must obtain in virtue of something: how things are with its subject matter.(1) We might express this thought as the idea that truth supervenes on, is asymmetrically determined by, being (see Bigelow 1988). But that would be misleading, since it suggests that truth is not part of being. The facts of truth, that certain propositions are true or false, are part of how things are, and so, are aspects of being. We should say rather that the facts of truth, the alethic facts, are made the case by non-alethic facts. (Still, as we shall see, that claim will need qualification.) Viewed in this way, the problem of truth-making reduces to the problem of making. What's making?" (p. 272)

(1) Rodríguez-Pereyra 2005 presents this kind of argument for truth-making.

24. Baron, Sam. 2015. "The Priority of the Now." *Pacific Philosophical Quarterly* no. 96:325-348.

Abstract: "This article motivates and develops a new theory of time: priority presentism. Priority presentism is the view according to which (i) only present entities exist fundamentally and (ii) past and future entities exist, but they are grounded in the present. The articulation of priority presentism is an exercise in applied grounding: it draws on concepts from the recent literature on ontological dependence and applies those concepts in a new way, to the philosophy of time. The result, as I will argue, is an attractive position that can do much of the same work in satisfying our intuitions about time as presentism, but without the ontological cost."

25. Baron, Sam, Miller, Kristie, and Norton, James. 2014. "Groundless Truth." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 57:175-195.

Abstract: "We defend two claims: (1) if one is attracted to a strong non-maximalist view about truthmaking, then it is natural to construe this as the view that there exist fundamental truths; (2) despite considerable aversion to fundamental truths, there is as yet no viable independent argument against them. That is, there is no argument against the existence of fundamental truths that is independent of any more specific arguments against the ontology accepted by the strong non-maximalist. Thus there is no argument that the strong non-maximalist herself will find dialectically motivating."

26. Baron, Sam, Miller, Kristie, and Tallant, Jonathan. 2020. "Grounding at a Distance." *Philosophical Studies* no. 177:3373-3390.

Abstract: "What distinguishes causation from grounding? One suggestion is that causation, but not grounding, occurs over

time. Recently, however, counterexamples to this simple temporal criterion have been offered. In this paper, we situate the temporal criterion within a broader framework that focuses on two aspects: locational overlapping in space and time and the presence of intermediaries in space and time. We consider, and reject, the idea that the difference between grounding and causation is that grounding can occur without intermediaries. We go on to use the fact that grounding and causation both involve intermediaries to develop a better temporal criterion for distinguishing causation from grounding. The criterion is this: when a cause and effect are spatially disjoint, there is always a chain of causal intermediaries between the cause and the effect that are extended in time. By contrast, when the grounds and the grounded are spatially disjoint, there is always a chain of grounding intermediaries, but the chain need not be extended in time, it can be purely spatial. The difference between grounding and causation, then, is that causation requires time for chaining in a way that grounding does not."

27. Baron, Samuel, Miller, Kristie, and Tallant, Jonathan. 2022. "The Harmony of Grounding." *Philosophical Studies*.

Not yet published, available philarchive.org.

Abstract: "Mereological harmony is the idea that the mereological structure of objects mirrors the mereological structure of locations. Grounding harmony is the idea that there is a similar mirroring between the grounding structure of objects and locations. Our goal in this paper is exploratory: we introduce and then explore two notions of grounding harmony: locative and structural. We outline potential locative and structural harmony principles for grounding, and show which of these principles may entail, or be entailed by, principles of mereological harmony. We then present a case study in grounding harmony, by applying it to Schaffer's (2010a) specific version of priority monism. We show that, given a strong form of grounding harmony, Schaffer-style monism is inconsistent, but that this inconsistency can be resolved by offering bespoke notions of grounding harmony. We use Schaffer's priority monism to demonstrate a broader tension within certain packages of metaphysical views, including

versions of priority pluralism. We close by briefly considering the case against structural grounding harmony."

28. Baron-Schmitt, Nathaniel. 2021. "Contingent Grounding." *Synthese* no. 199:4561-4580.

Abstract: "A popular principle about grounding, "Internality", says that if A grounds B, then necessarily, if A and B obtain, then A grounds B. I argue that Internality is false. Its falsity reveals a distinctive, new kind of explanation, which I call "ennobling". Its falsity also entails that every previously proposed theory of what grounds grounding facts is false. I construct a new theory."

29. Batchelor, Roderick. 2010. "Grounds and Consequences." *Grazer Philosophische Studien* no. 80:65-77.

Summary: "We first introduce the intuitive idea of a relation of grounding between facts (§ 1).

Then we propose a definition of this idea, based on a certain theory of the structure of facts (§ 2, with formalization in an appendix). Finally we consider the idea of proofs of a special kind, namely proofs which follow the grounds of what is proved (§ 3)."

30. Bennett, Karen. 2004. "Spatio-Temporal Coincidence and the Grounding Problem." *Philosophical Studies* no. 118:339-371.

Abstract: "A lot of people believe that distinct objects can occupy precisely the same place for the entire time during which they exist. Such people have to provide an answer to the 'grounding problem' – they have to explain how such things, alike in so many ways, nonetheless manage to fall under different sortals, or have different modal properties. I argue in detail that they cannot say that there is anything in virtue of which spatio-temporally coincident things have those properties. However, I also argue that this may not be as bad as it looks, and that there is a way to make sense of the claim that such properties are primitive."

31. ———. 2011. "By Our Bootstraps." *Philosophical Perspectives* no. 25:27-41.

"Conclusion: I admit that the superintentionality solution is occasionally hard to articulate, but that does not make it wrong. The regresses are surprisingly hard to articulate, too, but that does not make them nonsense.

The grounding dilemma is hard. On pain of flatworldism, we must solve it.

To solve it, we must either claim that both the grounding facts and the grounding relation are fundamental, or else claim that they are grounded, or else wave a magic wand and find some way between the horns. I have not argued that the first and third options are hopeless. I have simply argued that the second is definitely not. Grounding is not fundamental." (p. 41)

32. ———. 2021. "Why I Am Not a Dualist." *Oxford Studies in Philosophy of Mind* no. 1:208-231.

"I am not a dualist. I do not think there are any nonphysical properties, substances, or facts. I think that the entire nature of the world is grounded in—determined or settled by—its fundamental physical nature.

But why do I think this? In the bright light of day, I take physicalism to be almost obvious. But in the dark of night, I have to admit to myself that it is not entirely clear why exactly I dislike dualism. Are there good arguments against it? That is, set aside whether there are good objections to the arguments *for* dualism, or against physicalism. Are there good arguments against the view itself?

In what follows, I will take up that question. After more carefully spelling out what I take dualism and physicalism to be, I will suggest that the most frequently heard arguments against dualism are more problematic than we physicalists like to admit. I will then offer a new argument against dualism.

In broad strokes, it is this: dualists do not dodge all demands for explanation by denying that consciousness can be explained in physical terms. I will articulate what exactly it is that they must explain, and offer two independent arguments for thinking that they cannot do so. The basic upshot is that

moving to dualism because of a perceived explanatory failure of physicalism simply does not help." (p. 208)

33. Benovsky, Jiri. 2012. "Aesthetic Supervenience vs. Aesthetic Grounding." *Estetika* no. 49:166-178.

Abstract: "The claim that having aesthetic properties supervenes on having non-aesthetic properties has been widely discussed and, in various ways, defended. In this article, I aim to demonstrate that even if it is sometimes true that a supervenience relation holds between aesthetic properties and 'subvenient' non-aesthetic ones, it is not the interesting relation in the neighbourhood. As we shall see, a richer, asymmetric, and irreflexive relation is required, and I shall defend the claim that the increasingly popular relation of grounding does a much better job than supervenience."

34. Benovsky, Jiry. 2016. *Meta-metaphysics: On Metaphysical Equivalence, Primitiveness, and Theory Choice*. Cham (Switzerland): Springer.

Chapter 4: *The Importance of Being Primitive*, pp. 61-71.

Abstract: "This chapter concerns primitiveness. Indeed, my way of arguing for or against equivalence claims in the previous chapters largely depends on the nature of primitives and on the role they play in each of the theories involved, and it is now time to be explicit about this. In general, in most metaphysical debates a lot depends on primitives—indeed, metaphysical theories rely heavily on the use of the primitives that they typically appeal to. So, I will emphasize here the utmost importance of primitives in the construction of metaphysical theories and in the subsequent evaluation of them. I will claim that almost all of the explanatory power of metaphysical theories comes from their primitives, and I will scrutinize the notion of "power" and "explanatory". All together, these points will naturally lead me to defend a global view on the nature of the metaphysical enterprise: what is at stake in metaphysics is to find out not just what there is or what there is not, but what is more fundamental than what—to find out what are the best primitives. Relationships between my view and the current debate concerning the notion of grounding will be discussed."

35. Berker, Selim. 2018. "The Unity of Grounding." *Mind* no. 127:729-777.

Abstract: "I argue—contra moderate grounding pluralists such as Kit Fine and more extreme grounding pluralists such as Jessica Wilson—that there is fundamentally only one grounding/in-virtue-of relation. I also argue that this single relation is indispensable for normative theorizing—that we can't make sense of, for example, the debate over consequentialism without it. It follows from what I argue that there is no metaethically-pure normative ethics (in contrast to Ronald Dworkin's claim that there is no normatively-pure metaethics)."

36. Bernstein, Sara. 2016. "Grounding Is Not Causation." *Philosophical Perspectives* no. 30:21-38.

"Grounding is not causation, and is not *like* causation, *contra* its contemporary characterizers. Apparent similarities between causation and grounding are mostly superficial, and utilizing causation as a way to illuminate ground glosses over their important dissimilarities while failing to untangle distinct, subtle problems that both grounding and causation face. Or so I will argue." (p. 21)

(...)

"In the following discussion, I set these claims in my sights. I target two distinct but similar theses: what Schaffer (2016) calls "grounding-causation unity", the thesis that grounding and causation are only nominally distinct relations, and what I will call "grounding-causation comparison", the methodological process of illuminating ground by appealing to similar features of causation. I call proponents of either of these two theses Grinders, or those who meld together the notions of causation and grounding literally or metaphorically." (p. 22)

(...)

"Conclusion

Grounding skepticism has largely focused on challenging the univocality, usefulness, and explanatory power of grounding.

Here I have issued a new challenge to grounding: that it cannot be illuminated by appeal to the familiar notion of causation. Perhaps groundhogs will find a new notion to which to appeal in order to illuminate ground, or perhaps grounding skeptics will be satisfied with another methodological route to securing a transparent notion of ground. But attempting to use causation as a guide to ground emphasizes similarities that turn out to be superficial, while ignoring the intricacies that genuinely characterize each notion. Groundhogs [*] should not be Grinders: they need another path forward." (p. 35)

[*] I owe thanks to Kit Fine's "Essential Glossary of Ground" for this term.

37. ———. 2018. "Causal Idealism." In *Idealism: New Essays in Metaphysics*, edited by Goldschmidt, Tyron and Pearce, Kenneth L., 217-230. New York: Oxford University Press.

"A quick disclaimer: as a causal realist, I am invested in discovering an objective, mind-independent causal relation. Thus I will not make it my goal in this discussion to defend causal idealism against general objections or broader criticism. Rather, my goal will be to give causal idealism a fair shake by articulating it clearly and fairly, and to explain why the view should be considered a viable alternative to the mixed views I have mentioned.

Roadmap: In section 1, I articulate the thesis of causal idealism, and apply it to some contemporary problems for causal theories. In section 2, I give an overview of a family of views that incorporates human thought and agency into the causal relation. In section 3, I weigh causal idealism against the discussed mixed views, and argue that causal idealism is a viable alternative." (p. 218)

38. Berto, Francesco, and Plebani, Matteo. 2015. *Ontology and Metaontology: A Contemporary Guide*. New York: Bloomsbury Academic.

Chapter 8: *The Grounding Approach*, pp. 113-119.

Abstract: "In this chapter we introduce the approach of *grounding* theorists: a recent, non-standard metaontological view according to which the Quinean understanding of ontological questions as quantificational questions limits the explanatory power of ontological theories. In Section 1, we motivate intuitively the grounding theorist's key idea that ontology should not look just at what there is, but rather at what is *fundamental*: at what underpins and explains the existence of what, and at the things, if there are any, that underpin and explain the existence of anything else. Section 2 introduces the notion of *ground*, used in this approach to account for the idea of ontological fundamentality, and investigates its plausible formal properties. Section 3 examines what happens to the methodology of ontology if we accept the grounding view, and Section 4 looks at some open issues."

39. Bertrand, Michael. 2020. "We Need Non-factive Metaphysical Explanation." *Erkenntnis*:1-21.

First online 7 February 2020.

Abstract: "Suppose that A explains B. Do A and B need to be true? Provided that we have metaphysical explanation in mind, orthodoxy answers "yes:" metaphysical explanation is factive. This article introduces and defends a non-factive notion of metaphysical explanation. I argue that we need a non-factive notion of explanation in order to make sense of explanationist arguments where we motivate a view by claiming that it offers better explanations than its competitors. After presenting and rejecting some initially plausible rivals, I account for non-factive metaphysical explanation by drawing on existing applications of structural equation models to metaphysical grounding."

40. Bianchi, Silvia, and Giannotti, Joaquim. 2021. "Grounding Ontic Structuralism." *Synthese* no. 199:5205-5223.

Abstract: "A respectable assessment of priority-based ontic structuralism demands an elucidation of its metaphysical backbone. Here we focus on two theses that stand in need of

clarification: (1) the Fundamentality Thesis states that structures are fundamental, and (2) the Priority Thesis states that these structures are prior to putative fundamental objects, if these exist. Candidate notions to illuminate (1) and (2) such as supervenience and ontological dependence failed at this task. Our purpose is to show that grounding is the best competitor to articulate (1) and (2), and regiment such theses in a desirable unified way. Our strategy is two-fold. First, we make the case that grounding does better than ontological dependence and supervenience. Second, we show that the distinction between partial and full grounds permits us to respond to an objection raised by Kerry McKenzie against the proposal of interpreting priority-based Ontic Structuralism in the idiom of metaphysical determination. Our conclusion is that priority ontic structuralists have compelling reasons for adopting a grounding-based approach."

41. Bliss, Ricki. 2013. "Viciousness and the Structure of Reality." *Philosophical Studies* no. 166:399-418.

Abstract: "Given the centrality of arguments from vicious infinite regress to our philosophical reasoning, it is little wonder that they should also appear on the catalogue of arguments offered in defense of theses that pertain to the fundamental structure of reality. In particular, the metaphysical foundationalist will argue that, on pain of vicious infinite regress, there must be something fundamental. But why think that infinite regresses of grounds are vicious? I explore existing proposed accounts of viciousness cast in terms of contradictions, dependence, failed reductive theories and parsimony. I argue that no one of these accounts adequately captures the conditions under which an infinite regress—any infinite regress—is vicious as opposed to benign. In their place, I suggest an account of viciousness in terms of explanatory failure. If this account is correct, infinite grounding regresses are not necessarily vicious; and we must be much more careful employing such arguments to the conclusion that there has to be something fundamental."

42. ———. 2014. "Viciousness and Circles of Ground." *Metaphilosophy* no. 45:245-256.

Abstract: "Metaphysicians of a certain stripe are almost unanimously of the view that grounding is necessarily irreflexive, asymmetric, transitive, and well-founded.

They deny the possibility of circles of ground and, therewith, the possibility of species of metaphysical coherentism. But what's so bad about circles of ground?

One problem for coherentism might be that it ushers in anti-foundationalism: grounding loops give rise to infinite regresses. And this is bad because infinite grounding regresses are vicious. This article argues that circles of ground do not necessarily give rise to infinite regresses, and where they do, those regresses are not necessarily vicious."

43. ———. 2018. "Grounding and Reflexivity." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 70-90. New York: Oxford University Press.

"This paper aims to focus the reasons for which we might find reflexive instances of dependence unacceptable: a task that necessitates an investigation into what it even means for a fact to ground itself. In §1, I introduce the notion of ground along with the kinds of circles of ground I will be considering. In §2, I present several different reasons to motivate the need to think about circles of ground more seriously. In §3, I discuss possible metaphysically substantive reasons to deny that anything can be self-dependent. Both historically and contemporarily, philosophers have expressed worries over the ontological priority ordering, bootstrapping, and the connection between self-dependence and the necessary and the divine. In §4, I turn to a consideration of explanatory reasons to avoid circles of ground. I discuss connections between circularity, non-well-foundedness, and viciousness, along with the thought that circles of ground are unacceptable for the more (deceptively) humdrum reason that they give rise to trivial and uninformative explanations. I conclude that the most salient reasons we have for supposing grounding is irreflexive are explanatory rather than metaphysical, and that reasons to reject or accept instances of reflexivity need to be assessed with a greater eye to other of our commitments." (p. 71)

44. Block, Ned. 2014. "The Canberra Plan Neglects Ground." In *Qualia and Mental Causation in a Physical World: Themes from the Philosophy of Jaegwon Kim*, edited by Horgan, Terence, Sabates, Marcelo and Sosa, David, 105-133. Cambridge: Cambridge University Press.

"According to the Canberra Plan, the first step in a reductive physicalist enterprise is to functionally define the property to be reduced, and the second step is to find the physical property that fills that functional role.

Reductive physicalism is true for the mind if both steps can always be carried out for mental properties.

(...)

This chapter will argue that the point of view of the Canberra Plan neglects ground. I will consider a few attempts to graft an account of the physical/functional ground of mind onto the Canberra Plan, arguing that such attempts lead nowhere." (p. 105)

45. Bohn, Einar Duenger. 2018. "Indefinitely Descending Ground." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 167-181. New York: Oxford University Press.

"We often say that some facts obtain in virtue of others, for example that semantic facts obtain in virtue of facts about language-use, or that normative facts obtain in virtue of descriptive facts, or that mental facts obtain in virtue of physical facts. The question I'm interested in is: must such in-virtue-of chains eventually end in some facts that don't obtain in virtue of any other facts? Or can they go on indefinitely without end?(1)

In other words (to be clarified below), must the in-virtue-of relation be well-founded?

In what follows, I argue that it must not, and point to some reasons for it even actually not being so. More specifically, in Section 1, I introduce what is perhaps the closest we get to a standard notion of the in-virtue-of relation, namely a relation

of grounding; in Section 2, I argue that there is no good reason to think that this relation of grounding must be well-founded; and in Section 3, I argue more directly that it's not necessarily well-founded, and further that there are reasons to think it's actually non-well-founded." (p. 167)

(1) Note that there can be infinite chains that are limited, but I wish to talk about infinite chains that are unlimited; I here and throughout use the term 'indefinite' for that purpose. This should not be confused with the way 'indefinite' is sometimes used in the philosophy of mathematics, where there is a constructional or potential aspect to it, nor should it be confused with the way 'indefinite' is sometimes used in debates over vagueness, where there is an aspect of, well, vagueness to it.

46. Braver, Lee. 2012. *Groundless Grounds: A Study of Wittgenstein and Heidegger*. Cambridge, MA: MIT Press.

"As we have seen, Wittgenstein and Heidegger challenge a number of the assumptions and aspirations that have guided philosophy since its inception.

One of these, foundationalism, is the attempt to trace all knowledge back to a source or set of claims that, as necessarily true, secure the truth of all that is derived from them. Just as a valid argument produces only true conclusions from true premises, so a properly built system insulates the circulation of truth throughout its entirety. As Descartes argues, if we don't know that we know what we think we know, then we may not know it after all.

The problem, which has been with us nearly as long as philosophy itself, is that a base–superstructure organization requires an ultimate level which itself has no justifying foundation underneath it. Absent the troubled notion of self-justifying beliefs, we have either a bottom level hovering over the abyss or, as they say, it's turtles all the way down. Wittgenstein and Heidegger accept the first horn of this perennial dilemma. Stopping at an unjustified level only seems worrisome to a mindset conditioned by foundationalism to expect a transcendent ground which, more than being right,

cannot be wrong, an idea which is incompatible with finite creatures like us. Freed from this incoherent demand, we can accept the grounding afforded by human nature and cultural norms as both all that is possible and all that is needed. Once we are weaned off millennia-old cravings for the transcendent, we can learn to live with the human." (pp. 173-174)

47. Brenner, Andrew. 2020. "Explaining Why There is Something Rather than Nothing." *Erkenntnis*:1-17.

First online 7 June 2020.

Abstract: "It is sometimes supposed that, in principle, we cannot offer an explanation for why there is something rather than nothing. I argue that this supposition is a mistake, and stems from a needlessly myopic conception of the form explanations can legitimately take. After making this more general point, I proceed to offer a speculative suggestion regarding one sort of explanation which can in principle serve as an answer to the question "why is there something rather than nothing?" The suggestion is that there may be something rather than nothing in virtue of the truth of certain sorts of subjunctive conditionals."

48. ———. 2021. "How Does God Know That $2 + 2 = 4$?" *Religious Studies* no. 57:301-316.

Abstract: "Sometimes theists wonder how God's beliefs track particular portions of reality, e.g. contingent states of affairs, or facts regarding future free actions. In this article I sketch a general model for how God's beliefs track reality. God's beliefs track reality in much the same way that propositions track reality, namely via grounding. Just as the truth values of true propositions are generally or always grounded in their truthmakers, so too God's true beliefs are grounded in the subject matters of those beliefs (i.e. God believes that p in virtue of the fact that p).

This is not idle speculation, since my proposal allows the theist to account for God's true beliefs regarding causally inert portions of reality."

49. Brewer, Bill. 2019. "Basic Objects as Grounds: A Metaphysical Manifesto." In *The Nature of Ordinary Objects*, edited by Cumpa, Javier and Brewer, Bill, 48-62. Cambridge: Cambridge University Press.

"Introduction: According to our commonsense world-view, macroscopic material objects endure, are never precisely collocated with each other, and may survive the loss of at least some of their parts. But these commitments are notoriously difficult to reconcile. My project in what follows is to elaborate an account that succeeds in reconciling them in the most basic cases, of what I call Natural Continuants, and to explore its potential as an adequate overall theory by explaining how such basic objects may serve as the grounds for various other material things." (p. 48)

50. Bryant, Amanda. 2018. "Naturalizing Grounding: How Theories of Ground Can Engage Science." *Philosophy Compass* no. 13:1-12.

Abstract: "This paper surveys some of the grounding literature searching for points of contact between theories of ground and science. I find that there are some places where a would-be naturalistic grounding theorist can draw inspiration. I synthesize a list of recommendations for how science may be put to use in theories of ground. I conclude that the prospects for naturalizing the metaphysics of ground are bright."

51. ———. 2020. "Physicalism." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 484-500. New York: Routledge.

"Before determining whether grounding may be fruitfully applied to physicalism, we will need some sense of what physicalism is supposed to be. To that end, Section 1 will lay out some key metaphysical physicalist theses. Section 2 will discuss supervenience and some central challenges to supervenience physicalism (see also Kovacs, Chapter 24, this volume). Section 3 will introduce the notion of grounding and use it to formulate physicalism. Finally, Section 4 will consider the relative merits and demerits of grounding physicalism. We will see that while

grounding physicalism arguably improves on supervenience physicalism in some respects, serious work remains if grounding is to enable a clearly viable formulation of physicalism." (p. 484)

52. ———. 2022. "Grounding Interventionism: Conceptual and Epistemological Challenges." *Metaphilosophy*.

First on line 18 February 2022.

Abstract: "Philosophers have recently highlighted substantial affinities between causation and grounding, which have inclined some to import the conceptual and formal resources of causal interventionism into the metaphysics of grounding. The prospect of grounding interventionism raises two important questions: What exactly are grounding interventions, and why should we think they enable knowledge of grounding? This paper approaches these questions by examining how causal interventionists have addressed (or might address) analogous questions and then comparing the available options for grounding interventionism. The paper argues that grounding interventions must be understood in worldly terms, as adding something to or deleting something from the roster of entities, or making some fact obtain or fail to obtain. It considers three bases for counterfactual assessment: imagination, structural equation models, and background theory. The paper concludes that grounding interventionism requires firmer epistemological foundations, without which the interventionist's epistemology of grounding is incomplete and ineffectually rationalist."

53. Busck Gundersen, Eline. 2013. "Response-Dependence and Conditional Fallacy Problems." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 369-392. Munich: Philosophia Verlag.

"Response-dependence theses seem vulnerable to conditional fallacy problems like those that afflict the simple conditional analysis of dispositions.

This paper is an attempt to clear response-dependence theses of these charges. I discuss what the counterexamples show, and how they might be resisted. I consider three suggested solutions from the literature on response-dependence: Johnston's construal of response-dependence theses in explicitly dispositional terms, Blackburn's 'elasticity' approach, and Wright's provisional equations. I develop a fourth strategy based on relativisation of the 'favourable conditions' that play a central role in response-dependence theses. I also table, but do not discuss in detail, a fifth suggestion inspired by Lewis's revised conditional analysis of dispositions. I conclude that the resources can be found to defend response-dependence theses against conditional fallacy problems." (p. 369)

54. Cameron, Margaret. 2014. "Is Ground Said-in-Many-Ways?" *Studia Philosophica Estonica* no. 7.2:29-55.

Abstract: "Proponents of ground, which is used to indicate relations of ontological fundamentality, insist that ground is a unified phenomenon, but this thesis has recently been criticized. I will first review the proponents' claims for ground's unicity, as well as the criticisms that ground is too heterogeneous to do the philosophical work it is supposed to do. By drawing on Aristotle's notion of homonymy, I explore whether ground's metaphysical heterogeneity can be theoretically accommodated while at the same time preserving its proponents' desideratum that it be a unified phenomenon."

55. Cameron, Ross P. 2016. "Do We Need Grounding?" *Inquiry: An Interdisciplinary Journal of Philosophy* no. 59:382-397.

Abstract: "Many have been tempted to invoke a primitive notion of grounding to describe the way in which some features of reality give rise to others. Jessica Wilson argues that such a notion is unnecessary to describe the structure of the world: that we can make do with specific dependence relations such as the part-whole relation or the determinate-determinable relation, together with a notion of absolute fundamentality. In this paper I argue that such resources are inadequate to describe the particular ways in which some parts of reality give rise to others, and thus that we do in fact need grounding."

"Conclusions: I hope to have vindicated the following claims: first, TDB [asymmetrical dependence of truth on being] truth; second, TDB isue in virtue of facts concerning the nature of our linguistic competence with the truth-predicate; third, a minimalist can perfectly explain, in his framework, these facts and thereb,· why TDB true" (p. 321)

57. Carmichael, Chad. 2016. "Deep Platonism." *Philosophy and Phenomenological Research* no. 92:307–328.

"According to the bundle theory, particulars are bundles of universals. For example, this blue cup is a bundle of universals including blueness, cuphood, etc. The elements of a bundle are said to be compresent, which distinguishes genuine bundles from arbitrary groupings of unrelated universals. Every particular, on this view, is a bundle of compresent universals. Given the plausible claim that all the facts about bundles are grounded in facts about their members, the bundle theory entails the thesis that all the facts about particulars are grounded in facts purely about universals. This thesis is what I call deep platonism."

(...)

"For a variety of reasons, I reject the bundle theory. But I accept deep platonism. I begin by showing how to meet the main objection to deep platonism (which is also the main objection to the bundle theory): that it is inconsistent with the possibility of distinct qualitative indiscernibles (section 1). The key to my reply is a non-standard theory of haecceities as non-well-founded properties of a certain sort. Then I will respond to

several objections (section 2). Finally, I will argue that we should accept deep platonism on the basis of considerations of parsimony about the fundamental (section 3)." (pp. 307-308, notes omitted)

58. Carnino, Pablo. 2014. "On the Reduction of Grounding to Essence." *Studia Philosophica Estonica* no. 7:56-71.

Abstract: "In a recent article, Fabrice Correia explores the project of reducing the notion of grounding to that of essence. He then goes on to provide several candidate definitions and test each of them against a number of objections. His final take on the situation is, roughly, that two of the definitions can handle all of the considered objections.

The aim of this paper is to re-evaluate Correia's conclusions in the light of two sources of insights: Firstly, I will argue that one of the objections treated by Correia has been somewhat underestimated, and that it still constitutes a threat against definitions of grounding in terms of essence. Secondly, there are at least two further objections that should be considered by the advocate of such definitions. As I will show, one of them can be neutralized; but the other one is more serious and suggests a clear dialectical edge to an operationalist definition."

59. ———. 2017. "Grounding Is Not Superinternal." *Thought: A Journal of Philosophy* no. 6:24-32.

Abstract: "Whenever a fact P grounds another fact Q, one may ask why that is so. Karen Bennett (2011) and Louis deRosset (2013) independently argue that grounding facts—such as the fact that P grounds Q—are always grounded in their grounds-part (what stands in P's position). Bennett calls this the view that grounding is superinternal. My aim in this paper is to argue that grounding is not superinternal. I will do so by

showing that superinternality, together with some widely accepted formal features of grounding—namely, transitivity and necessitation—yield implausible claims about how necessities are explained. Then, I will discuss how my argument compares with Dasgupta’s (2014) argument against superinternality.”

60. Carrara, Massimiliano, and Martino, Enrico. 2015. "Grounding Megethology on Plural Reference." *Studia Logica* no. 103:697-711.

Abstract: "In *Mathematics is megethology* (Lewis, *Philos Math* 1:3–23, 1993) Lewis reconstructs set theory combining mereology with plural quantification. He introduces megethology, a powerful framework in which one can formulate strong assumptions about the size of the universe of individuals. Within this framework, Lewis develops a structuralist class theory, in which the role of classes is played by individuals. Thus, if mereology and plural quantification are ontologically innocent, as Lewis maintains, he achieves an ontological reduction of classes to individuals. Lewis’work is very attractive. However, the alleged innocence of mereology and plural quantification is highly controversial and has been criticized by several authors. In the present paper we propose a new approach to megethology based on the theory of plural reference developed in To be is to be the object of a possible act of choice (Carrara, *Stud Log* 96: 289–313, 2010). Our approach shows how megethology can be grounded on plural reference without the help of mereology."

61. Chilovi, Samuele. 2020. "Grounding-based Formulations of Legal Positivism." *Philosophical Studies* no. 177:3283–3302.

Abstract: "The goal of this paper is to provide an accurate grounding-based formulation of positivism in the philosophy of law. I start off by discussing some simple formulations, based on the ideas that social facts are always either full or partial grounds of legal facts. I then raise a number of objections against these definitions: the full grounding proposal rules out possibilities that are compatible with positivism; the partial grounding proposal fails, on its own, to vindicate the distinctive role that is played by social facts within positivist accounts of law. Then, I present a more adequate and insightful formulation capable of solving their problems, which crucially relies on a robust notion of a social enabler. Finally, I model inclusive and exclusive positivism on the resulting template, and set out the advantages of the ground-enablers proposal."

62. ———. 2021. "Grounding Entails Supervenience." *Synthese* no. 198:1317–1334.

Abstract: "Do grounding claims entail corresponding supervenience claims? The question matters, as a positive answer would help grounding theorists address worries that their hyperintensional primitive is obscure, and also increase the argumentative strategies that are available within ground-theoretic frameworks for metaphysical inquiry. Stephan Leuenberger („From Grounding to Supervenience?", 2014a) argues for a negative response, by specifying some candidate principles of entailment and then claiming that each of them is subject to counterexamples. In this paper, I critically assess those principles and the objections he raises against them, and advocate a novel entailment principle that overcomes all the problems suffered by those other principles. The principle I

defend places a supervenience-based constraint on grounding claims, and secures a substantive connection between grounding and modality, weaker than necessitation."

Abstract: "Law being a derivative feature of reality, it exists in virtue of more fundamental things, upon which it depends. This raises the question of what is the relation of dependence that holds between law and its more basic determinants. The primary aim of this paper is to argue that grounding is that relation. We first make a positive case for this claim, and then we defend it from the potential objection that the relevant relation is rather rational determination.(1) Against this challenge, we argue that the apparent objection is really no objection, for on its best understanding, rational determination turns out to actually be grounding. Finally, we clarify the framework for theories on law-determination that results from embracing our view; by way of illustration, we offer a ground-theoretic interpretation of Hartian positivism, and show how it can defuse an influential challenge to simple positivist accounts of law."

First online 8 November 2021.

Abstract: "A new strategy in philosophy of law appeals to explanatory gap arguments to attack legal positivism. We argue that the strategy faces a dilemma, which derives from two available readings of the constraint it places on legal grounding. To this end, we elaborate the most promising ways of spelling

out the epistemic constraints governing law-determination and show that each of the arguments based on them has problems. Throughout the paper, we evaluate a number of explanatory requirements, ultimately with a view to shedding light on the explanatory nature of both grounding in general and legal grounding in particular."

Abstract: "I argue that three different notions of essence—temporal, definitional, and modal— are all distinct notions, and are all philosophically useful. After defining the different notions, I discuss the philosophical problems each addresses."

66. Claas, Jan. 2021. "The Grounds and the Components of Concepts." *Erkenntnis*:1-21.

"In this paper I investigate the idea that in conceptual analysis we are in a substantial way concerned with revealing metaphysical grounds. I argue that a recent proposal fails, according to which we aim to reveal what complex concepts are grounded in.

The notion of *composition*, rather than that of *grounding*, is the best way to understand the intuitive hierarchy of concepts. In an analysis we reveal the *components* or *parts* of complex concepts and their structure. Finally, I propose an alternative role for grounding in our accounts of analysis: in analyses we reveal truths about the composition of concepts that serve as grounds for truths about their *functions*, which are what we want to understand."

67. Clark, Michael J. 2018. "What Grounds What Grounds What." *The Philosophical Quarterly* no. 68:38-59.

Abstract: "If there are facts about what grounds what, are there any grounding relations between them? This paper suggests so, arguing that transitivity and amalgamation principles in the logic of grounding yield facts of grounding that are grounded by others. I develop and defend this view and note that combining it with extant accounts of iterated grounding commits us to seemingly problematic instances of ground-theoretic

overdetermination. Taking the superinternality thesis as a case study, I discuss how defenders of this thesis should respond. It emerges that our discussion puts pressure on superinternalists to make an interesting qualification to their view: to only regard as a fundamental metaphysical law a version of the superinternality thesis that is restricted to minimal and immediate grounding."

68. Clark, Michael J., and Liggins, David. 2012. "Recent Work on Grounding." *Analysis* no. 72:812-823.

"'In virtue of' is a mainstay of philosophical discourse. So are similar expressions, such as 'depends on', 'is prior to', and 'is determined by'. It is reasonable to suppose that these expressions are all used to express claims of non-causal dependence, or – as is becoming the standard term – 'grounding'.

Whilst causation has been studied extensively, it is only in recent years that grounding has become established as a major concern of metaphysics. In this article, we will take stock by bringing together some of the main themes to have emerged in the recent debate. We begin by introducing the notion of grounding (Section 1). Then we discuss scepticism about grounding (Section 2) before setting out some of the main questions about grounding under current investigation (Section 3). The final section introduces further avenues for future research." (p. 812)

69. Clark, Michael J., and Wildman, Nathan. 2018. "Grounding, Mental Causation, and Overdetermination." *Synthese* no. 195:3723-3733.

Abstract: "Recently, Kroedel and Schulz have argued that the exclusion problem—which states that certain forms of non-reductive physicalism about the mental are committed to systematic and objectionable causal overdetermination—can be solved by appealing to grounding. Specifically, they defend a principle that links the causal relations of grounded mental events to those of grounding physical events, arguing that this renders mental–physical causal overdetermination unproblematic. Here, we contest Kroedel and Schulz's result.

We argue that their causal-grounding principle is undermotivated, if not outright false. In particular, we contend that the principle has plausible counterexamples, resulting from the fact that some mental states are not fully grounded by goings on 'in our heads' but also require external factors to be included in their full grounds. We draw the sceptical conclusion that it remains unclear whether non-reductive physicalists can plausibly respond to the exclusion argument by appealing to considerations of grounding."

"To summarize then, this book deals with the place that perspectives must occupy in the world. Besides that I will attend to some of these cases later, this book is not particularly interested in establishing whether some of these perspectives are better understood as mere ways of speech. Think, for instance, of uncontroversial cases regarding whether you are late for an appointment or not, or what actually is nearby, or some political and partisan opinions about events, or which scientific paradigm better accounts for gravity, or whether Secretariat (a horse) is an "athlete." These are, with no doubt, very interesting disputes. However, the core of this book must analyze in depth substantial ontological arguments regarding the existence of what I call metaphysical points of view." (p. VIII)

Annotated bibliography on metaphysical grounding. Second part: Cor-Fin

Bibliography

1. Correia, Fabrice. 2000. "Propositional Logic of Essence."
Journal of Philosophical Logic no. 29:295-311.

"Introduction: The present paper can be considered as a companion to Kit Fine's papers 'The Logic of Essence' and 'Semantics for the Logic of Essence'.(1) In the first paper Fine presents a logical system for quantified essentialist statements, E_5 .(2) In the second he presents a semantics for a variant of the system, and proves this system adequate (i.e. sound and complete) with respect to that semantics. I propose here a Kripke-style semantics for $E_5\pi$, a propositional counterpart of E_5 , and prove the adequacy of the latter with respect to the former.

There are many, more or less natural, more or less interesting, ways to extend E_5 (or one of its cousins) to a system of quantified logic of essence. $E_5\pi$, together with its semantics, is intended to constitute the core of subsequent, more expressive, logics of essence. So, the study of $E_5\pi$ per se, regardless of possible quantificational extensions, is of great interest.

Another interesting point about the present study lies in the fact that the completeness proof given here is much simpler than the one Fine gives for his quantificational system.

The reader is strongly urged to take a look at Fine's papers on the logic of essence, if only because no detailed comparison

- between Fine's material and mine will be offered." (p. 295)
2. ———. 2005. *Existential Dependence and Cognate Notions*. Munich: Philosophia Verlag.

Contents: Introduction 11; 1. Preamble 17; 2. Simple Dependence I: Presentation, and Rejection of Some Accounts 43; 3. Metaphysical Grounding 57; 4. Simple Dependence II: The Foundational Approach 69; 5. Some Other Notions of Existential Dependence 93;

"The use of notions of existential dependence pervades the whole history of philosophy, and as the above remarks suggest there are good reasons to consider them as notions of central philosophical importance. Yet they have never been a topic of philosophical research of their own—at least in the contemporary period—a few exceptions aside. The first notable exception is Husserl with his third *Logical Investigation* on modal mereology. Yet even if in this work Husserl not only uses, but also spends time to define some notions of existential dependence, the result is quite imprecise, and how exactly Husserl's views should be understood is still a matter of controversy.

The remaining exceptions are three. There is first and foremost the work of the Manchester triad which, at least at the beginning, to a certain extent tries to dig up the Husserlian investigations. Kevin Mulligan, Peter Simons and Barry Smith are responsible for "introducing" existential dependence to the analytic world, and two approaches to dependence pervade an important amount of their work, namely the modal-existential approach and the essentialist-existential approach. The second exception is E. J. Lowe and his purely essentialist approach, and finally the third is Kit Fine, to whom I shall also attribute the essentialist-existential approach." (p. 12)

(...)

"My plan is the following. In the Preamble, I introduce notions and principles that will be useful in the rest of this work. After a short break, chapter 2 introduces the simplest notion of existential dependence, presents some existing accounts of this notion and some objections to these accounts. In chapter 3 the crucial notion of grounding is introduced. In chapter 4, I then propose my own account of simple existential dependence, and show how it escapes the difficulties faced by its rivals. Chapter 5 deals with other forms of existential dependence—like generic dependence, disjunctive dependence and temporalized forms of existential dependence—and finally chapter 6 is about supervenience." (p. 15)

3. ——. 2006. "Generic Essence, Objectual Essence, and Modality." *Noûs* no. 40:753-767.

Abstract: "When thinking about the notion of essence or of an essential feature, philosophers typically focus on what I will call the notion of objectual essence. The main aim of this paper is to argue that beside this familiar notion stands another one, the notion of generic essence, which contrary to appearance cannot be understood in terms of the familiar notion, and which also fails to be correctly characterized by certain other accounts which naturally come to mind as well. Some of my objections to these accounts are similar to some of Kit Fine's compelling objections to the standard modal account of (objectual) essence (Fine 1994). In the light of these objections, Fine advances the view that it is metaphysical necessity which has to be understood in terms of essence, rather than the other way around, and takes essence to be unanalyzable.

When formulating his view, Fine had only objectual essence in mind (or had both concepts in mind, but assumed that the generic is a special case of the objectual), and for that reason, I will argue, his account fails. I will suggest that Fineans should modify their view, and take it that metaphysical necessity is to be understood in terms of the two notions of essence—a view I myself find appealing. Finally, I will end by suggesting a further move which reduces the objectual to the generic, making metaphysical necessity reducible to generic essence alone—a move with which I myself have some sympathy."

4. ———. 2010. "Grounding and Truth-Functions." *Logique et Analyse* no. 53:251-279.

"The plan of the paper is the following. I first discuss the question of the logical form of statements of grounding (§1). There I distinguish between the predicational view on the logical form of these statements, and the operational view, which I endorse. I then introduce the notions of factual identity and factual equivalence, and argue that the formulation of a logic of grounding must go in tandem with the formulation of a logic of factual identity in case one opts for predicationalism, and of a logic of factual equivalence if one opts for operationalism (§2). In §3, I define the language relative to which I subsequently formulate the logic of grounding and factual equivalence.

In §4 I lay down structural principles for grounding and factual equivalence.

In §5, I then propose principles for the logic of factual equivalence and truth-functions, and in §6, I do the same for the logic of grounding and truth-functions. Finally, I present a semantical characterization of the resulting logical system and prove the system to be sound and complete with respect to the semantics (§7)" (pp. 252-263)

5. ———. 2011. "From Grounding to Truth-Making: Some Thoughts." In *Mind, Values, and Metaphysics. Philosophical Essays in Honor of Kevin Mulligan. Vol. 1*, edited by Reboul, Anne, 85-98. Dordrecht: Springer.

Abstract: "The number of writings on truth-making which have been published since Kevin Mulligan, Peter Simons and Barry Smith's seminal, rich and deep article 'Truth-Makers' in 1984 is considerable. Some deal with the theory of the notion, some with its applications and some with both. This chapter adds up to the pile of writings which focus on the theory. I focus on one account of truth-making I find plausible, the view that for a

truth-bearer to be made true by an entity is for it to be the case that the truth-bearer is true because the entity exists, where 'because' is understood as expressing a form of objective, metaphysical explanation which is now often subsumed under the label 'grounding'. Taking this account for granted, we may distinguish, amongst the general principles governing truth-making, those which derive from more basic principles governing the notions in terms of which it is defined, from those which do not. Which principles compose the first class, which are the more basic principles from which they derive and how do the former derive from the latter? I try to make some steps towards an answer to this difficult question."

- "As I see it, the main interest of this study is threefold. First, the study provides a precise account of a pretheoretic notion of logical explanation which, I take it, is of great intrinsic interest. Second, it shows that the concept of logical grounding can be used to provide a new angle of approach in logic, which is illuminating and possesses a certain power of unification. And third, it shows that the concept of logical grounding is not irremediably obscure or fruitless, thereby providing (i) a direct response to some forms of scepticism about this concept and (ii) an element of response to certain forms of scepticism about more general concepts of grounding (in particular, that of metaphysical grounding)." Abstract: "I give a semantic characterization of a system for the logic of grounding similar to the system introduced by Kit Fine in his "Guide to Ground", as well as a semantic characterization of a variant of that system which excludes the possibility of what Fine calls 'zero-grounding'."

10. ———. 2020. "Granularity." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 228-243. New York: Routledge.

"Grounding is a hyperintensional notion: necessarily equivalent sentences need not be equivalent from a ground-theoretic perspective. How fine-grained, exactly, is grounding? There is a striking lack of consensus on this question. In this chapter, I try to systematize and review the main options that have been put forward in the literature. For reasons that have to do with both naturalness and convenience, I for the most part take the question to be about what is sometimes called, following Kit Fine's (2012a) terminology, strict full grounding, and I take for granted a conception of grounding as a relation that is many-to-one and non-factive. I discuss the consequences of making alternative assumptions only in the very last section." (p. 228, notes omitted)

11. ———. 2021. "A New Argument for the Groundedness of Grounding Facts." *Erkenntnis*:1-16.

First online 8 June 2021.

Abstract: "Many philosophers have recently been impressed by an argument to the effect that all grounding facts about "derivative entities"—e.g. the facts expressed by the (let us suppose) true sentences 'the fact that Beijing is a concrete entity is grounded in the fact that its parts are concrete' and 'the fact that there are cities is grounded in the fact that p', where 'p' is a suitable sentence couched in the language of particle physics—must themselves be grounded. This argument relies on a principle, Purity, which states that facts about derivative entities are non-fundamental. Purity is questionable.

In this paper, I introduce a new argument—the argument from Settledness—for a similar conclusion but which does not rely on

Purity. The conclusion of the new argument is that every “thick” grounding fact is grounded, where a grounding fact [F is grounded in G, H, ...] is said to be thick when at least one of F, G, H, ... is a fact—a condition that is automatically satisfied if grounding is factive. After introducing the argument, I compare it with the argument from Purity, and I assess its cogency relative to the relevant accounts of the connections between grounding and fundamentality that are available in the literature.”

12. ———. 2021. "Ontological dependence, Grounding and Modality." In *The Routledge Handbook of Modality*, edited by Bueno, Otávio and Shalkowski, Scott A. , 100-113. New York: Routledge.

"Ontological dependence and grounding are two important items in the metaphysician’s toolbox: both notions can be used to formulate important philosophical claims and to define other notions that play a central role in philosophical theorising. Philosophical inquiry about ontological dependence and (especially) grounding has been very lively over the past few years, making it difficult to write a short review article on any of them, let alone a short review article on both.

I try to reach a good compromise between a discussion of each notion taken separately and a discussion of how they relate to one another." (p. 100)

14. ———. 2012. "Grounding: An Opinionated Introduction." In *Metaphysical Grounding: Understanding the Structure of Reality*, edited by Correia, Fabrice and Schnieder, Benjamin, 1-36. Cambridge: Cambridge University Press.

"Some of the most important questions in philosophy, we believe, concern matters of priority.

(...)

What concerns us here is not so much whether these specific claims are true, but rather something they have in common topic-wise: it seems to us that they all target a particular sort of non-causal priority which we would like to call *grounding* and which we regard as a phenomenon of the highest philosophical importance.

This volume collects papers in which this phenomenon is addressed from various (both sympathetic and critical) sides. Summaries of those papers are provided in Section 6 of this introduction. But first, we want to walk you through an opinionated survey of pertinent issues, preparing the field and putting the papers into perspective.

While the recent debate about grounding is not older than a decade, the topic has been dealt with before. So, we start by briefly walking through some important stages of the history of grounding. We then devote two sections on systematic issues, one on the theory of grounding proper, and one on its connections with other notions.(1)" (pp. 1-2)

(1) For further reading we recommend a survey article by Trogon (forthcoming). While his paper naturally has some overlap with ours, he often has a different focus so that the two papers complement each other.

15. Correia, Fabrice, and Skiles, Alexander. 2019. "Grounding, Essence, and Identity." *Philosophy and Phenomenological Research* no. 98:642-670.

Abstract: "Recent metaphysics has turned its focus to two notions that are—as well as having a common Aristotelian pedigree—widely thought to be intimately related: grounding and essence. Yet how, exactly, the two are related remains opaque. We develop a unified and uniform account of grounding and essence, one which understands them both in terms of a generalized notion of identity examined in recent work by Fabrice Correia, Cian Dorr, Agustin Rayo, and others. We argue that the account comports with antecedently plausible principles governing grounding, essence, and identity taken individually, and illuminates how the three interact. We also argue that the account compares favorably to an alternative unification of grounding and essence recently proposed by Kit Fine."

16. Cusbert, John, and Millier, Kristie. 2018. "The Unique Groundability of Temporal Facts." *Philosophy and Phenomenological Research* no. 94:410-432.

Abstract: "The A-theory and the B-theory advance competing claims about how time is grounded. The A-theory says that A-facts are more fundamental in grounding time than are B-facts, and the B-theory says the reverse.

We argue that whichever theory is true of the actual world is also true of all possible worlds containing time. We do this by arguing that time is uniquely groundable: however time is actually grounded, it is necessarily grounded in that way. It follows that if either the A-theory or the B-theory is actually false, then it is necessarily false."

17. Daly, Chris. 2012. "Scepticism about Grounding." In *Metaphysical Grounding: Understanding the Structure of Reality* edited by Correia, Fabrice and Schnieder, Benjamin, 81-100. Cambridge: Cambridge University Press.

"A minimal claim that any theory of grounding will make is that talk of grounding is intelligible. Yet it is controversial whether such talk is intelligible.

Two (mutually exclusive) strategies to support that minimal claim are available.

One is to define 'grounding' using terms that are already well understood.

The other is to take 'grounding' as a primitive term but to use various ways to convey its meaning. This chapter will offer sceptical responses to both strategies whilst paying special attention to the second. The chief contention of the chapter is that, if treated as a primitive, 'grounding' is unintelligible.

Grounding theorists are alive to this sceptical response and have tried to counter it. The chapter will seek to show that their attempts to date fail."

18. Dasgupta, Shamik. 2014. "On the Plurality of Grounds." *Philosophers' Imprint* no. 13:1-28.

Recent metaphysics has contained a good deal of discussion about the notion of *ground*.

(...)

"In this spirit, one aim of this paper is to argue that ground is *irreducibly plural*. It is well known that something's ground can be a plurality — the occurrence of a conference is an example of something that is presumably grounded in a multitude of facts concerning the actions of its many participants. *Those* facts together are what explains why there is a conference occurring, even though none of them is a sufficient explanation individually. But the literature uniformly assumes that what is grounded must be a single fact. Here I disagree and argue that what is grounded can be a plurality too:

there can be cases in which *they*, the members of a plurality, *are* explained in more fundamental terms, even though none of them admits of explanation on its own." (pp. 1-2)

19. ———. 2014. "The Possibility of Physicalism." *The Journal of Philosophy* no. 111:557-592.

"It has been suggested that many philosophical theses—physicalism, nominalism, normative naturalism, and so on—should be understood in terms of ground.⁽¹⁾ Against this, Ted Sider has argued that ground is ill-suited for this purpose.⁽²⁾ Here I develop Sider's objection and offer a response. In doing so I develop a view about the content of these philosophical theses, and hence about how to understand disagreements over them." (p. 557)

(1) For some recent examples, see Kit Fine, "The Question of Realism," *Philosophers' Imprint*, 1 (2001): 1–30; Gideon Rosen, "Metaphysical Dependence: Grounding and Reduction," in B. Hale and A. Hoffmann, eds., *Modality: Metaphysics, Logic, and Epistemology* (Oxford: Oxford University Press, 2010), pp. 109–36; and Jonathan Schaffer, "On What Grounds What," in D. Chalmers, D. Manley, and R. Wasserman, eds., *Metametaphysics: New Essays on the Foundations of Ontology* (Oxford: Clarendon Press, 2009), pp. 347–83. The suggestion is not new; indeed these authors take themselves to be reinvigorating a traditional conception of these issues that stems back at least to the ancient Greeks.

20. ———. 2016. "Metaphysical Rationalism." *Noûs* no. 50:379-418.

Abstract: "The Principle of Sufficient Reason states that everything has an explanation. But different notions of explanation yield different versions of this principle. Here a version is formulated in terms of the notion of a "grounding" explanation.

Its consequences are then explored, with particular emphasis on the fact that it implies necessitarianism, the view that every truth is necessarily true. Finally, the principle is defended from

a number of objections, including objections to necessitarianism. The result is a defense of a “rationalist” metaphysics, one that constitutes an alternative to the contemporary dogmas that some aspects of the world are “metaphysically brute” and that the world could in so many ways have been different.”

21. ———. 2017. "Constitutive Explanation." *Philosophical Issues* no. 27:74-97.

"I will argue that ground can be significantly deflated: one can hold that it corresponds to no part of reality, that it is not primitive in any metaphysically significant sense, even that it is a person- or culture-relative notion with noncognitive elements, and yet still find it philosophically important. I will not argue that the best conception of ground is maximally deflationary in all these respects. But it is worth asking what the limit case looks like, if only to clarify whether certain objections to ground target the core notion or just inflated varieties.(1)" (pp. 74-75)

(1) To be clear, the conception of ground I initially latched onto was not deflationary in all these respects. It is only recently that I've come to see that it can be deflated more than I had previously thought.

22. De Florio, Ciro. 2018. "On Grounding Arithmetic." In *From Arithmetic to Metaphysics: A Path Through Philosophical Logic*, edited by Giordani, Alessandro and Florio, Ciro de, 103-118. Berlin: De Gruyter.

Abstract: "Philosophy of mathematics of last fifty years has been dominated by the metaontological stance according to which one fundamental problem of the ontology of mathematical theories is the existence of mathematical objects and the related epistemic access to them. But during the last ten years another fecund and promising metaphysical framework has been developed: the key idea (which goes back to Aristotle) is that the main problem of metaphysics is about the relation of grounding among various levels of reality. Although this approach should be relevant for almost all the metaphysical questions, however,

there are few attempts to extend these intuitions to the debate in philosophy of mathematics. The aim of this, preliminary, work is analysing some possible outcomes of the grounding approach in metaphysics of mathematics."

23. De Rizzo, Julio. 2019. *Reasons Why Not: On the Positive Grounds of Negative Truths*. Berlin: J. B. Metzler.

"A suggestive way of turning this slogan [*Reality is ultimately positive*] into a precise thesis makes use of the fashionable ideology of *grounding*: roughly put, the idea of a non-causal connection between truths expressible by claims to the effect that some truths obtain *because* other truths obtain. (More on this in due course.) When this is the case, the latter truths are typically said to be more *fundamental* than the former.

In this manner, grounding is taken to shed light on theses which have a bearing on how truths of a certain class are structured relatively to another class or other classes of truths. Thus the thesis of physicalism, for example, might be understood as the thesis that physical truths ground truths about consciousness, i.e. that the latter truths obtain *because* physical truths obtain. By way of analogy, one can expect that the bias against negativity announced in the slogan be captured by the claim that negative truths obtain because positive truths do, i.e. that positive truths *ground* negative ones. Henceforth, I will label this the *positivist thesis*, and the position thereby characterized *positivism*.

The main aim of the present study is to examine the positivist thesis and the position it characterizes in detail. The task is twofold. Firstly, to clarify what the thesis amounts to; and secondly, to explore its credentials relative to some specific domains of negative truths." (pp. 2-3)

24. ——. 2020. "The Ground of All Negative Existential Truths." *Critica* no. 52:129-148.

Summary: "A natural proposal for the grounds of negative existential truths, such as that Vulcan does not exist, states that these truths are grounded in the totality truth affirming the existence of every existent thing together with the truth that

they are all. In this paper I will put forward three objections to straightforward formulations of this idea, and argue that a change in the usual grammar of grounding claims, allowing for pluralities of sentences to express not only grounds, but also groundees, is effective in making the account immune to the objections raised."

25. ———. 2021. "Grounding Grounds Necessity." *Analysis* no. 80:639-647.

Abstract: "Drawing from extensions of existing ideas in the logic of ground, a novel account of the grounds of necessity is presented, the core of which states that necessary truths are necessary because they stand in specific grounding connections."

26. ———. 2021. "A Ground-theoretical Modal Definition of Essence." *Analysis*.

First Online 20 September 2021.

Abstract: "I provide a case-by-case definition of essential truths based on the notions of metaphysical necessity and ontological dependence. Relying on suggestions in the literature, I adopt a definition of the latter notion in terms of the notion of ground. The resulting account is adequate in the sense that it is not subject to Kit Fine's famous counterexamples to the purely modal account of essence. In addition, it provides us with a novel conception of truths pertaining to the essence of objects, which might help to dispel doubts on the legitimacy of the notion of essence itself."

27. Declos, Alexandre. 2021. "More Grounds for Grounding Nominalism." *Philosophia* no. 49:49-70.

Abstract: "In this paper, I examine Peter Schulte's "Grounding Nominalism" (Schulte, 2018), understood as the claim that first-order properties and relations are grounded in the concrete particulars which instantiate them. While Schulte offered reasons to think that this view is consistent, along with answers to a number of objections, a more straightforward argument for GN is still needed. I take on this task here, by discussing and defending what I call the "argument from

abstraction". The latter, I suggest, offers more grounds to Grounding Nominalism."

My central concern here – violations of the Principle of Sufficient Reason (hereafter: ‘PSR’) – does indeed stem from my engagement with two figures from the history of philosophy: Leibniz and Spinoza. Both of these philosophers are big fans of the Principle of Sufficient Reason, the principle according to which each thing that exists has an explanation.(1) Indeed, a strong case can be made that each of these thinkers structures his entire system around the PSR more or less successfully.(2) However, despite these similarities, the character of each philosopher’s commitment to the PSR differs, and the differences have illuminating implications for our understanding of the power of these rationalist systems and for the metaphysical issues these philosophers take up that concern us today. One way to distill these differences is by exploring the perhaps surprising ways violations of the PSR arise for Leibniz and Spinoza. It will turn out that Leibniz is, or would be, unable to handle such violations, while Spinoza can handle them more or less in stride in his more resilient and, in some ways, more exotic, rationalist system." 29. ———. 2014. "Razing Structures to the Ground." *Analytic Philosophy* no. 55:276-294.

"However, despite this bulwark of support for grounding, I want here at least to begin a new challenge to this now popular

notion. I think that there are reasons to doubt that there are any instances of grounding, and I think that these reasons are broadly in keeping with the spirit of Quine's best argument against modality: what I call the argument from arbitrariness. Once we see the force of this argument against grounding, we will be in a position, I believe, to advance a powerful argument for something like existence monism, a monism more extreme than the priority monism that Schaffer defends." (p. 278)

30. deRosset, Louis. 2010. "Getting Priority Straight." *Philosophical Studies* no. 149:73-97.

"Here is the plan. I will start by trying to get a little clearer on what the priority theorist claims (Sect. 1). Then I will articulate a constraint on the kind of explanation central to the priority theorist's view (Sect. 2). I will show how that constraint makes trouble for the priority theorist (Sect. 3). I will review two avenues of response available to priority theorists, and provide reasons for thinking that neither are satisfactory (Sect. 4). Next I will articulate a more cautious variant of priority theory that avoids the trouble, and show that it nevertheless faces similar problems (Sect. 5). I will conclude with a brief discussion of the prospects for retaining the spirit of priority theory while abandoning its letter (Sect. 6)."

31. ———. 2011. "What is the Grounding Problem?" *Philosophical Studies* no. 156:173-197.

Abstract: "A philosophical standard in the debates concerning material constitution is the case of a statue and a lump of clay, Lumpl and Goliath respectively.

According to the story, Lumpl and Goliath are coincident throughout their respective careers. Monists hold that they are identical; pluralists that they are distinct. This paper is concerned with a particular objection to pluralism, the Grounding Problem. The objection is roughly that the pluralist faces a legitimate explanatory demand to explain various differences she alleges between Lumpl and Goliath, but that the pluralist's theory lacks the resources to give any such explanation.

In this paper, I explore the question of whether there really is any problem of this sort. I argue (i) that explanatory demands that are clearly legitimate are easy for the pluralist to meet; (ii) that even in cases of explanatory demands whose legitimacy is questionable the pluralist has some overlooked resources; and (iii) there is some reason for optimism about the pluralist's prospects for meeting every legitimate explanatory demand. In short, no clearly adequate statement of a Grounding Problem is extant, and there is some reason to believe that the pluralist can overcome any Grounding Problem that we haven't thought of yet."

32. ———. 2013. "Grounding Explanations." *Philosophers' Imprint* no. 13:1-26.

"Unfortunately the use of grounding to articulate the layered conception faces a problem, recently pressed by Ted Sider [Sider, 2011, §7.2, 8.2.1]. I will call this problem *the collapse*. The problem, very roughly, is that if we take grounding explanations to state fundamental facts, then the facts about what explains, e.g., my preference for oatmeal will be fundamental. So, my preference for oatmeal will be mentioned in any complete description of the fundamental layer. The same goes for any other entity. All of the layers collapse into one; every entity turns out to occupy the fundamental layer. The collapse turns on the question of how to ground the facts stated by the explanations themselves.

I will suggest a way of grounding explanations that avoids the problem. Briefly, the suggestion is that the fact stated by a grounding explanation is grounded in its explanans.

Here's the plan. §1 lays out a simple-minded way of using grounding explanations to articulate the intuitive conception of layered structure.

I also differentiate this approach to articulating the idea of layered structure from a more traditional one centering on reduction. §2 shows how the commitments articulated in §1 lead to the collapse, when paired with the claim that grounding explanations are fundamental.

In §3, I defend a claim that plays a central role in both my articulation of the idea of layered structure and the collapse. §4 proposes an alternative way of avoiding the collapse by denying that grounding explanations are fundamental. §5 outlines and criticizes a different proposal for avoiding the collapse implicit in some of the extant literature, and §6 discusses objections." (pp. 2-3, anote omitted)

33. ———. 2013. "What is Weak Ground?" *Essays in Philosophy* no. 14:7-18.

Abstract: "Kit Fine, in "The Pure Logic of Ground", has made a seminal attempt at formalizing the notion of ground. Fine ties the formal treatment of grounding to the notion of a weak ground. Formalization of this sort is supposed to bring clarity and precision to our theorizing. Unfortunately, as I will argue, it's not clear what weak ground is.

I review five alternative explanations of the idea, and argue that none of them are ultimately satisfactory. I close by outlining a more complicated explanation of the notion that turns out to be more satisfactory."

"Some philosophers (see Armstrong 1997; Cameron 2008; Melia 2005 and Schaffer 2007, 2009, 2010a) have recently suggested that explanations of a certain sort can mitigate our ontological commitments.

The explanations in question, *grounding explanations*, are those that tell us what it is in virtue of which an entity exists and has the features it does.

(...)

These philosophers argue that derivative entities are 'no addition to being', in the sense that an ontology is no less sparse for containing them than it is for containing the entities which ground them; derivative entities are an 'ontological free lunch'." (p. 243)

(...)

"Here I argue that they are wrong: barring reduction, every entity is fundamental, in the sense that either its existence or its possession of at least one other feature is explanatorily basic. Thus, the claim

EXPLANATION

Many entities are derivative: their existence and other features can be explained solely by reference to the existence and properties of other things should be rejected. An upshot is that, whatever form Ockham's Razor, should take, grounding explanations on their own do not provide 'an ontological free lunch'." (p. 245, a note omitted)

35. ———. 2014. "On Weak Ground." *The Review of Symbolic Logic* no. 7:713-744.

Abstract: "Though the study of grounding is still in the early stages, Kit Fine, in "The Pure Logic of Ground", has made a seminal attempt at formalization. Formalization of this sort is supposed to bring clarity and precision to our theorizing, as it has to the study of other metaphysically important phenomena, like modality and vagueness. Unfortunately, as I will argue, Fine ties the formal treatment of grounding to the obscure notion of a *weak ground*. The obscurity of weak ground, together with its centrality in Fine's system, threatens to undermine the extent to which this formalization offers clarity and precision. In this paper, I show how to overcome this problem. I describe a system, the logic of strict ground (LSG) and demonstrate its adequacy; I specify a translation scheme for interpreting Fine's weak grounding claims; I show that the interpretation verifies all of the principles of Fine's system; and I show that derivability in Fine's system can be exactly characterized in terms of derivability in LSG. I conclude that Fine's system is reducible to LSG."

36. ———. 2015. "Better Semantics for the Pure Logic of Ground." *Analytic Philosophy* no. 56:229-252.

"Kit Fine has offered an exact treatment of these formal features of grounding (Fine, 2012a). He specifies a language in which grounding claims may be expressed, proposes a system of axioms which capture the relevant formal features, offers a semantics which interprets grounding claims expressible in the language, and shows that his axioms are sound and complete for his semantics.

As we shall see, however, there are reasons for dissatisfaction with Fine's semantics.

(...)

In this paper I show that there is another approach available. I offer a formally specified, model-theoretic semantics for Fine's

language, for which a certain natural axiomatization of the pure logic of ground is sound and complete. The semantics is motivated by ideas already present in the grounding literature, so it offers a plausible candidate for an exact specification of an intended interpretation of grounding claims. I also show how the semantics I offer avoids problems faced by Fine's semantics." (p. 229)

37. ———. 2017. "Grounding the Unreal." *Philosophy and Phenomenological Research* no. 95:535-563.

Abstract: "(...) It is tempting to explain this layered structure of dependence and determination among our theories by appeal to a corresponding layered structure of dependence and determination among the entities putatively treated by those theories. In this paper, I argue that we can resist this temptation: we can explain the sense in which, e.g., the biological truths are dependent on and determined by chemical truths without appealing to properly biological or chemical entities. This opens the door to a view on which, though there are more truths than just the purely physical truths, there are no entities, states, or properties other than the purely physical entities, states, and properties. I argue that some familiar strategies to explicate the idea of a layered structure of theories by appeal to reduction, ground, and truthmaking encounter difficulties. I then show how these difficulties point the way to a more satisfactory treatment which appeals to something very close to the notion of ground. Finally, I show how this treatment provides a theoretical setting in which we might fruitfully frame debates about which entities there really are."

38. ———. 2020. "Anti-Skeptical Rejoinders." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 180-193. New York: Routledge.

"The recent groundswell of interest in the theory of grounding has been met in some quarters with a skeptical reaction. There are two kinds of skepticism that should be distinguished. Relatively local skeptical doubts concern the appropriateness of applying grounding to this or that particular theoretical purpose.

(...)

The kind of skepticism that is our focus here is more ambitious. Global skepticism about ground is the view that the attempt to develop a theory of ground is generally and in principle defective, and attempts to apply such a theory will be fruitless. There are several global skeptics in the literature (Daly 2012), (Hofweber 2009: 269–72), (Koslicki 2015), (Thompson 2016a), (Turner 2016), (Wilson 2014). Are their doubts warranted? In this chapter, I review both the reasons that seem to favor global skepticism and the responses to those reasons by defenders of ground. I suspect that the number of published global skeptics is a tiny fraction of the total population of global skeptics. So rather than merely offering a piecemeal enumeration of skeptical arguments and responses in the literature, I will attempt to fit them into a more general scheme."

Abstract: "Partial grounding is often thought to be formally analogous to proper parthood in certain ways. Both relations are typically understood to be asymmetric (and hence irreflexive) and transitive, and as such, are thought to be strict partial orders. But how far does this analogy extend? Proper parthood is often said to obey the weak supplementation principle. There is reason to wonder whether partial grounding, or, more precisely, proper partial grounding, obeys a ground-theoretic version of this principle. In what follows, I argue that it does not. The cases that cause problems for the supplementation principle for grounding also serve as counterexamples to another principle, minimality, defended by Paul Audi."

40. ———. 2016. "What Is the Well-Foundedness of Grounding?" *Mind* no. 125:439-468.

Abstract: "A number of philosophers think that grounding is, in some sense, well-founded.

This thesis, however, is not always articulated precisely, nor is there a consensus in the literature as to how it should be characterized. In what follows, I consider several principles that one might have in mind when asserting that grounding is well-founded, and I argue that one of these principles, which I call 'full foundations', best captures the relevant claim. My argument is by the process of elimination. For each of the inadequate principles, I illustrate its inadequacy by showing either that it excludes cases that should not be ruled out by a well-foundedness axiom for grounding, or that it admits cases that should be ruled out."

41. ———. 2018. "Upward Grounding." *Philosophy and Phenomenological Research* no. 97:48-78.

Abstract: "Realists about universals face a question about grounding. Are things how they are because they instantiate the universals they do? Or do they instantiate those universals because they are how they are? Take Ebenezer Scrooge. You can

say that (i) Scrooge is greedy because he instantiates greediness, or you can say that (ii) Scrooge instantiates greediness because he is greedy. I argue that there is reason to prefer the latter to the former. I develop two arguments for the view. I also respond to some concerns one might have about the view defended. I close by showing that analogous views regarding the truth of propositions (that if the proposition that p is true, then it is true because p) and the existence of facts (that if the fact that p exists, then it exists because p) are supported by analogs of one of these arguments."

42. ———. 2020. "Infinite Descent." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 244-258. New York: Routledge.

"Introduction: Once one accepts that certain things metaphysically depend upon or are metaphysically explained by other things, it is natural to begin to wonder whether these chains of dependence or explanation must come to an end. This chapter surveys the work that has been done on this issue—the issue of grounding and infinite descent. I frame the discussion around two questions:

Question 1. What is infinite descent of ground?

Question 2. Is infinite descent of ground possible?

In addressing the second question, I will consider a number of arguments that have been made for and against the possibility of infinite descent of ground. When relevant, I connect the discussion to two important views about the way reality can be structured by grounding: metaphysical foundationalism and metaphysical infinitism. A third such view, metaphysical coherentism, countenances cyclic grounding chains. Due to limitations on space, I will not discuss this view in what follows, though I will have cause to discuss cyclic chains. For further discussion of coherentism, see "Strict Partial Order" (Chapter 17 in this volume)." (p. 244)

43. Donaldson, Thomas. 2016. "The (Metaphysical) Foundations of Arithmetic?" *Noûs* no. 51:775-801.

"This paper is a thorough discussion of a proposal due independently to Robert Schwartzkopff and Gideon Rosen about what grounds facts involving cardinal numbers. Roughly, the principle is as follows:

For any properties F and G, if the number of things that have the property F is identical to the number of things that have the property G, then this fact is grounded by the fact that the things that have the property F and the things that have the property G can be paired one-to-one.(8)

For obvious reasons, I call this the ‘Schwartzkopff-Rosen Principle’. The principle is a perfect case study: it is precise enough that it can be investigated in detail, but it is no mere toy case.

(...)

"I proceed as follows. I begin in section two by presenting a ‘framework’ for the subsequent discussion—that is, I set out my preferred notation and my initial assumptions. In section three I begin my discussion of the Schwartzkopff-Rosen Principle. In sections four, five, six and seven I refine the principle. In section eight I show that the principle implies that the relation of ‘partial ground’ is not acyclic.

Section nine is my conclusion. In an appendix, I discuss ground and second-order quantification." (pp. 775-776)

299. New York: Routledge.

"In this chapter, I will begin to explore the question of what happens if we take seriously both the notion of analyticity and the notion of ground. I will do this by revisiting the old idea that analytic truths are "true in virtue of meaning". One warning is necessary before we start. I will indulge in the convenient but questionable practice of assuming that ground is a relation among facts. Nothing of consequence hangs on this, however, so readers who are wary of this way of thinking about grounding can make suitable adjustments as they read. See the Introduction to this volume for discussion." (p. 289)

45. Dorsey, Jonathan Eric. 2016. "On the Grounding-Reduction Link." *American Philosophical Quarterly* no. 53:411-422.

Abstract: "The claim that reduction entails grounding (but not vice versa)---called "the grounding-reduction link"-is potentially very important but not clearly correct. After working through a fruitful debate between Gideon Rosen (who maintains the link) and Paul Audi (who maintains its impossibility), I distinguish between what I call "strict" and "broad" reduction. Strict reduction is incompatible with grounding, but broad reduction is not. Thus the link is possible, at least for broad reduction. However, neither strict nor broad reduction entails grounding. Ultimately, there may be a link between grounding and some highly qualified form of reduction. However, the philosophical traction that one might hope to gain for grounding via such a link is considerably diminished if not outright lost."

46. Dumsday, Travis. 2014. "E. J. Lowe on the Unity Problem." *Studia Philosophica Estonica* no. 7:195-218.

Abstract: "Some properties are connected in a perspicuous and unproblematic way. For instance, the possession of shape clearly entails the possession of size (and vice versa).

In other cases the connection is not so perspicuous. For instance, assuming that the precise rest mass and negative charge of an electron are both among its fundamental intrinsic properties, what links them, given that those properties are inherently separable? (Their separability is apparent from the fact that other kinds of particle have the same mass as an electron but a different charge, or the same charge but a different mass.) Given the inherent separability of those properties, what explains their conjunction in this case? Oderberg (2007, 2011) calls this the "unity problem", and attempts to solve it have issued from assorted schools of thought within both substance ontology and the metaphysics of natural kinds. One of the more significant of these solutions is proffered by E.J. Lowe as part of his four-category ontology.

Here I explicate his solution, raise a possible objection, and suggest a reply."

"Two topics that have received a lot of attention in recent years are hyperintensionality and grounding. In this paper, we explore the relation between them. It is often said that grounding is hyperintensional; but there are a number of ways to understand this claim.

We argue that whether it is true depends both on what view of grounding one endorses and also on what one means by 'hyperintensional'." (p. 297)

48. Elqayam, Shira. 2012. "Grounded rationality: Descriptivism in epistemic context." *Synthese* no. 189:39-49.

Abstract: "Normativism, the approach that judges human rationality by comparison against normative standards, has recently come under intensive criticism as unsuitable for psychological enquiry, and it has been suggested that it should be replaced with a descriptivist paradigm. My goal in this paper is to outline and defend a meta-theoretical framework of such a paradigm, *grounded rationality*, based on the related principles of descriptivism and (moderate) epistemic relativism. Bounded rationality takes into account universal biological and cognitive limitations on human rationality. Grounded rationality accepts universal constraints but adds cognitive variability: Within-individual variability (dual processing), and individual as well as cultural differences. I discuss the implications of grounded rationality to dual processing, proposing that investing limited cognitive resources in analytic processing might be less instrumentally rational for individuals with low cognitive ability."

49. Emery, Nina. 2018. "Laws and Their Instances." *Philosophical Studies* no. 176:1535-1561.

Abstract: "Abstract I present an argument for the view that laws ground their instances. I then outline two important consequences that follow if we accept the conclusion of this argument. First, the claim that laws ground their instances threatens to undermine a prominent recent attempt to make sense of the explanatory power of Humean laws by distinguishing between metaphysical and scientific explanation. And second, the claim that laws ground their instances gives rise to a novel argument against the view that grounding relations are metaphysically necessary."

50. ———. 2020. "Laws of Nature." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 437-448. New York: Routledge.

"Here is a plan for what follows. In Section 1, I will set out some groundwork with respect to the notion of laws of nature. I will then turn to two central questions in the metaphysics of laws: what (if anything) grounds the laws (Section 2) and what (if anything) the laws ground (Section 3). To keep things (relatively) simple, I will focus on these questions as they apply to deterministic laws that show up in fundamental physics. In Section 4, I say a bit about how the discussion might extend to laws that are not deterministic." (p. 437)

Chapter 6: *Grounding and Anchoring*, pp. 74-87.

"Grounding is most straightforwardly understood as a relation between facts. And in investigating social metaphysics, we look for the reasons for a wide variety of social facts to be the case. This is what a constitutive rule should be telling us. Sometimes we set up grounding conditions for a *particular* fact.

For instance, we set up grounding conditions for the existence of one particular boundary around a village. More typically, we set up general conditions for grounding some *kind* of social fact." (p. 76)

52. Fine, Kit. 1994. "Essence and Modality." *Philosophical Perspectives* no. 8:1-16.

Reprinted in *The Philosopher's Annual for 1994*, volume 16, (edited by Patrick Grim, Gary Mar, Peter Williams), Stanford: CSLI 1996 and in J. Kim, D. Korman, E. Sosa (eds.), *Metaphysics: An Anthology*, Oxford: Wiley-Blackwell 2011 (second edition).

"The concept of essence has played an important role in the history and development of philosophy; and in no branch of the discipline is its importance more manifest than in metaphysics.

Its significance for metaphysics is perhaps attributable to two main sources. In the first place, the concept may be used to characterize what the subject, or at least part of it, is about.

For one of the central concerns of metaphysics is with the identity of things, with what they are.

But the metaphysician is not interested in every property of the objects under consideration. In asking 'What is a person?', for example, he does not want to be told that every person has a deep desire to be loved, even if this is in fact the case.

What then distinguishes the properties of interest to him? What is it about a property which makes it bear, in the metaphysically significant sense of the phrase, on what an object is?

It is in answer to this question that appeal is naturally made to the concept of essence. For what appears to distinguish the intended properties is that they are essential to their bearers." (p. 1)

(...)

"It is my aim in this paper to show that the contemporary assimilation of essence to modality is fundamentally misguided and that, as a consequence, the corresponding conception of metaphysics should be given up. It is not my view that the modal account fails to capture anything which might reasonably be called a concept of essence. My point, rather, is that the notion of essence which is of central importance to the metaphysics of identity is not to be understood in modal terms or even to be regarded as extensionally equivalent to a modal notion. The one notion is, if I am right, a highly refined version of the other; it is like a sieve which performs a similar function but with a much finer mesh.

I shall also argue that the traditional assimilation of essence to definition is better suited to the task of explaining what essence is. It may not provide us with an analysis of the concept, but it does provide us with a good model of how the concept works. Thus my overall position is the reverse of the usual one. It sees real definition rather than de re modality as central to our understanding of the concept." (p. 3)

53. ——. 1995. "Senses of Essence." In *Modality, Morality and Belief. Essays in Honor of Ruth Barcan Marcus*, edited by

Sinnott-Armstrong, Walter, 53-73. Cambridge: Cambridge University Press.

"One may distinguish between the essential and accidental properties of an object. A property of an object is essential if it must have the property to be what it is; otherwise the property is accidental.

But what exactly is meant by this account? It has been common to give a further explanation in modal terms. A property is taken to be essential when it is necessary that the object have the property or, alternatively, when it is necessary that it have the property if it exist. For reasons that I have already given in my paper "Essence and Modality," I doubt whether this or any other modal explanation of the notion can succeed. Indeed, I doubt whether there exists any explanation of the notion in fundamentally different terms. But this is not to deny the possibility of further clarification; and it is the aim of the present paper to provide it.

What I shall do is to distinguish some of the closely related ways in which the notion may be understood. This will be important for getting clearer both on which claims can be made with its help and on which concepts can be defined with its help. In particular, we shall see that several different senses of ontological dependence correspond to the different senses of essence. The task is also important for the purpose of developing a logic of essentialist reasoning; for most of the different senses of essence that we distinguish will make a difference to the resulting logic. My main concern in this paper has been with making the distinctions, and not with drawing out their implications; but I hope it is clear from the examples what some of these implications are." (p. 53)

54. ———. 2001. "The Question of Realism." *Philosopher's Imprint* no. 1:1-30.

Reprinted in Andrea Bottani, Massimiliano Carrara, Pierdaniele Giaretta (eds.), *Individuals, Essence and Identity. Themes of Analytic Metaphysics*, Dordrecht: Kluwer 2002, pp. 3-48.

"My aim in this paper is to help lay the conceptual and methodological foundations for the study of realism. I come to two main conclusions: first, that there is a primitive metaphysical concept of reality, one that cannot be understood in fundamentally different terms; and second, that questions of what is real are to be settled upon the basis of considerations of *ground*. The two conclusions are somewhat in tension with one another, for the lack of a definition of the concept of reality would appear to stand in the way of developing a sound methodology for determining its application; and one of my main concerns has been to show how the tension between the two might be resolved.

The paper is in two main parts. In the first, I point to the difficulties in making out a metaphysical conception of reality.

I begin by distinguishing this conception from the ordinary conception of reality (§ 1) and then show how the two leading contenders for the metaphysical conception -- the factual and the irreducible--both appear to resist formulation in other terms. This leads to the quietist challenge, that questions of realism are either meaningless or pointless (§ 4); and the second part of the paper (§§ 5-10) is largely devoted to showing how this challenge might be met. I begin by introducing the notion of ground (§ 5) and then show how it can be used as a basis for resolving questions both of factuality (§§ 6-7) and of irreducibility (§§ 8-9). I conclude with some remarks on the essential unity of these two questions and of the means by which they are to be answered (§ 10)." (pp. 3-4)

55. ———. 2009. "The Question of Ontology." In *Metametaphysics: New Essays on the Foundations of Ontology*, edited by Chalmers, David J., Manley, David and Wassermann, Ryan, 157-177. New York: Oxford University Press.

"There are a number of difficulties with the standard quantificational view. They are for the most part familiar but it will be worth spelling them out, if only to make clear how far removed our understanding of the ontological question is from our understanding of their quantificational counterparts. Philosophers may have learned to live with the disconnect

between the two, but their tolerance of the situation should not lull us into thinking that it is tolerable." (p. 138)

"This account of our method for settling ontological dispute requires that we have a grasp not only of an absolute conception of reality, of there *being nothing more than ...*, but also of a relative conception, of *there being nothing more to ... than ...*, since it is through our assessment of the relative claims that we attempt to adjudicate the plausibility of the absolute claims. Many philosophers seem to have supposed that our having a good working grasp of such notions depends upon our being able to define them in other terms, so that questions of metaphysics or ontology thereby become questions of semantics or epistemology or total science. I consider this to be a serious methodological error: upon careful reflection we can see that our intuitive grasp of these notions is a sufficient guide in itself to their proper employment; and the attempt to define these notions in other terms has served merely to distort our understanding of the metaphysical questions and of the methods by which they are to be resolved." (p. 176)

56. ———. 2010. "Some Puzzles of Ground." *Notre Dame Journal of Formal Logic* no. 51:97-118.

"In recent years there has been a growing interest in the concept of ground—of one thing holding in virtue of another, and, in developing an account of ground, a number of philosophers have laid down principles which they regard as unquestionably true of the concept. (1) The purpose of this note is to show that these principles are in conflict with seemingly impeccable principles of logic. Thus a choice must be made; either one or more of the metaphysical principles or one or more of the logical principles should be given up.

Some philosophers—and especially those already unsympathetic to ground—may think that the conflict reveals some underlying defect in the concept. For if acceptance of the concept of ground has such untoward consequences, then this can only be because the concept was no good in the first place. My own view—which I suggest toward the end of the paper—is quite different. It is not that considerations of ground should be

ignored or even that the principles of ground should be given up in the light of their conflict with the principles of logic. Rather we need to achieve some kind of reflective equilibrium between the two sets of principles, one that does justice both to our logical intuitions and to our need for some account of their ground. Thus the conflict, far from serving to undermine the concept of ground, serves to show how important it is to arriving at a satisfactory view of what in logic, as in other areas of thought, can properly be taken to hold.

The puzzle to which the conflict of principles gives rise bears some resemblance to the paradoxes of self-reference. It is not itself a paradox of self-reference: the puzzle, on the one side, makes no direct use of self-reference; the paradox, on the other side, makes no direct appeal to the notion of ground. But considerations of ground are often used to motivate certain solutions to the paradoxes, and the puzzle makes clear the reasoning behind these considerations and brings out the critical role played by the notion of ground. (2)" (pp. 97-98)

(1) They include Audi [1], Batchelor [2], Correia [3], Correia [4], Rosen [10], Schneider [11], and Schneider [12].

(2) I especially have in mind the kind of solution to the semantic paradoxes to be found in Kripke [8].

"A number of philosophers have recently become receptive to the idea that, in addition to scientific or causal explanation, there may be a distinctive kind of metaphysical explanation, in which explanans and explanandum are connected, not through some sort of causal mechanism, but through some constitutive form of determination. I myself have long been sympathetic to this idea of constitutive determination or “ontological ground”; and it is the aim of the present chapter to help put the idea on a firmer footing – to explain how it is to be understood, how it relates to other ideas, and how it might be of use in philosophy. (1)" (p. 37)

(1) A number of other philosophers (they include Audi [forthcoming], Batchelor [2010], Schaffer [2009b], Correia [2005, 2010], Raven [2009], Rosen [2010], Schnieder [2011]) have done related work in defense of the notion; and I have not attempted to make a detailed comparison between their ideas and my own.

I am grateful to the participants at the Boulder conference on dependence and to Neil Tennant for many helpful comments on an earlier draft of the chapter. I should add that, for reasons of space, some of the material in the chapter originally submitted to the volume had been abridged.

58. ———. 2012. "The Pure Logic of Ground." *The Review of Symbolic Logic* no. 5:1-25.

"Ground is the relation of one truth holding in virtue of others. This relation is like that of consequence in that a necessary connection must hold between the relata if the relation is to obtain but it differs from consequence in so far as it required that there should also be an explanatory connection between the relata. The grounds must account for what is grounded. Thus even though P is a consequence of P & P, P & P is not a ground for P, since it does not account for the truth of P.

It is the aim of this paper to develop a semantics and proof theory for the pure logic of ground. The pure logic of ground stands to ground as Gentzen's structural rules stand to

consequence. One prescind from the internal structure of the propositions under consideration and simply asks what follows from what in virtue of the formal features of the underlying relation. Thus the claim that ground is transitive, that if P is a ground for Q and Q a ground for R then P should be a ground for R, is plausibly regarded as part of the pure logic of ground; but the claim that P is a ground for P & P will be part of the applied as opposed to the pure logic of ground, since it turns on the logical properties of &." (p. 1)

Available at <https://www.academia.edu/27080402>

"ground - a philosophical foodstuff, considered by some to be the elixir of life and by others to be

a deadly poison." (p. 1)

60. ———. 2015. "Unified Foundations for Essence and Ground." *Journal of the American Philosophical Association* no. 1:296-315.

"There are, I believe, two different kinds of explanation or determination to be found in metaphysics - one of identity, or of what something is, and the other of truth, or of why something is so. One may explain what singleton Socrates is, for example, by saying that it is the set whose sole member is Socrates and one may explain why, or that in virtue of which, singleton Socrates exists by appeal to the existence of Socrates. One might talk, in connection with the first, of essence, of what singleton Socrates essentially is and, in connection with the second, of ground, of what grounds the existence of singleton Socrates. (1)

Of course, explanations of identity and of truth also occur outside of metaphysics, but what is characteristic of their occurrence within metaphysics is the especially tight connection between explanandum and explanans. Being a set whose sole member is Socrates is somehow constitutive of what Socrates is; and Socrates' existing is somehow constitutive of the existence of singleton Socrates. It is perhaps hard to say in general what constitutes a constitutive explanation but it is at

least required, in any case of a constitutive explanation, that there should be metaphysically necessary connection between explanandum and explanans. Given that singleton Socrates is essentially a set whose sole member is Socrates, then it is metaphysically necessary that the set is one whose sole member is Socrates; and given that Socrates existence grounds the existence of singleton Socrates, it will be metaphysically necessary if Socrates exists that his singleton exists." (p. 296)

(...)

"My present view is that the relationship between the two kinds of explanation is much closer than I had originally taken it to be. The decisive step towards achieving the desired rapprochement is to see both kinds of explanation as having a generic, as well as a specific, bearing on the objects with which they deal; they must be allowed to have application to an arbitrary individual of a given kind and not just to specific individuals of that kind. Once this step is taken, the initial disparities between essence and ground disappear and we are able to provide a unified and uniform account of the two notions. I had previously referred to essence and ground as the pillars upon which the edifice of metaphysics rests (Fine [2012], p. 80), but we can now see more clearly how the two notions complement one another in providing support for the very same structure." (p. 297)

(1) I should like to thank the members of audiences at Birmingham, Oxford and Oslo for many helpful comments. The present paper is a companion to my paper 'Identity Criteria and Ground' and the reader may find it helpful, if not essential, to have the other paper at hand. I should note that Correia [2014] attempts to provide unified foundations, of a very different sort, in terms of an underlying notion of factual identity.

There has been a growing literature on essence and ground in the recent philosophical literature. My own work on essence dates back to Fine [1994]; and a useful reference on ground is the anthology of Correia & Schnieder [2012].

61. ———. 2016. "Identity Criteria and Ground." *Philosophical Studies* no. 173:1-19.

"Philosophers often look for criteria of identity or think they are not to be found. They may ask for a criterion of identity for sets, for example, or for propositions, or for persons across time, or for individuals across possible worlds. And in response to such requests, they have said such things as: a criterion of identity for sets is their having the same members; or a criterion of identity for persons across time is their psychological continuity. (1)

But what are these philosophers asking for when they ask for such criteria? I shall argue that the usual way of construing these questions is seriously misguided. I shall also propose an alternative - and, I hope, preferable - way of construing these questions and shall briefly indicate its significance for our more general understanding of metaphysical explanation. In what follows, I shall often use the criteria of identity for sets and for persons as examples. But it is important to bear in mind that

they are just that, examples, and that the points I make concerning them are meant to apply, across the board, to all identity criteria." (p. 1)

62. ———. 2017. "A Theory of Truthmaker Content II: Subject-matter, Common Content, Remainder and Ground." *Journal of Philosophical Logic* no. 46:675-702.

"We continue with the development of the theory of truthmaker content begun in part I, dealing with such 'non-standard' topics as subject matter, common content, logical remainder and ground. This is by no means an exhaustive list of topics that might have been considered but it does provide an indication of the nature and scope of the theory. As before, the paper is divided into an informal exposition and a technical addendum. Both can be read independently of the other but it would be helpful, in either case, to have the first part of the paper at hand." (p. 675)

63. ———. 2020. "Semantics." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 501-509. New York: Routledge.

"It has often been supposed that there need only be a modal connection between a truth-maker and the sentence it makes true or that the truth-maker need only be partially relevant to the sentence it makes true, so that the fact that it is raining and windy, for example, would then be a truth-maker for the sentence 'it is raining or snowing'. It is therefore important to note that the notion of ground gives rise to a quite distinctive notion of truth-making, which requires not merely a modal connection but also a very strong relevant connection.

Truth-making has been used for two quite distinct ends, one metaphysical and the other semantical. By attempting to discern the truth-makers of sentences, it has been thought that we might achieve a better understanding of the world via an

understanding of *what* makes the sentences true and also that we might achieve a better understanding of language via an understanding of *how* the sentences are made true." (p. 502, note omitted)

64. Fine, Kit, and de Rosset, Louis. 2021. "A Semantics for the Impure Logic of Ground."

Available at <https://www.uvm.edu/~lrosset/impure.pdf>

"This paper establishes a sound and complete semantics for the impure logic of ground. Fine [2012a] sets out a system for the pure logic of ground, one in which the formulas between which ground-theoretic claims hold have no internal logical complexity; and it provides a sound and complete semantics for the system.

Fine [2012b, §§6-8] sets out a system for an impure logic of ground, one that extends the rules of the original pure system with rules for the truth-functional connectives, the first-order quantifiers, and λ -abstraction. However, it does not provide a semantics for this system. The present paper partly fills this lacuna by providing a sound and complete semantics for a system GG containing the truth-functional operators that is closely related to the truth-functional part of the system of [Fine, 2012b].(1)" (p. 1)

(1) The main differences between the two systems are that we now only allow finitely many formulas to occur to the left of the ground-theoretic operator and that we have added the Irreversibility Rule, which should have been part of the original system.

1. Fisher, David, Hong, Hao, and Perrine, Timothy. 2021. "A Challenge to the New Metaphysics: deRosset, Priority, and Explanation." *Synthese* no. 198:6403-6433.

Abstract: "Priority Theory is an increasingly popular view in metaphysics. By seeing metaphysical questions as primarily concerned with what explains what, instead of merely what exists, it promises not only an interesting approach to traditional metaphysical issues but also the resolution of some outstanding disputes. In a recent paper, Louis deRosset argues that Priority Theory isn't up to the task: Priority Theory is committed to there being explanations that violate a formal constraint on any adequate explanation.

This paper critically examines deRosset's challenge to Priority Theory. We argue that deRosset's challenge ultimately fails: his proposed constraint on explanation is neither well-motivated nor a general constraint. Nonetheless, lurking behind his criticism is a deep problem for prominent ways of developing Priority Theory, a problem which we develop."

2. Folde, Christian. 2015. "Grounding Interpretation." *British Journal of Aesthetics* no. 55:361-374.

Abstract: "In this paper I examine the relationship between interpreting a fiction and specifying its content.

The former plays a major role in literary studies; the latter is of central concern in the philosophical debate on truth in fiction. After elucidating these activities, I argue that they do not coincide but have interesting interdependencies. In particular, I argue that correct interpretations are metaphysically grounded in fictional content. I discuss this claim in detail and show why it is not in tension with the evidential claim that correct interpretations give us epistemic access to fictional content, which I also endorse."

3. Forrai, Gábor. 2011. "Grounding Concepts: The Problem of Composition." *Philosophia* no. 39:721-731.

Abstract: "In a recent book C.S. Jenkins proposes a theory of arithmetical knowledge which reconciles realism about arithmetic with the a priori character of our knowledge of it. Her basic idea is that arithmetical concepts are grounded in experience and it is through experience that they are connected to reality. I argue that the account fails because Jenkins's central concept, the concept for grounding, is inadequate. Grounding as she defines it does not suffice for realism, and by revising the definition we would abandon the idea that grounding is experiential. Her account falls prey to a problem of which Locke, whom she regards as a source of inspiration was aware and which he avoided by choosing anti-realism about mathematics."

4. Francez, Nissim. 2021. "Logical Grounding: The Case of "if-then-else"." *Theoria* no. 87:1175-1192.

Abstract: "The paper proposes grounding the ternary connective "if ... then ... else" (classically interpreted), thus far not considered in the logical grounding literature. In doing so, a new kind of plural grounding, called collective immediate grounding, is proposed as more adequate than the traditional complete immediate grounding in avoiding redundancy. The approach is proof-theoretic."

5. Fritz, Peter. 2021. "Ground and Grain." *Philosophy and Phenomenological Research*.

First online 11 August 2021.

"Current views of metaphysical ground suggest that a true conjunction is immediately grounded in its conjuncts, and only its conjuncts. Similar principles are suggested for disjunction and universal quantification. Here, it is shown that these principles are jointly inconsistent: They require that there is a distinct truth for any plurality of truths. By a variant of Cantor's Theorem, such a fine-grained individuation of truths is inconsistent. This shows that the notion of grounding is either not in good standing, or that natural assumptions about it need to be revised."

6. Genco, Francesco A., Poggiolesi, Francesca, and Rossi, Lorenzo. 2021. "Grounding, Quantifiers, and Paradoxes." *Journal of Philosophical Logic* no. 50:1417-1448.

Abstract: "The notion of grounding is usually conceived as an objective and explanatory relation. It connects two relata if one—the ground—determines or explains the other—the consequence. In the contemporary literature on grounding, much effort has been devoted to logically characterize the formal aspects of grounding, but a major hard problem remains: defining suitable grounding principles for universal and existential formulae. Indeed, several grounding principles for quantified formulae have been proposed, but all of them are exposed to paradoxes in some very natural contexts of application. We introduce in this paper a first-order formal system that captures the notion of grounding and avoids the paradoxes in a novel and nontrivial way. The system we present formally develops Bolzano's ideas on grounding by employing Hilbert's ε -terms and an adapted version of Fine's theory of arbitrary objects."

7. Giannini, Giacomo, and Stephen, Mumford. 2021. "Formal Causes for Powers Theorists." In *Neo-Aristotelian Perspectives on Formal Causation*, edited by Jansen, Ludger and Sandstad, Petter, 87-105. New York: Routledge.

"We have examined three degrees of involvement between powers and formal explanations involving essences. We have done this without taking a stance on the precise nature of the essence-operator, and therefore on what it is to be constitutively essential. This leaves an unsatisfactory gap in our treatment of the topic: those formal explanations appealing only to constitutive essences seem to have a much weaker link with powers. This leaves open the possibility of a *fourth* degree of essential involvement: that the essence-operator could be analysed or reduced to the basic ideology of powers metaphysics (be it Vetter's POT operator, or some primitive 'directedness' relation). In other words, that constitutive essence itself could be reduced to some feature of powers. This would establish the strongest possible link between formal explanations and powers. We are skeptical that this can be done. We will not, however, attempt to discuss it: taking on the debate about the best understanding of constitutive essence goes beyond the scope of the paper, and beyond our powers at the moment. So, in this paper, we settle for a modest conclusion: we are content to show that an important subset of formal explanations, those involving *propria*, can be grounded in a metaphysics of powers, without showing that all of them do, nor that powers are uniquely qualified to do so."
(Conclusion, p. 102)

8. Giannotti, Joaquim, and Bianchi, Silvia. 2021. "Grounding Ontic Structuralism." *Synthese* no. 199:5205-5223.

Abstract: "A respectable assessment of priority-based ontic structuralism demands an elucidation of its metaphysical backbone. Here we focus on two theses that stand in need of clarification: (1) the Fundamentality Thesis states that structures are fundamental, and (2) the Priority Thesis states that these structures are prior to putative fundamental objects, if these exist. Candidate notions to illuminate (1) and (2) such as supervenience and ontological dependence failed at this task.

Our purpose is to show that grounding is the best competitor to articulate (1) and (2), and regiment such theses in a desirable unified way. Our strategy is two-fold. First, we make the case that grounding does better than ontological dependence and supervenience. Second, we show that the distinction between partial and full grounds permits us to respond to an objection raised by Kerry McKenzie against the proposal of interpreting priority-based Ontic Structuralism in the idiom of metaphysical determination. Our conclusion is that priority ontic structuralists have compelling reasons for adopting a grounding-based approach."

"I look at prominent approaches to vertical relations from three different areas of philosophy that are increasingly used to provide accounts

of scientific composition. In section 1.1, I provide a brief overview of work in analytic metaphysics on "Grounding"; in section 1.2, I outline what I term "neo-Causal" treatments from philosophy of science of "constitutive" relations and explanations; and, in section 1.3, I survey standard "functionalist" frameworks from the philosophy of mind. Although differing in various ways, I suggest all these views, when considered as treatments of scientific composition, are Unengaged to varying degrees because each of these positions does not construct its account of scientific composition through the detailed examination of compositional explanations.

How then are these various views constructed? I show that work in all of these areas actually pursues the Appropriational strategy: each account appropriates machinery developed for other phenomena." (p. 211)

10. Glazier, Martin. 2017. "Essentialist Explanation." *Philosophical Studies* no. 174:2871-2889.

Abstract: "Recent years have seen an explosion of interest in metaphysical explanation, and philosophers have fixed on the notion of ground as the conceptual tool with which such explanation should be investigated. I will argue that this focus on ground is myopic and that some metaphysical explanations that involve the essences of things cannot be understood in terms of ground. Such 'essentialist' explanation is of interest, not only for its ubiquity in philosophy, but for its being in a sense an ultimate form of explanation. I give an account of the sense in which such explanation is ultimate and support it by defending what I call the *inessentiality of essence*. I close by suggesting that this principle is the key to understanding why essentialist explanations can seem so satisfying."

11. ———. 2020. "Explanation." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 121-132. New York: Routledge.

"Metaphysical ground, like other topics in philosophy, is the subject of intense disagreement. What is it? What principles govern it? How can we know anything about it? Controversy surrounds these and other questions about ground. But if there is one uncontroversial claim in this area, it is that ground is deeply linked with a certain form of explanation, what we will call grounding explanation. This link and this form of explanation are the subject of this chapter."

(...)

"This chapter surveys the philosophical literature on grounding explanation and its connection to metaphysical ground. I begin by discussing explanation in general (§1) before turning to grounding explanation in particular (§2). I then take up the question of whether and how this form of explanation relates to reality (§3). I turn finally to ground (§4)." (p. 121)

12. ———. 2021. "The Difference Between Epistemic and Metaphysical Necessity." *Synthese* no. 198:1409-1424.

Abstract: "Philosophers have observed that metaphysical necessity appears to be a true or real or genuine form of necessity while epistemic necessity does not. Similarly, natural

necessity appears genuine while deontic necessity does not. But what is it for a form of necessity to be genuine? I defend an account of genuine necessity in explanatory terms. The genuine forms of necessity, I argue, are those that provide what I call *necessitarian explanation*. I discuss the relationship of necessitarian explanation to ground."

13. Goff, Philip. 2019. "Grounding, Analysis, and Russellian Monism." In *The Knowledge Argument*, edited by Coleman, Sam, 198-222. Cambridge: Cambridge University Press.

"Mary in her black and white room knows all that physical science can teach us about the physical facts involved in colour experience. But it does not follow that she knows everything there is to know about these facts. The Russellian monist exploits this gap to defend a form of physicalism – in a very broad sense of that word. Unfortunately, recent developments in the grounding literature cast doubt on that strategy, or so I will argue." (p. 198)

14. Grajner, Martin. 2021. "Grounding, Metaphysical Laws, and Structure." *Analytic Philosophy* no. 62:376-395.

Abstract: According to the deductive-nomological account of ground, a certain fact A grounds another fact B in case the laws of metaphysics determine the existence of B on the basis of the existence of A. Accounts of grounding of this particular variety have already been developed in the literature.

My aim in this paper is to sketch a new version of this account.

My preferred account offers two main improvements over extant accounts. First, the present account is able to deal with necessitarian as well as non-necessitarian cases of grounding by acknowledging the existence of two types of metaphysical laws. I will argue that we should assume that metaphysical laws come in the necessitarian as well as in the non-necessitarian variety—closely paralleling the distinction between strict and non-strict laws made in the philosophy of science. The second main improvement of the present account is that it can provide an explanation of why metaphysical laws have a direction built into them. I will argue that we should characterize

metaphysical laws with the help of Theodore Sider's notion of structure, which is a descendent of David Lewis's notion of naturalness. According to the account of metaphysical laws developed in this paper, metaphysical laws express in their antecedents either perfectly structural truths or more structural truths than in their consequents.

Since on Sider's account structural features of reality are fundamental features of reality, the account explains the direction built into metaphysical laws."

15. Greco, Daniel. 2018. "Explanation, Idealism, and Design." In *Idealism: New Essays in Metaphysics*, edited by Goldschmidt, Tyron and Pearce, Kenneth L., 231-245. New York: Oxford University Press.

"My aim in this essay is twofold. First, following up a common suggestion in the recent literature,(1) I'll show how we can formulate versions of physicalism, dualism, and idealism as theses about grounding, or metaphysical explanation, rather than as more straightforwardly ontological theses concerning what exists. Second, I'll argue that this reformulation provides a helpful lens through which to look at arguments in the philosophy of religion. In particular, traditional versions of theism are naturally understood as versions of idealism, once idealism is understood as a thesis about grounding." (p. 231)

Abstract: "This paper is concerned with the relation between two important metaphysical notions, 'truthmaking' and 'grounding.' I begin by considering various ways in which truthmaking could be explicated in terms of grounding, noting both strengths and weaknesses of these analyses. I go on to articulate a problem for any attempt to analyze truthmaking in terms of a generic and primitive notion of grounding based on differences we find among examples of grounding. Finally, I outline a more complex view of how truthmaking and grounding could relate. On the view explored, truthmaking is a species of grounding differentiated from other species of grounding by the unique form of dependence it involves."

17. ———. 2018. "Social Construction and Grounding." *Philosophy and Phenomenological Research* no. 97:393-409.

Abstract: "The aim of this paper is to bring recent work on metaphysical grounding to bear on the phenomenon of social construction. It is argued that grounding can be used to analyze social construction and that the grounding framework is helpful for articulating various claims and commitments of social constructionists, especially about social identities, e.g., gender and race. The paper also responds to a number of objections that have been (or could be) leveled against the application of grounding to social construction from Elizabeth Barnes (2014), Mari Mikkola (2015), and Jessica Wilson (2014)."

Abstract: "A number of philosophers have recently found it congenial to talk in terms of grounding. Grounding discourse features grounding sentences that are answers to questions about what grounds what. The goal of this article is to explore and defend a counterpart-theoretic interpretation of grounding discourse. We are familiar with David Lewis's applications of the method of counterpart theory to *de re* modal discourse.

Counterpart-theoretic interpretations of *de re* modal idioms and grounding sentences share similar motivations, mechanisms, and applications. I shall explain my motivations and describe two applications of a counterpart theory for grounding discourse. But, in this article, my main focus is on counterpart-theoretic mechanisms."

"In Section 1, we will outline the central features of our theory relevant to the present discussion. We will argue in Section 2 that dispositional essentialism is incompatible with the Strong Nuclear Theory or Keith Campbell's and Douglas Ehring's trope theories because tropes would be identity-dependent on other tropes in dispositional essentialism. In addition to being incompatible with these one-category trope ontologies, dispositional essentialism faces serious problems in characterizing essences of fundamental properties. As we will argue in Section 3, the exact advantages of dispositional essentialism remain unclear in comparison with the views taking laws of nature as primitive. Finally, in Section 4, we outline an alternative account, based on Smith's (2016) non-recombinatorial quidditism, according to which tropes as particular characters or natures necessitate their own fundamental nomological roles. The resulting conception of

powerful tropes is compatible with the Strong Nuclear Theory and does not introduce any such problematic additional constructions as primitive dispositional essences or laws of nature considered as fundamental constituents of reality. In our view, the closest substitutes for formal causes are powerful tropes necessary

to a given substance." (p. 107)

"Kripke's well-known theory of truth(1) has some (also well-known) problems with regard to semantic openness and inadequate modelling of some intuitively unproblematic uses of the truth predicate. I will present a modification of the theory that solves some of these problems. But first (Section II) it is argued that the basic version of Kripke's theory is on the right track if we are looking for an explication of the correspondence theory of truth, because the correspondence relation is a grounding relation. The modification is done in an attempt to stay true to these basic ideas behind Kripke's construction and just take them a step further by extending the range of facts that truth values can be grounded in to include facts about sentences being ungrounded.

Thereby some of the problems of expressive weakness in Kripke's own theory are solved." (p. 216)

Abstract: "This paper offers a unification and systematization of the grounding approaches to truth, denotation, classes and abstraction. Its main innovation is a method for "kleenifying" bivalent semantics so as to ensure that the trivalent semantics used for various linguistic elements are perfectly analogous to the semantics used by Kripke, rather than relying on intuition to achieve similarity. The focus is on generalizing strong Kleene semantics, but one section is devoted to supervaluation, and the unification method also extends to weak Kleene semantics."

22. Harbecke, Jens. 2016. "Is Mechanistic Constitution a Version of Material Constitution?" In *Scientific Composition and Metaphysical Ground*, edited by Carl Gillett, Ken Aizawa, 91-121. London: Palgrave-Macmillan.

"The investigation proceeds as follows. In a first step, I reconstruct the context in which the question about mechanistic constitution arises (section "The Question of Mechanistic Constitution"). I then review the philosophical enquiry associated with mechanistic constitution (section "The Mechanistic Approach"), which includes a discussion of the regularity theory (section "What Is Mechanistic Constitution?") and of identity statements about phenomena and mechanisms (section "Identity").

Subsequently, I review the problem of material constitution and the grounding problem (section "The Question of Material Constitution").

I then show that material constitution is to be distinguished from mechanistic constitution (section "Is Mechanistic Constitution Material Constitution?") while there are various logical and conceptual connections between the two notions (section "Connections"). In a final step, I suggest that the ontology presupposed by the regularity approach to mechanistic constitution offers an informative eliminativist

solution to the problem of mechanistic constitution and grounding (section “Mechanisms and the Grounding Problem”). The last section summarizes the argument and raises some open questions that the present chapter was unable to answer (section “Conclusion”)." (p. 93)

23. Haukioja, Jussi. 2013. "Different Notions of Response-Dependence." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 167-190. Munich: Philosophia Verlag.

"An intuitively compelling distinction seems to exist between those areas of discourse in which the facts are in some sense 'up to us' and those in which they are not.

(...)

Response dependence theories were initially proposed as an attempt to sharpen this distinction. However, the original idea has since been extended in various different ways, with different philosophical aims in mind. As a result, discussions of response-dependence can sometimes be confusing--my hope in the present chapter is to clarify the situation and reduce the risk of misunderstandings, by presenting an overview of the main theories and their differences." (p. 167)

24. Henderson, David, and Horgan, Terry. 2013. "On the Armchair Justification of Conceptually Grounded Necessary Truths." In *The a Priori in Philosophy*, edited by Casullo, Albert and Thurow, Joshua C., 111-133. New York: Oxford University Press.

"The plan of the chapter is as follows. In Section 1, we discuss armchair methodology in linguistics, as a useful model for armchair philosophical reasoning. In Section 2, we elaborate on our conception of low-grade a priori reasoning in philosophy, in a way that emphasizes some key respects in which such reasoning incorporates empirical considerations. In Section 3, we illustrate low-grade a priori reasoning in action. We discuss a series of scenarios concerning a much-discussed concept (namely, the concept water), and we use these scenarios to

argue for two hypotheses, each of which is apt to seem somewhat surprising in the current philosophical climate: first, metaphysically necessary truths that are semantically non-analytic and epistemologically a posteriori— e.g., “Water is composed of H₂O”—are underwritten by yet-more-fundamental necessary truths that are analytic; and second, it is a conceptually grounded necessary truth that some statements expressing epistemic possibilities do not express metaphysical possibilities. In Section 4, we situate our conception of armchair reasoning in philosophy in relation to two other conceptions—on the one hand, that of Timothy Williamson, whose construal of such reasoning is less traditional than ours, and on the other hand, that of those philosophers who continue to deploy a more traditional understanding of the a priori. We argue that our own conception is preferable to each of these alternatives." (p. 112)

26. Horgan, Terence. 1993. "From Supervenience to
Superdupervenience: Meeting the Demands of a Material
World." *Mind* no. 102:555-586.

"There now seems to be emerging (e.g., Kim 1990; 1993b, ch. 9)
an attitude of sober reassessment, accompanied by a suspicion
that supervenience theses per se do less work philosophically
than some had hoped they would.

I think this change of mood was in many ways inevitable, given
certain ironic facts about the history of the notion of
supervenience in philosophical thought during the 20th
century. There is much to be learned from this history about
both the uses and the limitations of supervenience theses,
especially with respect to materialism. So the first half of this
paper, §§ 1-4, will be a historical overview, aimed at highlighting
some key ironies and drawing some important lessons for
materialist metaphysics. The principal moral will be that
supervenience relations, in order to figure in a broadly
materialistic worldview, must be explainable rather than *sui
generis*."

27. Horvath, Joachim. 2018. "Philosophical Analysis: The Concept
Grounding View." *Philosophy and Phenomenological Research*
no. 97:724-750.

Abstract: "Philosophical analysis was the central preoccupation
of 20th-century analytic philosophy. In the contemporary
methodological debate, however, it faces a number of pressing

external and internal challenges. While external challenges, like those from experimental philosophy or semantic externalism, have been extensively discussed, internal challenges to philosophical analysis have received much less attention. One especially vexing internal challenge is that the success conditions of philosophical analysis are deeply unclear.

According to the standard textbook view, a philosophical analysis aims at a strict biconditional that captures the necessary and sufficient conditions for membership in the relevant category. The textbook view arguably identifies a necessary condition on successful philosophical analyses, but understood as a sufficient condition it is untenable, as I will argue in this paper. To this end, I first uncover eight conditions of adequacy on successful philosophical analyses, some of which have rarely been spelled out in detail. As we shall see, even sophisticated alternatives to the textbook view fail to accommodate some of these conditions.

I then propose the concept grounding view as a more promising account of philosophical analysis.

According to this view, successful philosophical analyses require necessary biconditionals that are constrained by grounding relations among the concepts involved. Apart from providing a satisfactory account of philosophical analysis in its own right, the concept grounding view is also able to meet the challenge that the success conditions of philosophical analysis are problematically unclear."

28. Hovda, Paul, and Cross, Troy. 2013. "Grounding Relation(s): Introduction." *Essays in Philosophy* no. 14:1-6.

"Metaphysics has witnessed a dramatic shift of late. While questions about existence, possibility, and necessity still matter to the discipline, the focus now rests on questions about essence, grounding, naturalness, fundamentality, and structure. Metaphysicians have gone from asking merely what there is, could be, or must be, to asking about features of things, and connections among things, that may not be describable merely in terms of existence, possibility, and necessity; for example: what grounds what?

From the perspective of a logical empiricist, the transition from ontology and modal metaphysics to essentialist metaphysics is a passing from dark to still darker days. But Aristotle might see things differently. In fact, one might be tempted to dub this transition “The Aristotelian Turn”. This issue features papers illuminating one of the central notions enabling this recent turn, the notion of grounding.” (p. 1)

29. Howard-Snyder, Daniel, Rasmussen, Joshua, and Cullison, Andrew. 2013. "On Whitcomb's Grounding Argument for Atheism." *Faith and Philosophy* no. 30:198-204.

Abstract: "Dennis Whitcomb argues that there is no God on the grounds that (i) God is supposed to be omniscient, yet (ii) nothing could be omniscient due to the nature of grounding. We give a formally identical argument that concludes that one of the present co-authors does not exist. Since he does exist, Whitcomb's argument is unsound. But why is it unsound? That is a difficult question.

We venture two answers. First, one of the grounding principles that the argument relies on is false. Second, the argument equivocates between two kinds of grounding: instance-grounding and quasi-mereological grounding.

Happily, the equivocation can be avoided; unhappily, avoidance comes at the price of a false premise."

31. ———. 2016. "Reality-Making: Introduction." In *Reality Making*, edited by Jago, Mark, 1-10. Oxford: Oxford University Press.

"This volume contains chapters based on the *Reality Making* conference in metaphysics, held in Nottingham in July, 2012. Most of them are revised and expanded versions of talks given at the conference. They are closely focused on the conference's main metaphysical themes: *grounding, fundamentality, and essence*. The first two, by Martin Glazier and Naomi Thompson, primarily concern grounding. They address questions of how entities non-causally depend on other entities for their existence and qualitative character; and they consider the nature and importance of that dependence relation. The next two chapters, by Jacek Brzozowski and Matthew Tugby, consider what kinds of entity, if any, are fundamental to reality. They investigate the relationship between the fundamental and all the other parts of reality, and the connection between fundamental reality and other ways the world could have been. The remaining four chapters, by Mark Jago, Nicholas Jones, Sonia Roca-Royes, and Nathan Wildman, focus on the topic of reality-making:

essence and its connection to *grounding* and *fundamentality*. These chapters focus on the essences of objects (as opposed to properties and other kinds of entity).

They ask: what are material objects? Are they fundamental parts of reality? If not, how are they grounded? What grounds their essences and their modal properties?"

32. ———. 2016. "Essence and the Grounding Problem." In *Reality Making*, edited by Jago, Mark, 99-120. Oxford: Oxford University Press.

"As I indicated above, I find pluralism to be well-motivated, independently of the modal argument; and I've argued for pluralism (by arguing against monism) elsewhere (Barker and

Jago 2014). My aim in this paper is not to argue for pluralism, but to defend it against its most serious problem."

(...)

"If modal differences (including differences in persistence conditions) between coincident objects cannot be grounded, then pluralism about coincident objects looks to be in bad shape.

How should the pluralist respond? Her options seem to be limited from the start.

Some have suggested that modal differences between coincident objects depend on the way we conceptualize the objects in question (§5.3). Others have claimed that the pluralist must take such modal differences to be primitive facts about our world (§5.4). Both approaches are unappealing; and the pluralist can do much better.

My aim in this chapter is to set out (what I take to be) the best response to the grounding problem." (p. 100)

"The underlying complaint is that there's no way to understand the general features of grounding.

(...)

We can develop both a general theory of grounding and a theory of how particular things are grounded. The key link between the simple logical cases and the difficult ones—involving material objects, mental states, truth, and so on—concerns the natures of those entities. I'll argue for a certain view of what makes those entities what they are, and then show how this provides us with information on how they are (or

could be) grounded. If we can get a grasp on the natures of things (in the sense to be articulated below), then the simple logical cases give us what we need to understand the grounding conditions for those entities." (pp. 199-200)

35. ———. 2021. "Introducing Formal Causation." In *Neo-Aristotelian Perspectives on Formal Causation*, edited by Jansen, Ludger and Sanstad, Petter, 1-16. New York: Routledge.

"The essays in this volume, together with this introduction, trace the historical development of formal causation and demonstrate its relevance for contemporary issues, such as causation, explanation, laws of nature, powers, functions, trope theory, essence, dependence, and metaphysical grounding. There are also papers connecting formal causation to contemporary work in biology and cognitive science.

In this introduction, we will first sketch the history of formal causation, from its beginning with Plato and Aristotle, its reception by (and criticism from) the ancient commentators, and all the way to our current time (Section 1). Second, we take a more systematic point of view, and attempt to answer the question of why we need a theory of formal causation today (Section 2). To do so, we point at possible applications for such a theory by pinpointing the relevance of formal causation to the current literature (Section 2.1). We next look at the different approaches to formal causation that is to be found today and investigate whether they are concerned with the same issue (Section 2.2). Lastly, we point out some open questions, some of which are addressed by the contributions of this volume (Section 2.3). Finally, we shall give a summary of each contribution of this volume (Section 3)." (p. 1)

36. Jansson, Lina. 2017. "Explanatory Asymmetries, Ground, and Ontological dependence." *Erkenntnis* no. 82:17-44.

Abstract: "The notions of ground and ontological dependence have made a prominent resurgence in much of contemporary metaphysics. However, objections have been raised. On the one hand, objections have been raised to the need for distinctively metaphysical notions of ground and ontological dependence.

On the other, objections have been raised to the usefulness of adding ground and ontological dependence to the existing store of other metaphysical notions. Even the logical properties of ground and ontological dependence are under debate. In this article, I focus on how to account for the judgements of non-symmetry in several of the cases that motivate the introduction of notions like ground and ontological dependence. By focusing on the notion of explanation relative to a theory, I conclude that we do not need to postulate a distinctively asymmetric metaphysical notion in order to account for these judgements."

"In section 2 I will briefly review how structural equation modelling works in the causal case before showing how the formal framework can be extended to the grounding case.

In section 3 I will argue that it is only the formal framework that carries over to the grounding case. In particular, the seeming unification of the structural equations approach to explanation disappears once we take into account what it takes for a structural equations model to have appropriately captured the situation that we are modelling. As Schaffer (2016) and Blanchard and Schaffer (2017) emphasize, structural equation modelling is a type of modelling. Once we are given a model of some scenario or system, the obvious question to ask is whether the model is any good. That is, is the model an apt or fitting one (for the purpose at hand)? For a model to be a good one for the purposes at hand it has to contain appropriate (whatever that turns out to mean) variables and appropriately (whatever that turns out to mean) represent the relations of causal or grounding relevance." Abstract: "Jonathan Schaffer has provided three putative counterexamples to the transitivity of grounding, and has argued that a contrastive treatment of grounding is able to provide a resolution to them, which in turn provides some motivation for accepting such a treatment. In this article, I argue that one of these cases can easily be turned into a putative counterexample to a principle which Schaffer calls differential transitivity. Since Schaffer's proposed resolution rests on this principle, this presents a dilemma for the contrastivist: either he dismisses the third case, which weakens the motivation for accepting his treatment of grounding, or else he accepts it, in which case he is faced with a counterexample to a principle that his proposed resolution to the original cases depends on. In the remainder of the article, I argue that the prima facie most promising strategy the contrastivist could take, which is to place some restriction on which contrastive facts are admissible so as to rule out the purported counterexample to differential transitivity, faces some important difficulties. Although these difficulties are not insurmountable, they do pose a substantial challenge for the contrastivist."

Press.

"I assume that arithmetical truths are conceptual truths; that is, that we can tell that they are true just by examining our concepts (i.e. certain of our mental representations). But, I say, the epistemological story cannot end there. In order for an examination of our concepts to supply us with knowledge of an independent reality, it must be that those concepts are appropriately sensitive to the nature of that reality, or what I call *grounded*. A concept's being grounded in my sense requires that it (or, perhaps, the constituent concepts from which it is built) should accurately represent some feature of the independent world.(8) That is, groundedness requires that the concept be what I call *fitting*. But more is also required: just as knowledge requires more than truth, groundedness requires more than fittingness. In fact, I suggest that there is a very tight analogy between the two cases." (Introduction, p. 8)

(8) In fact, there is a little more subtlety involved in the precise formulation of this notion. But this sketch will do to convey the general idea.

40. ——. 2011. "Is Metaphysical Dependence Irreflexive?" *The Monist* no. 94:267-276.

"It is very commonly asserted that metaphysical dependence or grounding is an irreflexive relation: that is to say, it *never holds between an item and itself*." (p. 267)

(...)

"Maybe the irreflexivity assumption doesn't require argument?

Perhaps it is reasonable just to assume it in the absence of arguments to the contrary. There are (at least) three possible ways to back up this suggestion.

One could take the irreflexivity claim to be:

1. stipulative,
2. intuitive, or
3. too basic to require justification (at least in the relevant contexts).

If it is taken to be stipulative (i.e. if one takes it to be true by definition that dependence is irreflexive), one runs the risk of discussing something that isn't what everyone else meant by 'dependence', or of discussing something that is less interesting than schmeppendence (a nearby non-irreflexive relation). One can mean whatever one likes by 'dependence', of course, but these risks are to be treated with respect by any serious philosopher.

If one merely takes irreflexivity to be intuitive, however, one is open to the possibility that its intuitiveness might be explained away as being due to quasi-irreflexivity.

What about taking irreflexivity to be too basic to require justification in the relevant contexts?⁸ After all, one must start somewhere if one is to make any progress; one can't argue for all one's assumptions. But one can assert that dependence appears to be irreflexive, or exhibits some features suggestive of irreflexivity, almost as quickly as one can assert that it is irreflexive.

Now that the irreflexivity assumption has been questioned and one obvious motivation for it undermined, it is not good philosophical practice to sweep the challenge back under the carpet." (p. 275, notes omitted)

42. Katzav, Joel. 2002. "Identity, Nature, and Ground." *Philosophical Topics* no. 30:167-187.

Abstract: "What does the qualitative identity of objects consist in? A standard response is that it consists in the possession of properties and relations. If all of an object's properties and relations are specified, all there is to be specified about its qualitative as opposed to its numerical identity will have been specified.

Another response adds that kinds, conceived of as an irreducible category of entity, also play a part in fixing the qualitative identities of objects.

In what follows, two arguments are offered according to which these views are insufficient. Both lead to the conclusion that the qualitative identities of objects consist in part in their natures being grounded in what differs from entities, that is to say in something like conditions for the possibility of entities.

The idea of such grounding will be clarified, and some of the criteria of adequacy for theses about it will be spelled out. Further, the implications of the claim that the natures of objects are grounded for the problems of the one and the many will be discussed."

43. Khudairi, Hasen. 2018. "Grounding, Conceivability, and the Mind-Body Problem." *Synthese* no. 195:919-926.

Abstract: "This paper challenges the soundness of the two-dimensional conceivability argument against the derivation of phenomenal truths from physical truths (cf. Chalmers in *The conscious mind*, Oxford University Press, Oxford, 1996; *The character of consciousness*, Oxford University Press, Oxford, 2010) in light of a hyperintensional regimentation of the ontology of consciousness. The regimentation demonstrates how ontological dependencies between truths about consciousness and about physics cannot be witnessed by epistemic constraints, when the latter are recorded by the conceivability—i.e., the epistemic possibility—thereof. Generalizations and other aspects of the philosophical

significance of the hyperintensional regimentation are further examined."

44. Kirchin, Simon. 2013. "Evaluation, Normativity and Grounding." *Aristotelian Society Supplementary Volume* no. 87:179-198.

Abstract: "I consider the 'normative relevance' argument and the idea of grounding. I diagnose why there appears to be a tension between the conclusion that we are tempted to reach and the intuition that the normative is grounded in or by the non-normative. Much of what I say turns on the idea of the normative itself. In short, I think that concentrating on this idea can help us see how the tension arises. My aim is to encourage people to reconceptualize the debate so as to begin to offer additional insight. To that end, I spend some time contrasting normativity with evaluation, and then think how the debate may alter if we run it with the latter. I doubt that doing so will solve any problem, and I suspect that what I say will be controversial anyway.

But there is some value to changing matters nonetheless. The idea that runs through this paper is that the whole issue is so complex and deep that we should not narrowly construe it with reference only to normativity."

45. Kment, Boris. 2014. *Modality and Explanatory Reasoning*. New York: Oxford University Press.

"The goal of this book is to shed light on metaphysical necessity and the broader class of modal properties to which it belongs."

(...)

I will argue that to understand modality we need to reconceptualize its relationship to causation and other forms of explanation such as grounding, a relation that connects metaphysically fundamental facts to non-fundamental ones. While many philosophers have tried to give modal analyses of causation and explanation, often in counterfactual terms, I will argue that we obtain a more plausible, explanatorily powerful and unified theory if we regard explanation as more fundamental than modality." (p. 1)

46. ———. 2021. "Russell–Myhill and Grounding." *Analysis*.

First online 1 October 2021.

Abstract: "The Russell-Myhill paradox (RMP) puts pressure on the Russellian structured view of propositions (structurism) by showing that it conflicts with certain prima facie attractive ontological and logical principles. I describe several versions of RMP and argue that structurists can appeal to natural assumptions about metaphysical grounding to provide independent reasons for rejecting the ontological principles used in these paradoxes. It remains a task for future work to extend this grounding-based approach to all variants of RMP."

Chapter 3: *Grounding, Ontological Dependence, and Fundamentality*, pp. 47-73.

"In recent years, many metaphysicians, following the lead of Kit Fine, have used the term 'grounding' to represent a relation of metaphysical dependency: if x is grounded in y, then x (in a certain sense) depends upon y, for its existence, or truth, or nature. We could identify fundamental entities or truths with those that are not grounded in other entities or truths, either by being absolutely ungrounded or by being in some special way grounded without being grounded in or by anything." (pp. 47-48)

48. Korbmacher, Johannes. 2015. "Yet Another Puzzle of Ground." *Kriterion - Journal of Philosophy* no. 29:1-10.

Abstract: "We show that any predicational theory of partial ground that extends a standard theory of syntax and that proves some commonly accepted principles for partial ground is inconsistent.

We suggest a way to obtain a consistent predicational theory of ground."

49. ———. 2018. "Axiomatic Theories of Partial Ground I: The Base Theory." *Journal of Philosophical Logic* no. 47:161-191.

Abstract: "This is part one of a two-part paper, in which we develop an axiomatic theory of the relation of partial ground. The main novelty of the paper is the use of a binary ground predicate rather than an operator to formalize ground. This allows us to connect theories of partial ground with axiomatic theories of truth. In this part of the paper, we develop an axiomatization of the relation of partial ground over the truths of arithmetic and show that the theory is a proof-theoretically conservative extension of the theory PT of positive truth. We construct models for the theory and draw some conclusions for the semantics of conceptualist ground."

50. ———. 2018. "Axiomatic Theories of Partial Ground II: Partial Ground and Hierarchies of Typed Truth." *Journal of Philosophical Logic* no. 47:193-226.

Abstract: "This is part two of a two-part paper in which we develop an axiomatic theory of the relation of partial ground. The main novelty of the paper is the use of a binary ground predicate rather than an operator to formalize ground. In this part of the paper, we extend the base theory of the first part of the paper with hierarchically typed truth-predicates and principles about the interaction of partial ground and truth.

We show that our theory is a proof-theoretically conservative extension of the ramified theory of positive truth up to ε_0 and thus is consistent. We argue that this theory provides a natural solution to Fine's "puzzle of ground" about the interaction of truth and ground. Finally, we show that if we apply the truth-predicate to sentences involving our ground-predicate, we run into paradoxes similar to the semantic paradoxes: we get ground-theoretical paradoxes of self-reference."

51. Koslicki, Kathrin. 2015. "The Coarse-Grainedness of Grounding." *Oxford Studies in Metaphysics* no. 9:306-344.

"At least with respect to its formal properties, then, grounding does appear to hold more promise than supervenience for the purposes of developing an approach to relative fundamentality,

if only because grounding is commonly stipulated to be asymmetric and not definable in modal terms. However, as we will discover below, grounding nevertheless suffers from some of the same deficiencies as supervenience: most prominently, grounding also fails to be sufficiently finegrained to do its intended explanatory work. In addition, there is doubt as to whether the phenomena collected together under the rubric of grounding are really unified by the presence of a single relation.

And, finally, grounding turns out not to be particularly helpful in capturing and illuminating what is philosophically important about the traditional substance/non-substance distinction. In the end, we will find that, although grounding performs better than supervenience in some ways, it does not solve all of the problems to which a supervenience-based approach to relative fundamentality falls prey." (p. 309)

52. ———. 2016. "Where Grounding and Causation Part Ways: Comments on Schaffer." *Philosophical Studies* no. 173:101-112.

Abstract: "Does the notion of ground, as it has recently been employed by metaphysicians, point to a single unified phenomenon (the "Unity Hypothesis")? Jonathan Schaffer holds that the phenomenon of grounding exhibits the unity characteristic of a single genus. In defense of this hypothesis, Schaffer proposes to take seriously the analogy between causation and grounding. More specifically, Schaffer argues that both grounding and causation are best approached through a single formalism, viz., that utilized by structural equation models of causation. In this paper, I present several concerns which suggest that the structural equation model does not transfer as smoothly from the case of causation to the case of grounding as Schaffer would have us believe. If it can in fact be shown that significant differences surface in how the formalism in question applies to the two types of phenomena in question, Schaffer's attempt at establishing an analogy between grounding and causation has thereby been weakened and, as a result, the

application of the Unity Hypothesis to the case of grounding once again stands in need of justification."

53. ———. 2020. "Skeptical Doubts." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 164-179. New York: Routledge.

"What exactly are we supposed to learn from the grounding enthusiast's alleged insight that factual and/or nonfactual connections such as those cited in (1) and (2) are all grounding connections? In what follows, I shall refer to this as "the Central Question". *Grounding skeptics* (also known as "ground busters", see Fine 2020), depending on the version of grounding skepticism they endorse, respond to the Central Question as follows: either (i) we learn nothing at all from the grounding enthusiast's alleged insight; or (ii) what we learn from the grounding enthusiast's alleged insight can be better stated in terms that do not appeal to the grounding idiom. In either case, so the grounding skeptic reasons, the grounding idiom lacks theoretical utility, and we therefore might as well continue to go about the business of trying to clarify the nature of the factual and/or nonfactual connections at issue without appeal to the grounding idiom." (p. 165, a note omitted)

54. Kovacs, David Mark. 2017. "Grounding and the Argument from Explanatoriness." *Philosophical Studies* no. 174:2927-2952.

Abstract: "In recent years, metaphysics has undergone what some describe as a revolution: it has become standard to understand a vast array of questions as questions about grounding, a metaphysical notion of determination. Why should we believe in grounding, though? Supporters of the revolution often gesture at what I call the *Argument from Explanatoriness*: the notion of grounding is somehow indispensable to a metaphysical type of explanation. I challenge this argument and along the way develop a "reactionary" view, according to which there is no interesting sense in which the notion of grounding is explanatorily indispensable. I begin with a distinction between two conceptions of grounding, a

distinction which extant critiques of the revolution have usually failed to take into consideration: grounding *qua* that which underlies metaphysical explanation and grounding *qua* metaphysical explanation itself. Accordingly, I distinguish between two versions of the Argument from Explanatoriness: the Unexplained Explanations Version for the first conception of grounding, and the Expressive Power Version for the second. The paper's conclusion is that no version of the Argument from Explanatoriness is successful."

55. ———. 2018. "What Is Wrong with Self-Grounding?" *Erkenntnis* no. 83:1157-1180.

Abstract: "Many philosophers embrace grounding, supposedly a central notion of metaphysics. Grounding is widely assumed to be irreflexive, but recently a number of authors have questioned this assumption: according to them, it is at least possible that some facts ground themselves. The primary purpose of this paper is to problematize the notion of self-grounding through the theoretical roles usually assigned to grounding. The literature typically characterizes grounding as at least playing two central theoretical roles: a structuring role and an explanatory role. Once we carefully spell out what playing these roles includes, however, we find that any notion of grounding that isn't irreflexive fails to play these roles when they are interpreted narrowly, and is redundant for playing them when they are interpreted more broadly.

The upshot is that no useful notion of grounding can allow a fact to ground itself."

56. ———. 2020. "Four Questions of Iterated Grounding." *Philosophy and Phenomenological Research* no. 101:341-364.

Abstract: "The Question of Iterated Grounding (QIG) asks what grounds the grounding facts. Although the question received a lot of attention in the past few years, it is usually discussed independently of another important issue: the connection between metaphysical explanation and the relation or relations that supposedly "back" it. I will show that once we get clear on the distinction between metaphysical explanation and the relation(s) backing it, we can distinguish no fewer than four

questions lumped under QIG. I will also argue that given some plausible assumptions about what it would take for a relation to back metaphysical explanation, many salient views about grounding allow us to give “easy” answers to these questions—easy in the sense that we can straightforwardly derive them from the respective conception of grounding without getting into the sorts of complexities that typically inform answers to QIG. The paper’s main upshot is that we cannot expect to make much progress on QIG without first addressing the difficult issue of how exactly grounding is related to metaphysical explanation.”

57. ———. 2020. "Modality." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 348-360. New York: Routledge.

"How is grounding related to modality? This question is ambiguous, since several phenomena fit under the broad label ‘modality’. First, we could ask whether grounds necessitate what they ground (‘Grounding Necessitarianism’). Second, we could ask whether grounding is an internal relation, i.e., whether in every possible world in which some fact and its grounds obtain they automatically stand in the grounding relation. Third, we could ask how grounding is related to modal notions, in particular supervenience, which used to be assigned similar theoretical roles.

Alex Skiles’s contribution to this volume [Chapter 10] discusses the first and the second of these questions, and in the context of a broader discussion of meta-grounding, Jon Erling Litland [Chapter 9] also touches on the second; the present chapter will entirely focus on the relation between grounding and supervenience." (p. 348)

58. ———. 2021. "An Explanatory Idealist Theory of Grounding." *Noûs*.

First online 12 April 2021.

Abstract: "How is grounding related to metaphysical explanation? The standard view is that the former somehow “backs”, “undergirds” or “underlies” the latter. This view fits

into a general picture of explanation, according to which explanations in general hold in virtue of a certain elite group of “explanatory relations” or “determinative relations” that back them. This paper turns the standard view on its head: grounding doesn't “back” metaphysical explanation but is in an important sense downstream from it. I call this view “grounding idealism”, since it structurally resembles an analogous view about causation that is known as “causal idealism” and has been endorsed by philosophers like Michael Scriven and Philip Kitcher. I formulate a specific version of grounding idealism, Metaphysical Explanation-First Idealism (MEFI), according to which the semantic value of ‘grounding’ is an abundant, gerrymandered relation settled by the metaphysical explanation facts. Then I offer some theoretical considerations that support MEFI over rival accounts of the relation between grounding and metaphysical explanation. Finally, I address the question of what role is left for grounding to play, if not that of “backing” metaphysical explanations.”

59. Krämer, Stephan. 2013. "A simpler puzzle of ground." *Thought: A Journal of Philosophy* no. 2:85-89.

Abstract: "Metaphysical grounding is standardly taken to be irreflexive: nothing grounds itself. Kit Fine has presented some puzzles that appear to contradict this principle. I construct a particularly simple variant of those puzzles that is independent of several of the assumptions required by Fine, instead employing quantification into sentence position. Various possible responses to Fine's puzzles thus turn out to apply only in a restricted range of cases."

60. ———. 2019. "Ground-theoretic Equivalence." *Synthese* no. 198:1643-1683.

Abstract: "Say that two sentences are ground-theoretically equivalent iff they are interchangeable *salva veritate* in grounding contexts. Notoriously, ground-theoretic equivalence is a hyperintensional matter: even logically equivalent sentences may fail to be interchangeable in grounding contexts. Still, there seem to be some substantive, general principles of ground-theoretic equivalence. For example, it seems plausible

hat any sentences of the form $A \wedge B$ and $B \wedge A$ are ground-theoretically equivalent. What, then, are in general the conditions for two sentences to stand in the relation of ground-theoretic equivalence, and what are the logical features of that relation? This paper develops and defends an answer to these questions based on the modified truthmaker theory of content presented in my recent paper 'Towards a theory of ground-theoretic content' (Krämer in *Synthese* 195(2):785–814, 2018)."

61. ———. 2020. "Puzzles." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 271–282. New York: Routledge.

"This chapter reviews the variety of logical puzzles of ground that have been identified in the literature, describes the solutions that have been proposed, and indicates what the main challenges are that these solutions face. I begin by introducing relevant notation as well as the key concepts and principles that will subsequently be used in formulating the puzzles before turning to the puzzles themselves. In principle, there is a huge number of different derivations of contradictions from the relevant principles about ground. Many of them are essentially alike, so that any reasonable solution to one will immediately provide a solution to the other. Some of them exhibit more substantial differences, however, and I shall try to describe all the substantially different types of puzzles. I then briefly discuss what desiderata we might impose on adequate solutions to the puzzles before I finally turn to the solutions themselves. Many of these, once developed in detail, involve a fair bit of formal machinery. I shall mainly attempt to convey the basic philosophical ideas underlying and motivating the technical work; readers keen on the details will have to consult the primary texts." (p. 271)

62. Krämer, Stephan, and Roski, Stefan. 2015. "A Note on the Logic of Worldly Ground." *Thought: A Journal of Philosophy* no. 4:59–68.

Abstract: "In his 2010 paper 'Grounding and Truth-Functions', Fabrice Correia has developed the first and so far only proposal

for a logic of ground based on a worldly conception of facts. In this paper, we show that the logic allows the derivation of implausible grounding claims. We then generalize these results and draw some conclusions concerning the structural features of ground and its associated notion of relevance, which has so far not received the attention it deserves."

Abstract: "This paper argues that the exclusion problem for mental causation can be solved by a variant of non-reductive physicalism that takes the mental not merely to supervene on, but to be grounded in, the physical. A grounding relation between events can be used to establish a principle that links the causal relations of grounded events to those of grounding events. Given this principle, mental events and their physical grounds either do not count as overdetermining physical effects, or they do so in a way that is not objectionable."

64. Lange, Marc. 2013. "Grounding, Scientific Explanation, and Humean Laws." *Philosophical Studies* no. 164:255-261.

Abstract: "It has often been argued that Humean accounts of natural law cannot account for the role played by laws in scientific explanations. Loewer (*Philosophical Studies* 2012) has offered a new reply to this argument on behalf of Humean accounts—a reply that distinguishes between grounding (which Loewer portrays as underwriting a kind of metaphysical explanation) and scientific explanation. I will argue that Loewer's reply fails because it cannot accommodate the relation between metaphysical and scientific explanation. This relation also resolves a puzzle about scientific explanation that Hempel and Oppenheim (*Philosophy of Science* 15:135–75, 1948) encountered."

"Increased attention has recently been paid to the fact that in mathematical practice, certain mathematical proofs but not others are recognized as explaining why the theorems they prove obtain (Mancosu 2008; Lange 2010, 2015a, 2016; Pincock 2015). Such “mathematical explanation” is presumably not a variety of causal explanation. In addition, the role of metaphysical grounding as underwriting a variety of explanations has also recently received increased attention (Correia and Schnieder 2012; Fine 2001, 2012; Rosen 2010; Schaffer 2016). Accordingly, it is natural to wonder whether mathematical explanation is a variety of grounding explanation. This paper will offer several arguments that it is not." (p. 1)

Abstract: "Matter's real essence is a ground for certain features of phenomena. Things in themselves are likewise a ground for certain features of phenomena. How do these claims relate? The former is a causal essentialism about physics, Stang argues; and the features so grounded are phenomenally nomically necessary. The latter involves a distinctive ontology of things in themselves, I argue; but the features so grounded are not noumenally nomically necessary. Stang's version of Kant's modal metaphysics is admirable, but does not go far enough. Kant's causal essentialism involves the essences of fundamental properties, as well as of matter. And things in themselves are grounds, because they are substances, the 'substrate' of phenomena."

Annotated bibliography on metaphysical grounding. Fourth part: Lar-Pic

Bibliography

1. Larsson, Staffan. 2018. "Grounding as a Side-Effect of Grounding." *Topics in Cognitive Science* no. 10:389-408.

Abstract: "In relation to semantics, “grounding” has (at least) two relevant meanings. “Symbol grounding” is the process of connecting symbols (e.g., words) to perception and the world. “Communicative grounding” is the process of interactively adding to common ground in dialog. Strategies for grounding in human communication include, crucially, strategies for resolving troubles caused by various kinds of miscommunication. As it happens, these two processes of grounding are closely related. As a side-effect of grounding an utterance, dialog participants (DPs) may adjust the meanings they assign to linguistic expressions, in a process of semantic coordination.

Meanings of at least some expressions (e.g., concrete nouns) include perceptual aspects which enable DPs to classify entities as falling under the expression or not based on their perception of those entities. We show how perceptual grounding of symbols can be achieved in a process of interactively adding to common ground. This requires that perceptual aspects of meaning can be updated as a result of participating in linguistic interaction, thereby enabling fine-grained semantic coordination of perceptually grounded linguistic meanings.

A formal semantics for low-level perceptual aspects of meaning is presented, tying these together with the logical-inferential aspects of meaning traditionally studied in formal semantics. The key idea is to model perceptual meanings as classifiers of perceptual input. This requires a framework where intensions are (a) represented independently of extensions, and (b) structured objects which can be modified as a result of learning. We use Type Theory with Records (TTR), a formal semantics framework which starts from the idea that information and meaning are founded on our ability to perceive and classify the world, that is, to perceive objects and situations as being of types. As an example of our approach, we show how a simple classifier of spatial information based on the Perceptron can be cast in TTR."

"My aim in this chapter, however, is to show that non-naturalists can offer a metaphysical explanation for why the normative supervenes on the natural by adopting the sort of essentialist metaphysics developed by Fine, Rosen, and Dasgupta.⁽⁵⁾ Specifically, I argue (in §4.4) that the non-naturalist may claim that there are some hybrid normative properties whose essences involve both naturalistic sufficient conditions for their instantiation and sufficient conditions for the instantiation of other sui generis normative properties, and that this explains why the normative is determined by, and supervenes on, the natural. Moreover, I argue (in §4.5) that this nonnaturalist explanation for supervenience does not covertly assume any brute metaphysically necessary connections between natural and normative properties, and thus avoids what McPherson calls "bruteness revenge."⁶" (p. 77)

3. ———. 2020. "Normativity." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 472–483. New York: Routledge.

"One of the ways in which grounding earns its keep as a respectable bit of ideology is by being useful for understanding long-standing philosophical debates, including debates in normative ethics and metaethics. (...)

But this common story about grounding's applications in normative inquiry is rife with controversy. First, even if normative ethicists are in the business of making because-claims, it's controversial whether these because-claims are about *metaphysical grounding* or a related but distinctly normative relation—*normative grounding*.

Second, this grounding characterization of the naturalism versus non-naturalism debate begins to look problematic once we ask whether on this characterization, for example, the fact that an act's maximizing happiness fully grounds that it's right is itself a normative fact that must be fully grounded in natural, non-normative facts in order for naturalism to be true. Very general metaphysical considerations suggest that such grounding-facts cannot be so grounded.

(...)

This chapter surveys these two main issues in §2 and §3, respectively, while highlighting what's at stake in these disputes for both normative and metaphysical theorizing." (p. 472)

4. Lenart, Karol. 2021. "Grounding, Essence, and Contingentism." *Philosophia* no. 49:2157-2172.

Abstract: "According to grounding necessitarianism if some facts ground another fact, then the obtaining of the former necessitates the latter. Proponents of grounding contingentism argue against this claim, stating that it is possible for the former facts to obtain without necessitating the latter. In this article I discuss a recent argument from restricted accidental generalisations provided by contingentists that advances such possibility. I argue that grounding necessitarianism can be defended against it. To achieve this aim, I postulate a relationship between grounding and essence by introducing a notion of individual essences understood as a set of essential properties that individuate its bearer. According to a proposed view grounding holds in virtue of identities of its relata, which are in turn determined by their respective individual essences. From there I claim that if grounding holds in virtue of the individual essences of its relata, then it is possible to resist the objection from restricted accidental generalisations and maintain a view that grounds necessitates what is grounded."

5. Lennox, James G. 2021. "Form as Cause and the Formal Cause: Aristotle's Answer." In *Neo-Aristotelian Perspectives on Formal Causation*, edited by Jansen, Ludger and Sandstad, Petter, 225-237. New York: Routledge.

"Introduction: The primary focus of this paper is a distinction of vital importance in understanding causality in the context of Aristotle's investigation of organisms. Aristotle insists that the form of a living being, that is, its soul (*psyche*), is a cause in three of the four ways of being a cause (DA [*De anima*] 11.4, 41568-21, discussed below). This claim has two important implications:

- Being a formal cause is only one way in which form is a cause

- It turns out that there is an intimate relationship in Aristotle's natural philosophy between the formal cause, the moving cause, and the cause for the sake of which (aka the final cause), and this has a direct implication for Aristotle's understanding of the way in which an animal's soul, that is, its form, serves as the cause of its being the kind of living thing it is.

As we will soon see, when it comes to living beings, the relationship between form as formal cause and form as final cause is an especially intimate one." (p. 225)

6. Leuenberger, Stephan. 2013. "Supervenience Among Classes of Relations." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 325-346. Munich: Philosophia Verlag.

"Whatever the exact relationship between supervenience and reducibility, the question whether some relations are reducible to properties naturally leads to the question whether the former supervene on the latter. What would it take for relations to supervene on properties?

The extant literature does not contain a sustained and systematic examination of this question, at least as far as I am aware. This is surprising, given that a great deal of work has been done on distinguishing various concepts of supervenience, supplying exact characterizations for them, and finding applications. It is even more surprising in light of the fact that the concept of supervenience is eminently suitable to be applied to relations, as I shall argue." (pp. 327-328)

7. ———. 2014. "Grounding and Necessity." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 57:151-174.

Abstract: "The elucidations and regimentations of grounding offered in the literature standardly take it to be a necessary connection. In particular, authors often assert, or at least assume, that if some facts ground another fact, then the obtaining of the former necessitates the latter; and moreover, that grounding is an internal relation, in the sense of being necessitated by the existence of the relata. In this article, I

challenge the necessitarian orthodoxy about grounding by offering two prima facie counterexamples.

First, some physical facts may ground a certain phenomenal fact without necessitating it; and they may co-exist with the latter without grounding it. Second, some instantiations of categorical properties may ground the instantiation of a dispositional one without necessitating it; and they may co-exist without grounding it. After arguing that these may be genuine counterexamples, I ask whether there are modal constraints on grounding that are not threatened by them. I propose two: that grounding supervenes on what facts there are, and that every grounded fact supervenes on what grounds there are. Finally, I attempt to provide a rigorous formulation of the latter supervenience claim and discuss some technical questions that arise if we allow descending grounding chains of transfinite length."

8. ———. 2014. "From Grounding to Supervenience?" *Erkenntnis* no. 79:227-240.

Abstract: "The concept of supervenience and a regimented concept of grounding are often taken to provide rival explications of pre-theoretical concepts of dependence and determination. Friends of grounding typically point out that supervenience claims do not entail corresponding grounding claims. Every fact supervenes on itself, but is not grounded in itself, and the fact that a thing exists supervenes on the fact that its singleton exists, but is not grounded in it. Common lore has it, though, that grounding claims do entail corresponding supervenience claims. In this article, I show that this assumption is problematic. On one way of understanding it, the corresponding supervenience claim is just an entailment claim under a different name. On another way of understanding it, the corresponding claim is a distinctive supervenience claim, but its specification gives rise to what I call the "reference type problem": to associate the classes of facts that are the relata of grounding with the types of facts that are the relata of supervenience. However it is understood, supervenience rules out prima facie possibilities: alien realizers, blockers, heterogeneous realizers, floaters, and heterogeneous blockers.

Instead of being rival explications of one and the same pre-theoretical concept, grounding and supervenience may be complementary concepts capturing different aspects of determination and dependence."

9. ———. 2020. "Emergence." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 312-323. New York: Routledge.

"Grounding is taken to be topic neutral, and contributors tend to be interested in general and noncontingent claims about it.

(...)

The literature on emergence is strikingly different on all those counts. It is dispersed over a number of subdisciplines of philosophy, with different intellectual traditions, notably philosophy of mind, philosophy of science, and to a lesser extent metaphysics. Indeed, collections on emergence (e.g., Bedau and Humphreys (2008); Clayton and Davies (2006)) tend to cast the net even wider and include contributions from various natural and social sciences, as well as speculative proposals from the margins of mainstream science. Accordingly, the literature is highly heterogeneous. This means that whatever generalizations I am about to offer on the literature should be taken with a grain of salt." (p. 312)

11. ———. 2016. "Grounding and the Indispensability Argument." *Synthese* no. 193:531-548.

Abstract: "There has been much discussion of the indispensability argument for the existence of mathematical objects. In this paper I reconsider the debate by using the notion of grounding, or non-causal dependence. First of all, I investigate what proponents of the indispensability argument should say about the grounding of relations between physical objects and mathematical ones. This reveals some resources which nominalists are entitled to use. Making use of these resources, I present a neglected but promising response to the indispensability argument—a liberalized version of Field's response—and I discuss its significance. I argue that if it succeeds, it provides a new refutation of the indispensability argument; and that, even if it fails, its failure may bolster some of the fictionalist responses to the indispensability argument already under discussion. In addition, I use grounding to reply to a recent challenge to these responses."

12. Litland, Jon Erling. 2011. Natural Deduction for Logics of Ground.

Available on academia.edu.

Abstract: "I develop two logics (pplg and pnlg) of grounding which can deal with iterated grounding claims. The logics are developed in natural deduction form and the grounding operators are equipped with both introduction and elimination

rules. I prove normalization results for pplg and pnlg and determine their relationship to Fine's Pure Logic of Ground."

14. ———. 2015. "Grounding, Explanation, and the Limit of Internality." *The Philosophical Review* no. 124:481-532.

"For the reader's benefit, here's an overview of the essay. In section 2, I introduce terminology and notation. In section 3, I explain what I mean by the thesis that grounding is internal. In section 4, I lay down the assumptions about ground that generate the problem for internality; in section 5, I present the counterexample; and in section 6, I defend it against a variety of objections. This concludes the negative part of the essay.

Moving on to the positive part of the essay, I link grounding with the notion of a "completely satisfactory explanation" (section 7).

(...)

On either alternative, we obtain a satisfactory logic of ground in settings where we have self-reference, and we can establish the conjecture of the previous section. After concluding (section 9), two technical appendixes establish some claims baldly asserted in the main text: appendix A shows how supervaluationism can be satisfactorily combined with a theory of ground, and appendix B works through the technical details of the account of ground in terms of completely satisfactory explanation." (pp. 482-483)

15. ———. 2016. "An Infinitely Descending Chain of Ground Without a Lower Bound." *Philosophical Studies* no. 173:1361-1369.

Abstract: "Using only uncontentious principles from the logic of ground I construct an infinitely descending chain of ground without a lower bound. I then compare the construction to the constructions due to Dixon (forthcoming [2016]) and Rabin and Rabern (J Philos Log, 2015)."

16. ———. 2016. "Pure Logic of Many-Many Ground." *Journal of Philosophical Logic* no. 45:531-577.

Abstract: "A logic of grounding where what is grounded can be a collection of truths is a "many-many" logic of ground. The idea that grounding might be irreducibly many-many has recently been suggested by Dasgupta (2014). In this paper I present a range of novel philosophical and logical reasons for being interested in many-many logics of ground. I then show how Fine's State-Space semantics for the Pure Logic of Ground (PLG) can be extended to the many-many case, giving rise to the Pure Logic of Many-Many Ground (PLMMG). In the second, more technical, part of the paper, I do two things. First, I present an alternative formalization of PLG; this allows us to simplify Fine's completeness proof for PLG. Second, I formalize PLMMG using an infinitary sequent calculus and prove that this formalization is sound and complete."

17. ———. 2017. "Grounding Ground." In *Oxford Studies in Metaphysics: Vol. 10*, edited by Bennett, Karen and Zimmermann, Dean W, 279-315. New York: Oxford University Press.

"If Γ 's being the case grounds ϕ 's being the case, what grounds that Γ 's being the case grounds ϕ 's being the case?1 This is the

Problem of Iterated Ground.(1)

Dasgupta (2014b), Bennett (2011), and deRosset (2013) have grappled with this problem from the point of view of metaphysics. But iterated ground is a problem not just for metaphysicians: the existing logics of ground(2) have had nothing to say about such iterated grounding claims. In this paper I propose a novel account of iterated ground and develop a logic of iterated ground. The account—what I will call the Zero-Grounding Account (ZGA for short)—is based on three mutually supporting ideas: (i) taking non-factive ground as a primitive notion of ground; (ii) tying nonfactive ground to explanatory arguments; and (iii) holding that true non-factive grounding claims are zero-grounded (in Fine’s sense).” (p. 279)

(1) Here Γ are some (true) propositions and ϕ is a (true) proposition. For the official formulation of claims of ground, see § 2 below. In the interest of readability I will not distinguish carefully between use and mention throughout.

18. ———. 2018. "Could the Grounds's Grounding the Grounded Ground the Grounded?" *Analysis* no. 78:56-65.

Abstract: "The answer to the opening question is 'yes': it follows from standard principles in the logic of ground that that there are facts φ and ψ such that φ 's partially grounding ψ partially grounds ψ . This might seem like a mere curiosity, but it has important consequences for the following hotly debated issue. Suppose that the fact φ grounds the fact ψ ; then this – that φ grounds ψ – is a further fact, and we may ask what grounds it. (This is the Problem of Grounding Ground.) Most philosophers who have addressed it have held that φ is at least a partial ground for φ 's grounding ψ . Unfortunately, this, together with standard principles in the logic of ground, entails that the answer to the opening question is 'no'. Standard and plausible principles about ground are thus inconsistent; moreover, this inconsistency turns on different principles than the inconsistencies unearthed by Fine (2010) and Krämer (2013). In particular, the principle of Amalgamation – that if each of φ and φ is a ground for θ then φ together with φ is a ground for θ – plays a role in generating the inconsistency.

In this article, I establish the above claims and, tentatively, argue that we resolve the inconsistency by giving up Amalgamation, thus clearing the way for φ 's grounding ψ 's grounding ψ ."

19. ———. 2018. "In Defense of the (Moderate) Disunity of Grounding." *Thought: A Journal of Philosophy* no. 7:97-108.

Abstract: "Fine (2012) is a pluralist about grounding. He holds that there are three fundamentally distinct notions of grounding: metaphysical, normative, and natural. Berker (2017) argues for monism on the grounds that the pluralist cannot account for certain principles describing how the distinct notions of grounding interact. This paper defends pluralism. By building on work by Fine (2010) and Litland (2015) I show how the pluralist can systematically account for Berker's interaction principles.

A monist about grounding holds that there is a single fundamental grounding relation; a pluralist holds that there are several fundamentally distinct grounding relations. In this paper I do two things. First, I defend the moderate pluralism of Fine (2012) from two challenges recently presented by Berker (2017). Second, I show that the pluralist's most basic grounding relations are not asymmetric." (A note omitted)

20. ———. 2018. "Pure Logic of Iterated Full Ground." *The Review of Symbolic Logic* no. 11:411-435.

Abstract: "This article develops the Pure Logic of Iterated Full Ground (PLIFG), a logic of ground that can deal with claims of the form " φ grounds that (ψ grounds θ)"—what we call iterated grounding claims. The core idea is that some truths ground a truth φ when there is an explanatory argument (of a certain sort) from premisses to conclusion φ . By developing a deductive system that distinguishes between explanatory and

nonexplanatory arguments we can give introduction rules for operators for factive and nonfactive full ground, as well as for a propositional “identity” connective.

Elimination rules are then found by using a proof-theoretic inversion principle."

21. ———. 2018. "Bicollective Ground: Towards a (Hyper)graphic Account." In *Reality and Its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 140-163. Oxford: Oxford University Press.

"Overview: We begin in §2 by introducing the central notion of immediate strict full ground.

In §3 we develop some ways of making sense of the characteristic non-distributivity of bicollective ground and argue that mathematical structuralists should avail themselves of bicollective ground. In §4 we rehearse the truthmaker semantics for bicollective ground and point out some problems that arise in the bicollective case.

In §5 we recall the graph-theoretic account for the left-collective case and argue against Fine's principle of Amalgamation. The main contribution of the paper comes in §6 where we develop the graph-theoretic account of bicollective ground. We discuss how to define acyclic graphs, mediate ground, the notions of partial ground, and what it is for two collections of truths to be ground-theoretically equivalent. We conclude with some questions for future research (§7)." (p. 141)

22. ———. 2020. "Meta-Ground." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 133-147. New York: Routledge.

"Suppose the facts Γ ground the fact ϕ . Then it is a fact that Γ grounds ϕ . And we may ask what grounds it. What is the answer? And what turns on this? This is the question of *meta-ground*, *grounding ground*, or *iterated ground*.

The goal of this chapter is to introduce the reader to the state of the debate about meta-ground and to indicate some areas for future research. Even though the problem of meta-ground is a

fairly small piece of the larger literature on ground, it is impossible to cover everything. Since I want to indicate what I take to be the most interesting areas for future research, regrettably some subtleties in the existing views had to be suppressed." (p. 133, a note omitted)

23. Lopez de Sa, Dan. 2013. "Rigid vs. Flexible Response-Dependent Properties." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 393-417. Munich: Philosophia Verlag.

"According to a more or less traditional view of secondary qualities, they are-or would be-real though not fully objective features of external objects. Roughly speaking, they are real not only by being the significations of natural simple predicates which can be used to make predications that are, for the most part, truth-evaluable and sometimes true, but also by being exemplified independently of those representations.

Roughly speaking, they are *less than fully objective* in that it is essential for something having them that it bears a certain relation to subjective responses of ours, at least as we actually are.

Response-dependence was intended to generalize the notion of a secondary quality in that respect, by applying also to values in a way such that-at least a qualified form of-realism was vindicated. My view is that response-dependence, by itself, fails with respect to this project." (p. 393)

24. Loss, Roberto. 2015. "Grounds, Roots and Abysses." *Thought: A Journal of Philosophy* no. 4:41-52.

Abstract: "The aim of this study is to address the "Grounding Grounding Problem," that is, the question as to what, if anything, grounds facts about grounding. I aim to show that, if a seemingly plausible principle of modal recombination between fundamental facts and the principle customarily called "Entailment" are assumed, it is possible to prove not only that grounding facts featuring fundamental, contingent grounds are

derivative but also that either they are (at least) partially grounded in the grounds they feature or they are “abysses” (i.e., derivative facts without fundamental grounds and lying at the top of an infinitely descending chain of ground)."

25. ———. 2016. "Parts Ground the Whole and Are Identical to It." *Australasian Journal of Philosophy* no. 94:489-498.

Abstract: "What is the relation between parts taken together and the whole that they compose?"

The recent literature appears to be dominated by two different answers to this question, which are normally thought of as being incompatible. According to the first, parts taken together are *identical* to the whole that they compose. According to the second, the whole is *grounded* in its parts. The aim of this paper is to make some theoretical room for the view according to which parts ground the whole they compose while being, at the same time, identical to it."

26. ———. 2017. "Grounding, Contingency and Transitivity." *Ratio* no. 30:1-14.

Abstract: "Grounding contingentism is the doctrine according to which grounds are not guaranteed to necessitate what they ground.

In this paper I will argue that the most plausible version of contingentism (which I will label ‘serious contingentism’) is incompatible with the idea that the grounding relation is transitive, unless either ‘priority monism’ or ‘contrastivism’ are assumed."

27. ———. 2019. "No Ground for Doomsday." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 62:1136-1156.

Abstract: "The ability of providing an adequate supervenience base for tensed truths may seem to be one of the main theoretical advantages of both the growing-block and the moving-spotlight theory of time over presentism. However, in this paper I will argue that some propositions appear to be as problematic for growing-block theorists as past-directed

propositions are for presentists, namely propositions stating that nothing will be the case in the future.

Furthermore, I will show that the moving-spotlight theory can adequately address all the main supervenience challenges that can be levelled against A-theories of time. I will, thus, conclude that, at least as far as the supervenience principle is concerned, the moving-spotlight theory should be preferred over both presentism and the growing-block theory."

28. Lovett, Adam. 2019. "A Simple Proof of Grounding Internality." *Thought: A Journal of Philosophy* no. 8:154-166.

Abstract: "Some people think that grounding is a type of identity. And some people think that grounding connections hold necessarily. I show that, under plausible assumptions, if grounding is a type of identity, then grounding connections hold necessarily."

29. ———. 2020. "The Puzzles of Ground." *Philosophical Studies* no. 177:2541-2564.

Abstract: "I outline and provide a solution to some paradoxes of ground."

30. Lowe, E. J. 1998. *The Possibility of Metaphysics: Substance, Identity, and Time*. Oxford: Clarendon Press.

"The arguments of Chapter 5 more or less take the concept of substance for granted and so part of the aim of Chapter 6 is to provide a rigorous definition of substance, in terms of the crucial notion of *existential dependency*. At the same time, I begin to build up a picture of the relationships between the category of substance and other categories of entities at the same ontological level—entities such as events, properties, places, and times. This picture is further developed in Chapter 7, where I go on to argue for quite general reasons that certain fundamental kinds of substance—what I call primitive substances—must exist in order to provide the ultimate existential grounding of all concrete existence. Such substances are distinctive in that their identity through time is itself primitive or ungrounded.

However, identifying these substances is a more difficult matter than arguing in a general way for the necessity of their existence." (Preface, p. VI)

31. ———. 2012. "Asymmetrical Dependence in Individuation." In *Metaphysical Grounding: Understanding the Structure of Reality* edited by Correia, Fabrice and Schnieder, Benjamin, 214-233. Cambridge: Cambridge University Press.

"Identity-dependence would appear to be an asymmetrical, or at least an antisymmetrical relation, with the implication that no two distinct entities can be each other's individuators – even if we can allow, as I believe we should, that some entities are self-individuating.

(...)

However, some so-called 'structuralist' ontologies seem to threaten the contention that two or more entities of a certain kind cannot all fix each other's identities.

(...)

If these suggestions are correct, then it would seem that, in principle, all facts about the identities of entities of any kind may 'supervene' upon relational facts about certain structures to which those entities belong. Hence, no identity fact would be metaphysically basic or foundational. In the present chapter, this line of thought will be challenged and thereby a case be made out for the claim that some entities in any coherent system of ontology must be self-individuating, with these entities ultimately explaining the identities of all other entities in the system." (p. 215)

32. ———. 2013. "Some Varieties of Metaphysical Dependence." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 193-210. Munich: Philosophia Verlag.

"In this paper, I shall first of all (in section 1) define various kinds of ontological dependence, motivating these definitions by appeal to examples. My contention is that whenever we

need, in metaphysics, to appeal to some notion of existential or identity-dependence, one or other of these definitions will serve our needs adequately, which one depending on the case in hand. Then (in section 2) I shall respond to some objections to one of these proposed definitions in particular, namely, my definition of (what I call) essential identity dependence.

Finally (in section 3), I shall show how a similar approach can be applied in the theory of truthmaking, by offering an account of the truthmaking relation which defines it in terms of a type of essential dependence. I shall also say why I think that this approach is preferable to one which treats the truthmaking relation as primitive. More generally, my view is that accounts of dependence or 'grounding' which treat these notions as primitive are less satisfactory than my own position, which is that in all cases a suitable definition is forthcoming if we look hard enough." (p. 193)

33. Lubrano, Michele. 2018. "The Emergence of Ground: Some Limitative Results." *Synthese* no. 198:1303-1315.

Abstract: "In this paper I'm going to deal with the divide between foundationalism and infinitism about grounding. I will examine a thesis about the emergence of ground that has recently been proposed by Matteo Morganti. I will show that a generalized version of this thesis suffers from some serious limits and it cannot be accepted without a significant departure from the standard notion of grounding."

34. Marshall, Daniel Graham. 2015. "Intrinsicity and Grounding." *Philosophy and Phenomenological Research* no. 90:1-19.

Abstract: "A number of philosophers have recently claimed that intrinsicity can be analysed in terms of the metaphysical

notion of grounding. Since grounding is a hyperintensional notion, accounts of intrinsicity in terms of grounding, unlike most other accounts, promise to be able to discriminate between necessarily coextensive properties that differ in whether they are intrinsic. They therefore promise to be compatible with popular metaphysical theories that posit necessary entities and necessary connections between wholly distinct entities, on which it is plausible that there are such properties. This paper argues that this promise is illusory. It is not possible to give an analysis of intrinsicity in terms of grounding that is consistent with these theories. Given an adequate analysis should be compatible with these theories, it follows

that it is not possible to analyse intrinsicity in terms of grounding."

35. Martínez, Sergio F., and Huang, Xiang. 2011. "Epistemic Groundings of Abstraction and Their Cognitive Dimension." *Philosophy of Science* no. 78:490-511.

Abstract: "In the philosophy of science, abstraction has usually been analyzed in terms of the interface between our experience and the design of our concepts. The often implicit assumption here is that such interface has a definite identifiable and universalizable structure, determining the epistemic correctness of any abstraction. Our claim is that, on the contrary, the epistemic grounding of abstraction should not be reduced to the structural norms of such interface but is also related to the constraints on the cognitive processes of specific abstractions. This suggests that we should understand abstraction as embodied in different kinds of abstraction practices."

36. Maurin, Anna-Sofia. 2019. "Grounding and Metaphysical Explanation: It's Complicated." *Philosophical Studies* no. 176:1573-1594.

Abstract: "Grounding theorists insist that grounding and explanation are intimately related. This claim could be understood as saying either that grounding 'inherits' its properties from (metaphysical) explanation (and that,

therefore, contemplating the nature of explanation informs us about the nature of grounding) or it could be interpreted as saying that grounding plays an important—possibly an indispensable— role in metaphysical explanation (and that, therefore, that there are these explanations justifies positing grounding). Or both. I argue that saying that grounding ‘inherits’ its properties from explanation can only be justified if grounding is explanatory by nature (if so-called ‘unionism’ is true), but that this view is untenable. We ought therefore to be ‘separatists’ and view grounding and explanation as distinct. As it turns out, though, once grounding has been in this sense distinguished from the explanation it backs, the view that the role grounding plays in explanation justifies its introduction ends up in serious trouble. I conclude that the role grounding plays in explanation (if any) does not justify attributing to grounding whatever nature we think it has, and it most likely does not give us any special reason to think grounding exists."

37. Mayer, Marta Cialdea, and Cerrito, Serenella. 2001. "Ground and Free-Variable Tableaux for Variants of Quantified Modal Logics." *Studia Logica* no. 69:97-131.

Abstract: "In this paper we study proof procedures for some variants of first-order modal logics, where domains may be either cumulative or freely varying and terms may be either rigid or non-rigid, local or non-local. We define both ground and free variable tableau methods, parametric with respect to the variants of the considered logics. The treatment of each variant is equally simple and is based on the annotation of functional symbols by natural numbers, conveying some semantical information on the worlds where they are meant to be interpreted.

This paper is an extended version of a previous work where full proofs were not included. Proofs are in some points rather tricky and may help in understanding the reasons for some details in basic definitions."

38. Mazurkiewicz, Szymon. 2019. "Legal Positivism Social Source Thesis and Metaphysical Grounding: Employing Metaphysical

Grounding Based on Metaphysical Laws." *Archiwum Filozofii Prawa i Filozofii Społecznej*:5-21.

"In this paper, I would like to examine the grounding account of the determination of the relation between social facts and legal facts, as well as try to resolve some problems that this account involves. The first one is its unintelligibility: if one claims that legal facts are metaphysically grounded in social facts without explaining why this relation holds, such a claim does not seem to be explanatory sufficient. The second one is insufficient explanation of how normative legal facts can be grounded in descriptive social facts." (p. 6)

39. McDaniel, Brannon. 2017. "Grounding and the Objection from Accidental Generalizations." *Thought: A Journal of Philosophy* no. 6:178-184.

Abstract: "*Monistic grounding* says that there is one fundamental ground, while *pluralistic grounding* says that there are many such grounds. *Grounding necessitarianism* says that grounding entails, but is not reducible to, necessitation, while *grounding contingentism* says that there are at least some cases where grounding does not entail necessitation. Pluralistic grounding necessitarianism is a very popular position, but accidental generalizations, such as 'all solid gold spheres are less than one mile in diameter', pose well-known problems for this view: the many fundamental grounds of such generalizations do not necessitate them. Though there is a straightforward response to this objection, I argue that it fails. Thus the objection from accidental generalizations stands, and proponents of pluralistic grounding necessitarianism face the following dilemma: either give up pluralistic grounding, or give up necessitarianism."

40. ——. 2022. "Grounding as Minimal Necessitation." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 65:154-175.

Abstract: Let NNG be the claim that necessitation is necessary for grounding, and let NSG be the claim that necessitation is sufficient for grounding. The consensus view is that grounding cannot be reduced to necessitation, and this is due to the

(approximately) universally-accepted claim that NSG is false. Among deniers of NSG: grounding contingentists think NNG is also false, but they are in the minority compared to grounding necessitarians who uphold NNG. For one who would defend the claim that grounding is reducible to necessitation, the task is formidable: she must defend NSG and NNG. I consider two prominent objections against NSG, and two more against NNG before developing a reductive account of grounding as minimal necessitation that avoids not only all four of the previously mentioned objections, but also an additional objection that targets minimal necessitation accounts in particular. If my arguments are compelling, then, insofar as we thereby have a strong prima facie case for thinking that grounding can be reduced to (minimal) necessitation, we have a strong prima facie case for thinking the consensus view is mistaken."

41. McDaniel, Kris. 2017. *The Fragmentation of Being*. Oxford: Oxford University Press.

Contents: Acknowledgments IX; Introduction 1; 1. Ways of Being 12; 2. A Return to the Analogy of Being 48; 3. Ways of Being and Time 78; 4. Categories of Being 109; 5. Being and Almost Nothingness 140; 6. Persons and Value 170; 7. Degrees of Being 195; 8. Being and Ground 223; 9. Being and Essence 256; Concluding Unsystematic Postscript 290; Bibliography 293; Index 317-320.

"One of the oldest questions in metaphysics concerns not the various natures of beings but rather the nature of being itself: is being unitary or does being fragment? The primary aims of this book are to explicate the idea that being fragments, to show how the fragmentation of being impacts various other extant philosophical disputes, and to defend the tenability and fruitfulness of the idea that being fragments.

These aims are interdependent. An inexplicable idea is neither tenable nor fruitful.

And an idea is fruitful only if it sheds light on extant disputes or provides new paths for interesting research. If the claim that being fragments has no philosophical payoff elsewhere, one must forgive those who neglect or dismiss the question of the

fragmentation of being. My hope is that I will convince you of the importance of the claim that being fragments by extensively exploring the connections between the various ways being might fragment and philosophical issues pertaining to metaphysical fundamentality, substances and accidents, time, modality, ontological categories, absences and presences, persons, value, ground, and essence. This book is devoted to these explorations." (p. 1)

42. ———. 2019. "The Principle of Sufficient Reason and Necessitarianism." *Analysis* no. 79:230-236.

"1. Introduction: Peter van Inwagen (1983: 202–4) presented a powerful argument against the Principle of Sufficient Reason, which I henceforth abbreviate as ‘PSR’. (See also Bennett 1984: 115 for a similar argument. I will elide the differences between them in what follows.) For decades, the consensus was that this argument successfully refuted PSR. However, now a growing consensus holds that van Inwagen’s argument is fatally flawed, at least when ‘sufficient reason’ is understood in terms of ground, for on this understanding, an ineliminable premiss of van Inwagen’s argument is demonstrably false and cannot be repaired. I will argue that this growing consensus is mistaken and that a powerful argument relevantly similar to van Inwagen’s should still concern us, even when we understand ‘sufficient reason’ in terms of ground.

Here is the plan for the paper. In §2, I briefly state a version of van Inwagen’s argument. In §3, I briefly discuss the recent criticism of it van Inwagen’s argument and then formulate an updated version of it that is more plausible than its predecessor but which avoids the recent criticism."

van Inwagen, P. 1983. *An Essay on Free Will*. Oxford: Oxford University Press

43. McKenzie, Kerry. 2022. *Fundamentality and Grounding*. Cambridge: Cambridge University Press.

Abstract: "A suite of questions concerning fundamentality lies at the heart of contemporary metaphysics. The relation of grounding, thought to connect the more to the less fundamental, sits at the heart of those

debates in turn. Since most contemporary metaphysicians embrace the doctrine of physicalism and thus hold that reality is fundamentally physical, a natural question is how physics can inform the current debates over fundamentality and grounding. This Element introduces the reader to the concept of grounding and some of the key issues that animate contemporary debates around it, such as the question of whether grounding is 'unified' or 'plural' and whether there exists a fundamental level of reality. It moves on to show how resources from physics can help point the way towards their answers - thus furthering the case for a naturalistic approach to even the most fundamental of questions in metaphysics."

44. McSweeney, Michaela M. 2020. "Debunking Logical Ground: Distinguishing Metaphysics from Semantics." *Journal of the American Philosophical Association* no. 6:156-170.

Abstract: "Many philosophers take purportedly logical cases of ground (such as a true disjunction being grounded in its true disjunct(s)) to be obvious cases, and indeed such cases have been used to motivate the existence of and importance of ground. I argue against this. I do so by motivating two kinds of semantic determination relations. Intuitions of logical ground track these semantic relations. Moreover, our knowledge of semantics for (e.g.) first order logic can explain why we have such intuitions. And, I argue, neither semantic relation can be a species of ground even on a quite broad conception of what ground is.

Hence, without a positive argument for taking so-called 'logical ground' to be something distinct from a semantic determination relation, we should cease treating logical cases as cases of ground."

45. ——. 2020. "Logic." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 449-459. New York: Routledge.

"Some of the paradigmatic examples of grounding (that are often used to motivate, or help us latch onto, the notion of grounding itself) are relations between logically complex facts and the logically simpler facts that entail them. For example:

[The grass is green] grounds [Either the grass is green or the moon is made of cheese].

[The grass is green], [The sky is blue] ground [The grass is green and the sky is blue].

[The chair is orange] grounds [Something is orange].

Either implicitly or explicitly, these are usually (but not always) taken as instances of variations of the following principles:

Conjunctive grounding ('CG'): If each of p , q is true, then $[p]$, $[q]$ together ground $[p \ \& \ q]$.

Disjunctive grounding ('DG'): If p is true, then $[p]$ grounds $[p \vee q]$.

Existential grounding ('EG'): If Fa is true, then $[Fa]$ grounds $[\exists x \ Fx]$.

This entry surveys some things that have been said in favor of these principles (and about logical grounding in general) and raises (but does not resolve) some questions about why we should accept these principles, and, if we should, what it means to accept these principles." (p. 449)

46. Melamedoff, Damian. 2018. "Against Existential Grounding." *Thought. A Journal of Philosophy* no. 7:3-11.

Abstract: "Existential grounding is the thesis that all existential generalizations are grounded in their particular instances. This paper argues that existential grounding is false. This is because it is inconsistent with two plausible claims about existence: (1) the claim that singular existence facts are generalizations and (2) the claim that no object can be involved in a fact that grounds that same object's existence. Not only are these claims intuitively plausible, but there are also strong arguments in favour of each of them."

47. Melnyk, Andrew. 2016. "Grounding and the Formulation of Physicalism." In *Scientific Composition and Metaphysical Ground*, edited by Aizawa, Ken and Gillett, Carl, 249-270. London: Palgrave Macmillan.

"Because I aspire to be a naturalistic metaphysician, I ask in this chapter whether an appeal to the relation of grounding posited recently by certain philosophers might be useful in one kind of approach to the problem of the many sciences—a physicalist approach." (p. 250)

48. Merlo, Giovanni. 2022. "Disjunction and the Logic of Grounding." *Erkenntnis* no. 87:567-587.

Abstract: "Many philosophers have been attracted to the idea of using the logical form of a true sentence as a guide to the metaphysical grounds of the fact stated by that sentence.

This paper looks at a particular instance of that idea: the widely accepted principle that disjunctions are grounded in their true disjuncts. I will argue that an unrestricted version of this principle has several problematic consequences and that it's not obvious how the principle might be restricted in order to avoid them. My suggestion is that, instead of trying to restrict the principle, we should distinguish between metaphysical and conceptual grounds and take the principle to apply exclusively to the latter. This suggestion, if correct, carries over to other prominent attempts at using logical form as a guide to ground."

49. Mikkola, Mari. 2015. "Doing Ontology and Doing Justice: What Feminist Philosophy Can Teach Us About Meta-Metaphysics." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 58:780-805.

Abstract: "Feminist philosophy has recently become recognised as a self-standing philosophical sub-discipline. Still, metaphysics has remained largely dismissive of feminist insights. Here I make the case for the value of feminist insights in metaphysics: taking them seriously makes a difference to our ontological theory choice and feminist philosophy can provide helpful methodological tools to regiment ontological theories.

My examination goes as follows. Contemporary ontology is not done via conceptual analysis, but via quasi-scientific means. This takes different ontological positions to be competing hypotheses about reality's fundamental structure that are then assessed with a loose battery of criteria for theory choice. Such criteria make up the constitutive values of ontology (e.g. providing a unified, coherent, non-circular, simple, parsimonious total theory). These values are distinguished from *contextual* values of a practice: the political and moral values embedded in the social context of inquiry. Although we may be frank about some meta-metaphysical value commitments, bringing in feminist contextual values is viewed as an unacceptable move when thinking about ontological theory choice. This paper then asks: is this move unacceptable? I think not and I aim to motivate this methodological insight here by examining recent work on grounding."

50. ———. 2019. "Grounding and Anchoring: On the Structure of Epstein's Social Ontology." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 62:198-216.

Abstract: "Brian Epstein's *The Ant Trap* is a praiseworthy addition to literature on social ontology and the philosophy of social sciences. Its central aim is to challenge received views about the social world – views with which social scientists and philosophers have aimed to answer questions about the nature of social science and about those things that social sciences aim to model and explain, like social facts, objects and phenomena. The received views that Epstein critiques deal with these issues in an overly people-centered manner. After all, even though social facts and phenomena clearly involve individual people arranged in certain ways, we must still spell out how people are involved in social facts and phenomena. There are many metaphysical questions about social properties, relations, dependence, constitution, causation, and facts that cannot be answered (for instance) just by looking at individual people alone. In order to answer questions about (e.g.) how one social entity depends for its existence on another, we need different metaphysical tools. Epstein thus holds that social ontological explanations would greatly benefit from making use of the

theoretical toolkit that contemporary analytical metaphysics has to offer. He focuses specifically on two metaphysical instruments: grounding and anchoring. This paper examines Epstein's understanding and use of these tools. I contend that Epstein is exactly right to say that contemporary metaphysics contains many theoretical instruments that can be fruitfully applied to social ontological analyses. However, I am unconvinced that Epstein's tools achieve what they set out to do. In particular, I will address two issues: (1) How is grounding for Epstein meant to work? (2) Is anchoring distinct from grounding, and a relation that we need in social ontology?"

51. Miller, Elizabeth. 2015. "Humean Scientific Explanation." *Philosophical Studies*:1311–1332.

Abstract: "In a recent paper, Barry Loewer attempts to defend Humeanism about laws of nature from a charge that Humean laws are not adequately explanatory.

Central to his defense is a distinction between metaphysical and scientific explanations: even if Humeans cannot offer further metaphysical explanations of particular features of their "mosaic," that does not preclude them from offering scientific explanations of these features. According to Marc Lange, however, Loewer's distinction is of no avail. Defending a transitivity principle linking scientific explanantia to their metaphysical grounds, Lange argues that a charge of explanatory inadequacy resurfaces once this intuitive principle is in place. This paper surveys, on behalf of the Humean, three strategies for responding to Lange's criticism. The ready availability of these strategies suggests that Lange's argument may not bolster anti-Humean convictions, since the argument rests on premises that those not antecedently sharing these convictions may well reject. The three strategies also correspond to three interesting ways of thinking about relations of grounding linking Humean laws and their instances, all of which are consistent with theses of Humean supervenience, and some of which have been heretofore overlooked."

52. Miller, Kristie, and Norton, James. 2017. "Grounding: It's (Probably) All in the Head." *Philosophical Studies* no. 174:3059-3081.

Abstract: "In this paper we provide a psychological explanation for 'grounding observations'—observations that are thought to provide evidence that there exists a relation of ground. Our explanation does not appeal to the presence of any such relation. Instead, it appeals to certain evolved cognitive mechanisms, along with the traditional modal relations of supervenience, necessitation and entailment. We then consider what, if any, metaphysical conclusions we can draw from the obtaining of such an explanation, and, in particular, if it tells us anything about whether we ought to posit a relation of ground."

53. Moran, Alex. 2018. "Kind-Dependent Grounding." *Analytic Philosophy* no. 59:359-390.

"I begin by saying something more about the notion of grounding itself (Section 2). Then, I set out the aforementioned passage from Rosen (2015), discussion of which will help us work towards the key notion of kind-dependent grounding that this paper appeals to (Section 3). Along the way, we will encounter the idea that each object instantiates a fundamental kind, which can determine the properties it may have, plus the idea that grounding claims can hold conditionally. The following two sections then put the notion of kinddependent grounding to work in connection with two important metaphysical problems (Sections 4–5). The final section concludes (Section 6)." (p. 361)

54. Morganti, Matteo. 2014. "Metaphysical Infinitism and the Regress of Being." *Metaphilosophy* no. 45:232-244.

Abstract: "This article offers a limited defense of metaphysical "infinitism," the view that there are, or might be, infinite chains of ontological dependence. According to a widespread

presupposition, there must be an ultimate ground of being—most likely, a plurality of fundamental atoms. Contrary to this view, this article shows that metaphysical infinitism is internally coherent. In particular, a parallel with the debate concerning infinitism about epistemic justification is suggested, and an “emergence model” of being is put forward. According to the emergence model, the being of any given entity gradually arises out of an infinite series of progressively less dependent entities—it is not wholly transmitted, as it were, from a basic, ungrounded level to all the dependent ones in a step-by-step fashion. Some objections are considered and rebutted.”

55. ———. 2018. "The Structure of Physical Reality. Beyond Foundationalism." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 254-272. New York: Oxford University Press.

"The plan of the paper is as follows. Section 2 briefly discusses the traditional view, based on grounding relations as determining strict partial orders and well-founded structures—so-called ‘metaphysical foundationalism’. The discussion then focuses on the prospects of non-standard models of the metaphysical structure of (parts of) physical reality. Section 3 looks at ‘infinitist’ models, where the well-foundedness assumption is dropped. Section 4 discusses ‘coherentist’ models, in which grounding relations fail to be irreflexive and symmetric and grounding structures give rise to ‘loops’ and/or ‘webs’. Section 5 concludes the paper by considering the plausibility of what one may call ‘hybrid’ models and, more generally, of pluralism with respect to the metaphysical structure of reality." (p. 257)

56. Morton, Justin. 2019. "Grounding Thick Normative Facts." *Pacific Philosophical Quarterly* no. 100:408-431.

Abstract: "Many philosophers have been concerned with the nature of thick normative concepts. In this paper, I try to motivate a different project: understanding the nature of thick normative properties and facts. I propose a ground-theoretic approach to this project. I then argue that some of the simplest and most initially plausible ways of understanding thick facts

fail and that we are forced to accept some initially implausible views. I try to show how these views are not so implausible after all."

57. Muñoz, Daniel. 2020. "Grounding Nonexistence." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 63:209-229.

Abstract: "Contingent negative existentials give rise to a notorious paradox. I formulate a version in terms of metaphysical grounding: nonexistence can't be fundamental, but nothing can ground it. I then argue for a new kind of solution, expanding on work by Kit Fine. The key idea is that negative existentials are contingently zero-grounded – that is to say, they are grounded, but not by anything, and only in the right conditions. If this is correct, it follows that grounding cannot be an internal relation, and that no complete account of reality can be purely fundamental."

58. Ney, Alyssa. 2016. "Grounding in the Philosophy of Mind: A Defense." In *Scientific Composition and Metaphysical Ground*, edited by Gillett, Carl and Aizawa, Ken, 271-300. London: Palgrave-Macmillan.

"One of the major trends in metaphysics in recent years has been in the development and application of novel conceptual frameworks for representing facts about realism, fundamentality, and metaphysical priority." (p. 271)

(...)

"I will argue that Fine's framework has distinctive advantages but to see this it needs to be carefully teased apart from the others.

As I hope to show, Fine's framework may be useful as a foundation for developing an approach to the mind-body problem that can resolve and clarify debates. I hope to show that by utilizing Fine's distinctions, we are able to offer novel, conciliatory positions allowing us to move past some debates that have been carrying on in the philosophy of mind for decades." (p. 274)

59. ———. 2020. "Mind." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 460-471. New York: Routledge.

"The concept of grounding is typically introduced in order to formulate and address questions about metaphysical relationships.

(...)

This chapter will (i) describe how some metaphysicians have proposed the introduction of grounding concepts in order to formulate and provide answers to the mind–body problem and (ii) survey concerns about the appropriateness, adequacy, and indispensability of grounding concepts for addressing questions about the status of mental phenomena in a physical world. Finally, this chapter will (iii) consider replies to these concerns. A central lesson will be that any adequate assessment of the usefulness of grounding frameworks for formulating issues and positions in the philosophy of mind must be sensitive to distinctions between the different grounding concepts that have been introduced." (p. 460)

60. Nolan, Daniel. 2018. "Cosmic Loops." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 91-106. New York: Oxford University Press.

"Conclusion: Cosmic loops are of intrinsic interest: thinking about them can satisfy the same urges to grapple with the unfamiliar which are satisfied by various sorts of speculative fiction, from science fiction to the stories of Borges. Metaphysical fiction is a genre in its infancy, but a promising one for all that.

I have argued that thinking about cosmic loops serves several more academic purposes, however. They demonstrate, that we can make sense of loops of ground in a different way from the usual examples of loops achieved through only a few steps, and the conceivability and perhaps possibility of them are supported in ways different from other arguments I know of to support failures of asymmetry and transitivity. ." (p.104)

61. Norton, James. 2017. *On the Dispensability of Grounding: Ground-breaking Work on Metaphysical Explanation*, The University of Sydney.

Unpublished PhD thesis available at

<https://ses.library.usyd.edu.au/handle/2123/16600>

Abstract: "Primitive, unanalysable grounding relations are considered by many to be indispensable constituents of the metaphysician's toolkit. Yet, as a primitive ontological posit, grounding must earn its keep by explaining features of the world not explained by other tools already at our disposal. Those who defend grounding contend that grounding is required to play two interconnected roles: accounting for widespread intuitions regarding what is ontologically prior to what, and forming the backbone of a theory of metaphysical explanation, in much the same way that causal relations have been thought to underpin theories of scientific explanation. This thesis undermines the need to posit grounding relations to perform either of these jobs. With regard to the first, it is argued that a pair of human psychological mechanisms—for which there is substantial empirical support—can provide a more theoretically virtuous explanation of why we have the intuitions that we do. With regard to the second, I begin by considering what we want from a theory of explanation, and go on to develop three attractive (yet grounding-free) theories of metaphysical explanation. I offer: i) a psychologistic theory that calls upon the aforementioned psychological mechanisms, as well as the modal relations of necessitation and supervenience, ii) a metaphysical variant of the deductive-nomological theory of scientific explanation, and iii) a metaphysical variant of the unificationist theory of scientific explanation. Furthermore, these theories draw upon mechanisms and relations (both logical and ontological) to which we are already committed. Thus, to posit grounding relations in order to explain our priority intuitions, or in order to develop a theory of metaphysical explanation, is ontologically profligate. I conclude that we should not posit relations of ground."

62. Nutting, Eileen S., Caplan, Ben, and Tillman, Chris. 2018. "Constitutive Essence and Partial Grounding." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 61:137-161.

Abstract: "Kit Fine and Gideon Rosen propose to define constitutive essence in terms of ground-theoretic notions and some form of consequential essence. But we think that the Fine–Rosen proposal is a mistake. On the Fine–Rosen proposal, constitutive essence ends up including properties that, on the central notion of essence (what Fine calls ‘the notion of essence which is of central importance to the metaphysics of identity’), are necessary but not essential. This is because consequential essence is (roughly) closed under logical consequence, and the ability of logical consequence to add properties to an object’s consequential essence outstrips the ability of ground-theoretic notions, as used in the Fine–Rosen proposal, to take those properties out. The necessary-but-not-essential properties that, on the Fine–Rosen proposal, end up in constitutive essence include the sorts of necessary-but-not-essential properties that, others have noted, end up in consequential essence."

63. O'Conaill, Donnchadh. 2018. "Grounding, Physicalism and Necessity." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 61:713-730.

Abstract: "Recent work on metaphysical grounding has suggested that physicalism can be characterised in terms of the mental facts being grounded in physical facts. It is often assumed that the full grounds of a fact metaphysically necessitate that fact. Therefore, it seems that if the physical grounds the mental, then the physical facts metaphysically necessitate the mental facts. Stefan Leuenberger argues that such a version of physicalism would be vulnerable to counterexamples. I shall outline a characterisation of grounding which appeals to a relation between grounding and the essences of properties instantiated in the grounded facts or in their grounds. If a grounded fact is such that its constituent property is essentially related to the properties instantiated in its grounds, or vice versa, then the grounded fact will be

metaphysically necessitated by its full grounds. This characterisation of grounding not only avoids Leuenberger's counterexamples, but has broader implications for characterising physicalism in terms of grounding."

64. O'Conaill, Donnchadh, and Tahko, Tuomas E. 2021. "New Frontiers in Ground, Essence, and Modality: Introduction." *Synthese* no. 198:1219-1230.

"Ground, essence, and modality seem to have something to do with each other. Can we provide unified foundations for ground and essence, or should we treat each as primitives? Can modality be grounded in essence, or should essence be expressed in terms of modality? Does grounding entail necessitation? Are the notions of ground and essence univocal? This volume focuses on the links—or lack thereof—between these three notions, as well as the foundations of ground, essence, and modality more generally, bringing together work on the metaphysics, epistemology, and logic of these three notions by some of the leading figures in the field as well as emerging young scholars.

(...)

After providing a brief historical summary of the (re)emergence of modality, essence and ground as central notions in metaphysics (Sect. 1), we shall outline some of the main themes in recent work on these notions and on the links between them (Sect. 2). In Sect. 3 we briefly introduce the papers in this volume." (p. 1219)

65. Oderberg, David S. 2021. "Formal Causation: Accidental and Substantial." In *Neo-Aristotelian Perspectives on Formal Causation*, edited by Jansen, Ludger and Sandstad, Petter, 40-61. New York: Routledge.

"Of Aristotle's famous four causes, the 'formal cause' has been arguably the most neglected, if not eliminated outright from philosophy. This paper is an attempt to contribute to the rehabilitation of formal causality.

First, I outline the Aristotelian-Scholastic understanding of form as the principle of actuality, explaining the overlap

between forms and universals.

I then begin, unconventionally, with an explanation of formal causation by *accidents*. There is a kind of causation by accidental forms that cannot be equated with efficient causation: I distinguish between the efficient causal trigger of actualisation and the continued actualisation of an object's potentiality, which latter is accounted for by formal causality. The discussion then moves to substantial forms and formal causation by them-where accounts of formal causality traditionally begin.

I argue that the causality whereby there exists a hylemorphic compound of matter and form cannot be efficient but must be formal. This requires an analysis of some aspects of matter as pure potentiality Aristotelian prime matter. I conclude by discussing the role of form as the *unifier* of matter into a single substance. This activity of unification is a central element in substantial formal causality. By contrast, Travis Dumsday's attempt to solve the unity problem without appealing to form is found wanting. I conclude that formal causation, far from being the relic of an outdated metaphysic, is both coherent and necessary to a proper understanding of fundamental being."

Abstract: "A version of Bradley's regress can be endorsed in an effort to address the problem of the unity of states of affairs or facts, thereby arriving at a doctrine that I have called fact infinitism. A consequence of it is the denial of the thesis, WF, that all chains of ontological dependence are well-founded or grounded. Cameron has recently rejected fact infinitism by arguing that WF, albeit not necessarily true, is however contingently true. Here fact infinitism is supported by showing

that Cameron's argument for the contingent truth of WF is unsuccessful."

WF = Ontological Well-Foundedness

"Functions constitute a debated issue at the intersection between ontology and philosophy of science. Indeed, functions have given rise to several philosophical theories about their features, their presence or absence within specific kinds of entities, and their origins. Nevertheless, before delving into these aspects of functions, it is necessary to clarify what functions are from an ontological viewpoint. Namely, it is necessary to single out the nature of functions.

In this contribution, I shall suggest that functions should be taken as powers. More precisely, I shall argue that there is a certain category of powers—that of functional powers—and that functional powers can be legitimately taken to play the role of functions." (p. 124)

"In recent years, there has been an increased interest in applying the tools and methods of analytic metaphysics to the study of social phenomena. This chapter examines how one such tool—the notion of metaphysical ground—may be used to elucidate some central notions, debates, and positions in the philosophy of race and gender, social ontology, and the philosophy of social science. Three main applications are examined: how the notion of social construction may be analyzed in ground-theoretic terms (§1); how debates over the

nature of social facts may be recast as grounding debates (§2); and how the doctrine of ontological individualism may be formulated using the notion of ground (§3). The chapter concludes by considering a skeptical challenge concerning the usefulness of the grounding framework for social metaphysics (§4)." (p. 510)

"Physicalism about the mental requires that all mental entities be appropriately founded in microphysical entities. Supposing the truth of physicalism, it remains an open question whether the relation between the microphysical and the mental is reductive or nonreductive. By contrast with the mid-twentieth century, currently, most nonreductivists maintain that the main reason for accepting the nonreductive option is not methodological but metaphysical. On the position I endorse, mental natural kinds are not identical to natural kinds in microphysics because mental causal powers are not identical to microphysical causal powers." (p. 124)

70. Petersen, Thorben. 2016. "The Grounding Problem for Eternalism." *Philosophical Studies* no. 173:1819-1852.

Abstract: "In this paper, I develop an argument against eternalism, which is similar to the widely discussed grounding problem for presentism. It has recently been argued by many that presentism should be rejected on grounds that its sparse ontology is not suited to underwrite the healthy dose of realism we all share about the past. My aim basically is to add a new twist to the debate, by showing that actually eternalists are no better off than their rivals. In particular, I argue that the eternalist's ontology does not have the appropriate shape to ground true propositions about the past."

71. Piccolomini D'Aragona, Antonio. 2021. "Proofs, Grounds and Empty Functions: Epistemic Compulsion in Prawitz's Semantics." *Journal of Philosophical Logic*.

First Online 8 November 2021.

Abstract: "Prawitz has recently developed a theory of epistemic grounding that differs in many respects from his earlier semantics of arguments and proofs. An innovative approach to (valid) inferences yields a new conception of the intertwinement of the notions of valid inference and proof. We aim at singling out three reasons that may have led Prawitz to the ground-theoretic turn, i.e.: a better order in the explanation of the relation between valid inferences and proofs; a notion of valid inference based on which valid inferences and proofs are recognisable as such; a reconstruction of the deductive activity that makes inferences capable of yielding justification per se. These topics are discussed by Prawitz with reference to a very general and ancient question: why and how correct deduction has the epistemic power to compel us to accept its conclusions, provided its premises are justified? We conclude by remarking that, in spite of some improvements, the ground-theoretic approach shares with the previous one a problem of vacuous validity which, as Prawitz himself points out, blocks in both cases a satisfactory explanation of epistemic compulsion."

2. Rabin, Gabriel Oak. 2018. "Grounding Orthodoxy and the Layered Conception." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki Leigh and Priest, Graham, 37-49. New York: Oxford University Press.

"Here's a roadmap for the remainder of the paper. In the next section (2: "Ground as the Generator as Layers"), we put some

flesh on the bones of the idea of the layered conception and how ground interacts with it. Each of Sections 3-6 explores how ground fares in its ability to vindicate the layered conception under the relaxation of some element of the orthodoxy. We consider abandoning foundationalism, antisymmetry, irreflexivity, and transitivity (in that order). The conclusory Section 7 steps back to consider the resulting overall picture." (p.39)

3. ———. 2019. "Grounding the Gaps or Bumping the Rug? On Explanatory Gaps and Metaphysical Methodology." *Journal of Consciousness Studies* no. 26:191-203.

Abstract: In a series of recent papers, Jonathan Schaffer (2017a,b) presents a novel framework for understanding grounding. Metaphysical laws play a central role. In addition, Schaffer argues that, contrary to what many have thought, there is no special 'explanatory gap' between consciousness and the physical world. Instead, explanatory gaps are everywhere. I draw out and criticize the methodology for metaphysics implicit in Schaffer's presentation. In addition, I argue that even if we accept Schaffer's picture, there remains a residual explanatory gap between consciousness and the physical. The residual gap does most of the same philosophical work as the original (e.g. in conceivability arguments). Schaffer has introduced a troublesome metaphysical methodology that fails to follow through on its biggest promise: to deflate the explanatory gap."

7. ———. 2020. "Grounding Rules and (Hyper-)Isomorphic Formulas." *Australasian Journal of Logic* no. 17:70-80.

Abstract: "An oft-defended claim of a close relationship between Gentzen inference rules and the meaning of the connectives they introduce and eliminate has given rise to a whole domain called proof-theoretic semantics, see Schroeder-Heister (1991); Prawitz (2006). A branch of proof-theoretic semantics, mainly developed by Došen (2019); Došen and Petrić (2011), isolates in a precise mathematical manner formulas (of a logic L) that have the same meaning. These isomorphic formulas are defined to be those that behave identically in inferences. The aim of this paper is to investigate another type of recently discussed rules in the literature, namely grounding rules, and their link to the meaning of the connectives they provide the grounds for. In particular, by using grounding rules, we will refine the notion of isomorphic formulas through the notion of hyper-isomorphic formulas. We will argue that it is actually the notion of hyper-isomorphic formulas that identify those formulas that have the same meaning."

8. ———. 2020. "Grounding Rules for (Relevant) Implication." *Journal of Applied Non-Classical Logics* no. 31:26-55.

Abstract: "In Poggiolesi (2020a) a definition of the notion of complete and immediate formal grounding in the background of a relevant framework has been introduced; this definition generates some intuitively acceptable grounding principles for relevant implication. In the present paper our aim is to construct a logic for the notion of complete and immediate formal grounding in a relevant framework based on that definition. Our logic will have the form of a calculus of natural deduction and will formalize the relation of grounding both as a meta-linguistic relation and as a connective. The calculus will contain grounding rules for relevant implication and will be proved to be sound and complete with respect to the original definition. Finally we will prove the deduction theorem at the grounding level, i.e. we will show that grounding formalized as a metalinguistic relation is equivalent to grounding formalized as a connective."

9. ———. 2020. "Logics." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 213-227. New York: Routledge.

"The concept of grounding has been long neglected or forgotten in the history of logic (exceptions can be found in this book, as in Chapter 5 by Roski). This fact is all the more astonishing once we realize that grounding seems to cover the same special logical role as the kindred notions of truth and provability: like its cousin concepts, grounding can be fruitfully formalized into two different ways, namely as (i) a predicate or sentential operator or as (ii) a metalinguistic relation. This double formalization, which testifies to the importance of grounding as a logical notion, will structure this chapter. The next section will be dedicated to studies of grounding under the perspective of (i), which is the most developed in the contemporary literature;

while Section 3 will focus on approaches adopting perspective (ii)." (p. 214)

10. ———. 2021. "Grounding Principles for (Relevant) Implication." *Synthese* no. 198:7351–7376.

Abstract: "Most of the logics of grounding that have so far been proposed contain grounding axioms, or grounding rules, for the connectives of conjunction, disjunction and negation, but little attention has been dedicated to the implication connective. The present paper aims at repairing this situation by proposing adequate grounding principles for relevant implication. Because of the interaction between negation and implication, new grounding principles concerning negation will also arise."

11. Prasada, Sandeep. 2021. "Formal Explanation and Mechanisms of Conceptual Representation." In *Neo-Aristotelian Perspectives on Formal Causation*, edited by Jansen, Ludger and Sandstad, Petter, 269-286. New York: Routledge.

"The plan for the paper is as follows. Section 2 provides a sketch of the empirical research that suggests that children and adults routinely make use of formal explanations. Section 3 defends the interpretation of those data as revealing the use of Aristotle's formal *aitia* in generating those explanations. I leave the Greek term *aitia* untranslated as common translations tend to be problematic. Section 4 describes the formal characteristics of the mechanisms that have been proposed to underlie the representation and acquisition of the type of generic knowledge for which formal explanation is intrinsic. Section 5 discusses some of the key characteristics of the mechanisms and the manner in which the mechanisms represent the type of generic knowledge for which formal explanations are crucial. Finally, Section 6 suggests some ways in which the work described may provide a new way to look at some Aristotelian claims regarding the acquisition of first principles and the role of formal explanation in that process." (p. 269)

12. Rabin, Gabriel Oak, and Rabern, Brian. 2016. "Well Founding Grounding Grounding." *Journal of Philosophical Logic* no. 45:349-379.

Abstract: "Those who wish to claim that all facts about grounding are themselves grounded ("the meta-grounding thesis") must defend against the charge that such a claim leads to infinite regress and violates the well-foundedness of ground. In this paper, we defend. First, we explore three distinct but related notions of "well-founded", which are often conflated, and three corresponding notions of infinite regress. We explore the entailment relations between these notions. We conclude that the meta-grounding thesis need not lead to tension with any of the three notions of "well-founded". Finally, we explore the details of and motivations for further conditions on ground that one might add to generate a conflict between the meta-grounding thesis and a well-founded constraint. We explore these topics by developing and utilizing a formal framework based on the notion of a *grounding structure*."

13. Rauti, Antonio. 2012. "Multiple Groundings and Deference." *The Philosophical Quarterly* no. 62:317-336.

Abstract: "The idea that reference is multiply grounded allows causal-historical theories of reference to account for reference change. It also threatens the stability of reference in light of widespread error and confusion. I describe the problem, so far unrecognised, and provide a solution based on the phenomenon of semantic deference, which I differentiate from reference-borrowing. I conclude that deference has an authentic foundational semantic role to play."

14. Raven, Michael J. 2012. "In Defence of Ground." *Australasian Journal of Philosophy* no. 90:684-701.

Abstract: "I defend (*metaphysical*) *ground* against recent, unanswered objections aiming to dismiss it from serious philosophical inquiry. Interest in ground stems from its role in the venerable metaphysical project of identifying which facts hold in virtue of others. Recent work on ground focuses on regimenting it.

But many reject ground itself, seeing regimentation as yet another misguided attempt to regiment a bad idea (like phlogiston or astrology). I defend ground directly against objections that it is confused, incoherent, or fruitless. This

vindicates the very attempt to regiment ground. It also refocuses our attention on the genuine open questions about ground and away from the distracting, unpersuasive reasons for dismissing them."

15. ———. 2013. "Is Ground a Strict Partial Order?" *American Philosophical Quarterly* no. 50:193-201.

"A Schism has formed among Devotees.

Orthodoxy says ground induces a strict partial order structure on reality, from the more derivative to the more fundamental. Heresy denies that ground is a strict partial order: ground is either not irreflexive (Jenkins 2011) or not transitive (Schaffer 2012).

What's at stake? The structure of reality, answer Devotees. Even Infidels have a stake: they might take Devotees' infighting as evidence against ground's coherence (cf. Wilson). My aim is to defend Orthodoxy against Heresy. I first characterize Orthodoxy (§ 2) and then the Heresy against it (§ 3). Next, I argue against the Heresy that ground is not irreflexive (§ 4) and then argue against the Heresy that ground is not transitive (§ 5). My defense of Orthodoxy vindicates ground's Orthodox deployment "in the wild" and weakens Infidels's attempts to leverage the Schism into an argument for ground's incoherence (§ 6)." (p. 193)

16. ———. 2015. "Ground." *Philosophy Compass* no. 10:322-333.

Abstract: "This essay focuses on a recently prominent notion of (metaphysical) ground which is distinctive for how it links metaphysics to explanation. Ground is supposed to serve both as the common factor in diverse in virtue of questions as well as the structuring relation in the project of explaining how some phenomena are "built" from more fundamental phenomena. My aim is to provide an opinionated synopsis of this notion of ground without engaging with others. Ground, so understood, generally resists illumination by appeal to more familiar models of explanation. Nevertheless, its distinctive explanatory and metaphysical aspects guide us on characterizing its explanatory logic and its metaphysical features. Some issues concerning the meta-question of what (if anything) grounds ground are explored, as well as some recent skeptical challenges to ground."

17. ———. 2017. "New Work for a Theory of Ground." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 60:625-655.

Abstract: "There has been much recent interest in a distinctively metaphysical kind of determinative explanation: ground. This paper concerns various skeptical challenges to ground's relevance to metaphysics, such as that it is an empty posit, that the work it is supposed to do is appropriated by other notions, and that it is inapt for specific issues it should serve. I argue against these challenges. My strategy is both critical and constructive. Critical because I argue that versions of these challenges raised by Elizabeth Barnes, Kathrin Koslicki, Mari Mikkola, and Jessica Wilson are not persuasive. Constructive because we may nevertheless learn from them new work for ground."

19. Rettler, Bradley. 2017. "Grounds and 'Grounds'." *Canadian Journal of Philosophy* no. 47:631-655.

Abstract: "In this paper, I offer a new theory of grounding. The theory has is that grounding is a job description that is realized by different properties in different contexts.

Those properties play the grounding role contingently, and grounding is the property that plays the grounding role essentially. On this theory, grounding is monistic, but 'grounding' refers to different relations in different contexts. First, I argue against Kit Fine's monist univocalism. Next, I argue against Jessica Wilson's pluralist multivocalism. Finally, I introduce monist multivocalism, explicate three versions of it, and show its advantages."

20. Richardson, Kevin. 2020. "Grounding Pluralism: Why and How." *Erkenntnis* no. 85:1399-1415.

Abstract: "Grounding pluralism is the view that there are multiple kinds of grounding. In this essay, I motivate and defend an explanation-theoretic view of grounding pluralism.

Specifically, I argue that there are two kinds of grounding: why-grounding—which tells us why things are the case—and how-grounding—which tells us how things are the case."

21. ———. 2020. "Varieties." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 194-208. New York: Routledge.

"In this chapter, I describe the state of the art for pluralist theories of grounding. Every pluralist must answer four questions:

- Why should one be a pluralist rather than a monist? (§2)
- What are the varieties of grounding? (§3)
- What is the sense (if any) in which grounding is unified? (§4)
- What is the meaning of "grounds"? (§5)

In what follows, I give various representative pluralist answers to these questions."

22. ———. 2021. "Grounding Is Necessary and Contingent." *Inquiry: An Interdisciplinary Journal of Philosophy* no.

64:453-480.

Abstract: "Grounding is necessary just in case: if P grounds Q, then necessarily: if P, then Q. Many accept this principle. Others propose counterexamples. Instead of straightforwardly arguing for, or against, necessity, I explain the sense in which grounding is necessary and contingent. I argue that there are two kinds of grounding: what-grounding (which tells us what it is for things to be the case) and why-grounding (which tells us why things are the case), where the former kind is necessary while the latter is contingent."

24. Rodriguez-Pereyra, Gonzalo. 2005. "Why Truthmakers." In *Truthmakers: The Contemporary Debate*, edited by Beebe, Helen and Dodd, Julian, 17-31. Oxford: Clarendon Press.

"Thus the insight behind the idea of truthmakers is that truth is grounded.

In other words, truth is not primitive. If a certain proposition is true, then it owes its truth to something else: its truth is not a primitive, brute, ultimate fact. The truth of a proposition thus depends on what reality, and in particular its subject matter, is like. What reality is like is anterior to the truth of the proposition, it gives rise to the truth of the proposition and thereby accounts for it." (p. 21, a note omitted)

25. ———. 2015. "Grounding Is Not a Strict Order." *Journal of the American Philosophical Association* no. 1:517-534.

Abstract: "The paper argues that grounding is neither irreflexive nor asymmetric nor transitive. In arguing for that conclusion the paper also argues that truthmaking is neither irreflexive nor asymmetric nor transitive."

26. Roland, Jeffrey W. 2010. "Concept Grounding and Knowledge of Set Theory." *Philosophia* no. 38:179-193.

Abstract: "Abstract C. S. Jenkins has recently proposed an account of arithmetical knowledge designed to be realist, empiricist, and apriorist: realist in that what's the case in arithmetic doesn't rely on us being any particular way; empiricist in that arithmetic knowledge crucially depends on the senses; and apriorist in that it accommodates the time-honored judgment that there is something special about arithmetical knowledge, something we have historically labeled with 'a priori'. I'm here concerned with the prospects for extending Jenkins's account beyond arithmetic—in particular, to set theory. After setting out the central elements of Jenkins's account and entertaining challenges to extending it to set theory, I conclude that a satisfactory such extension is unlikely."

27. Rooney, James Dominic. 2019. "Grounding Relations Are Not Unified: Aquinas and Heil versus Schaffer." *International Philosophical Quarterly* no. 59:57-64.

Abstract: "Jonathan Schaffer, among others, has argued that metaphysics should deal primarily with relations of "grounding." I will follow John Heil in arguing that this view of metaphysics is problematic, for it draws on ambiguous notions of grounding and fundamentality that are unilluminating as metaphysical explanations. I take Heil's objections to presuppose that "grounding" relations do not form a natural

class, where a natural class is one where some member of that class has (analytic or contingent a posteriori) priority among others and explains order among other members in the class. To strengthen Heil's criticism that "grounding" is a non-natural class of relations, I will draw on an unlikely ally. Thomas Aquinas's "analogy of being" doctrine, if accurate, offers reasons that no categorical relations (like grounding relations) form a natural class."

28. Rosa, Luis. 2019. "Knowledge Grounded on Pure Reasoning." *Pacific Philosophical Quarterly* no. 100:156-173.

Abstract: "In this paper, I deal with epistemological issues that stem from the hypothesis that reasoning is not only a means of transmitting knowledge from premise-beliefs to conclusion-beliefs but also a primary source of knowledge in its own right. The idea is that one can gain new knowledge on the basis of suppositional reasoning. After making some preliminary distinctions, I argue that there are no good reasons to think that purported examples of knowledge grounded on pure reasoning are just examples of premise-based inferences in disguise. Next, I establish what kinds of true propositions can to a first approximation be known on the basis of pure reasoning. Finally, I argue that beliefs that are competently formed on the basis of suppositional reasoning satisfy both externalist and internalist criteria of justification."

29. Rosen, Gideon. 2010. "Metaphysical Dependence: Grounding and Reduction." In *Modality: Metaphysics, Logic, and Epistemology*, edited by Hale, Bob and Hoffmann, Aviv, 109-135. New York: Oxford University Press.

"Introduction: This essay is a plea for ideological toleration. Philosophers are right to be fussy about the words they use, especially in metaphysics where bad vocabulary has been a source of grief down through the ages. But they can sometimes be too fussy, dismissing as 'unintelligible' or 'obscure' certain forms of language that are perfectly meaningful by ordinary standards and which may be of some real use.

So it is, I suggest, with certain idioms of metaphysical determination and dependence. We say that one class of facts

depends upon or is grounded in another.

We say that a thing possesses one property in virtue of possessing another, or that one proposition makes another true. These idioms are common, as we shall see, but they are not part of anyone's official vocabulary. The general tendency is to admit them for heuristic purposes, where the aim is to point the reader's nose in the direction of some philosophical thesis, but then to suppress them in favor of other, allegedly more hygienic formulations when the time comes to say *exactly* what we mean. The thought is apparently widespread that while these ubiquitous idioms are sometimes convenient, they are ultimately too unclear or too confused, or perhaps simply too exotic to figure in our first-class philosophical vocabulary.

Against this tendency, I suggest that with a minimum of regimentation these metaphysical notions can be rendered clear enough, and that much is to be gained by incorporating them into our analytic tool kit. I make this proposal in an experimental spirit. Let us see how things look if we relax our antiseptic scruples for a moment and admit the idioms of metaphysical dependence into our official lexicon alongside the modal notions (metaphysical necessity and possibility, the various forms of supervenience) with which they are often said to contrast unfavorably. If this only muddies the waters, nothing is lost; we can always retrench. If something is gained, however, as I believe it is, we may find ourselves in a position to make some progress. (pp. 109-110)

30. ———. 2015. "Real Definition." *Analytic Philosophy* no. 56:189-209.

"The case can be made that contemporary analytic philosophy is up to its ears in idioms of definition, analysis, reduction and constitution that are best understood in a similarly metaphysical key—as demands for real definition rather than linguistic or conceptual analysis.

(...)

The main argument for this view is that when we try to answer these questions, we are happy to entertain analyses cast in

terms that fully competent masters of the analysandum need not grasp.

(...)

In my travels I have encountered some resistance to this idea, even among philosophers who are otherwise sanguine about the recrudescence of premodern metaphysics in postmodern philosophy.

(...)

The best way to overcome this skepticism would be to explain, in clear and independently intelligible terms, what it is to define a thing, or in other words, to provide a (real) definition of (real) definition. The

aim of the present note is to do just that." (p. 189)

31. ———. 2017. "Ground by Law." *Philosophical Issues* no. 27:279-301.

"It is a commonplace, or anyway it used to be, that one way to explain a fact is to subsume it, together with its conditions, under a general law.

(...)

Metaphysical grounding is an explanatory relation. When a set of facts grounds a fact *A*, the grounded fact obtains *because* its grounds obtain.

And so we might want to know whether laws play a similar role in the grounding explanation of particular facts, and if so, what that implies about the nature of those laws. This paper explores these questions." (p. 279, a note omitted)

32. ———. 2017. "What Is a Moral Law?" *Oxford Studies in Metaethics* no. 12:135-159.

"The main metaphysical challenge for realists about the normative is to characterize this explanatory connection between the particular normative facts and the non-normative facts that 'underlie' them. The most straightforward answer is ethical naturalism, which I take to be the view that every

particular normative fact [*Fa*] is metaphysically grounded without remainder in facts whose constituents are 100 percent non-normative." (p. 135 notes omitted)

(...)

Naturalist and non-naturalist agree that particular moral facts [*Fa*] always stand in some explanatory relation to the non-normative facts in the vicinity. The non-naturalist's distinctive claim is that this relation is not the much-studied relation of metaphysical grounding; nor is it causation or any other familiar explanatory relation. The challenge for the non-naturalist is to give a positive account of this connection." (pp. 136-137)

33. ———. 2017. "Metaphysical Relations in Metaethics." In *The Routledge Handbook of Metaethics*, edited by McPherson, Tristram and Plunkett, David, 151-169. New York: Routledge.

"This chapter aims to clarify a question that can be vaguely put as follows: How are the normative facts related to the natural facts?

(...)

Our discussion assumes that there are normative facts—facts about the normative properties of things and the normative relations in which they stand. It also assumes that some facts are clearly "natural," e.g., the fact that the fish will die if they are not fed.

The challenge is to say how facts of the first sort are related to facts of the second sort.

But it must be conceded at the outset that this question is not exactly clear. When we ask how the normative is "related" to the natural, what sort of information are we seeking?

The best way to clarify a question that is unclear in this way is to say what would count as an answer to it, so the plan for what follows is to do just that. Recent work in general metaphysics provides a vocabulary in which hypotheses about the relation between the normative and the natural can be stated with some precision. This chapter explains that vocabulary by putting it to

work for the purpose of providing a taxonomy of answers to our target question." (p. 151)

34. Roski, Stefan. 2018. "Grounding and the Explanatory Role of Generalizations." *Philosophical Studies* no. 175:1985-2003.

Abstract: "According to Hempel's (*Aspects of scientific explanation and other essays*. The Free Press, New York, 1965) influential theory of explanation, explaining why some a is G consists in showing that the truth that a is G follows from a law-like generalization to the effect that all Fs are G together with the initial condition that a is F. While Hempel's overall account is now widely considered to be deeply flawed, the idea that some generalizations play the explanatory role that the account predicts is still often endorsed by contemporary philosophers of science.

This idea, however, conflicts with widely shared views in metaphysics according to which the generalization that all Fs are G is partially explained by the fact that a is G. I discuss two solutions to this conflict that have been proposed recently, argue that they are unsatisfactory, and offer an alternative."

35. Russell, Jeffrey Sanford. 2016. "Qualitative Grounds." *Philosophical Perspectives* no. 30:309-348.

"Ground and Necessity: Shamik Dasgupta argues that we shouldn't think there are any fundamental facts about particular individuals: these would be undetectable danglers, redundant to our scientific explanations (2009; 2014; forthcoming; see also 2011; 2013).

Rather, we should hold that all facts about particular individuals are grounded in what the world is like qualitatively. (1) All non-qualitative facts hold in virtue of qualitative facts. He calls this "qualitativism". (Other names for the view are "generalism", "structuralism", or "metaphysical anti-haecceitism".) I'll call it the Qualitative Grounds thesis. I find this thesis intriguing, but I don't entirely understand it. In this paper I strive to get a clearer view of what it really involves." (p. 309)

36. Rydéhn, Henrik. 2018. "Grounding and Ontological dependence." *Synthese* no. 198:1231-1256.

Abstract: "Recent metaphysics has seen a surge of interest in grounding—a relation of non-causal determination underlying a distinctive kind of explanation common in philosophy. In this article, I investigate the connection between grounding and another phenomenon of great interest to metaphysics: ontological dependence. There are interesting parallels between the two phenomena: for example, both are commonly invoked through the use of "dependence" terminology, and there is a great deal of overlap in the motivations typically appealed to when introducing them. I approach the question of the relationship between grounding and ontological dependence through an investigation of their modal connections (or lack thereof). I argue, firstly, that on the common assumption that grounding is factive, it can be shown that no known variety of rigid ontological dependence is either necessary or sufficient for grounding. I also offer some suggestions in support of the claim that this generalizes to every possible form of rigid ontological dependence. I then broaden the discussion by considering a non-factive conception of grounding, as well as by looking at forms of generic (rather than rigid) ontological dependence. I argue that there is at least one form of rigid ontological dependence that is sufficient for non-factive grounding, and

that a form of generic dependence may be necessary (but not sufficient) both for factive and non-factive grounding.

However, justifying even these fairly weak modal connections between grounding and ontological dependence turns out to require some quite specific and substantive assumptions about the two phenomena that have only rarely been discussed."

37. Saenz, Noël B. 2015. "A Grounding Solution to the Grounding Problem." *Philosophical Studies* no. 172:2193-2214.

Abstract: "The statue and the lump of clay that constitutes it fail to share all of their kind and modal properties. Therefore, by Leibniz's Law, the statue is not the lump.

Question: What grounds the kind and modal differences between the statue and the lump? In virtue of what is it that the lump of clay, but not the statue, can survive being smashed? This is the grounding problem. Now a number of solutions to the grounding problem require that we substantially revise our view of reality. In this paper, I provide a solution to this problem that does not require such a revision. I then show how my solution to the grounding problem can solve a related problem and answer a related question. The upshot is that the solution I offer is not only nonrevisionary, but also fruitful."

38. ——. 2020. "Ontology." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 361-374. New York: Routledge.

"In this chapter, I will explore a number of ways the literature has said that grounding and ontology relate. To summarize: §2 concerns itself with grounding's ability to save the ontology: to provide a safe and sane way of quantifying over certain kinds of things in our theories. §3 with its ability to price the ontology: to show how we should measure ontological simplicity. And §4 with its ability to restrict derivative ontology: to restrict what can be grounded from what.(7)" (pp. 361-362)

(7) Notice that we can also ask what ontology has to "say" about grounding. This can be divided into two. We can ask about the ontology of grounding: does grounding exist? But we can also ask about what an ontology has to say about grounding: given a

preferred ontology, how should we think about grounding? Since we need to assume that grounding exists in order to discuss its import on ontology, and since this chapter is devoted to applying grounding to ontology and not ontologies to grounding, I will not address these questions here.

39. Sandstad, Petter, and Jansen, Ludger. 2021. "A Non-hylomorphic Account of Formal Causation." In *Neo-Aristotelian Perspectives on Formal Causation*, edited by Jansen, Ludger and Sandstad, Petter, 65-86. New York: Routledge.

"In this paper, we develop our own account of formal causation, which is basically inspired by Aristotle's views and might, in a way, be seen as a development of Lowe's. In Section 2, we present the basic framework of our own account of formal causation. In Section 3, we make clear that our view of formal causation is not committed to, though consistent with, (i) any specific view on universals, (ii) hylomorphism, (iii) individual forms, and (iv) biological kinds, social entities, artefacts, etc. as real kinds. Our view thus has fewer ontological commitments than many rival accounts of formal causation, and may therefore be of more general interest. In Section 4, we contrast our variant of formal causation with a more traditional hylomorphic account. In Section 5, we argue that formal causation is indispensable in explanation, and, more controversially, that it is a type of causation. To back up this position, we explore in Section 6 the dependence relations involved in cases of formal causation, such that formal causes are difference-makers. The seventh section concerns epistemological issues." (p. 66)

Lowe, E. J. (2006) *The Four-Category Ontology: A Metaphysical Foundation for Natural Science*. Oxford: Oxford University Press

40. Sattler, Wolfgang. 2021. "Finean Feature Dependence and the Aristotelian Alternative." In *Neo-Aristotelian Perspectives on Formal Causation*, edited by Jansen, Ludger and Sandstad, Petter, 175-200. New York: Routledge.

"In his seminal paper 'Essence and Modality' Kit Fine argues that traditionally there have been two distinct approaches to essentialism."

(...)

In this paper I discuss the application first of Fine's and then of Aristotle's account of 'ontological dependence' to cases where an attribute that is accidental to its subject(s), depends ontologically on its subject(s). I start with a short exposition of Fine's account of ontological dependence and then apply it to cases concerning accidental attributes, first conceived as 'Aristotelian universals' (in the modern sense of that term), and then conceived as tropes of a sort (Section 2). I then do the same with respect to Aristotle's account (Section 3). I argue, for one, that there are clear differences between the results of applying Fine's account and of applying Aristotle's account. Moreover, some of the results following from Fine's account are *prima facie* implausible.

(...)

In the last section (4) I argue that the difference in results between applying Fine's account and applying Aristotle's account reflects a difference in method and in commitment between these accounts. I then suggest, and argue in outline for an explanation of these differences, namely, that Fine's essentialism and Aristotle's essentialism aim to explain somewhat different things. And this entails that the notions of what something is and of essence are conceived differently within these two theories." (pp. 175-176, a note omitted)

41. Savu, Bianca-Alexandra. 2017. "Grounds and Structural Realism: A Possible Metaphysical Framework." *Symposion. Theoretical and Applied Inquiries in Philosophy and Social Sciences*:97-106.

Abstract: "This article discusses the proposal of accommodating grounding theories and structural realism, with the aim to provide a metaphysical framework for structural realism (ST). Ontic structural realism (OSR), one of the most accepted metaphysical versions for structural realism,

is taken into account here, with the intention of analyzing the framework in which GT and OSR are compatible, and to what extent."

42. Schaffer, Jonathan. 2009. "On What Grounds What." In *Metametaphysics: New Essays on the Foundations of Ontology*, edited by Chalmers, David, Manley, David and Wasserman, Ryan, 347-383. Oxford: Clarendon Press.

"On the now dominant Quinean view, metaphysics is about what there is. Metaphysics so conceived is concerned with such questions as whether properties exist, whether meanings exist, and whether numbers exist. I will argue for the revival of a more traditional Aristotelian view, on which metaphysics is about what grounds what. Metaphysics so revived does not bother asking whether properties, meanings, and numbers exist. Of course they do! The question is whether or not they are fundamental.

In §1 I will distinguish three conceptions of metaphysical structure. In §2 I will defend the Aristotelian view, coupled with a permissive line on existence. In §3 I will further develop a neo-Aristotelian framework, built around primitive grounding relations." (p. 347)

43. ———. 2010. "Monism: The Priority of the Whole." *Philosophical Review* no. 119:31-76.

"The *monist* holds that the whole is prior to its parts, and thus views the cosmos as fundamental, with metaphysical explanation dangling downward from the One. The *pluralist* holds that the parts are prior to their whole, and thus tends to consider particles fundamental, with metaphysical explanation snaking upward from the many. Just as the materialist and idealist debate which properties are fundamental, so the monist and pluralist debate which objects are fundamental.

I will defend the monistic view. In particular I will argue that there are physical and modal considerations that favor the priority of the whole.

Physically, there is good evidence that the cosmos forms an entangled system and good reason to treat entangled systems

as irreducible wholes. Modally, mereology allows for the possibility of atomless gunk, with no ultimate parts for the pluralist to invoke as the ground of being." (pp. 31-32)

44. ———. 2010. "The Least Discerning and Most Promiscuous Truthmaker." *Philosophical Quarterly* no. 60:307-324.

Abstract: "I argue that the one and only truthmaker is the world. This view can be seen as arising from (i) the view that truthmaking is a relation of grounding holding between true propositions and fundamental entities, together with (ii) the view that the world is the one and only fundamental entity. I argue that this view provides an elegant and economical account of the truthmakers, while solving the problem of negative existentials, in a way that proves ontologically revealing."

45. ———. 2012. "Grounding, Transitivity, and Contrastivity." In *Metaphysical Grounding: Understanding the Structure of Reality*, edited by Correia, Fabrice and Schnieder, Benjamin, 122-138. Cambridge: Cambridge University Press.

"Grounding is generally assumed to be transitive. The assumption of transitivity is natural. For instance, if the physical system grounds the chemical arrangement, and the chemical arrangement grounds the biological organism, then it is natural to thereby infer that the physical system must ground the biological organism. Moreover the assumption of transitivity is useful. By treating grounding as transitive (and irreflexive), one generates a strict partial ordering that induces metaphysical structure.

Yet I will offer counterexamples to the transitivity of grounding. Such counterexamples should not be so surprising given that grounding is akin to causation, and that there are known counterexamples to the transitivity of causation. I will conclude by explaining how a contrastive approach can resolve the counterexamples while retaining metaphysical structure." (p. 121)

46. ———. 2015. "What Not to Multiply Without Necessity." *Australasian Journal of Philosophy* no. 93:644-664.

"Introduction: The Razor commands: *Do not multiply entities without necessity!* Few principles are as pervasive in contemporary metaphysics. Yet I argue that the Razor is too blunt a measure of ontological economy, failing to distinguish fundamental from derivative entities. Instead I recommend the more precise *Laser*, which is focused specifically on fundamental entities, and commands: *Do not multiply fundamental entities without necessity!*

I argue that the Laser represents an improvement over the Razor, I connect the Laser to an underlying 'bang for the buck' methodology, and I trace the implications of this bang-for-the-buck methodology for certain metaphysical debates. What emerges is general pressure towards a *permissive* and abundant view of what there is, coupled with a restrictive and sparse view of what is fundamental. Classical mereology and pure set theory come out as paradigms of methodological virtue, for making so much from so little.

In arguing that the Laser represents an improvement over the Razor, I take for granted that ontological economy is an aspect of rational theory choice.

(...)

My thesis is that, given that ontological economy is an aspect of rational theory choice, this notion of economy is better scanned through the Laser.

47. ———. 2016. "Grounding in the Image of Causation." *Philosophical Studies* no. 173:49-100.

Abstract: "Grounding is often glossed as metaphysical causation, yet no current theory of grounding looks remotely like a plausible treatment of causation. I propose to take the analogy between grounding and causation seriously, by providing an account of grounding in the image of causation, on the template of structural equation models for causation."

48. ———. 2016. "Ground Rules: Lessons from Wilson." In *Scientific Composition and Metaphysical Ground*, edited by Aizawa, Ken and Gillett, Carl, 143-170. London: Palgrave-Macmillan.

"*Overview*: In section "A Brief Introduction to Grounding", I offer a brief introduction to the notion of grounding. In sections "Are Grounding Claims Informative? and Are Grounding Claims Helpful?", I take up Wilson's two main objections to grounding-based approaches—that bare grounding claims are uninformative, and that such claims are unhelpful—and extract two main lessons. In section "Wilson's Pluralistic Framework", I critique Wilson's rival pluralistic approach for, among other things, not taking up Wilson's own lessons. I conclude in section "Structural Equation Models to the Rescue" by explaining how an approach based on structural equation models for grounding has a special claim to adequacy." (p. 144)

49. ———. 2017. "The Ground Between the Gaps." *Philosophers' Imprint* no. 17:1-26.
- "*Overview*: In §1 I review and clarify the idea there is a special explanatory gap arising between the physical and the phenomenal. In §2 I examine the usual "transparent" connections such as between the H, H, and O atoms and the H₂O molecule they compose, and argue that such transitions require substantive metaphysical principles (in this case mereological principles about both the existence and the nature of wholes). In §3 I offer a more theoretical route to the more general conclusion that substantive metaphysical principles are needed in all concrete cases, by presenting a formalism for grounding relations generally (based on structural equation models) which requires the specification of dependence functions. Finally, in §4 I articulate a form of physicalism — "ground physicalism" — on which the physical is the ultimate ground for the chemical, the biological, and the psychological, and show how it resolves explanatory gap worries." (p. 2)
50. ———. 2017. "Social Construction as Grounding; or: Fundamentality for Feminists, a Reply to Barnes and Mikkola." *Philosophical Studies* no. 174:2449-2465.

Abstract: "Feminist metaphysics is guided by the insight that gender is socially constructed, yet the metaphysics behind social construction remains obscure. Barnes and Mikkola charge that current metaphysical frameworks—including my grounding framework—are hostile to feminist metaphysics. I argue that not only is a grounding framework hospitable to feminist metaphysics, but also that a grounding framework can help shed light on the metaphysics behind social construction. By treating social construction claims as grounding claims, the feminist metaphysician and the social ontologist both gain a way to integrate social construction claims into a general metaphysics, while accounting for the inferential connections between social construction and attendant notions such as dependence and explanation. So I conclude that a grounding framework can be helpful for feminist metaphysics and social ontology."

51. ———. 2021. "Ground Functionalism." *Oxford Studies in Philosophy of Mind* no. 1:171-207.

"I have the bold ambition of reviving the hopeful materialist story, by adding a new chapter—*ground functionalism*—which integrates functionalist insights about the mind with ground-theoretic insights about explanation.

The ground functionalist posits a *mind making* principle linking material states to mental states via functional role, such that a properly choreographed system dances out a mind. I argue that ground functionalism preserves the insights of functionalism, while enabling a viable explanation for consciousness." (pp. 171-172)

52. Schnieder, Benjamin. 2006. "Truth-Making without Truth-Makers." *Synthese* no. 152:21-46.

Abstract: "The article is primarily concerned with the notion of a truthmaker.

An explication for this notion is offered, which relates it to other notions of making something such-and-such. In particular, it is shown that the notion of a truth-maker is a close relative of a concept employed by van Inwagen in the

formulation of his *Consequence Argument*. This circumstance helps understanding the general mechanisms of the concepts involved. Thus, a schematic explication of a whole battery of related notions is offered. It is based on an explanatory notion, introduced by the sentential connector “because”, whose function is examined in some detail. Finally, on the basis of the explication proposed, an argument is developed to the effect that the objects usually regarded as truthmakers are not apt to play this role.”

53. ———. 2010. "A Puzzle about ‘Because’." *Logique et Analyse* no. 53:317-343.

Abstract: "The essay is a partial investigation into the semantics of the explanatory connective ‘because’. After three independently plausible assumptions about ‘because’ are presented in some detail, it is shown how their interaction generates a puzzle about ‘because’, once they are combined with a common view on conceptual analysis. Four possible solutions to the puzzle are considered."

54. ———. 2011. "A Logic for ‘Because’." *The Review of Symbolic Logic* no. 4:445-465.

Abstract: "In spite of its significance for everyday and philosophical discourse, the explanatory connective ‘because’ has not received much treatment in the philosophy of logic. The present paper develops a logic for ‘because’ based on systematic connections between ‘because’ and the truth-functional connectives."

55. ———. 2016. "In Defence of a Logic for ‘Because’." *Journal of Applied Non-Classical Logics*:160-171.

Abstract: "The present author developed a calculus for the logic of ‘because’.

In a recent paper in this journal, it has been claimed that the central inference rules for the logic are invalid and that the intuition upon which the rules are based is not accounted for. This note criticises these arguments and presents an independent argument in favour of the rules used in the logic."

- Abstract: "What does it mean that some proposition follows from others? The standard way of spelling out the notion proceeds in modal terms: x follows from y iff necessarily, if y is true, so is x . But although this yields a useful and manageable account of consequence, it fails to capture certain aspects of our pre-theoretical understanding of consequence. In this paper, an alternative notion of logical consequence, based on the idea of grounding, is developed."

- Abstract: "Three traditional philosophical issues that van Inwagen discusses in his metaphysical works are the Principle of Sufficient Reason, the question of why there is something rather than nothing, and the question of whether free will is compatible with determinism. The three topics are connected by a conceptual tie: the notion of a ground. In this essay, it is argued that van Inwagen's take on the three topics, ingenious as it otherwise is, suffers from an inadequate conception of the underlying notion of a ground."
58. ———. 2020. "Grounding and Dependence." *Synthese* no. 197:95-124.

Abstract: "The paper deals with the notions of grounding and of existential dependence.

It is shown that cases of existential dependence seem to be systematically correlated to cases of grounding and hence the question is raised what sort of tie might hold the two notions together so as to account for the observed correlation. The paper focusses on three possible ties between grounding and existential dependence: identity (as suggested in Jonathan

Schaffer's works), definition (as suggested by Fabrice Correia and Benjamin Schnieder), and grounding (as suggested by Kathrin Koslicki and Francesco Orilia). A case for the definitional tie is made."

"According to W. V. Quine, the goal of ontology is simply to determine what there is. But neo-Aristotelians think that this leaves out a crucial aspect of the ontological enterprise. For, not all entities are born equal.

Some entities exist only derivatively: they depend for their existence on other, more fundamental, entities which make the former exist. To study such existential dependencies is a central task of ontology." (p. 151)

61. Schulte, Peter. 2019. "Grounding Nominalism." *Pacific Philosophical Quarterly* no. 100:482-505.

Abstract: "The notion of grounding has gained increasing acceptance among metaphysicians in recent years. In this paper, I argue that this notion can be used to formulate a very attractive version of (property) nominalism, a view that I call 'grounding nominalism'. Simplifying somewhat, this is the view that *all properties are grounded in things*. I argue that this view is coherent and has a decisive advantage over competing versions of nominalism: it allows us to accept properties as real, while fully accommodating nominalist intuitions. Finally, I

defend grounding nominalism against several seemingly troublesome objections."

62. Sher, Gila. 2019. "Where Are You Going, Metaphysics, and How Are You Getting There? – Grounding Theory as a Case Study." In *Quo Vadis, Metaphysics?: Essays in Honor of Peter van Inwagen*, edited by Szatkowski, Mirosław, 37-57. Berlin: de Gruyter.

Abstract: "The viability of metaphysics as a field of knowledge has been challenged time and again. But in spite of the continuing tendency to dismiss metaphysics, there has been considerable progress in this field in the 20th- and 21st-centuries. One of the newest – though, in a sense, also oldest – frontiers of metaphysics is the grounding project. In this paper I raise a methodological challenge to the new grounding project and propose a constructive solution. Both the challenge and its solution apply to metaphysics in general, but grounding theory puts the challenge in an especially sharp focus. The solution consists of a new methodology, *holistic grounding* or *holistic metaphysics*. This methodology is modeled after a recent epistemic methodology, *foundational holism*, that enables us to pursue the foundational project of epistemology without being hampered by the problems associated with foundationalism."

63. Shumener, Eric. 2020. "Identity." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 413-424. New York: Routledge.

"This chapter concerns the nature of identity criteria and the relationship between ground and facts of identity or distinctness. After some preliminaries in Section I, we turn to formulations of identity criteria in terms of ground in Section II. Section III explores reasons for and against taking identity and distinctness facts to be fundamental. Section IV tackles specific proposals for grounding identity and distinctness facts." (p. 413)

64. Sider, Theodore. 2020. "Ground Grounded." *Philosophical Studies* no. 177:747-767.

Abstract: "Most facts of grounding involve nonfundamental concepts, and thus must themselves be grounded. But how? The leading approaches—due to Bennett, deRosset, and Dagupta—are subject to objections. The way forward is to deny a presupposition common to the leading approaches, that there must be some simple formula governing how grounding facts are grounded. Everyone agrees that facts about cities might be grounded in some complex way about which we know little; we should say the same about the facts of grounding themselves. The kinds of facts that might enter into the grounds of the facts of grounding are explored at length."

65. ———. 2020. *The Tools of Metaphysics and the Metaphysics of Science*. Oxford: Oxford University Press.

Chapter 1: Postmodal Metaphysics and Structuralism 1;
Chapter 2: Nomic Essentialism 23-44.

"Recently there has been a shift to new tools (or perhaps a return to old ones), which I will call "postmodal". David Lewis (who had also been a leader in the modal revolution) enriched his conceptual toolkit with the concept of natural properties and relations—those elite properties and relations that determine objective similarities, occur in the fundamental laws, and whose distribution determines everything else. I myself have argued for the centrality of a concept that is closely related to Lewis's notion of naturalness: the concept of structure, or as I'll put it here, the concept of a fundamental concept. Fundamental concepts are not limited to those expressed by predicates; we may ask, for instance, whether quantifiers or modal operators express fundamental concepts—whether they help to capture the world's fundamental structure. Kit Fine (re-)introduced the concept of essence, and argued that it should not be understood modally. He pointed out that although it does seem to be an essential feature of the singleton set [Socrates] that it contain Socrates, it does not seem to be an essential feature of Socrates that he be contained in [Socrates]; being a member of this set is not "part of what Socrates is". Thus we cannot define a thing's essential features, as it had been common to do in the halcyon days of the modal era, as those features that the thing possesses necessarily, for it is plausible that Socrates possesses the

feature of being a member of [Socrates] necessarily.(2) Fine also (re-)introduced a notion of ground. One fact grounds another, he said, if the second holds in virtue of the first—if the first explains, in a distinctively metaphysical way, the second. Interest in ground and related concepts over the past ten years or so has been intense." (p. 2)

First online December 16, 2021.

Abstract: "In this article, I seek to assess the extent to which Theism, the claim that there is a God, can provide a true fundamental explanation for the instantiation of the grounding relation that connects the various entities within the layered structure of reality. More precisely, I seek to utilise the explanatory framework of Richard Swinburne within a specific metaphysical context, a ground-theoretic context, which will enable me to develop a true fundamental explanation for the existence of grounding. And thus, given the truth of this type of explanation, we will have a further reason to believe in the existence of God."

'Participating' Mean Nothing? 168-194; Travis Dumsday: E.J.
Lowe on the Unity Problem 195-218.

"This special issue of *Studia Philosophica Estonica* centers around Aristotelian metaphysics, construed broadly to cover both scholarly research on Aristotle's metaphysics as well as work by contemporary metaphysicians on Aristotelian themes.

(...)

"The contribution this special issue makes to the ongoing discussion is twofold. First, the special issue promotes a deeper interaction between scholars of Aristotle and contemporary metaphysicians. We hope that the papers encourage people working in the history of philosophy to relate to contemporary discussions and people working in contemporary metaphysics to engage with Aristotle and Ancient scholarship. Second, the special issue is unified in its focus on two themes in Aristotelian metaphysics, essence and grounding. The papers address questions concerning fundamentality and dependence, ontological independence or priority, the causal priority of forms, the unity of grounding, the reduction of grounding to essence, the unity of essence, the roles of essence, and explanation and definition. We hope that this issue opens up fresh and exciting avenues for future research both in Ancient scholarship as well as in contemporary metaphysics. A brief summary of the volume's papers follows."(p. 1)

68. Siscoe, Robert Weston. 2021. "Grounding and a Priori Epistemology: Challenges for Conceptualism." *Synthese* no. 199:11445-11463.

Abstract: "Traditional rationalist approaches to a priori epistemology have long been looked upon with suspicion for positing a faculty of rational intuition capable of knowing truths about the world apart from experience. Conceptualists have tried to fill this void with something more empirically tractable, arguing that we know a priori truths due to our understanding of concepts. All of this theorizing, however, has carried on while neglecting an entire cross section of such

truths, the grounding claims that we know a priori. Taking a priori grounding into account poses a significant challenge to conceptualist accounts of a priori knowledge, as it is unclear how merely understanding conceptual connections can account for knowledge of grounding. The fact that we do know some grounding truths a priori, then, is a significant mark in traditional rationalism's favor, and the next frontier for those who aim to eliminate the mystery surrounding a priori knowledge."

69. ———. 2021. "Grounding, Understanding, and Explanation." *Pacific Philosophical Quarterly*.

Abstract: "Starting with the slogan that understanding is a 'knowledge of causes', Stephen Grimm and John Greco have argued that understanding comes from a knowledge of dependence relations. Grounding is the trendiest dependence relation on the market, and if Grimm and Greco are correct, then instances of grounding should also give rise to understanding. In this paper, I will show that this prediction is correct – grounding does indeed generate understanding in just the way that Grimm and Greco anticipate. However, grounding examples of understanding also show that Grimm and Greco are not telling the full story when it comes to understanding. Understanding can only be generated by a particular subset of dependence relations – those dependence relations that are also explanatory. Grimm and Greco should thus appeal to a privileged class of dependence relations, relations like grounding that can also give rise to explanation."

70. Skiba, Lukas. 2022. "In Defence of Hybrid Contingentism." *Philosophers' Imprint* no. 22:1-30.

"After situating, in §2, the haecceities objection more carefully in the overall context of Williamson's case for uniform necessitism and clarifying it in some important respects, I turn to the notion of non-causal explanation it involves and whose role in the objection has, surprisingly, not yet received much attention. I fill this lacuna in §3, where I argue that the objection can be fruitfully understood as challenging the contingentists to provide metaphysical grounds for the

haecceity facts in question. In §4, I propose a way in which contingentists can meet this challenge, drawing on recent work concerning the interaction of ground and essence. In §5, I develop and defend the resulting hybrid contingentist position by showing that, first impression to the contrary, it coheres well with an essence-based account of ontological dependence.⁹" (p. 3, notes omitted)

71. Skiles, Alexander. 2014. "Primitivism about Intrinsicity." In *Companion to Intrinsic Properties*, edited by Francescotti, Robert M., 221-252. Berlin: de Gruyter.

"Objections to the thesis that intrinsicity fails to succumb to reductive analysis have not been fully articulated or defended anywhere in the literature. Indeed, the thesis is rarely mentioned even as an option (let alone a live one). Nor has it been discussed what a viable account of intrinsicity along these lines could, or should, look like.

The goal of this chapter is to explore the prospects of the view I shall call *primitivism about intrinsicity*, and offer a limited defense. A key component of this limited defense consists simply in clarifying what it could be, exactly, for intrinsicity to be "primitive". As we shall see, at least some *prima facie* decisive objections to primitivism seem less convincing once this has been done.

Doing so is the task of section 1. In section 2, I then consider several arguments for primitivism about intrinsicity. And finally, in section 3, I consider several arguments against it." (p. 222, a note omitted)

72. ———. 2015. "Against Grounding Necessitarianism." *Erkenntnis* no. 80:717-751.

Abstract: "Can there be grounding without necessitation? Can a fact obtain wholly in virtue of metaphysically more fundamental facts, even though there are possible worlds at

which the latter facts obtain but not the former? It is an orthodoxy in recent literature about the nature of grounding, and in first-order philosophical disputes about what grounds what, that the answer is no. I will argue that the correct answer is yes. I present two novel arguments against grounding necessitarianism, and show that grounding contingentism is fully compatible with the various explanatory roles that grounding is widely thought to play."

73. ———. 2020. "Necessity." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 148-163. New York: Routledge.

"In §1, I discuss the main arguments in the literature for necessitarianism and consider responses to them. In §2, contingentism is subjected to the same treatment. In §3, I survey the internalism versus externalism dispute. (Since the necessitarianism vs. contingentism dispute has been explored in more depth than the internalism vs. externalism dispute, and because many of the maneuvers available within the first dispute have analogues in the second, I will focus more attention on the former.)" (pp. 148-149)

74. Skiles, Alexander, and Trogon, Kelly. 2013. "Grounding." In *The Routledge Handbook of Metametaphysics*, edited by Bliss, Ricki and Miller, J. T. M., 199-210. New York: Routledge.

"Metametaphysics concerns foundational metaphysics. Questions of foundational metaphysics include: What is the subject matter of metaphysics? What are its aims? What is the methodology of metaphysics? Are metaphysical questions coherent? If so, are they substantive or trivial in nature? Some have claimed that the notion of grounding is useful in addressing such questions. In this chapter, we introduce some core debates about whether – and, if so, how – grounding should play a role in metametaphysics." (p. 199)

(...)

"In what follows, we focus on three of the most interesting and widely discussed roles that have been assigned to grounding in metametaphysics. Specifically, we consider how grounding

might be relevant to whether metaphysical questions are substantive (§1), how to choose between metaphysical theories (§2), and how to understand so-called ‘location problems’ (§3).” (.p 200, a note omitted)

75. ———. 2019. "Maurin on Grounding and Explanation." In *Maurinian Truths – Essays in Honour of Anna-Sofia Maurin on her 50th Birthday*, edited by Wahlberg, Tobias Hansson and Stenwall, Robin, 159-172. Lund: Lund University.

"In the classical and contemporary literature on grounding, explanatory language is routinely used to communicate what it is and to motivate substantive principles about how it behaves."

(...)

"Two views have emerged about how to answer this question.

Some stipulate that by ‘grounding’ they mean a distinctive form of determination, what we will call *determination_G*, where to determine is, roughly speaking, to *produce* or *bring about* (Audi 2012; Schaffer 2016; and Trogon 2013)."

(...)

"Others stipulate that by ‘grounding’ they mean a distinctive form of explanation, what we will call *explanation_G* (Dasgupta 2017; Litland 2015; and Rosen 2010).

(...)

As is customary, let us call the latter view *Unionism* (grounding is *explanation_G*) and the former view *Separatism* (grounding is *determination_G*).

Compatible with Separatism is the idea that there are conditions under which grounding backs or underwrites explanations, and Unionism is compatible with the view that there are conditions under which grounding itself is backed or underwritten by other relations.

In “Grounding and Explanation: It’s Complicated” (2019), Anna-Sofia Maurin aims to show that, despite appearances, Unionism and Separatism in fact undermine the use that

explanatory language has been put to in elucidating grounding, rather than undergird it. In what follows we will critically assess her interesting argument." (pp. 159-160)

Annotated bibliography on metaphysical grounding. Sixth part: Sko-Z

Bibliography

1. Skow, Bradford. 2016. *Reasons Why*. New York: Oxford University Press.

"Why-questions are important in metaphysics. The obvious example is their importance to the theory of grounding. Many metaphysicians are very busy producing theories of grounding—but what is grounding? A common strategy for helping initiates get a handle on the subject matter of these theories is to say that when one fact grounds another, the first may be used to answer the question why the second obtains. Another example of a part of metaphysics where why-questions are important is the theory of modality. If some fact F obtains in two possible worlds W and V, then those worlds are in one respect similar. Boris Kment argues, in "Counterfactuals and Explanation," that this respect of similarity matters for how close V and W are, in the sense of closeness relevant to evaluating counterfactuals, if and only if the question why F obtains has the same answer in both worlds." (p. 2)

2. Smithson, Robert. 2020. "Metaphysical and Conceptual Grounding." *Erkenntnis* no. 85:1501-1525.

Abstract: "In this paper, I clarify the relation between two types of grounding: metaphysical and conceptual. Metaphysical grounding relates entities at more and less fundamental ontological levels. Conceptual grounding relates semantically primitive sentences and semantically derivative sentences. It is important to distinguish these relations given that both types of grounding can underwrite non-causal "in-virtue-of" claims. In this paper, I argue that conceptual and metaphysical grounding are exclusive: if a given in-virtue-of claim involves conceptual grounding, then it does not involve metaphysical grounding. I then present two heuristics for deciding which type of grounding is relevant to a given case. These heuristics suggest that certain proposed cases of metaphysical grounding may not actually involve metaphysical grounding at all."

3. Solomyak, Olla. 2020. "Realism." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 375-386. New York: Routledge.

"Questions of ground and questions of realism appear to be tightly connected in a number of ways, but there has not been consensus on precisely how these connections should be understood nor a full explication of the various approaches one might take on this issue. My aim in this chapter will be to spell out several ways in which we might see these questions as connected and thereby clarify the role for questions of ground in metaphysical inquiry more generally." (p. 375)

4. Steinberg, Alex. 2013. "Supervenience: A Survey." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 123-166. Munich: Philosophia Verlag.

"Many philosophers think that an important sort of dependence that relates conjunctive facts to atomic facts and the primary colours to the specific shades can be captured by supervenience claims."

(...)

"Supervenience, then, promises to be one of the dependence relations that structure the world we live in. This paper aims to give an overview of the subject. Section 1 introduces the main kinds of supervenience.

Section 2 discusses their relations. And section 3 makes the case that purely modal definitions of supervenience can fruitfully be improved upon.

In the rest of the paper I will follow the bulk of the philosophical literature in focusing exclusively on properties as the relata of supervenience." (pp. 123-124)

5. Stenwall, Robin. 2017. "Causal Grounds for Negative Truths." *Philosophical Studies* no. 174:2973-2989.

Abstract: "Among truthmaker theorists it is generally thought that we are not able to use the entailment principle (i.e. the principle according to which truthmaking distributes across entailment) to ground negative truths. But these theorists usually only discuss truthmakers for truth-functional complexes, thereby overlooking the fact that there are non-truth-functional complexes whose truth values are not solely determined by the truth or falsity of their atomic propositions. And once we expand the class of truths that require their own bespoke truthmakers to also include these, there is no reason to exempt negative truths from grounding. For given that truthmaking is closed under entailment and every negative truth is entailed by some non-truth-functional complex or other, any resources rich enough to ground the truth of the latter will do the same job for the former."

6. ———. 2021. "A Grounding Physicalist Solution to the Causal Exclusion Problem." *Synthese* no. 198:11775-11795.

Abstract: "Remember how Kim (*Philos Perspect* 3:77–108, 1989, in: Heil and Mele (eds) *Mental causation*, Clarendon Press, Oxford, 1993b) used to argue against non-reductive physicalism to the effect that it cannot accommodate the causal efficacy of the mental?

The argument was that if physicalists accept the causal closure of the physical, they are faced with an exclusion problem. In the

original version of the argument, the dependence holding between the mental and the physical was cashed out in terms of supervenience. Due to the work of Fine (*Philos Perspect* 8:1–16, 1994) and others, we have since come to realize that modal notions are not well-suited to perform the work of properly characterizing dependence. As a consequence of this, an increasingly larger community of contemporary metaphysicians prefer to spell out mental-physical dependence in terms of a non-causal and non-reductive notion called grounding, which is intended to target a particular sort of metaphysical relation that takes us from ontologically less fundamental features of the world to that which is more fundamental. In this paper I join forces with those who think that this shift in focus is on the right track.

More specifically, I will argue that the grounding physicalist can solve the exclusion problem in a way that is preferable to the supervenience-based nonreductive physicalist solution, as well as in a way that is compatible with the externalist picture of the mental."

Chapter 5: *Grounding and ontological dependence*, pp. 93-119.

"The notion of 'ground' stormed into contemporary analytic metaphysics at the beginning of the twenty-first century,⁽¹⁾ but the roots of the notion go all the way back to Aristotle. At its simplest, grounding may be understood as 'metaphysical explanation'. To be more precise, when some x is grounded in

some y, it is usually thought that y explains x. Moreover, the status of y is generally thought to be somehow prior to that of x – grounding is typically understood to express priority between things. For instance, we might say that the members of a set are prior to the set itself; the existence of the set is grounded in its members. Or to take a more concrete example, the existence of any given composite object is grounded in the existence of its parts." (p. 93)

8. Tahko, Tuomas E. 2013. "Truth-Grounding and Transitivity." *Thought: A Journal of Philosophy* no. 2:332-340.

Abstract: "It is argued that if we take grounding to be univocal, then there is a serious tension between truth-grounding and one commonly assumed structural principle for grounding, namely transitivity.

The primary claim of the article is that truth-grounding cannot be transitive. Accordingly, it is either the case that grounding is not transitive or that truth-grounding is not grounding, or both."

9. ———. 2020. "Structure." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 387-395. New York: Routledge.

WIn this chapter, I will discuss both of these senses of structure as well as their potential connections. I will first briefly outline a potential connection between ground, structure, and fundamentality. Next we take up the idea that reality has a hierarchical structure and we will then examine whether there

could be a systematic connection between ground and structure via the Lewisian notion of *naturalness*. This leads us to a question about the relationship between reality and representation, before concluding with a more detailed discussion about a famous principle regarding fundamentality, namely, the principle of *purity*." (p. 387)

10. Tajer, Diego. 2016. "Grounding and Logical Basing Permissions." *Diametros* no. 50:81-96.

Abstract: "The relation between logic and rationality has recently re-emerged as an important topic of discussion. Following the ideas of Broome [1999] and Macfarlane [2004], the debate focused on providing rational requirements, which work as bridges between logic and epistemic norms. However, as Broome [2014] and Way [2011] observed, the usual requirements cannot capture some important aspects of rationality, such as how one can rationally believe something on the basis of believing something else. Broome [2014] proposed a few additional principles ("basing permissions") for this purpose. In this paper I develop a more systematic family of basing permissions using the recent notion of grounding (Fine [2012], Correia [2014]). In particular, I claim that if Γ (logically) grounds A, and you believe Γ then rationality permits you to believe A on the basis of believing Γ ."

11. Tallant, Jonathan. 2018. *Truth and World: An Explanationist Theory*. New York: Routledge.

"My starting point for many of the arguments will be Armstrong's canonical *Truth and Truthmaking*. So, to the theory. I borrow (with slight emendation) from Cameron (2008a).(1)

Maximalism: for any true proposition, there exists some thing or things that necessitate(s) the truth of that proposition. (cf. Cameron, 2008a: 292)

Maximalism is an extreme version of truthmaker theory.

The truthmaker theorist merely holds that:

Truthmaker theory: for some true propositions, there exists some thing or things that necessitate(s) the truth of that proposition.

As we move through this chapter, we will have to refine these principles. For one thing, note that this treats necessitation as the truthmaker relation (as do, e.g., both Armstrong (2004) and Cameron (2008a)). I will suggest that mere necessitation is not fit to play the role of the truthmaker relation. Following a number of others (e.g., Schaffer, 2008a, 2008b, 2009: 365), I suggest that the truthmaker relation should be treated as a grounding relation – the 'in virtue of' relation. I take this relation to be a primitive and unanalysable relation, though there are things that can be said to cast light on its nature."

(1) The emendation: Cameron states that truthmakers must be pluralities: things. There is no obvious reason that a truthmaker might not, instead, be a thing.

12. Thompson, Naomi. 2014. *Structuring Reality*.

PhD thesis at the University of Birmingham; available at Academia.edu.

Abstract: "This thesis explores attempts to characterise the structure of reality. Three notions stand out: Lewisian *naturalness*, Sider's '*structure*', and *grounding*, where the latter has become the most popular way to characterise the structure of reality in the contemporary literature. I argue that none of these notions, as they are currently understood, are suited for limning the metaphysical structure of reality. In the first part of the thesis I argue that, by the lights of the relevant theories, both naturalness and structure fall short of the theoretical role carved out for those posits. In the second part of the thesis I present two challenges to the 'orthodox' conception of grounding. The first contests the standard assumption that grounding is asymmetric, both by citing what I take to be best described as symmetric instances of grounding, and by developing and arguing for a new theory of metaphysical structure – 'metaphysical interdependence' – which takes grounding to be nonsymmetric. The second challenge concerns the relationship between grounding and (metaphysical) explanation, and leads to a dilemma for the grounding theorist. My proposed resolution to the dilemma is to adopt an antirealist approach to grounding, which I further motivate and develop in the final chapter."

13. ———. 2016. "Grounding and Metaphysical Explanation." *Proceedings of the Aristotelian Society* no. 116:395-402.

Abstract: "Attempts to elucidate grounding are often made by connecting grounding to metaphysical explanation, but the

notion of metaphysical explanation is itself opaque, and has received little attention in the literature. We can appeal to theories of explanation in the philosophy of science to give us a characterisation of metaphysical explanation, but this reveals a tension between three theses: that grounding relations are objective and mind-independent; that there are pragmatic elements to metaphysical explanation; and that grounding and metaphysical explanation share a close connection. Holding fixed the mind-independence of grounding, I show that neither horn of the resultant dilemma can be blunted. Consequently, we should reject the assumption that grounding relations are mind-independent."

14. ———. 2016. "Metaphysical Interdependence." In *Reality Making*, edited by Jago, Mark, 38-56. Oxford: Oxford University Press.

"I assume the existence of a distinctive relation of non-causal dependence: the grounding relation. Intuitive examples of grounding can help to elucidate the notion. Consider, for example, the relationship that obtains between Socrates's singleton—the set that only has Socrates as a member—and Socrates himself (see Fine 1995, 271), where Socrates's singleton exists because Socrates exists. Grounding can be understood as a relation of metaphysical explanation, as emphasized by the 'because' in the previous sentence. Claims about the dependence of truths on their truthmakers are also plausibly construed as grounding claims (e.g. Rodriguez-Pereyra 2006, 960; Correia 2011)—we get a particular truth in virtue of the existence of the relevant truthmaker. The truth is thus grounded in the truthmaker. Borrowing another kind of example of grounding from Schaffer 2009, 375), the Euthyphro dilemma concerns whether an act is morally right because it is approved by the gods, or is approved by the gods because it is morally right. If we take the first horn of the dilemma, then the rightness of the act is grounded in the approval of the gods. If the latter, the approval of the gods is grounded in the rightness of the act." (p. 38)

15. ———. 2018. "Irrealism about Grounding." *Royal Institute of Philosophy Supplement* no. 172:2405-2425.

Abstract: "Grounding talk has become increasingly familiar in contemporary philosophical discussion. Most discussants of grounding think that grounding talk is useful, intelligible, and accurately describes metaphysical reality. Call them *realists* about grounding. Some dissenters reject grounding talk on the grounds that it is unintelligible, or unmotivated. They would prefer to eliminate grounding talk from philosophy, so we can call them *eliminativists* about grounding. This paper outlines a new position in the debate about grounding, defending the view that grounding talk is (or at least can be) intelligible and useful. Grounding talk does not, however, provide a literal and veridical description of mind-independent metaphysical reality. This (non-eliminative) *irrealism* about grounding treads a path between realism and eliminativism."

16. ———. 2019. "Questions and Answers: Metaphysical Explanation and the Structure of Reality." *Journal of the American Philosophical Association*:98-116.

Abstract: "This paper develops an account of metaphysical explanation according to which metaphysical explanations are answers to what-makes-it-the-case-that questions. On this view, metaphysical explanations are not to be considered entirely objective, but are subject to epistemic constraints imposed by the context in which a relevant question is asked.

The resultant account of metaphysical explanation is developed independently of any particular views about grounding.

Toward the end of the paper an application of the view is proposed that takes metaphysical explanations conceived in this way to characterize reality's structure. According to this proposal, reality's structure is partly constituted by a projection of our explanatory practices onto reality."

17. ———. 2020. "Strict Partial Order." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 259-270. New York: Routledge.

"This chapter explores aspects of the logic of ground. A strict partial order is transitive, irreflexive, and asymmetric. Whilst it is generally assumed that grounding exhibits these properties, this has consequences for other aspects of the study of ground, and so each assumption has been challenged in the grounding literature. The present chapter critically discusses those challenges and explores reasons for thinking that grounding forms a strict partial order in the first place." (p. 259)

18. Tiehen, Justin. 2015. "Grounding Causal Closure." *Pacific Philosophical Quarterly* no. 96:501-522.

Abstract: "What does it mean to say that mind-body dualism is causally problematic in a way that other mind-body theories, such as the psychophysical type identity theory, are not? After considering and rejecting various proposals, I advance my own, which focuses on what grounds the causal closure of the physical realm.

A metametaphysical implication of my proposal is that philosophers working without the notion of grounding in their toolkit are metaphysically impoverished.

They cannot do justice to the thought, encountered in every introductory class in the philosophy of mind, that dualism has a special problem accounting for mental causation."

19. ———. 2015. "Explaining Causal Closure." *Philosophical Studies* no. 172:2405-2425.

Abstract: "The physical realm is causally closed, according to physicalists like me.

But why is it causally closed, what metaphysically explains causal closure? I argue that reductive physicalists are committed to one explanation of causal closure to the exclusion of any independent explanation, and that as a result, they must give up on using a causal argument to attack mind–body dualism. Reductive physicalists should view dualism in much the way that we view the hypothesis that unicorns exist, or that the Kansas City Royals won the 2003 World Series: false, but not objectionable in any distinctively causal way. My argument turns on connections between explanation, counterfactuals, and inductive confirmation."

20. Torza, Alessandro. 2020. "Ground and Modality." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 63:563-585.

Abstract: "The grounding relation is routinely characterized by means of logical postulates.

The aim of this paper is twofold. First, I show that a subset of those postulates is incompatible with a minimal characterization of metaphysical modality. Then I consider a number of ways for reconciling ground with modality. The simplest and most elegant solution consists in adopting serious actualism, which is best captured within a first-order modal language with predicate abstraction governed by negative free logic. I also explore a number of alternative strategies by revising the ground-theoretic postulates, while keeping the modal ones fixed. As I argue, each of those strategies is either unviable, highly contentious, or insufficiently motivated."

21. Trogon, Kelly. 2013. "Grounding: Necessary or Contingent?" *Pacific Philosophical Quarterly* no. 94:465-485.

Abstract: "Recent interest in the nature of grounding is due in part to the idea that purely modal notions are too coarse-grained to capture what we have in mind when we say that one thing is grounded in another. Grounding not being purely modal in character, however, is compatible with it having modal consequences.

Is grounding a necessary relation? In this article I argue that the answer is 'yes' in the sense that propositions corresponding to full grounds modally entail propositions corresponding to what they ground. The argument proceeds upon two substantive principles: the first is that there is a broadly epistemic constraint on grounding, while the second links this constraint with Fine's Aristotelian notion of essence. Many think grounding is necessary in something like the sense specified above, but just why it's necessary is an issue that hasn't been carefully addressed. If my argument is successful, we now know why grounding is necessary."

22. ———. 2013. "An Introduction to Grounding." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 97-122. Munich: Philosophia Verlag.

"There is a burgeoning literature on grounding. The primary goal of this chapter is to set out and clarify some of the central issues and disputes concerning this notion. In the course of the chapter I'll weigh in on certain positions, treat others as working assumptions, and remain neutral on others. In some cases philosophers either explicitly endorse or reject the positions I discuss, while in other cases the positions have yet to be discussed in any detail.

The plan for the chapter is as follows. I begin by distinguishing two general approaches to grounding—on one our talk of grounding in philosophy is univocal, and on the other it isn't—and consider different ways in which each view might be further developed (§2). Then I consider the logical form of grounding statements as well as the structural principles that govern grounding (§3-4). Next, I take up the matter of how the notions of grounding, modality, and reduction interact (§5-6). I close with a brief discussion of the grounds for what grounds what (§7)." (pp. 97-98)

23. ———. 2015. "Placement, Grounding, and Mental Content." In *The Palgrave Handbook of Philosophical Methods*, edited by Daly, Chris, 481-496. London: Palgrave-Macmillan.

"Introduction: One central issue concerning philosophical methodology is this: what concepts should go into our philosophical toolbox? That is to say, what notions are appropriate to rely on in doing philosophy? This issue is relevant not only to how we should go about addressing philosophical problems but also how we're to formulate those problems in the first place. There is a burgeoning literature on the notion of grounding. I'm a proponent of grounding – I think the notion of grounding is coherent and theoretically useful. Supposing that the notion of grounding belongs in our philosophical toolbox, what consequences might this have for familiar philosophical problems? In this chapter I focus on what Jackson (1998) calls *placement problems* – problems concerning how the manifest facts (e.g. facts concerning ordinary macroscopic objects, the mental, and the moral) “fit into” the world given that the world is ultimately physical in nature.

If we formulate placement problems in terms of grounding, we should expect new possibilities to open up with respect to how to solve them. My goal in this chapter is to show that this is precisely what happens with respect to the *content* placement problem, the problem of how to fit facts concerning mental content into the actual world given that it's ultimately physical in nature." (p. 481, a note omitted)

24. ———. 2018. "Grounding-Mechanical Explanation."
Philosophical Studies no. 175:1289-1309.

Abstract: "I argue that there is an important similarity between causation and grounding. In particular I argue that, just as there is a type of scientific explanation that appeals to causal mechanisms—causal-mechanical explanation—there is a type of metaphysical explanation that appeals to grounding mechanisms—grounding-mechanical explanation. The upshot is that the role that grounding mechanisms play in certain metaphysical explanations mirrors the role that causal mechanisms play in certain scientific explanations. In this light,

it becomes clear that grounding-mechanical explanations make crucial contributions to the evaluation of a variety of important philosophical theses, including priority monism and physicalism."

25. ———. 2020. "Truthmaking." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 396-407. New York: Routledge.

"Before getting into the details, I should note some of the assumptions I'm going to make about grounding and truthmaking. While each of these assumptions has been challenged in the literature, they strike me as reasonable starting points. As for regimentation, I assume that grounding and truthmaking claims are to be formulated with the predicates "grounds" and "makes true" rather than sentential connectives such as "because". As for the ontological status of grounding and truthmaking, I assume that they're relations 'out there' in the domain of our ontology rather being primitive pieces of ideology. As for their relata, I assume that something is a ground, a grounded entity, or a truthmaker only if it's a *fact*, and something is made true only if it's a *proposition*. I assume that facts and propositions are structured entities, where the former are worldly in that they lack concepts or modes of presentation as constituents, and the latter are representational in that they do have such constituents. Collections of one or more facts ground other facts, and collections of one or more facts make true propositions." (p. 396, a note omitted)

26. Trogon, Kelly, and Witmer, D. Gene. 2021. "Full and Partial Grounding." *Journal of the American Philosophical Association* no. 7:252-271.

Abstract: "While controversy about the nature of grounding abounds, our focus is on a question for which a particular answer has attracted something like a consensus. The question concerns the relation between *partial* grounding and *full* grounding. The apparent consensus is that the former is to be defined in terms of the latter. We argue that the standard way of doing this faces a significant problem and that we ought to

pursue the reverse project of defining full grounding in terms of partial grounding. The guiding idea behind the definition we propose is that full grounding is what happens when partial grounding works in a way that ensures that the grounded is nothing over and above the grounds. We ultimately understand this idea in terms of iterated nothing-over-and-above claims."

27. Trueman, Robert. 2021. "Truthmaking, Grounding and Fitch's Paradox." *Analysis* no. 81:270-274.

Abstract: "Jago and Loss have recently used variations on Fitch's paradox to argue that every truth has a truthmaker, and that every fact is grounded. In this paper, I show that Fitch's paradox can also be adapted to prove the exact opposite conclusions: no truth has a truthmaker, and no fact is grounded. All of these arguments are as dialectically effective as each other, and so they are all in bad company."

30. ———. 2021. "Grounding Theories of Powers." *Synthese* no. 198:11187-11216.

Abstract: "Necessitarianism, as we shall use the term, is the view that natural properties and causal powers are necessarily connected in some way. In recent decades the most popular forms of necessitarianism have been the anti-Humean powers-based theories of properties, such as dispositional essentialism and the identity theory. These versions of necessitarianism have come under fire in recent years and I believe it is time for necessitarians to develop a new approach. In this paper I identify unexplored ways of positing metaphysically necessary connections in nature, using the concepts of grounding and essential dependence. For example, I show that one could be a necessitarian by insisting that the properties of things necessarily *ground* their powers, and that one can maintain this while rejecting dispositional essentialism. Using different combinations of claims about grounding and essential dependence (or lack thereof), I map out a spectrum of new positions and compare them to previous theories of natural modality. Some of these positions are compatible with Humean metaphysics (given certain readings of Hume's Dictum) while others are not. The overall aim of the paper is to provide a new metaphysical framework for understanding theories of powers and thereby launch a new necessitarian research programme."

31. Turner, Jason. 2016. "Curbing Enthusiasm About Grounding." *Philosophical Perspectives* no. 30:366-396.

"Metaphysics in the high old style is back in fashion, and this season's favorite accessory is a relation philosophers are pleased to call metaphysical grounding.

By 'grounding', the fashionistas do not intend merely the venerable project of trying to figure out how the ordinary appearances are settled by ultimate reality.

They mean, instead, a very particular sort of metaphysical relation (or something like a relation) used to tie together the fundamental with the non-fundamental— a kind of priority relation that structures the world.

Some stodgier critics have objected that metaphysics' newfound enthusiasm for grounding is misguided, because the notion is in fact *unintelligible*: Talk of the alleged relation makes no sense, and metaphysicians have simply fooled themselves into thinking otherwise. I do not share this diagnosis—as far as I can see, talk of the relation makes perfect sense. But I too want to curb the discipline's grounding-based enthusiasm. The enthusiasm has led many to make wild claims about grounding's virtues, such as that we can use it to shield entities from Ockham's razor. And it has led many to embark on grand grounding-theoretic projects, such as the search for its 'logic'. I think many of these claims unfounded and projects unpromising: Grounding's marketing campaign has made promises which, I will argue, it cannot deliver." (p. 366)

32. Ujvári, Márta. 2020. "Metaphysical Explanation Separated from Grounding." *Metaphysica* no. 21:55-69.

Abstract: Grounding is typically associated to metaphysical explanation on the basis of the explanatory role's being characteristic of grounding as well. Some even say that all what metaphysical explanation does is tracking the grounding relation. However, recently Maurin has argued that grounding does not "inherit" its properties from metaphysical explanation and, consequently, we should be "separatists". In this paper separatism will be defended from the perspective of metaphysical explanation thus giving a turn to the separatist strategy. In particular, the structural difference between grounding and metaphysical explanation will be pointed out as

affecting also the explanatory function. It will be shown how dispositions and essentialist claims play different roles in the two theories.

Lastly, it will be claimed that the two theories diverge on accounting for law-like and accidental generalizations. Provided these arguments are sound, there will be good reason to tell metaphysical explanation apart from grounding.

33. Valore, Paolo. 2021. "A Proposed Taxonomy of Realism in Conceptual Frameworks." *European Journal of Pragmatism and American Philosophy* no. 13:1-10.

"One of the complications of a clear evaluation of different positions in metaphysics and ontology is discrepancy in terminology and variance, if not incongruity, of basic concepts associated to relevant notions. This is a common problem in philosophy, but it seems that it has been exacerbated in recent debates about different clusters of positions called "realism."

(...)

Evidently, a significant reconstruction of the various systems (not even of the most important authors) and the many possible foundations and justifications of "realism" is out of the scope of this paper (a well-done comprehensive synopsis of versions of "realism" can be easily found in several other papers and encyclopedia entries, for instance Miller 2019). Instead of trying to infer a definition of "realism," as if by induction, from the countless pictures given by philosophers identifying (or identified by others) as "realists" in the history of philosophy or in a catalogue of current debates, here I offer a taxonomy provided by a conceptual analysis of the notion of "realism" in what I think are its sub-concepts, recognizing three different conceptual frameworks." (p. 2)

34. Väyrynen, Pekka. 2013. "Grounding and Normative Explanation." *Aristotelian Society Supplementary Volume* no. 87:156-178.

Abstract: "This paper concerns non-causal normative explanations such as 'This act is wrong because/in virtue of ' (where the blank is often filled out in non-normative terms, such as 'it causes pain'). The familiar intuition that normative facts aren't brute or ungrounded but anchored in non-normative facts seems to be in tension with the equally familiar idea that no normative fact can be fully explained in purely non-normative terms. I ask whether the tension could be resolved by treating the explanatory relation in normative explanations as the sort of 'grounding' relation that receives extensive discussion in recent metaphysics. I argue that this would help only under controversial assumptions about the nature of normative facts, and perhaps not even then. I won't try to resolve the tension, but draw a distinction between two different sorts of normative explanations (one concerning 'bearers', the other concerning 'sources' of normativity) which helps to identify constraints on a resolution. One distinctive constraint on normative explanations in particular might be that they should be able to play a role in normative justification."

35. von Solodkoff, Tatjana. 2012. "Straightening Priority Out." *Philosophical Studies* no. 161:391-401.

Abstract: "In recent work, Louis deRosset (*Philosophical Studies* 149:73-97, 2010) has argued that priority theorists, who hold that truths about macroscopic objects can be metaphysically explained without reference to such things, cannot meet an independently motivated constraint upon good explanation. By clarifying the nature of the priority theorist's project, I argue that deRosset's argument fails to establish its conclusion."

36. Wallner, Michael. 2021. "The Ground of Ground, Essence, and Explanation." *Synthese* no. 198:1257-1277.

Abstract: "This paper is about the so-called meta-grounding question, i.e. the question of what grounds grounding facts of the sort 'φ is grounded in Γ'. An answer to this question is pressing since some plausible assumptions about grounding and fundamentality entail that grounding facts must be grounded. There are three different accounts on the market which each answer the meta-grounding question differently: Bennett's and deRosset's "Straight Forward Account" (SFA), Litland's "Zero-Grounding Account" (ZGA), and "Grounding Essentialism" (GE). I argue that if grounding is to be regarded as metaphysical explanation (i.e. if unionism is true), (GE) is to be preferred over (ZGA) and (SFA) as only (GE) is compatible with a crucial consequence of the thought that grounding is metaphysical explanation. In this manner the paper contributes not only to discussions about the ground of ground but also to the ongoing debate concerning the relationship between ground, essence, and explanation."

"Versions of (GE) are discussed in Rosen (2010), Fine (2012) and Dasgupta (2014)." (p. 1258)

37. Wang, Jennifer. 2020. "Cause." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 300–311. New York: Routledge.

"The notion of ground is often introduced as the metaphysical analogue of the notion of cause. For the most part, no more is said about the connection between the two notions, for instance, the extent of the analogy or whether theorizing about one notion might shed light on the other. But in recent literature, some philosophers have developed a sustained analogy between grounding and causation, with the end goal of showing that they present a unified phenomenon. Although there are other questions about the connection between grounding and causation, this chapter centers on the unification claim." (300, a note omitted)

38. Werner, Jonas. 2020. "Plural Grounding and the Principle of Sufficient Reason." *Analysis* no. 80:90–95.

"McDaniel (2019) presents a novel argument that aims to establish that the principle of sufficient reason fails if there is a contingent truth. It is a variant of an argument to the same conclusion that has been presented by van Inwagen 1983: 202–4. Van Inwagen's argument has been shown to fail if the principle of sufficient reason is formulated as the thesis that every truth has a full ground (see e.g. Schnieder and Steinberg 2015). The crucial aspect of McDaniel's new argument is that it employs a notion of plural grounding, with plural grounding allowing that 'many facts can collectively ground many facts collectively' (McDaniel 2019: 232). McDaniel defines that 'a plurality of truths are contingently true if and only if at least one of them is contingently true' (2019: 233) and he formulates the principle of sufficient reason as the thesis that 'any plurality of contingent truths has a full ground' (2019: 232). I will

henceforth use ‘(PPSR)’ (for ‘plural principle of sufficient reason’) to refer to this thesis." (p. 90)

(...)

"General irreflexivity is an assumption that is needed for McDaniel's argument against (PPSR) to work. If I have been successful in showing that (PPSR) only captures the spirit of the principle of sufficient reason if it is formulated in terms of a notion of plural grounding for which general irreflexivity fails, then I have rebutted McDaniel's attack on the principle of sufficient reason." (p. 94)

39. ———. 2021. "Arbitrary Grounding." *Philosophical Studies*.

First Online 10 July 2021.

Abstract: "The aim of this paper is to introduce, elucidate and defend the usefulness of a variant of grounding, or metaphysical explanation, that has the feature that the grounds explain of some states of affairs that one of them obtains without explaining which one obtains. I will dub this variant *arbitrary grounding*. After informally elucidating the basic idea in the first section, I will provide three metaphysical hypotheses that are best formulated in terms of arbitrary grounding in the second section. The third section will be concerned with the relation between arbitrary grounding and non-arbitrary grounding. The fourth section will compare arbitrary grounding to two extant proposals in the literature."

Contents: Acknowledgements IX; 1. Introduction 1; 2. Immediate Minimal Grounds 19; 3. Constructing the Semantics 39; 4. Essence 75; 5. Necessity and Possibility 111; 6. Grounding 133; 7. Comparison and Conclusion 163; Final Remarks 175; Bibliography 177-183.

"Introduction: In this first chapter I present the core idea of this book and lay out its structure. Furthermore, I introduce its main topics. I will start by painting a big picture of the view I want to develop in this work and I situate it in the present philosophical landscape. Afterwards, I will briefly discuss the central concepts of essence, grounding and metaphysical modality and I will specify the ways in which I will use them in the subsequent chapters. Finally, an overview of the following chapters will be provided.

1.1 The Basic Idea

In this book I develop and defend a unified semantic treatment of essence, grounding and metaphysical modality. Statements like "Socrates is essentially wise", "Possibly the number of ducks in Hamburg is odd" and "Bob the ball is red grounds Bob the ball is coloured" can be modelled in the resulting semantics. It will take the form of a world semantics similar to the standard possible world semantics for metaphysical modality. One of its central features will be that not only possible worlds, but also impossible worlds - ways the world might not have been - are its semantic values. The semantics will be argued to shed light on the deep philosophical connections between three of the most important posits of contemporary metaphysics. It will be shown to bear relevance to some important and controversial issues regarding the relations between essence, ground and modality.

The core idea standing in the background of my semantics is to model essences with accessibility-relations, relations that specify which worlds can see other worlds, metaphorically speaking. Essences modelled with accessibility-relations will be the sole primitive of the view to be developed. Accounts of grounding and metaphysical modality will be given in terms of essence." (p. 1)

41. Whitcomb, Dennis. 2012. "Grounding and Omniscience." *Oxford Studies in Philosophy of Religion* no. Vol. 4:173-201.

Abstract: "This chapter argues that omniscience is impossible and therefore that there is no God. The argument turns on the notion of grounding. The chapter begins by illustrating and clarifying that notion. It then lays out five claims, one of which is the claim that there is an omniscient being, and the other four of which are claims about grounding. It shows that these five claims are jointly inconsistent. It then argues for the truth of each of them, except the claim that there is an omniscient being. From these arguments it follows that there are no omniscient beings and thus that there is no God."

42. Wigglesworth, John. 2018. "Grounding in Mathematical Structuralism." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki Leigh and Priest, Graham, 217-236. Oxford: Oxford University Press.

"Conclusion: We have argued for two grounding claims involving mathematical entities that are relevant to the mathematical structuralist: that the identity of a mathematical object is grounded in the identity of the structure it belongs to, and in the identities of other mathematical objects in that structure. This argument has proceeded by describing mathematical structures in terms of unlabelled graphs. With this account of structure to hand, we present standard identity conditions for objects in a structure and for structures themselves, which allow us to articulate the notion of the identity of a mathematical entity in the context of structuralism. We then interpret grounding claims involving these entities as claims about what happens in the space of possible mathematical structures. This is an interpretation which makes no reference to any particular systems or realizations that exemplify the structures in question. And so, unlike Linnebo's account, it is an account of grounding that is available to both the ante rem and in re non-eliminativist structuralists. On this interpretation, we argue that the grounding claims are true. Their truth follows from, or is at least evidenced by, the truth of the relevant corresponding necessity

claims, claims ranging over the space of possible mathematical structures." (p. 232)

44. Wilhelm, Isaac. 2020. "An Argument for Entity Grounding." *Analysis* no. 80:500-507.

"According to those I will call 'fact-only grounders' (Rosen 2010 and Fine 2012), grounding only obtains between facts. Physical objects, abstract objects, events and other non-fact entities do not ground anything. According to those I will call 'entity grounders' (Schaffer 2009 and deRosset 2013), nonfact entities can serve as grounds. Facts can ground, but so can physical objects, abstract objects and perhaps other kinds of entities.

In this paper, I give an argument in favour of entity grounding over fact only grounding. Put roughly, the argument is this: entity grounders can give a more unified, less disjunctive account of the grounds of identity facts than fact-only grounders. After presenting the argument, I consider some responses that fact-only grounders might give." (p. 500, a note omitted)

"My focus in this chapter is how *revisionary* we need to be about wider theory, in order to incorporate the minimal metaphysics.

In Section 6.1 I outline a 'Moorean' epistemological challenge: that overly revisionary or error-theoretical theories of the world will *not be reasonable to believe* for those that start off with a fair share of common sense and a healthy respect for the testimony of best science. I outline two strategies for responding to this challenge by reconciling educated common sense and minimal metaphysics – 'structured metaphysics', in the mode of Fine and Schaffer, and the linguistic strategies favoured by Quine and contemporary fictionalists. Section 6.2 focuses on some familiar 'representational' strategies; and Section 6.3 develops my own favoured version of this strategy" (p. 165)

47. Wilsch, Tobias. 2015. "The Nomological Account of Ground." *Philosophical Studies* no. 172:3293-3312.

Abstract: "The article introduces and defends the Nomological Account of ground, a reductive account of the notion of metaphysical explanation in terms of the laws of metaphysics. The paper presents three desiderata that a theory of ground should meet: it should explain the modal force of ground, the generality of ground, and the interplay between ground and certain mereological notions. The bulk of the paper develops the Nomological Account and argues that it meets the three desiderata.

The Nomological Account relies on two central notions: the notion of a 'law of metaphysics' and the notion of 'determination via the laws'. The paper offers the constructional conception of the laws of metaphysics, on which the metaphysical laws are general principles that characterize construction–operations such as composition, constitution, or set-formation. The role of determination in the account is explained and some reductive approaches to the notion are sketched. The case for the Nomological Account presented in this article is also a case for the laws of metaphysics. Since the Nomological Account offers a promising approach to metaphysical explanation we should take the laws of metaphysics seriously."

48. ———. 2016. "The Deductive-Nomological Account of Metaphysical Explanation." *Australasian Journal of Philosophy* no. 94:1-23.

Abstract: "The paper explores a deductive-nomological account of metaphysical explanation: some truths metaphysically explain, or ground, another truth just in case the laws of metaphysics determine the latter truth on the basis of the former. I develop and motivate a specific conception of metaphysical laws, on which they are general rules that regulate the existence and features of derivative entities. I propose an analysis of the notion of 'determination via the laws', based on a restricted form of logical entailment. I argue that the DN-account of ground can be defended against the well-known objections to the DN-approach to scientific explanation. The goal of the paper is to show that the DN-account of

metaphysical explanation is a well-motivated and defensible theory."

49. ———. 2020. "Laws of Metaphysics." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 425-436. New York: Routledge.

"If causal explanations are supported by general laws, non-causal explanation might be supported by general laws as well. Consider metaphysical explanations like 'Peter the elephant is colored because he is grey' and '{Socrates} exists because Socrates exists'. These explanations might arise from general laws which entail that any grey object is also colored and that any object is the member of its singleton set (see Glazier's entry "Ground and Explanation", Chapter 8 in this volume). The role of such laws of metaphysics is to guide the bottom-up development of facts, much like the role of laws of nature is to govern facts along the temporal axis." (p. 425)

50. Wilson, Alastair. 2018. "Grounding Entails Counterpossible Non-Triviality." *Philosophy and Phenomenological Research* no. 92:716-728.

Abstract. "This paper outlines a non-reductive counterfactual account of grounding along interventionist lines, and uses the account to argue that taking grounding seriously requires ascribing non-trivial truth-conditions to a range of counterpossible counterfactuals. This result allows for a diagnosis of a route to scepticism about grounding, as deriving at least in part from scepticism about non-trivial counterpossible truth and falsity."

51. ———. 2018. "Metaphysical Causation." *Noûs* no. 52:723-751.

Abstract: "There is a systematic and suggestive analogy between grounding and causation. In my view, this analogy is no coincidence. Grounding and causation are alike because grounding is a type of causation: metaphysical causation. In this paper I defend the identification of grounding with metaphysical causation, drawing on the causation literature to explore systematic connections between grounding and metaphysical dependence counterfactuals, and I outline a non-

reductive counterfactual theory of grounding along interventionist lines."

52. ———. 2020. "Classifying Dependencies." In *The Foundation of Reality: Fundamentality, Space, and Time*, edited by Glick, David, Darby, George and Marmodoro, Anna, 46-68. Oxford: Oxford University Press.

"These days, metaphysical questions are frequently cast in terms of the ideology of grounding. This notion is usually introduced in explicit contrast to causation: ground is supposed to be a non-causal dependency relation that supports metaphysical explanations, just as causal relations support causal explanations. But the distinction between causation and grounding has never been very clear-cut, and recent work (Schaffer 2016; A. Wilson 2018a) has highlighted how deep the structural similarities between the notions run. Schaffer concludes that causation and grounding are merely closely analogous, whereas I have defended the more radical view that grounding is a specific type of causation; however, I set that heterodox view aside for the purposes of this chapter and proceed on the assumption that there is a coherent distinction to be drawn between the two notions." (p. 46)

(...)

"First, Section 2.2 provides some relevant background on causation and grounding.

Then in Sections 2.3-28 I examine six obvious criteria by which to distinguish these two notions. I argue that each of the criteria is problematic in some way or other, which motivates the search for a better criterion. In Section 2.9 I offer my own account of the distinction between grounding and causation in terms of how the dependency is mediated. This mediation criterion can explain the appeal of the next best candidate criteria—the temporal criterion and the modal criterion—without suffering from their problems. Section 2.10 provides further support for the mediation criterion by arguing that it makes the classification of dependencies in physics appropriately sensitive to the interpretation of the physical theories involved.

- Section 2.11 is a conclusion." (p. 47)
53. Wilson, Jessica M. 2014. "No Work for a Theory of Grounding." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 57:535-579.

Abstract: "It has recently been suggested that a distinctive metaphysical relation — ‘Grounding’—is ultimately at issue in contexts in which some goings-on are said to hold ‘in virtue of’, be (constitutively) ‘metaphysically dependent on’, or be ‘nothing over and above’ some others. Grounding is supposed to do good work (better than merely modal notions, in particular) in illuminating metaphysical dependence. I argue that Grounding is also unsuited to do this work. To start, Grounding alone cannot do this work, for bare claims of Grounding leave open such basic questions as whether Grounded goings-on exist, whether they are reducible to or rather distinct from Grounding goings-on, whether they are efficacious, and so on; but in the absence of answers to such basic questions, we are not in position to assess the associated claim or theses concerning metaphysical dependence. There is no avoiding appeal to the specific metaphysical relations typically at issue in investigations into dependence—for example, type or token identity, functional realization, classical mereological parthood, the set membership relation, the proper subset relation, the determinable/determinate relation, and so on—which are capable of answering these questions. But, I argue, once the specific relations are on the scene, there is no need for Grounding."

54. ——. 2016. "The Unity and Priority Arguments for Grounding." In *Scientific Composition and Metaphysical Ground*, edited by Aizawa, Ken and Gillett, Carl, 171-204. London: Palgrave MacMillan.

"...in two recent papers, however, Jonathan Schaffer (2016 and this volume) aims to develop a better version of the Unity argument, and offers certain objections to my reasons for rejecting the Priority argument. In this paper, I consider and respond to these new motivations for Grounding. I start with some clarificatory remarks concerning the dialectical import of

Grounding, its assumed relata, and how I take the ideology/ontology distinction to be relevant to the discussion; I then present and respond to Schaffer's new versions of the Unity and Priority arguments." (p. 172)

55. ———. 2016. "Grounding-Based Formulations of Physicalism." *Topoi* no. 35:1-18.

Abstract: "I problematize Grounding-based formulations of physicalism. More specifically, I argue, first, that motivations for adopting a Grounding-based formulation of physicalism are unsound; second, that a Grounding-based formulation lacks illuminating content, and that attempts to imbue Grounding with content by taking it to be a (nonmonotonic, hyperintensional) strict partial order are unuseful (since 'over and above' relations such as strong emergence may also be non-monotonic hyperintensional strict partial orders) and problematic (in ruling out reductive versions of physicalism, and relatedly, in undermining the ostensive definition of primitive Grounding as operative in any context where idioms of dependence are at issue); third, that conceptions of Grounding as constitutively connected to metaphysical explanation conflate metaphysics and epistemology, are ultimately either circular or self-undermining, and controversially assume that physical dependence is incompatible with explanatory gaps; fourth, that in order to appropriately distinguish physicalism from strong emergentism (physicalism's primary rival), a Grounding-based formulation must introduce one and likely two primitives in addition to Grounding; and fifth, that understanding physical dependence in terms of Grounding gives rise to 'spandrel' questions, including, e.g., "What Grounds Grounding?", which arise only due to the overly abstract nature of Grounding."

56. ———. 2016. "Metaphysical Emergence; Weak and Strong." In *Metaphysics in Contemporary Physics*, edited by Bigaj, Tomasz and Wüthrich, Christian 345-398. Leiden: Brill Rodopi.

Abstract: "Motivated by the seeming structure of the sciences, metaphysical emergence combines broadly synchronic dependence coupled with some degree of ontological and causal autonomy. Reflecting the diverse, frequently incompatible interpretations of the notions of dependence and autonomy, however, accounts of emergence diverge into a bewildering varieties.

Here I argue that much of this apparent diversity is superficial. I first argue, by attention to the problem of higher-level causation, that two and only two strategies for addressing this problem accommodate the genuine emergence of special science entities. These strategies in turn suggest two distinct schema for metaphysical emergence – ‘Weak’ and ‘Strong’ emergence, respectively. Each schema imposes a condition on the powers of (features of) entities taken to be emergent: Strong emergence (associated with British emergentism) requires that higher-level features have more token powers than their dependence base features, whereas (following Wilson 1999) Weak emergence (associated with non-reductive physicalism) requires that higher-level features have a proper subset of the token powers of their dependence base features. Importantly, the notion of ‘power’ at issue here is metaphysically neutral, primarily reflecting commitment just to the plausible thesis that what causes an entity may (perhaps only contingently) bring about are associated with how the entity is – that is, with its features."

57. Wirling, Ylwa Sjölin. 2020. "Is Backing Grounding?" *Ratio* no. 33:129-137.

Abstract: "Separatists are grounding theorists who hold that grounding relations and metaphysical explanations are distinct, yet intimately connected in the sense that grounding relations back metaphysical explanations, just as causal relations back causal explanations. But Separatists have not elaborated on the nature of the 'backing' relation. In this paper, I argue that backing is a form of (partial) grounding. In particular, backing has many of the properties commonly attributed to grounding, and taking backing to be partial grounding allows Separatists to make the most of their position vis-à-vis their Unionist opponents."

58. Witmer, D. Gene, Butchard, William, and Trogdon, Kelly. 2005. "Intrinsicity without Naturalness." *Philosophy and Phenomenological Research* no. 70:326-350.

Abstract: "Rae Langton and David Lewis have proposed an account of "intrinsic property" that makes use of two notions: being independent of accompaniment and being natural. We find the appeal to the first of these promising; the second notion, however, we find mystifying.

In this paper we argue that the appeal to naturalness is not acceptable and offer an alternative definition of intrinsicity. The alternative definition makes crucial use of a notion commonly used by philosophers, namely, the notion of one property being had in virtue of another property. We defend our account against three arguments for thinking that this "in virtue of" notion is unacceptable in this context. We also take a look at a variety of cases in which the definition might be applied and defend it against potential counterexamples. The upshot, we think, is a modest but adequate account of what we understand by "intrinsic property."

59. Woods, Jack. 2017. "Emptying a Paradox of Ground." *Journal of Philosophical Logic* no. 47:631-648.

Abstract: "Sometimes a fact can play a role in a grounding explanation, but the particular content of that fact make no difference to the explanation—any fact would do in its place. I call these facts vacuous grounds. I show that applying the distinction between-vacuous grounds allows us to give a principled solution to Kit Fine and Stephen Kramer's paradox of (reflexive) ground. This paradox shows that on minimal assumptions about grounding and minimal assumptions about logic, we can show that grounding is reflexive, contra the intuitive character of grounds. I argue that we should never have accepted that grounding is irreflexive in the first place; the intuitions that support the irreflexive intuition plausibly only require that grounding be non-vacuously irreflexive. Fine and Kramer's paradox relies, essentially, on a case of vacuous grounding and is thus no problem for this account."

"A number of philosophers with a metaphysical orientation have criticized *Making Things Happen* for its failure to provide an account of the metaphysical foundations or grounds or truth-makers for causal and explanatory claims. I originally attempted to write an ordinary paper responding to these criticisms but found this to be a very difficult undertaking: I realized that I disagreed with my critics about so much that putting everything into an ordinary "linear" argument was impossible.

(...)

What follows is, I readily admit, a caricature that makes no attempt to be fair or balanced. Many of the philosophers I know who are analytical metaphysicians do not share the affect and attitudes of my Professor Metafisico, and many are far more knowledgeable about science.

I hope that readers will take the dialogue in the spirit in which it is intended— as an attempt to be provocative and to raise in a sharp, unnuanced way some questions that deserve more attention than they have hitherto received. These include issues about just what metaphysical grounding consists in or amounts to, why (or when or for what purposes) it is required, and how providing metaphysical foundations relates to providing scientific explanations of a more ordinary empirical sort and to methodological concerns that at least in the past were regarded as an important component of philosophy of science. In particular, I want to raise the question of whether it is somehow obligatory that all philosophers of science do the sort of metaphysics associated with providing grounds or truth-makers or (as I maintain and hope) there are kinds of inquiry in philosophy of science having to do with methodology and the interpretation of the content of the particular scientific theories that can be pursued independently of the kinds of concerns that animate analytical metaphysicians." (pp. 193-194)

61. Wygoda Cohen, Shlomit. 2020. "Not All Partial Grounds Partly Ground: Some Useful Distinctions in the Theory of Grounding." *Philosophy and Phenomenological Research* no. 100:75-92.

Abstract: "The aim of this paper is to argue for some useful distinctions in the theory of grounding. I do so by first introducing the notion of grounding, discussing some of its features, and arguing that grounds must play some role in bringing about what they ground (sec. 1). I then argue that there are various distinct roles a fact may play in bringing about

another, and more particularly that we should distinguish between three such roles; enablers, partial grounds, and facts that partly ground (sec. 2). Finally, I present two theoretical advantages to incorporating these distinctions into our theory of grounding. Namely, that it reframes, and arguably dissolves, the contingentist-necessitarian debate (sec. 3), and that it helps to elegantly deal with the purported counterexamples to the transitivity of grounding and thus maintain the plausible elements of the assumption that grounding is a transitive relation (sec. 4)."

62. Yablo, Stephen. 1982. "Grounding, Dependence, and Paradox." *Journal of Philosophical Logic* no. 11:117-137.

"The idea that grounding is an important component of our intuitive notion of well-definedness has long formed part of the conceptual background axiomatic set theory.' Yet only in recent years have we come to appreciate how heavily grounding figures in our intuitions of semantical well-definedness. The culmination of this developing appreciation, for the present at least, is Kripke's celebrated Theory of Truth; and while it would be a mistake to say that Kripke's ideas came as a complete surprise to concerned semanticists, it would be."

(...)

"The first purpose of this paper is to hasten the process by attempting to place some aspects of Kripke's work into formal and philosophical perspective. The second purpose has to do with my feeling that Kripke has only done half, albeit the first and therefore by far the most important half, of the The intuition of grounding is, I want to maintain, a two-sided intuition. the one side is what I'll call the *inheritance* aspect. (pp. 117-118)

(...)

"This paper is divided into two parts, one theoretical and one (compara- tively) applied. Sections 2-7 deal with the development of dependence in an abstract setting. Our main result is that any collection with an inheritance- style characterization admits a canonically related dependence-style

charac- terization. In Sections 8-10 we show in a series of applications how the dependence way of doing things can improve our understanding of truth, semantic level, and paradoxicality." (p- 119)

63. Yip, Jack. 2015. "Truthmaking as an Account of How Grounding Facts Hold." *Kriterion - Journal of Philosophy* no. 29:11-32.

Abstract: "Grounding, as a way to articulate ontological dependence, faces the problem of what grounds grounding facts themselves (such as the fact that the singleton of Socrates is grounded in Socrates).

This problem stems from the need to account for the holding of grounding facts, which generates the hierarchical structure of ontological dependence. Within the grounding framework, grounding facts are either ungrounded or grounded. I will first argue that neither option can provide us with a satisfactory account. The main reason is that non-fundamental entities have to be counted as fundamental or involved in the essences of fundamental entities in order for either of the two options to work - the non-fundamental is being smuggled into the fundamental.

My suggestion is to appeal to the notion of truthmaking and tackle the problem about the holding of grounding facts outside the grounding framework|instead of asking what grounds grounding facts, I ask what makes grounding claims true.

Truthmaking is a prima facie relation holding between the representational and the non-representational such that the latter makes the former true. With the principle 'if (p) is true, then it is a fact that p,' we can account for the holding of grounding facts in a derivative sense. As a proposition contains the information about its truthmaker, the nature of grounding claims will tell us how grounding facts hold. I accept a realm of concepts which make up propositions (which might be needed already if there are propositions and propositions are compositional). These concepts will act as part of the truthmaker for grounding claims (in addition to the non-

conceptual fundamental entities) - the concept of the ground must figure in the concept of the grounded.

For a concept to figure in another, it is to be involved in the constitutive essence of the latter (analogous to Kit Fine's idea that the ground of a grounded entity figures in the essence of the grounded entity). This account will not smuggle anything non-fundamental into the fundamental realm. The implication is that ontological dependence stems from our different kinds of conceptualisations (perhaps of the same stuff, as in the concepts of water and H₂O), which justifies metaphysicians' armchair method."

64. Zanetti, Luca. 2021. "Grounding and Auto-abstraction." *Synthese* no. 198:10187-10205.

Abstract: "Abstraction principles and grounding can be combined in a natural way (Rosen in Hale B, Hoffmann A (eds) *Modality: metaphysics, logic, and epistemology*, Oxford University Press, Oxford, pp 109–136, 2010; Schwartzkopff in *Grazer philosophische studien* 82(1):353–373, 2011). However, some ground-theoretic abstraction principles entail that there are circles of partial ground (Donaldson in *Noûs* 51(4):775–801, 2017).

I call this problem auto-abstraction. In this paper I sketch a solution. Sections 1 and 2 are introductory. In Sect. 3 I start comparing different solutions to the problem. In Sect. 4 I contend that the thesis that the right-hand side of an abstraction principle is (metaphysically) prior to its left-hand side motivates an independence constraint, and that this constraint leads to predicative restrictions on the acceptable instances of ground-theoretic abstraction principles. In Sect. 5 I argue that auto-abstraction is acceptable unless the left-hand side is essentially grounded by the right-hand side. In Sect. 6 I highlight several parallelisms between auto-abstraction and the puzzles of ground. I finally compare my solution with the strategies listed in Sect. 3."

65. Zimmermann, Alexander, Kleinknecht, Reinhard, and Dorn, Georg J. W. 2020. "Grounding from a Syntactic Point of View: A Sentential-Logical Approach." *Erkenntnis*.

First online 3 March 2020.

Abstract: "We define the term \ulcorner a set T of sentential-logical formulae grounds a sentential-logical formula A from a syntactic point of view \urcorner in such a way that A is a syntactic sentential-logical consequence of T , and specific additional syntactic requirements regarding T and A are fulfilled. These additional requirements are developed strictly within the syntactics of sentential-logical languages, the three most important being new, namely: to be atomically minimal, to be minimal in degree, and not to be conjunction-like. Our approach is independent of any specific sentential-logical calculus."

66. Zylstra, Justin. 2018. "The Essence of Grounding." *Synthese* no. 196:5137-5152.

Abstract: "I develop a reduction of grounding to essence. My approach is to think about the relation between grounding and essence on the model of a certain concept of existential dependence. I extend this concept of existential dependence in a couple of ways and argue that these extensions provide a reduction of grounding to essence if we use sorted variables that range over facts and take it that for a fact to obtain is for it to exist. I then use the account to resolve various issues surrounding the concept of grounding and its connection with essence; apply the account to paradigm cases and to the impure logic of grounding; and respond to objections."

67. ——. 2018. "Essence with Ground." *Analytic Philosophy* no. 59:193-207.

"Many metaphysicians would like to have both essence and ground in their toolkit.(1) Applications of one concept often invoke the other.

(...)

In this paper, I argue that the compatibility of essence and ground is not simply given. I do this by first giving a pentad of claims that plausibly govern the concepts of essence and ground, and how they interact. I argue that each claim in the

pentad has independent albeit defeasible support but that they are jointly inconsistent. I then offer a way out of inconsistency by expanding our ideology: I introduce a non-factive operator that expresses the sort of thing an item is, in a distinctive sense of the term. The upshot is that we can make sense of the idea that something pertains to the essence of an item but involves contingency." (p. 193)

68. ———. 2019. "Making Semantics for Essence." *Inquiry: An Interdisciplinary Journal of Philosophy* no. 62:859-876.

Abstract: "In this paper, I develop a truthmaker semantics for essence and use the semantics to investigate the explanatory role of essence."

69. ———. 2020. "Essence." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 324-335. New York: Routledge.

"Philosophers have recently explored various interesting relations between metaphysical grounding and essence, not all of which are compatible.

(...)

The aim of this chapter is to provide an overview of this literature. To achieve this aim in a systematic way, I divide the chapter into four sections. In the first section, I review the literature on essence. In the second section, I outline various reductive proposals: reductions of essence to ground, reductions of ground to essence, and reductions of both to a third party. In the third section, I outline various proposed entailments: entailments from essence to ground and entailments from ground to essence. In the fourth section, I outline how essence and ground have been jointly applied toward various theoretical ends." (p. 325)

Annotated bibliography on the history of metaphysical grounding (A - M)

Bibliography

1. Amijee, Fatema. 2020. "Principle of Sufficient Reason." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 63-75. New York: Routledge.

"According to the Principle of Sufficient Reason (henceforth 'PSR'), everything has an explanation or sufficient reason. The PSR was a central tenet of rationalist metaphysics but has since gone out of vogue.

(...)

But lately, interest in the PSR has been enjoying a resurgence. This has been due, at least in part, to the recent interest in grounding, and relatedly, metaphysical explanation. If the notions of ground and metaphysical explanation are in good standing, then we can formulate a version of the PSR on which 'explanation' picks out either ground or metaphysical explanation. Since this chapter figures in a volume on grounding, I will focus on the version of the PSR that says that every fact has a ground. My primary goal is to address three questions. First, how continuous is the contemporary notion of grounding with the notion of sufficient reason endorsed by Spinoza, Leibniz, and other rationalists? In particular, does a PSR formulated in terms of ground retain the intuitive pull and power of the PSR endorsed by the rationalists? Second, to what extent can the PSR avoid the formidable traditional objections levelled against it if it is formulated in terms of ground? And

finally, how might historical discussion of the PSR shed light on the contemporary notion of grounding?" (p. 63)

2. ———. 2022. "Principle of Sufficient Reason." In *Encyclopedia of Early Modern Philosophy and the Sciences*, edited by Jalobeanu, Dana and Wolfe, Charles T., 1670-1680. Cham (Switzerland): Springer.

"Our need to understand the world, and our place in it, drives both philosophy and science. But to what extent is our world intelligible? According to the Principle of Sufficient Reason ("PSR"), everything is—at least in principle—intelligible.

Everything has an explanation, even if that explanation may not be accessible to us. While the Principle of Sufficient Reason was not known by that label until the seventeenth century, the principle's provenance goes at least as far back as Parmenides, and discussions that exploit the principle are to be found in medieval philosophers like Aquinas, Avicenna, Averroes, and Maimonides.

But the principle takes center stage in the early modern era. It is in this period that we find direct engagement with the PSR. A first task of this entry will thus be to bring to the fore the nature of the early modern commitment to this principle, and the arguments for and against it. A second task will be to highlight how historical discussions of the PSR have shaped—and continue to shape—contemporary philosophy.

This entry will proceed as follows. In the next section, "Proponents," I discuss the views, as well as some arguments, developed by three early modern PSR proponents: Spinoza, Leibniz, and du Châtelet. The following section, "Contemporary Proponents," examines a few contemporary arguments for the PSR. Lastly, the section on "The PSR in Contemporary Debates" discusses some ways in which the PSR has influenced contemporary philosophy." (pp. 1670-1671)

3. Angioni, Lucas. 2014. "Aristotle on Necessary Principles and on Explaining X Through the Essence of X." *Studia Philosophica Estonica* no. 7:88-112.

Abstract: "I discuss what Aristotle means when he says that scientific demonstration must proceed from necessary principles. I argue that, for Aristotle, scientific demonstration should not be reduced to sound deduction with necessary premises. Scientific demonstration ultimately depends on the fully appropriate explanatory factor for a given explanandum. This explanatory factor is what makes the explanandum what it is. Consequently, this factor is also unique. When Aristotle says that demonstration must proceed from necessary principles, he means that each demonstration requires the principle that is the necessary one for the fully appropriate explanation of its explanandum. This picture also provides a key to understand Aristotle's thesis that scientific explanation depends on essences: it is the essence of the attribute to be explained (rather than the essence of the subject-term within the explanandum) that should be stated as the fully appropriate explanatory factor."

4. Archambault, Jacob. 2024. "Grounding Medieval Consequence." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 129-146. Cham (Switzerland): Springer.

Abstract: "Developed out of earlier work on Aristotelian topics, syllogistic, and fallacies, by the early fourteenth century the medieval theory of consequence came to provide the first unified framework for the treatment of inference as such. With such a development came the task of unifying the various justifications for inferences treated in earlier frameworks. Prior to the appearance of theories of consequences, the task of providing a real foundation, or grounding, for good inferences is shared between theories of demonstration, such as those provided in commentaries on Aristotle's *Posterior Analytics*, and theories of topical inference, passed on to the medievals via Boethius. But by the time of the earliest *consequentiae*, most consequences were grounded in the theory of supposition, which began its own development in the twelfth century. Secondary literature on supposition has generally held that in the most common form of supposition, personal supposition, a term is taken to stand for individuals falling under it. In this

paper, I show that for the earliest consequentiae this is false: prior to William of Ockham's work, personal supposition could also involve descent to concepts or types falling under a term, previously thought to be the exclusive provision of simple supposition. As such, a greater variety of ways of grounding consequence exists in the period than has hitherto been recognized."

5. Betti, Arianna. 2010. "Explanation in Metaphysics and Bolzano's Theory of Ground and Consequence." *Logique et Analyse* no. 56:281-316.

Abstract: "In (2006a, 2006b), Benjamin Schnieder criticizes truthmaking as a relation between entities in the world and the truths those entities 'make true'. In (2006b), his criticism exploits a notion of conceptual explanation that is very similar to Bolzano's grounding. In the first part of this paper, I offer an analysis of Bolzano's grounding. I discuss some open problems and argue that Bolzano's grounding is not a systematization of the ordinary notion of 'because' as others have maintained, but of the technical notion of explanatory proof in the context of an axiomatic conception of (proper) science. On the basis of this analysis, in the second part, I offer a critical discussion of Schnieder 2006b's arguments against truthmaking. I conclude that the latter are not very effective from a methodological point of view and that Bolzano's original position fares better in this respect; still, truthmaker theorists will be able to defend truthmaking only at a high price."

6. Bliss, Ricki. 2024. "Some Work for a Theory of Grounding?" In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 307-330. Cham (Switzerland): Springer.

Abstract: "In her "No Work for a Theory of Grounding," Jessica Wilson argues that we have no need for a theory of what she calls Big-G Grounding. The reason for this, thinks Wilson, is that the work that Big-G Grounding is invoked for can be better done by what she calls small-g grounding relations: membership, parenthood, realization, and so on. Contra Wilson, I argue that small-g grounding relations may not allow us to do all the grounding work that needs to be done. In particular, I argue that small-g grounding relations may not be adequate to the task of engaging with the work of historical Western and non-Western figures; nor do they allow us to explore the full array of possibilities regarding the overarching structure of reality. To this end, I offer two case studies: one that explores dependence relations in the work of Leibniz, and the other the cosmology of the Chinese Buddhist thinker Fazang. Although I do not defend the claim that there is in fact some work for a theory of Grounding, my argument is highly suggestive of it."

7. ——. 2024. *Grounding, Fundamentality and Ultimate Explanations*. Cambridge: Cambridge University Press.

Chapter 2: *Ultimate Explanations: An Idea and Its History*

"Anyone familiar with the contemporary grounding literature will be aware that there is something of a tension or, perhaps better to say, divergence of opinion over the history of the notion. On one view, the notion of grounding is thought to be as old as

philosophy itself, with many of its most important thinkers engaging with questions pertaining to it. On this approach, although more contemporary discussions certainly take on their own flavour, the resurgence in interest in the notion is very much entangled with a return to the glorious days of good old-fashioned metaphysics. On another view, the notion of grounding is very much the plaything of contemporary analytic metaphysicians. According to this understanding of grounding, its origin myth traces itself back to Manhattan in the early naughties, where Kit Fine, Gideon Rosen and Jonathan Schaffer laid the foundations for a new and important program

of research. Mutatis mutandis for the notion of fundamentality assuming it to be married to and/or defined in terms of grounding.

How is it that such seemingly juxtaposed views of the history of grounding have come to characterise the discourse?

Which one is correct? These are difficult (and partly, if not largely, sociological) questions and I won't really attempt to answer them here. What I will do, however, is try to say something more about how we might characterize these different conceptions of grounding and its relationship to history, as well as to defend the position that will illuminate the rest of this Element: the notions of grounding and fundamentality can reasonably be understood as old, if not in letter, then at least in spirit."

8. Cameron, Margaret. 2014. "Is Ground Said-in-Many-Ways?" *Studia Philosophica Estonica* no. 7:29-53.

Abstract: "Proponents of ground, which is used to indicate relations of ontological fundamentality, insist that ground is a unified phenomenon, but this thesis has recently been criticized. I will first review the proponents' claims for ground's unicity, as well as the criticisms that ground is too heterogeneous to do the philosophical work it is supposed to do. By drawing on Aristotle's notion of homonymy, I explore whether ground's metaphysical heterogeneity can be theoretically accommodated while at the same time preserving its proponents' desideratum that it be a unified phenomenon."

9. ———. 2020. "Medieval and Early Modern." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 49-62. New York: Routledge.

"To be sure, medieval, Renaissance, and early modern philosophers did not have at their disposal the theoretical terminology afforded by the recent grounding literature, including the very term "ground" as it is currently used. It is, however, well known that ground has its roots in, broadly speaking, the Aristotelian metaphysical tradition. Given the fact that Aristotle's philosophy, and specifically his metaphysics,

provided the foundation for the subject during most of this time, it should come as no surprise that we find philosophers engaging in many of the same debates and discussions regarding questions of fundamentality, ontological priority, metaphysical explanation, and dependence relations." (p. 49)

10. Caputo, John D. 1970. "Being, ground and play in Heidegger." *Man and World* no. 3:26-48.

"By the summer of 1935 what was intimated in the earlier discussion of finitude and the Nothing is made explicit. At this time the treatment of ground takes the form of what Heidegger calls the "ground-question" (*Grund-frage*) of metaphysics: why is there any being at all and not rather nothing? This well-known question of Leibniz, mentioned in passing in *The Essence of Ground* and *What is Metaphysics?*, is transitional to the later Heidegger. It inquires into the being and asks about its ground. Why are there any beings at all? Obviously no being can serve as the answer to the question. The ground which the question seeks is Being itself. Being sustains the being and prevents its falling back into the abyss of Nothingness.

The ground that is sought after is sought for as the ground for the decision for being rather than for nothingness.

Being is the inner power of the being by which it is. Being is the perduring power which remains whatever fluctuations may occur within beings.

Being is the emergent power, stepping forth into the light of itself. Being as ground therefore is physis: the emergent-enduring-power (*aufgehend-verweilend--Walten*)." (p. 30, notes omitted)

11. Casati, Filippo. 2018. "Heidegger's *Grund*: (Para-)Foundationalism." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki Leigh and Priest, Graham, 291-312. New York: Oxford University Press.

"This paper presents two new grounding theories (called para-foundationalism 1.0 and para-foundationalism 2.0) that, in virtue of their being inconsistent (but not trivial) theories, do not fit in the taxonomy presented by Bliss and Priest.[*] In

order to do so, we will develop some metaphysical ideas proposed by Martin Heidegger.

Consistently with a vast part of the current literature, he thought that all things have whatever form of being they have because they depend on other things. In particular, he believed that every thing is because every thing depends on being. Heidegger's being is the ground [*Grund*] of literally everything because being is what makes any entity an entity. Chairs, stars, dreams, and the world are in virtue of being.

In Section 2, we introduce Heidegger's concept of ground by distinguishing between an ontic ground and an ontological ground. In Section 3, we focus our attention on the ontological ground. We present Heidegger's idea according to which being is the ground of every entity and being is itself ungrounded. We also discuss its relation with the Principle of Sufficient Reasons (PSR), and we describe its structural properties. Finally, we show that these structural properties are the same ones that characterize a particularly strong form of foundationalism. In Section 4 and Section 5, we show how Heidegger's characterization of being leads to a contradiction, according to which being both is and is not an entity. After that, assuming that such a contradiction is a dialetheia (namely a true contradiction), we show how Heidegger's foundationalism should be revised in order to do justice to the antinomic nature of being itself. Thus, we introduce two forms of para-foundationalism, which is an inconsistent version of foundationalism. In Section 6, using para-foundationalism, we try to give an interpretation of one of the most obscure concepts of the so-called late Heidegger, namely the last God. Finally, in the Appendix, we propose two formal models that show how, working in a paraconsistent setting, para-foundationalism does not lead to logical triviality." (p. 292, notes omitted)

[*] Ricki Bliss and Graham Priest, *The Geography of Fundamentality: An Overview*, (Introduction to the volume, pp. 1-33).

12. ———. 2019. "Heidegger and the contradiction of Being: a dialetheic interpretation of the late Heidegger." *British Journal for the History of Philosophy* no. 27:1002-1024.

Abstract: "It is well known that, from the beginning to the end of his philosophical trajectory, Martin Heidegger tries to develop a fundamental ontology which aims at answering the so-called question of Being: what does Being mean?"

Unfortunately, in trying to answer this question, Heidegger faces a predicament: given his own premises, speaking about Being leads to a contradiction. Moreover, according to the majority, if not all, of the interpreters who admit the existence of such a predicament, Heidegger tries to avoid the contradiction in question. But is this the only way Heidegger tries to solve the predicament? In this paper, I argue that, in some of his late works and, in particular, in the *Contributions to Philosophy*, Heidegger also takes into serious consideration the possibility of accepting the contradiction he faces in speaking about Being as true. If this is correct, Heidegger endorses what nowadays analytic philosophers call dialetheism, namely the metaphysical position according to which some (but not all) contradictions are true."

13. Centrone, Stefania. 2016. "Early Bolzano on *Ground-Consequence* Proofs." *The Bulletin of Symbolic Logic* no. 2:215-237.

Abstract: "In his early *Contributions to a Better-Grounded Presentation of Mathematics* (1810) Bernard Bolzano tries to characterize rigorous proofs (*strenge Beweise*). Rigorous is, *prima facie*, any proof that indicates the grounds for its conclusion. Bolzano lists a number of methodological constraints all rigorous proofs should comply with, and tests them systematically against a specific collection of elementary inference schemata that, according to him, are evidently of ground-consequence-kind. This paper intends to give a detailed and critical account of the fragmentary logic of the *Contributions*, and to point out as well some difficulties Bolzano's attempt runs into, notably as to his methodological ban on 'kind crossing'."

14. Chignell, Andrew. 2012. "Kant, Real Possibility, and the Threat of Spinoza." *Mind* no. 121:635-675.

Abstract: "In the first part of the paper I reconstruct Kant's proof of the existence of a 'most real being' while also highlighting the theory of modality that motivates Kant's departure from Leibniz's version of the proof. I go on to argue that it is precisely this departure that makes the being that falls out of the pre-critical proof look more like Spinoza's extended *natura naturans* than an independent, personal creator-God. In the critical period, Kant seems to think that transcendental idealism allows him to avoid this conclusion, but in the last section of the paper I argue that there is still one important version of the Spinozistic threat that remains."

"The final part of our story, however—the part which Kant did not seem to notice—is that the threat of Spinozism returns when we consider how the real harmony of non-fundamental or derivative predicates (with one another, and with the fundamental predicates) is grounded. It is unclear in light of his own argument how Kant could avoid appealing to God as the ground of this harmony, and it would seem that God could only do that by actually exemplifying all possible predicates—fundamental and derivative—as modes of an infinite array of explanatorily distinct divine furcations or attributes. With respect to this second Spinozistic threat, transcendental idealism is impotent." (p. 37)

15. Corkum, Phil. 2013. "Substance and Independence in Aristotle." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 65-95. Munich: Philosophia Verlag.

"Individual substances are the ground of Aristotle's ontology. Taking a liberal approach to existence, Aristotle accepts among existents entities in such categories other than substance as quality, quantity and relation; and, within each category, individuals and universals. As I will argue, individual substances are ontologically independent from all these other entities, while all other entities are ontologically dependent on

individual substances. The association of substance with independence has a long history and several contemporary metaphysicians have pursued the connection. (1) In this chapter, I will discuss the intersection of these notions of substance and ontological dependence in Aristotle." (p. 65)

16. ———. 2016. "Ontological Dependence and Grounding in Aristotle." In *Oxford Handbooks Online in Philosophy*, 1-14.

Abstract: "The relation of ontological dependence or grounding, expressed by the terminology of separation and priority in substance, plays a central role in Aristotle's *Categories*, *Metaphysics*, *De Anima* and elsewhere.

The article discusses three current interpretations of this terminology. These are drawn along the lines of, respectively,

modal-existential ontological dependence, essential ontological dependence, and grounding or metaphysical explanation. I provide an opinionated introduction to the topic, raising the main interpretative questions, laying out a few of the exegetical and philosophical options that influence one's reading, and locating questions of Aristotle scholarship within the discussion of ontological dependence and grounding in contemporary metaphysics."

17. ———. 2020. "Ancient." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 20-32. New York: Routledge.

"Is there grounding in ancient philosophy? To ask a related but different question: Is grounding a useful tool for the scholar of ancient philosophy? These questions are difficult, and my goal in this chapter is not so much to give definitive answers as to clarify the questions. I hope to direct the student of contemporary metaphysics towards passages where it may be fruitful to look for historical precedent. But I also hope to offer the student of ancient philosophy some guidance on when drawing on the contemporary discussion of grounding may be beneficial." (p. 20)

18. Correia, Fabrice. 2004. "Husserl on Foundation." *Dialectica* no. 58:349-367.

Abstract: "In the third of his *Logical Investigations*, Husserl draws an important distinction between two kinds of parts: the dependent parts like the redness of a visual datum or the squareness of a given picture, and the independent parts like the head of a horse or a brick in a wall. On his view, the distinction is to be understood in terms of a more fundamental notion, the notion of foundation. This paper is an attempt at clarifying that notion. Such attempts have already been undertaken (separately) by Peter Simons and Kit Fine, and the paper also contains elements of comparison of our three sets of views."

19. Dahlstrom, Daniel O. 2011. "Being and Being Grounded." In *The Ultimate Why Question: Why Is There Anything at All Rather than Nothing Whatsoever?*, edited by Wippel, John F., 125-145. Washington, D. C.: The Catholic University of America Press.

"The world today stands under the spell of Leibniz's thought. Or, perhaps more carefully, we might say that the world today stands under the spell of what Leibniz thought only too well. With uncanny perceptiveness, he managed to articulate a basic principle of thinking and being in the early modern world that is arguably as vital today as it was at the outset of the eighteenth century.

(...)

I am referring, of course, to what has been called, since Leibniz's time, the principle of sufficient reason.

Many of the foregoing sentiments were voiced by Heidegger in lectures and an address held some fifty years ago and published in 1957 as *Der Satz vom Grund*, the German abbreviation for Leibniz's principle of

reason.(1)" (p. 125)

(...)

"However, as I hope to show by means of the following considerations, the issue is far more complicated than Heidegger lets on. In particular, his way of painting Leibniz's principle with the same colors that he applies to the so-called "atomic age" is, I argue, misleading to a fault. But the main

thrust of my following remarks is to establish what is wrong with Heidegger's interpretation of Leibniz's principle of sufficient reason as a means of clarifying what I take to be right about it.

My comments are divided into three parts. In the first part I discuss Leibniz's complex account of the principle of sufficient reason with an eye to its bearing on his conception of the contingency of finite existence.

In the second part I turn to Heidegger's account of Leibniz's principle of sufficient reason and his "argument" for a different, nonconventional reading of the principle.² In the third part I address the trenchancy of the argument." (p. 127)

20. de Boer, Karin, and Howard, Stephen. 2019. "A Ground Completely Overgrown: Heidegger, Kant and the Problem of Metaphysics." *British Journal for the History of Philosophy* no. 27:358-377.

Abstract: "While we endorse Heidegger's effort to reclaim *Kant's Critique of Pure Reason* as a work concerned with the possibility of metaphysics, we hold, first, that his reading is less original than is often assumed and, second, that it unduly marginalizes the critical impetus of Kant's philosophy. This article seeks to shed new light on *Kant and the Problem of Metaphysics* and related texts by relating Heidegger's interpretation of Kant to, on the one hand, the epistemological approach represented by Cohen's *Kant's Theory of Experience* and, on the other, the metaphysical readings put forward by Heimsoeth, Wundt and others in the 1920s. On this basis, we argue that Heidegger's interpretation of Kant remains indebted to the methodological distinction between ground and grounded that informed Cohen's reading and was transferred to the problem of metaphysics by Wundt. Even if Heidegger resists a 'foundationalist' mode of this distinction, we argue that his focus on the notions of ground and grounding does not

allow him to account for Kant's critique of the metaphysical tradition."

21. de Jong, Willem R. , and Betti, Arianna. 2010. "The Classical Model of Science: a millennia-old model of scientific rationality." *Synthese*:185-203.

Abstract: "Throughout more than two millennia philosophers adhered massively to ideal standards of scientific rationality going back ultimately to Aristotle's *Analytica posteriora*. These standards got progressively shaped by and adapted to new scientific needs and tendencies. Nevertheless, a core of conditions capturing the fundamentals of what a proper science should look like remained remarkably constant all along. Call this cluster of conditions the Classical Model of Science. In this paper we will do two things. First of all, we will propose a general and systematized account of the Classical Model of Science. Secondly, we will offer an analysis of the philosophical significance of this model at different historical junctures by giving an overview of the connections it has had with a number of important topics. The latter include the analytic-synthetic distinction, the axiomatic method, the hierarchical order of sciences and the status of logic as a science. Our claim is that particularly fruitful insights are gained by seeing themes such as these against the background of the Classical Model of Science. In an appendix we deal with the historiographical background of this model by considering the systematizations of Aristotle's theory of science offered by Heinrich Scholz, and in his footsteps by Evert W. Beth."

22. della Rocca, Michael. 2010. "PSR." *Philosopher's Imprint* no. 10:1-13.

"One can see my argument as highlighting an important dialectical advantage that our imagined rationalist (i. e., me) has over our imagined non-rationalist (i. e., you). I have been arguing that the non-rationalist who accepts some explicability arguments has no non-question-begging way to avoid the rationalist position, i. e., no non-question-begging way to avoid the PSR. By contrast, the rationalist who accepts the necessitarian implication of the PSR is not under any pressure,

as far as I can see, to accept the non-rationalist position, i. e., to deny the PSR. In this way, the rationalist position is internally coherent in a way that the position of the non-rationalist who accepts some explicability arguments is not. And, of course, an internally incoherent position is worse off than an internally coherent one. So, again, we have powerful and un-rebutted reason to accept the PSR, a principle that most of us have been taught to scorn." (p. 13)

23. ———. 2012. "Violations of the Principle of Sufficient Reason (in Leibniz and Spinoza)." In *Metaphysical Grounding: Understanding the Structure of Reality*, edited by Correia, Fabrice and Schnieder, Benjamin, 139-164. Cambridge: Cambridge University Press.

"My central concern here – violations of the Principle of Sufficient Reason (hereafter: 'PSR') – does indeed stem from my engagement with two figures from the history of philosophy: Leibniz and Spinoza. Both of these philosophers are big fans of the Principle of Sufficient Reason, the principle according to which each thing that exists has an explanation.(1) Indeed, a strong case can be made that each of these thinkers structures his entire system around the PSR more or less successfully.(2)" (p. 139)

(...)

"But can we enter the promised land and should we? Certainly if we – like Spinoza – accept the PSR, then, given the Leibnizian arguments concerning relations, we should enter the promised land of monism.

But can we get to the promised land without invoking something as strong as the PSR? Yes, I believe that all we need to invoke is the plausible claim that relations must be grounded. Given this relatively uncontroversial claim, it follows – as we have seen – that relations are not fully real and that the only thing that fully exists is the one world.

Of course, this relatively uncontroversial claim and the PSR itself are in need of further scrutiny before we can confidently accept the results advanced in this chapter.(17)" (p. 164)

(17) In Della Rocca forthcoming, I explore in a rationalist spirit some problems for the rationalist position developed here.

25. Di Bella, Stefano. 2005. "Leibniz's Theory of Conditions: A Framework for Ontological Dependence." *The Leibniz Review* no. 15:67-93.

Abstract: "The aim of this paper is to trace in Leibniz' s drafts the sketched outline of a conceptual framework he organized around the key concept of 'requisite'. We are faced with the project of a semi-formal theory of conditions, whose logical skeleton can have a lot of different interpretations. In particular, it is well suited to capture some crucial relations of ontological dependence. Firstly the area of 'mediate requisites' is explored - where causal and temporal relations are dealt with on the basis of a general theory of 'consequence'.

Then the study of 'immediate requisites' is taken into account - a true sample of mereological inquiry, where Leibniz strives for a unitary treatment of part-whole relation, conceptual inclusion and inherence. Far from simply conflating these relations one with another and with causality, therefore, Leibniz tried to spell them out, while at the same time understanding them within a single conceptual framework."

"A little known episode in the later history of philosophy and logic could help us to grasp the significance of these Leibnizian ideas. I am thinking of Bolzano's theory of the 'consequence' (*Abfolge*) relation, as it is introduced in the second part of his *Wissenschaftslehre*. This notion is not a purely logical one,

insofar as it is distinguished from that of 'deducibility' (*Ableitbarkeit*, the true ancestor of our Tarskian consequence), and properly holds only for true propositions. It aims at capturing the old Aristotelian distinction between explanations '*tau oti*' (that) and '*tau dioti*' (why), hence it is an objective asymmetrical relation of 'grounding' between 'propositions in themselves' ('*an sich*'), in Bolzano's jargon. It is accurately distinguished from epistemical inference, but also from the notion of 'cause' (*Ursache*), that is a further specification of that relation in the sense of a 'real ground': "An object A is the cause of another B, whenever the proposition 'A does exist' contains the reason for the proposition 'B does exist' ." (21)" (p. 73)

Abstract: "The purpose of this paper is to argue that, for Spinoza, causation is a more fundamental relation than conceptual connection, and that, in fact, it explains conceptual connection. I will firstly offer a criticism of Michael Della Rocca's 2008 claims that, for Spinoza, causal relations are identical to relations of conceptual dependence and that existence is identical to conceivability. Secondly, I will argue that, for Spinoza, causation is more fundamental than conceptual dependence, offering textual evidence from both *Treatise on the Emendation of the Intellect* and *Ethics*.

In particular, I will offer an interpretation of the attributes as first and foremost causal activities, or powers: this interpretation has the advantage to clarify the role of [definiton] 1D6 as a "genetic definition"."

"Suárez explains the difference between existence and objective being in terms of intrinsicity and extrinsicity: existence is an intrinsic sort of being, and objective being is an extrinsic sort of being." (p. 6)

(...)

"But how exactly are we to understand the notion of extrinsic being?" (p. 7)

(...)

"David Lewis once informally characterized the distinction as follows:

"In general, something has an intrinsic property solely in virtue of how that thing itself is; it has a purely extrinsic property solely in virtue of how accompanying things, and its external relations to those accompanying things, are" (Lewis 2001: 384). Here Lewis characterizes the intrinsic/extrinsic distinction in terms of the *in virtue of* relation.

He ultimately finds this characterization unsatisfactory because we do not have a "clear enough understanding of 'solely in virtue of'" Lewis 2001: 384).

However, the *in virtue of* relation has been the subject of much progress in recent metaphysics. Even critics of the *in virtue of* relation agree that we have a clear enough understanding of it (Wilson 2014, Koslicki 2015). Advocates note that we often say that certain facts obtain in virtue of others." (p. 7)

(...)

"This is not the place to argue for a particular analysis of intrinsicity, but I want to show how the notion of grounding can provide a better sense of what it could mean to say that something has extrinsic being." (p. 8)

29. Fine, Kit. 2022. "Some Remarks on Bolzano on Ground." In *Bolzano's Philosophy of Grounding: Translations and Studies*, edited by Roski, Stefan and Schnieder, Benjamin, 276-300. New York: Oxford University Press.

"When I developed my own ideas on ground in the 1990s I was oblivious to Bolzano's work on the topic in his *Theory of Science* (henceforth WL). It was almost a couple of decades later that I became aware of his work and I was then astonished both by its level of sophistication and by the extent to which he

had anticipated many of our contemporary concerns. Although the topic has had a long history, going all the way back to the ancients, there is little doubt in my mind that Bolzano deserves a special place as the first person to embark upon a systematic study of the topic; and I believe his contributions in this area to be as

great an intellectual achievement, in their own way, as his contributions to logic or real analysis." (p. 276, a note omitted)

(...)

"I wish in this paper to take Bolzano at his word and to follow through on a couple of issues raised by some of his suggestions. It would have been desirable if I had been able to show how, by following through on this suggestion, these various issues might have been resolved. Unfortunately, I was not able to do this and I can only hope to have made clear the interest of the issues and the direction in which further investigation of them might proceed." (p. 276)

"Indeed, throughout his logical investigations, Bolzano's considerably more sustained focus was devoted, not to the *Ableitbarkeit* relation, but to the theory of this objectively significant consequence relation, a theory he called "Grundlehre."

Bolzano's 1810 *Beyträge* is the definitive exposition of this theory of ground and consequence." (p. 83)

(...)

"Bolzano's two theories of logical consequence are themselves not precise enough for their correspondence with one another to be subject to proof. All the same, the question is at the center of Bolzano's thought.

The procedural *Ableitbarkeit* relation provides a calculus of inference.

The ontological *Abfolge* relation is a feature of the world absolutely independent of our ability to reason about it. By establishing that these notions correspond, we would ensure that the logical structure of the world is accessible, that some line of thought could trace the dependencies of truths, that the reasons behind the complex facts of reality are discoverable and comprehensible." (p. 92)

31. Frost, Gloria. 2023. "Medieval." In *The Routledge Handbook of Essence in Philosophy*, edited by Koslicki, Kathrin and Raven, Michael J., 30-40. New York: Routledge.

"The first section examines medieval views on basic issues about essences. The section begins by discussing medieval conceptions of the distinction between essential and accidental features. Next the section discusses medieval positions on whether there are only species essences or also individual essences. Lastly, the section examines medieval views on the knowability of essences. The second section of the of the essay focuses on two medieval debates about essences. The first debate had to do with which features of material beings were essential to them. The Latin scholastic authors on whom this essay focuses adopted Aristotle's theory of hylomorphism. This theory maintains that material substances are composed of matter and form. Scholastic authors debated about whether the essences of material substances were constituted merely by their forms or if their essences also contained their matter. The second debate focused on the question of whether there is a real distinction between the essence of a created substance and its existence. The debate was about whether in addition to their essence a creature was composed by a distinct actualizing principle through which the essence was the essence of a real being, rather than a merely possible one. Though this question is foreign to contemporary philosophy, it was one of the most pressing concerns regarding essences for medieval scholastic thinkers." (p. 30)

32. Guigon, Ghislain. 2012. "Spinoza on Composition and Priority." In *Spinoza on Monism*, edited by Goff, Philip, 183-205. New York: Palgrave-Macmillan.

"In section 9.1 I argue that Spinoza agrees that there are many concrete things though there is only one fundamental concrete thing. In section 9.2 I argue that Spinoza's view is that the fundamental concrete thing, the extended substance, is mereologically simple. However, this interpretation of Spinoza faces two challenges that I shall explore: a puzzle about the occurrence of composition in extended reality, and a puzzle about substantial simplicity. Sections 9.3 and 9.4 provide conceptual tools that will allow me to address these two challenges in sections 9.5 and 9.6: section 9.3 introduces Spinoza's threefold distinction between kinds of composition and section 9.4 is a study of Spinoza's doctrine about *beings of reason*." (p. 184)

33. Hocutt, Max. 1974. "Aristotle's Four Because." *Philosophy* no. 49:385-399.

"I. Introduction

What has traditionally been labelled 'Aristotle's theory of causes' would be more intelligible if construed as 'Aristotle's theory of explanations', where the term 'explanation' has substantially the sense of Hempel and Oppenheim, who construe explanations as deductions.(1) For Aristotle, specifying 'causes' is constructing demonstrations.

This interpretation has two virtues: unlike the theory of the 'four causes', it makes sense; and it shows what the logical theory of *aitia* in the *Posterior Analytics* has to do with the metaphysical treatment in the *Physics* and *Metaphysics*. On the assumption that Aristotle's metaphysics might be contaminated by his logic, Aristotle's metaphysics and logic have traditionally been kept scrupulously separate, as if they were by different men.

The result of this separation is to make Aristotle's metaphysics seem illogical. I want here to go a little way towards showing that this is not necessarily so." (p. 385, a note omitted)

34. Howat, Andrew. 2023. "Pragmatism." In *The Routledge Handbook of Essence in Philosophy*, edited by Koslicki, Kathrin and Raven, Michael J., 53-66. New York: Routledge.

"After some terminological preliminaries (§1), this chapter defends the following claims.

First, there are at least two different interpretations available of C.S. Peirce's views on essence and essentialism (§2). One of them suggests that Peirce may have endorsed his own novel, pragmatist understandings of essence/essentialism. William James's few remarks on the topic are somewhat ambivalent (§3), evincing a superficial anti-essentialism that seemingly anticipates Quine's views, while remaining consistent with an anti-realist form of essentialism. Although John Dewey's pragmatism (§4) is the most vividly anti-essentialist in spirit, once again there are prominent scholars who seemingly reject that interpretation, partly because Dewey's attitude to metaphysics in general is difficult to establish. Some of his anti-essentialist remarks seem grounded in his own pragmatist, empirically naturalist metaphysics, while others suggest an outright metaphysical quietism that seemingly rules out "essence" and "essentialism" as meaningful terms." (pp. 53-54)

35. Kappes, Yannic. 2024. "Bolzano's Tortoise and a loophole for Achilles." *Synthese* no. 203:1-29.

Abstract: "This paper discusses a novel response to two closely related regress arguments from Bolzano's *Theory of Science* and Carroll's *What the Tortoise Said to Achilles*. Bolzano's argument aims to refute the thesis that full grounds must include propositions involving notions such as entailment, grounding or lawhood which link the respective grounds to their groundee. This thesis is motivated, Bolzano's argument is reconstructed, and a response based on self-referential linking propositions is developed and defended against objections concerning self-reference and Curry's paradox. Finally, the idea is applied to a reading of Carroll's dialogue and a corresponding solution to the so-called infinite regress problem of inference is proposed."

36. Kasabova, Anna. 2012. "Bolzano's Semantic Relation of Grounding: A Case Study." In *Inference, Consequence, and Meaning: Perspectives on Inferentialism*, edited by Gurova,

Lilia, 85-103. Newcastle upon Tyne: Cambridge Scholars Publishing.

"Bernard Bolzano, the 19th Century mathematician and philosopher who taught at the University of Prague, worked out a semantic notion of grounding (*Abfolge*) for providing proofs with an objective ground (*Begründung*) or explanatory force. He claims that a true statement or truth is grounded or scientifically proved if and only if it is shown to be objectively dependent on other truths.(1) Bolzano holds a foundationalist view on which there are basic true propositions or axioms and basic beliefs that support derivative propositions and derivative beliefs based on the more basic propositions and beliefs. He claims that a semantic dependence relation holds between basic propositions or basic beliefs and derivative propositions or derivative beliefs, a relation he calls *Abfolge*, translated as the grounding relation, where grounding a statement means giving a reason for that statement." (p. 85)

(1) *Beyträge* II, (1810), § 12. cf. also 1817, §1 where he says that scientific proofs should be groundings (*Begründungen*) and introduces the terms *Grundwahrheiten* and *Folgewahrheiten*."

37. Kment, Boris. 2014. *Modality and Explanatory Reasoning*. New York: Oxford University Press.

"The goal of this book is to shed light on metaphysical necessity and the broader class of modal properties to which it belongs."

(...)

I will argue that to understand modality we need to reconceptualize its relationship to causation and other forms of explanation such as grounding, a relation that connects metaphysically fundamental facts to non-fundamental ones. While many philosophers have tried to give modal analyses of causation and explanation, often in counterfactual terms, I will argue that we obtain a more plausible, explanatorily powerful and unified theory if we regard explanation as more fundamental than modality." (p. 1)

38. Knappik, Franz. 2016. "And Yet He is a Monist: Comments on James Kreines, *Reason in the World*." *Hegel Bulletin*:1-17.

Abstract: "I critically discuss Kreines's arguments against readings on which Hegel holds some version of metaphysical monism. In section 1, I address Kreines's claim that Hegel's revised version of Kant's argument in the Transcendental Dialectic implies a rejection of metaphysical monism. I argue both that the argument that Kreines ascribes to Hegel does not itself rule out monism, and that there are serious exegetical problems with the way Kreines understands Hegel's diagnosis of the antinomies and his critique of the metaphysics of the understanding. In section 2, I discuss additional reasons that Kreines gives for seeing Hegel as rejecting metaphysical monism. In particular, I argue that Hegel is much more optimistic about the intelligibility of nature than Kreines thinks: to a substantial degree, the basic structure of nature, including the laws of mechanics, is open to explanations that are ultimately based on a monistic principle."

39. Koslicki, Kathrin. 2014. "The Causal Priority of Form in Aristotle." *Studia Philosophica Estonica* no. 7:113-141.

Abstract: "In various texts (e.g., *Met. Z.17*), Aristotle assigns priority to form, in its role as a principle and cause, over matter and the matter-form compound. Given the central role played by this claim in Aristotle's search for primary substance in the *Metaphysics*, it is important to understand what motivates him in locating the *primary* causal responsibility for a thing's being what it is with the form, rather than the matter. According to *Met. Θ.8*, actuality [*energeia/entelecheia*] in general is prior to potentiality [*dunamis*] in three ways, viz., in *definition, time and substance*. I propose an explicitly *causal* reading of this general priority claim, as it pertains to the matter-form relationship. The priority of form over matter in *definition, time and substance*, in my view, is best explained by appeal to the role of form as the *formal, efficient and final* cause of the matter-form compound, respectively, while the posteriority of matter to form according to all three notions of priority is most plausibly accounted for by the fact that the causal contribution of matter is limited to its role as material cause. When approached from this angle, the work of *Met. Θ.8*, can be seen to lend direct support to the more specific and explicitly causal priority claim we encounter in *Met. Z.17*, viz., that form is prior to matter in its role as the principle and primary cause of a matter-form compound's being what it is."

40. ———. 2024. "Modality and Essence in Contemporary Metaphysics." In *Modality: A History*, edited by Melamed, Yitzhak Y. and Newlands, Samuel, 263-293. New York: Oxford University Press.

"Introduction. Essentialists hold that at least a certain range of entities can be meaningfully said to have natures, essences, or essential features independently of how these entities are described, conceptualized, or otherwise placed with respect to our specifically human interests, purposes, or activities. For quite some time, it was common among contemporary metaphysicians to regard essence as a modal notion: an essential truth, on this conception, is a modal truth of a certain kind (viz., one that is both necessary and *de re*, i.e., about a certain entity); and an essential property is a feature an entity has necessarily, if it is to exist. The essential truths, according

to this approach, are thus a subset of the necessary truths; and the essential properties of entities are included among their necessary properties." (p. 263)

41. Koslicki, Kathrin, and Raven, Michael J. 2023. "History." In *The Routledge Handbook of Essence in Philosophy*, edited by Koslicki, Kathrin and Raven, Michael J., 15-17. New York: Routledge.

"Philosophers have discussed essence since antiquity. The notion of essence played a central role in ancient Greek philosophy and occupied center stage during the Middle Ages. A more critical stance towards this notion developed during the early modern era and continues, in some quarters, into the present time. The turn of the millennium saw the notion of essence falling upon especially hard times.

(...)

All this suggests that it is high time to reevaluate essence. To arrive at an adequate assessment of where we are, however, it is necessary first to appreciate the history of philosophical discussions of essence that have preceded our current vantage point. Part I of this Handbook thus begins by offering a historical survey of the role of essence in ancient Greek, medieval, and modern philosophy as well as in the contemporary traditions of pragmatism, phenomenology, and early analytic philosophy." (p. 15)

42. Kreines, James. 2015. *Reason in the World: Hegel's Metaphysics and Its Philosophical Appeal*. New York: Oxford University Press.

"What we are discovering, as we step through these debates, is the fundamentality of the question of *what is a reason for what*. We need the basic and general notion of one thing being a reason for another in order to engage *any* of these debates. And so we should accept that notion as basic and proceed to consider what specific forms of reason there really are, which directions they run in different cases, and how they relate to one another. This point can be expressed in contemporary terminology as well, but it requires stretching a bit beyond the

usage generally intended. Schaffer, for example, speaks of “ontological dependence” and “grounding.” Part of his point is to distinguish a special sort of worldly dependence in metaphysics, parallel to but distinct from cases like the causality of interest in the natural sciences. My point here is that we need a more general notion of *worldly dependence*, or (better) *reason in the world*, in order to open up in a parallel manner all the questions and possible positions concerning laws, causality, and so on.(13)" (p. 68)

(13) See especially Schaffer (2009). The notion of “worldly dependence” here, then, is closer not to Schaffer’s “grounding” but to Kim’s (1994) notion of a “metaphysical dependence” that is the “correlate” of explanation, where this can but need not be specifically causal.

43. ———. 2016. “Things in Themselves and Metaphysical Grounding: On Allais’ *Manifest Reality*.” *European Journal of Philosophy* no. 24:253-266.

"I conclude, then, as follows: There is no comparatively comprehensive interpretation of transcendental idealism that is, in my view, more successful than Allais’ ambitious *Manifest Reality*. With respect to Kant on things in themselves, however, I think Allais’ account retains one disadvantage common to its competitors. Escape, as I see it, requires different understanding of the extremes that a “moderate” interpretation should avoid: On the one extreme, there are indeed deflationary readings, precluding a metaphysical assertion of the existence of things in themselves as grounds of appearances.

But the other extreme is not precisely noumenalism, as Allais claims. It is rather any metaphysics asserting the existence of unconditioned grounds, or metaphysical fundamentality in this sense. The argument of the Dialectic rules these all to be unacceptably dogmatic, and for what seem to me powerfully philosophical reasons. I would think that the big interpretive challenge is to navigate between these extremes concerning things in themselves—hopefully in a manner that can retain access to the many unmatched advantages of Allais’ interpretation of Kant on appearances." (p. 264)

Abstract: "This article is a reply to comments by Franz Knappik and Robert Stern on my book, *Reason in the World: Hegel’s Metaphysics and its Philosophical Appeal*. Issues addressed include the systematicity of Hegel’s philosophy, the prioritizing of metaphysical over epistemological questions in his arguments, Hegel’s response to Kant’s Antinomy of Pure Reason, and my conclusion that there are senses in which Hegel’s own position is both ambitiously metaphysical and also monist, but that the monism present there is epistemological, and the ambitious metaphysics is non-monist."

45. Kriener, Jönne. 2017. "Bolzano." In *The History of Philosophical and Formal Logic: From Aristotle to Tarski*, edited by Malpass, Alex and Antonutti Marfori, Marianna, 121-142. New York: Bloomsbury Academic.

See *Bolzano’s theory of grounding* (pp. 133-137).

5.1 Grounding

Bolzano's logic as developed so far applies equally to true as to false propositions.

However, Bolzano has more to offer: a special system for *truths*. True propositions are ordered by what Bolzano calls the relation of *Abfolge*. Let me translate it as 'grounding'. Bolzano motivates his theory of grounding from examples of the following kind (WL §198).

(3) It is warmer in Palermo than in New York.

(4) The thermometer stands higher in Palermo than in New York.

Both propositions are true. However, it is the truth of (3) that explains (4) and not vice versa. The truth of (3) grounds the truth of (4).

This relation of grounding stands out from Bolzano's system in that it is not defined in terms of variation. In particular, the fact that (3) grounds (4) and not vice versa cannot be captured by deducibility: (3) can be derived from (4).

Therefore, a stronger concept is needed: (3) *grounds* (4).

For a long time, interpreters have found this part of Bolzano's work 'obscure' (Berg 1962 : 151). Nothing in a modern logic textbook corresponds to Bolzanian grounding. Nonetheless, the concept has a long and venerable tradition. Bolzano connects with Aristotle's distinction between *why* -proofs and mere *that* -proofs (Aristotle 2006 : 1051b; Betti 2010)." (p. 133)

"The parallelogram law for the composition of forces was introduced in 1586 by Simon Stevin. It seems to have been widely recognized by Newton's day since both Pierre Varignon and Bernard Lamy stated it in the same year (1687) as Newton did in the *Principia*.⁽²⁾ But long after the parallelogram law's truth had become uncontroversial, considerable dispute remained over why it holds. Rival approaches to its explanation were developed and criticized by many notable scientists over the course of the eighteenth and nineteenth centuries.

Bernard Bolzano's contribution to this debate was his *Attempt at an Objective Grounding of the Theory of the Composition of Forces* (as Russ (2004, 684) translates the title of Bolzano (1842)). (Bolzano did not publish this paper until 1842, but some commentators have suggested that the paper was composed much earlier; for instance, Russ says that it was written 'probably in the 1810's'.⁽³⁾" (p. 394, a note permitted)

48. MacBride, Fraser, and Janssen-Lauret, Frederique. 2022. "Why Lewis Would Have Rejected Grounding." In *Perspectives on the Philosophy of David K. Lewis*, edited by Beebe, Helen and Fsher, A. R. J., 66-91. New York: Oxford University Press.

"In this chapter we argue that were Lewis to be writing today, he would—drawing upon the corpus of his established views—

provide us with principled reasons for saying both (1) that we don't need the notions of 'metaphysical dependence', 'grounding' or 'ontological priority' and (2) that they're not intelligible notions anyway. They're not needed because, he would have held, either there is work to be done but all the heavy lifting can be achieved by other means or there really isn't any work that needs doing at all. They're not intelligible, he would have continued, because they presuppose metaphysical modalities which Lewis had always held suspect. So much the worse, we conclude, for contemporary developments, whatever may be de rigueur. The tradition to which Lewis belonged cannot be consigned to the dustbin of history.

Here we use 'grounding' as a generic label for a range of theories which deem metaphysics stymied without metaphysical dependency, grounding or ontological priority. Although 'metaphysical dependence', 'grounding' and 'ontological priority' can be used differently, their proponents often share motivations and themes. We focus upon the alleged shortcomings of supervenience, the oft-cited need to invoke grounding to explain how a singleton relates to its sole member and the appeal to facts, essentialism or metaphysical necessity to explain grounding itself—all motivations and themes incompatible with Lewis's philosophy." (pp. 66-67)

49. Malink, Marko. 2020. "Aristotelian Demonstration." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 33-48. New York: Routledge.

"In what follows, I give an overview of Aristotle's argument and its historical significance (Section 2). The relevant relation of priority in nature is determined by the order of terms in acyclic chains of immediate universal affirmations (Sections 3 and 4). Given the deductive framework of Aristotle's syllogistic theory, it can be shown that all direct demonstrations but not all indirect demonstrations proceed from premises that are prior in nature to the conclusion (Section 5). I conclude by indicating how this fact correlates with similar results in modern versions of the impure logic of ground (Section 6)." (p. 34)

50. ———. 2022. "Aristotle and Bolzano on Grounding." In *Bolzano's Philosophy of Grounding: Translations and Studies*, edited by Roski, Stefan and Schnieder, Benjamin, 221-243. New York: Oxford University Press.

"In 1837 Bernard Bolzano published his most important work in the area of logic, the *Theory of Science: Attempt at a Detailed and in the Main Novel Exposition of Logic with Constant Attention to Earlier Authors*. As indicated by the subtitle, a significant portion of the *Theory of Science* is devoted to a discussion of the work done by earlier theorists on the various topics covered in the treatise. Bolzano thus develops his logical theory by examining and criticizing his predecessors' views. Among the authors that figure most prominently in the *Theory of Science* is Aristotle. In particular, Aristotle takes centre stage in Bolzano's discussion

of grounding (*Abfolge*) in §§ 198-222." (p. 221, a note omitted)

51. ———. 2023. "Ancient." In *The Routledge Handbook of Essence in Philosophy*, edited by Koslicki, Kathrin and Raven, Michael J., 19-29. New York: Routledge.

"The status of questions of the form "What is X?" was an important topic of discussion among Socratic thinkers. For example, Antisthenes, a pupil of Socrates and opponent of Plato, examined the nature of definitions: Antisthenes was the first to define "definition" (*logos*), by saying: "A definition is an account revealing what a thing was or is." (Diogenes Laertius, *Lives of the Eminent Philosophers* 6.3) However, unlike Socrates and Plato, Antisthenes ended up denying the possibility of defining things by specifying their essence. According to Aristotle, Antisthenes held the view that "one cannot define the essence of a thing since the definition would be a long account; but one can specify and teach of what sort a thing is" (*Metaphysics* H 3 1043b23–7).⁵ As we will see, Aristotle himself does not share Antisthenes' skepticism, but contends that we are in fact able to define things by specifying their essence." (pp. 20-21)

52. ———. 2024. "Aristotle on Modality." In *Modality: A History*, edited by Melamed, Yitzhak Y. and Newlands, Samuel, 1-30. New York: Oxford University Press.

"While necessity figures centrally in the cosmologies presented by Plato and the Pre- Socratics, we do not have any evidence that these thinkers provided an account of the nature of necessity in general. The

first philosopher known to have provided such an account is Aristotle.

In his logical and metaphysical works, Aristotle develops a systematic theory of necessity and related modalities such as possibility and impossibility." (p. 2)

53. Martin, Christopher J. 2004. "Formal Consequence in Scotus and Ockham: towards an account's of Scotus logic." In *Duns Scot à Paris, 1302–2002: Actes du colloque de Paris, 2–4 septembre 2002*, edited by Boulnois, Olivier, Karger, Elizabeth, Solère, Jean-Luc and Sondag, Gérard, 117-150. Turnhout: Brepols.

"The status of a striking and important counter-possible conditional claim is much disputed in the late thirteenth and fourteenth centuries.

Thomas Aquinas argues that the proposition "if the Holy Spirit does not proceed from the Son, then it is not distinct from the Son" is true and he is followed in this by Godfrey of Fontaines and Thomas of Sutton. Henry of Ghent, to the contrary, insists that it is false and this is also the view of John Dims Scotus who claims to prove the falsity of the conditional by showing that the consequent does not follow formally from the antecedent. William of Ockham for his part argues for just the opposite, maintaining that the consequent of the conditional does indeed follow formally its antecedent, but he insists that despite this the conditional is not evidently true.

We know a good deal about Ockham's theory of conditional propositions(1) but not very much about Scotus' views on the subject. In this paper I will try to make some progress towards

understanding Scotus' logic by considering his account of the conditional in solving this particular theological problem and propose that his theory of formal consequence can be connected with that of the formal distinction.

I will then argue that in the light of this connection Ockham's different theory of consequences can be understood as part of his general rejection Scotus' metaphysics." (p. 117)

54. ———. 2024. "Abelard on Grounding in Ontology and Logic." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 103-128. Cham (Switzerland): Springer.

Abstract: "Contemporary discussions of grounding have found an historical ances

tor for their claims in Aristotle's appeal to the four causes. In this paper I propose what I think is a much closer and certainly more developed anticipation of theories of grounding as dependence in the work of Peter Abelard. Abelard explicitly appeals to grounding in his account of the ontological structure of substance in terms of what we now call tropes. This theory itself then grounds his appeal to the theory of the dialectical topics in formulating the truth conditions of conditional propositions and the validity conditions of arguments corresponding to different grounding relationships."

55. Massimi, Michela. 2017. "Grounds, Modality, and Nomic Necessity in the Critical Kant." In *Kant and the Laws of Nature*, edited by Massimi, Michela and Breitenbach, Angela, 150-170. Cambridge: Cambridge University Press.

"In this section, I turn to Kant's lectures on metaphysics to clarify why, in my view, Kant's considered answer to the problem of inference should be searched for in his multifaceted notion of ground and consequence. I clarify three different kinds of nomic necessity that Kant saw at play in different kinds of laws, each respectively relying on a different notion of ground, qua conceptual ground ("ratio cognoscendi"), qua ground of being ("ratio essendi"), or qua ground of becoming

("ratio fiendi"). Only the latter notion captures cause–effect relations at play in empirical causal laws, I argue." (p. 169)

(...)

"The main goal of this chapter was to advance an interpretation that could vindicate Kant's bold claim that the understanding prescribes laws to nature. To this end, I have elucidated the metaphysical aspect of the dispositional essentialist reading that I am defending on Kant's behalf with an eye to clarifying different kinds of necessity that Kant seems to be referring to in various passages of the lectures on metaphysics. We identified three main notions of necessity (conceptual, metaphysical, and natural necessity, respectively). They are, respectively, at work in conceptual truths, theoretical identity statements, and empirical causal laws, via three different kinds of grounds (*ratio cognoscendi*, *essendi*, and *fiendi*). This taxonomy is far from exhaustive and is meant only to map out (tentatively) the territory of lawlike claims and their necessity in Kant." (p. 168)

56. McDaniel, Kris. 2024. "Modality in 20th- Century Philosophy." In *Modality: A History*, edited by Melamed, Yitzhak Y. and Newlands, Samuel, 221-251. New York: Oxford University Press.

"Introduction. It is hard to overstate how important the topic of modality was for philosophy in the 20th century. Fittingly, a comprehensive discussion of this topic and its role in the development of 20th-century philosophy in a piece this size is impossible, and as such, choices must be made about what to cover. Here is what I plan to do here. First, much of early 20th-century modal theorizing is a response, either direct or indirect, to Kant, and so I begin by outlining some key Kantian claims about modality. Second, I describe two philosophical traditions stemming from this reaction, the phenomenological tradition, with a focus on Husserl and Heidegger, and the analytic tradition, with a focus on Russell and Quine. Next, I turn to the relatively recent history of modality in the analytic tradition, and focus on work by Barcan Marcus on the formula discovered by and named after her, Kripke on the necessary a posteriori

and contingent a priori, and Lewis on modal realism." (pp. 221-222)

57. Melamed, Yitzhak Y. 2012. "Why Spinoza is not an Eleatic Monist (Or Why Diversity Exists)." In *Spinoza on Monism*, edited by Goff, Philip, 206-222. New York: Palgrave Macmillan.

"In the first part of the chapter I will present and explain the problem of justifying the existence of infinite plurality modes in Spinoza's system. In the second part of the chapter I consider the radical solution to the problem according to which modes do not really exist, and show that this solution must be rejected upon consideration. In the third and final part of the chapter I will suggest my own solution according to which the essence of God is active and it is this feature of God's essence which requires the flow of modes from God's essence. I also suggest that Spinoza considered radical infinity and radical unity to be roughly the same, and that the absolute infinity of what follow from God's essence is grounded in the absolute infinity of God's essence itself." (pp. 206-207)

58. Michels, Robert. 2023. "Contemporary (analytical) tradition." In *The Routledge Handbook of Essence in Philosophy*, edited by Koslicki, Kathrin and Raven, Michael J., 84-99. New York: Routledge.

"Due to the strong influence of logical empiricism, the notion of essence seemed like a relic of the past to many analytic philosophers working in the first half of the 20th century. Yet, at the beginning of the 21st century, analytic philosophers considered the notion worthy of serious discussion and even relied on it in philosophical explanations and theories. This chapter gives a roughly chronological overview of the history of essence in 20th century philosophy in the analytic tradition, focusing on a number of important developments leading from the logical positivists' opposition to essence to its current renaissance in analytic metaphysics and beyond." (p. 84)

60. ———. 2022. "The Grounds of Moral 'Truths'." In *Bolzano's Philosophy of Grounding: Translations and Studies*, edited by Roski, Stefan and Schnieder, Benjamin, 343-363. New York: Oxford University Press.

"From whatever area of knowledge you are approaching Bolzano's work-be it theology, philosophy, mathematics, or natural sciences-it is almost impossible not to come across a reference to Aristotle's distinction between the knowledge of 'that' (ὅτι), and the knowledge of 'why' (διότι). Bolzano's favourite examples for illustrating this distinction are taken from the natural sciences: From the information that the thermometer (or barometer) reading in location l_1 at time t is higher than in location l_2 we can infer that the temperature (or atmospheric pressure, respectively) in l_1 at t is higher than in l_2 . The higher thermometer (or barometer) reading, however, is not the ground why the temperature (or the atmospheric pressure, respectively) is higher at t in l_1 than in l_2 , but it is exactly the other way around: the truth that the temperature (or atmospheric pressure) is higher is the ground for the truth that the thermometer (or barometer) reading is higher, which is its consequence.(1)

(...)

The present chapter of this book is concerned with Bolzano's application of this distinction within the field of ethics. In the introductory first section I will lay out the conceptual framework to be used in the third (main) section of this chapter. In the intermediate second section I will present a brief introduction to Bolzano's ethics." (p. 343)

61. Mulligan, Kevin. 2004. "Essence and Modality: The Quintessence of Husserl's Theory." In *Semantik und Ontologie*:

Beiträge zur philosophischen Forschung, edited by Siebel, Mark and Textor, Mark, 387-418. Frankfurt: Ontos Verlag.

"Even the most cursory reader of Husserl's writings must be struck by the frequent references to essences ("Wesen", "Essenzen"), Ideas ("Idee"), kinds, natures, types and species and to necessities, possibilities, impossibilities, necessary possibilities, essential necessities and essential laws.

What does Husserl have in mind in talking of essences and modalities?

What did he take the relation between essentiality and modality to be? In the absence of answers to these questions it is not clear that a reader of Husserl can be said to understand him.

Thus in the first part of Husserl's first major work, the "Prolegomena" to the *Logical Investigations* (P, LI), he mentions the essence of logic, of knowledge, the rational essence of deductive science (Preface), the essence of truth, falsity, generality, particularity, ground and consequence, affirmation and denial (§ 18), of colours and tones (§ 40), of numbers (§ 46), the essence of theoretical connections (§ 66), of process, cause, effect, time and thinking (§ 71 A). And he continues in this style throughout his later writings (cf. Smith 1989).

Husserl often mentions essences in the course of making claims to the effect that some universal proposition holds in virtue of the essence of this or that. He says that such propositions are grounded in the essence of this or that. We therefore need to understand what expressions of the form "the essence of x" mean, what Husserl took their extension to be, what he understands by "ground" and how modality, essence, grounding and universality or generality stand to one another. Answers to all these questions are required, it may seem, before we can even begin to understand Husserl's account of the epistemology of essences and essential connections." (pp. 387-388)

62. ———. 2020. "Austro-German Phenomenologists." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 90-101. New York: Routledge.

"Brentano's heirs, in particular Husserl and Meinong, as well as their students and many philosophers influenced by them, rely heavily on grounding (*begründen*), founding (*fundieren*), and related ties such as dependence (*Abhängigkeit*) and existential relativity.

(...)

In this section, we look at how Brentano's heirs understood grounding and foundation, in particular their relation to essentialism and modality, and say something about the variety of the claims they put forward that employ grounding and foundation. In the following sections, we look in more detail at a handful of philosophical claims formulated in terms of foundation (§2) and grounding (§§3–5)." (p. 90)

63. ———. 2022. "Logic, Logical Norms, and (Normative) Grounding." In *Bolzano's Philosophy of Grounding: Translations and Studies*, edited by Roski, Stefan and Schnieder, Benjamin, 244-275. New York: Oxford University Press.

"In what follows I expound and evaluate Husserl's views about 'because' and grounding (section 8.2) and then consider some specific questions where his views are opposed to those of Bolzano. I begin with Husserl's ground-theoretical argument against Bolzano's account of the general structure of a proposition (section 8.3), which bears on the controversy between operationalist and predicationalist views in the contemporary debate about grounding. I then briefly outline Husserl's very non-Bolzanian views about essence and foundation (section 8.4), and finally examine (section 8.5) Husserl's account of the nature of logic, which he himself contrasts with Bolzano's account, and his views about

grounding relations between normative facts (such as logical norms) and non-normative facts (such as logical principles)." (pp. 244-245)

64. ———. 2023. "Contemporary (phenomenological) tradition." In *The Routledge Handbook of Essence in Philosophy*, edited by Koslicki, Kathrin and Raven, Michael J., 67-83. New York: Routledge.

"The phenomenologists' confidence in their ability to intuit essences and connections between them (essential connections) seems to have done much to discredit phenomenology and to have led to a lack of interest in their views about essence and its roles, in particular its relation to modality and grounding, not least amongst later so called phenomenologists. Meinong, unlike Husserl and his followers, did not go in for intuiting essences and was never philosophically intoxicated. But he, too, thought that essences and natures play a central role in philosophy. What, then, did the phenomenologists take essences and their connections to be? What rôles, philosophical and non-philosophical, did they assign to essence? What sort of contact, epistemic and non-epistemic, with essence did they take themselves to enjoy?" (p. 67 a note omitted)

Annotated bibliography on the history of fundamentality and grounding (N - Z)

Bibliography

1. Newlands, Samuel. 2018. *Reconceiving Spinoza*. New York: Oxford University Press.

Chapter 3: *Conceptual Dependence Monism*, pp. 57-89.

"2.5 *Eliminativism and the Nature of Grounding*.

We have seen Spinoza account for claims and facts about some putative forms of metaphysical dependence, such as causation and inherence, in terms of conceptual dependence, without ever moving in the reverse direction. I suggested that this unidirectional explanatory priority follows from Spinoza's more general privileging of conceptual dependence over all other putative forms of dependence. Causation, inherence, following-from, and existential dependence obtain *in virtue of* conceptual connections between *relata*. But what is this further in-virtue-of, if not itself a kind of dependence?

In contemporary parlance, how are causal facts dependent on or grounded in conceptual facts, according to Spinoza? By Spinoza's own explanatory demands, we need an explanation of *that* form of dependence too." (p. 79)

(...)

"In the end, I am inclined to think Spinoza embraces the starker eliminative option. There are no distinctions between causation, inherence, following-from, and the rest of his non-

conceptual laundry list. All forms and instances of metaphysical dependence just are conceptual in the stronger sense that there are neither extensional nor intensional differences among the conceptual relations that are the truth-makers for ascriptions of causation, inherence, and the rest. Or, if the appeal to truth-making seems worrisome here (what is making, if not yet more dependence?), we could say that for Spinoza, all and only features of conceptual dependence relations are the features of every form and instance of metaphysical dependence. That is, in addition to affirming conceptual sensitivity of causation and the rest, Spinoza affirms conceptual identification as well. This would also explain why Spinoza treats conceptual dependence as explanatorily prior to (what others take to be) other forms of dependence." (p. 81, a note omitted)

2. ———. 2024. "Leibniz on Modality." In *Modality: A History*, edited by Melamed, Yitzhak Y. and Newlands, Samuel, 118-143. New York: Oxford University Press.

"Leibniz contributed to three distinct projects involving modality, all of which were lively points of debate in the 17th century. The first concerns the distribution of necessity and contingency. What exists, happens, or is true necessarily? What exists, happens, or is true contingently? The second project concerns the analysis of modality.

What is the nature and true account of necessity and contingency? We might expect an analysis of modality to provide answers to the distribution question, but for Leibniz, the order of discovery usually went in the other direction. He antecedently wanted to avoid certain distribution answers, and he developed various analyses of modality in order to secure the desired distribution. I will present several of his most prominent efforts, some of which seem more promising than others.

Leibniz was also interested in the grounds of modality. Like many early moderns, Leibniz thought that God was the ultimate ground of both modal truths and modal truthmakers. But there was fierce disagreement about exactly how God serves as the ultimate ground of modality.

Leibniz defends an intellectualist account of the divine grounds of possibility and he offers pointed criticisms of the main alternatives.

After exploring Leibniz's grounding account in Section 3, I will conclude by sketching how Leibniz's different modal projects could work in tandem." (p. 119)

5. Oberst, Michael. 2021. "Kant on Real Grounds and Grounds of Being." In *The Court of Reason: Proceedings of the 13th International Kant Congress. Vol. 1*, edited by Himmelmann, Beatrix and Serck-Hanssen, Camilla, 591-597. Berlin: de Gruyter.

"In recent years, some scholars have argued that Kant embraces a theory of "real grounds" that is akin to contemporary accounts of grounding. In their view, Kantian real grounds are 'explanatory' grounds, and (real) grounding is an ontological dependence relation.¹ Whilst they acknowledge causality as the paradigmatic case of grounding, these readers think that causality is by no means the only one (Stratmann 2018, 6–7). Other examples allegedly include mathematical grounding, grounds of possibility, substance-accident and whole-part relations, and noumenal affection.

I shall argue that this reading is mistaken. A compelling textual case can be made that, according to Kant, all real grounds are causes(2). Thus, if one wanted to argue against this view, one would need to establish that he considers certain kinds of non-causal grounds as real grounds. The arguably most promising candidate for that are "grounds of being" (*rationes essendi*). Although Kant put some efforts into finding a place for grounds of being within his classification of grounds, he apparently did not reach a solution that he himself considered satisfactory.

Notwithstanding this, I argue that an account would have been available to him that captures the modal intuition behind grounds of being without being real grounds in Kant's sense. I conclude that grounds of being cannot serve as an example for non-causal real grounds" (p. 591)

(1) For example, Stang argues that the grounding relation is a "non-logical non-causal asymmetric real grounding relation between mutually necessarily entailing propositions" (Stang 2016, 236). See also Chignell 2012, 650, Massimi 2017, 156–158, Stratmann 2018, 3–7, Stang 2019.

(2) My view is actually more complex. For some grounds of possibility are not actual causes, but nonetheless potential causes which are actualized under appropriate causal circumstances. As I see it, Kant follows the broadly Aristotelian tradition of understanding possibility in terms of potentiality, yet ultimately goes beyond it. I cannot argue for this view in the present paper.

Abstract: "Does William Ockham believe in a metaphysical form of grounding? In particular, does Aristotelian natural priority (as Ockham understands it) qualify as a kind of metaphysical grounding? I offer a close analysis of Ockham's texts, and I suggest that the answer is probably no. In the course of my analysis, I show that Ockham sparks a debate about priority that was taken up by other fourteenth century thinkers, and I show that Ockham's view is striking because he so sharply separates natural priority and causal priority. Unlike

certain other scholastics who understand natural priority as a kind of dependence, Ockham insists that natural priority is entirely non-causal, and qua natural priority, it involves no dependence between the entities involved. This leads Ockham to deny that natural priority applies to certain cases which otherwise might count as standard candidates."

7. Poggiolesi, Francesca. 2022. "Bolzano, (the Appropriate) Relevant Logic, and Grounding Rules for Implication." In *Bolzano's Philosophy of Grounding: Translations and Studies*, edited by Roski, Stefan and Schnieder, Benjamin, 319-342. New York: Oxford University Press.

"In the first part of this paper the main aim is to take a closer look at exact deducibility and its relations to contemporary logic. More precisely, we will show that there exists a particular connection between Bolzano's notion of exact deducibility and the relevant logic *CR* introduced by Tennant (1984). These reflections will not only clarify the notion of exact deducibility per se, but also, in virtue of the connection between exact deducibility and grounding, shed further light on the general Bolzanian conception of grounding In the second part of the paper we will focus on the recent studies on the logic of grounding and in particular on the grounding rules for implication, a topic that, as far as we know, has received relatively little treatment. We will try to argue that the logic *CR* can again play a role: it is indeed a useful and interesting framework for formulating the grounding rules for implication. The paper is organized as follows. In section 11.2 we will recall Bolzano's notions of deducibility and exact deducibility, emphasizing their logical properties.

In section 11.3 we will introduce the logic *CR*, while in section 11.4 we will explain why this is the adequate contemporary counterpart of Bolzano's notion of exact deducibility. We will use section 11.5 to discuss the issue of the grounding rules for implication. We will show that even in this context the logic *CR* has a role to play." (pp. 319-320)

8. Priest, Graham. 2018. "Buddhist dependence." In *Reality and its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 126-139. New York: Oxford University Press.

"Many issues in Western philosophy were discussed with great sophistication in the Eastern philosophical traditions. A prime example of this is metaphysical dependence.(1)

This is absolutely central to Buddhist metaphysics. Indeed, there is a wide variety of views about, in particular, the structure of metaphysical dependence.

In this essay, I will explain some of these views, and some of their ramifications.

The aim is neither to give a scholarly account of any of these views, nor to argue for or against any one of them. Rather, the point of the essay is to open the eyes of philosophers who know little of the Eastern philosophical traditions to important possibilities of which they are likely to be unaware.

In Section 3 of this essay, I will explain three Buddhist positions concerning metaphysical dependence: those of Abhidharma, Madhyamaka, and Huayan. In Section 4, I will turn to some ways in which these positions engage with some Western debates. But first, for those readers whose knowledge of the history and development of Buddhist philosophy may be incomplete, I will explain enough of this in Section 2 to situate what is to follow." (p. 126, two note omitted)

(1) In contemporary Western philosophy, the topic is discussed under a variety of names, such as ontological dependence and grounding. Moreover, there seems to be little unanimity as to whether there is just one relationship here, or, if not, how the different varieties of the species are related.(...).

9. Puryear, Stephen. 2020. "The Logic of Leibniz's Borrowed Reality Argument." *The Philosophical Quarterly* no. 70:350-370.

Abstract: "Leibniz argues that there must be a fundamental level of simple substances because composites borrow their reality from their constituents and not all reality can be borrowed. I contend that the underlying logic of this 'borrowed reality argument' has been misunderstood, particularly the rationale for the key premise that not all reality can be borrowed. Contrary to what has been suggested, the rationale turns neither on the alleged viciousness of an unending regress of reality borrowers nor on the Principle of Sufficient Reason, but on the idea that composites are phenomena and thus can be real only insofar as they have a foundation in substances, from which they directly 'borrow' their reality. The claim that composites are phenomena rests in turn on Leibniz's conceptualism about relations. So understood, what initially looked like a disappointingly simple argument for simples turns out to be a rather rich and sophisticated one."

10. Raven, Michael J. 2019. "(Re)Discovering Ground." In *The Cambridge History of Philosophy, 1945–2015*, edited by Becker, Kelly and Thomson, Iain D., 147-159. Cambridge: Cambridge University Press.

"Recently, there has been a rapid growth of literature on questions of determination. It has become increasingly clear that subtly different notions of determination are involved. Nevertheless, much of this literature operates under the working hypothesis that there is a distinctive kind of determination that is at issue in these questions and is itself a topic worthy of study on its own.

"Ground" has emerged as the popular, quasi-technical term for this kind of determination. A question of ground asks in virtue of what some phenomenon obtains and is answered either by stating its grounds or that it has none.

Much has recently been written about ground.¹ Here the focus is on its history in the Western analytic philosophical tradition since 1945.⁽²⁾ (p. 147)

(2) Although ground does not only appear in the Western analytic philosophical tradition, space requires omitting its appearances elsewhere.

11. Roques, Magali. 2024. "Introduction: Grounding Then and Now." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 1-32. Cham (Switzerland): Springer.

"Sincede the contributions in this volume ctically examines medieval views on non-causal explanation by referring to the current debate on non-causal explanation, I will open the volume with an introduction to this debate, which will motivate the examination of medieval texts. I will begin with an overview of the philosophical background to the neo-Aristotelian turn in metaphysics, in which non-causal explanation occupies a central place. This will lead me to introduce the core features of the notion of non-causal explanation as it is understood in the current debate. I will then present the current state of the debate on the history of non-causal explanation, and will explain why an investigation into medieval views on non-causal explanation is much needed. Before giving a summary of the contributions, I will present the core result to which they converge—namely, that in medieval thought grounding claims are not seen as instances of a univocal concept of non-causal explanation. For medieval thinkers, the kind of claim which we would describe as a grounding claim is either a complex sentence that includes a hyperintensional sentential operator, or an atomic sentence that includes a predicate referring to a relation of priority that relates things that may be of different categories.(2) They are not troubled by working with two different types of grounding claims at the same time, since I will suggest that medieval authors need both kinds of grounding claims in order to articulate their logic and metaphysics." (pp. 2-3)

(2) See Stephan Schmid's chapter in this volume, p. 292, for another scholastic view on this interpretation of the grounding operator. According to Suárez, on Schmid's interpretation, the thought 'Snow is white' is true in virtue of its object being the fact that snow is white and of its being the case that snow is white.

12. ———. 2024. "William of Ockham on Essential Dependence and Causation." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 203-223. Cham (Switzerland): Springer.

Abstract: "It has become a commonly held view that Ockham does not defend a reductionist account of efficient causality, and that for him causal powers cannot be eliminated from causal statements. This paper argues that this reading can be refined, and that according to Ockham the analysis of causality can go one step further. In reaction to Scotus's concept of essentially ordered causes, Ockham claims that a relation of "essential dependence" holds between a total cause and its effect. I argue for a reading of this relation in counterfactual terms. If this reading is correct, Ockham's account is close in spirit to the "neo-Humean" account of causality defended by David Lewis, according to which efficient causality is counterfactual dependence plus restrictive clauses concerning cases of counterfactual dependence that are not causal and cases of redundant causation. From this view point, Ockham's view is close in spirit to the positivist conception of metaphysics that was prevalent before the "neo-Aristotelian" turn in metaphysics."

"Overview of the book

As each of the following chapters will be accompanied by a detailed overview of its content and line of argumentation, I

will confine myself here to a brief overview of the main line of argumentation of the book.

At the core of Bolzano's theory of grounding lies a set of general principles that express properties the relation exhibits according to him. An analysis of these principles, their interrelation, and their role in Bolzano's methodology will form the main bulk of the book. It is heuristically useful to divide these principles into two classes. The first class contains principles that hold for every case of grounding, irrespective of any specific properties of the relata. These principles capture, as it were, minimal conditions an explanatory relation has to satisfy according to Bolzano. The second class consists of more specific principles that mostly apply only to truths from deductive or a priori sciences. Adapting a distinction by Kit Fine, I will call the former Bolzano's *pure logic of grounding* and the latter his *impure logic of grounding*.⁽⁵²⁾ Before we can dive into the details of Bolzano's theory, we will have to gain some familiarity with the nuts and bolts of his logical framework. This will be done in Chapter Two. Chapter Three then discusses Bolzano's pure logic of grounding, while Chapter Four is concerned with the impure logic of grounding. Chapter Five wraps up and draws some connections to the recent debate on grounding. In what follows I will sketch the content of each of these chapters in a little more detail." (p. 16)

(52) Cf. (Fine [The Pure Logic of Ground. *Review of Symbolic Logic* 5(1) 1-25] 2012b). The justification for employing this distinction will be given further below.

14. ———. 2019. "Bolzano and Kim on Grounding and Unification." *Synthese* no. 196:2971-2999.

Abstract: "It is sometimes mentioned that Bernard Bolzano's work on grounding anticipates many insights of the current debate on metaphysical grounding. The present paper discusses a certain part of Bolzano's theory of grounding that has thus far not been discussed in the literature. This part does not so much anticipate what are nowadays common assumptions about grounding, but rather goes beyond them. Central to the discussion will be a thesis of Bolzano's by which

he tries to establish a connection between grounding and (deductive) unification. The paper spells out this thesis in detail and discusses the assumptions on which it rests. Next to this mainly historical aim, the paper also presents reasons why philosophers who are not interested in the historical Bolzano should find the thesis interesting by relating it to a certain view on unification and explanation that has been put forward by Kim. A final part of the paper provides a critical evaluation of the thesis against the background of current accounts of grounding."

15. ———. 2020. "Bolzano." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 76-89. New York: Routledge.

"This chapter provides an overview of Bernard Bolzano's views about grounding. On Bolzano's account, grounding is an objective priority relation among true propositions that has certain explanatory features. The chapter briefly highlights historical influences on Bolzano's account of grounding and subsequently provides an overview of the most important aspects of it. As we shall see, Bolzano's account resembles current accounts of metaphysical grounding in many respects and can thus easily be related to many positions in the current debate. This is going to be a main focus of this chapter. Apart from that, we shall investigate some Bolzanian ideas about grounding that differ from the current orthodoxy but may constitute interesting additions, challenges or inspirations for those working in the current debate." (p. 76)

16. Roski, Stefan, and Rumberg, Antje. 2016. "Simplicity and Economy in Bolzano's Theory of Grounding." *Journal of the History of Philosophy* no. 54:469-496.

Abstract: This paper is devoted to Bolzano's theory of grounding (*Abfolge*) in his *Wissenschaftslehre*. Bolzanian grounding is an explanatory consequence relation that is frequently considered an ancestor of the notion of metaphysical grounding. The paper focuses on two principles that concern grounding in the realm of conceptual sciences and relate to traditionally widespread ideas on explanations: the principles,

namely, that grounding orders conceptual truths from simple to more complex ones (Simplicity), and that it comes along with a certain theoretical economy among them (Economy). Being spelled out on the basis of Bolzano's notion of deducibility (*Ableitbarkeit*), these principles are revealing for the question to what extent grounding can be considered a formal relation."

17. Roski, Stefan, and Rusnock, Paul. 2014. "Bolzano on Necessary Existence." *Archiv für Geschichte der Philosophie* no. 96:320-359.

Abstract: "This paper is devoted to an examination of Bolzano's notion of necessary existence, which has so far received relatively little attention in the literature.

We situate Bolzano's ideas in their historical context and show how he proposed to correct various flaws of his predecessors' definitions. Further, we relate Bolzano's conception to his metaphysical and theological assumptions, arguing that some consequences of his definition which have been deemed counterintuitive by some of his interpreters turn out to be more reasonable given the broadly Leibnizian background of his metaphysics. Finally, we consider some difficulties that arise from Bolzano's evolving views on freedom, which, at least in his early thought, was intimately linked with contingency. In an appendix, we discuss a recent debate on Bolzano's notion of necessary truth between Textor and Rusnock that has some bearing on our overall line of interpretation of Bolzano's notion of *necessary existence*."

19. ———. 2019. "Fundamental Truths and the Principle of Sufficient Reason in Bolzano's Theory of Grounding." *Journal of the History of Philosophy* no. 57:675-706.

Abstract: "Bernard Bolzano developed his theory of grounding in opposition to the rationalists' Principle of Sufficient Reason (the PSR). He argued that the PSR fails because there are fundamental, that is, ungrounded truths. The current paper examines Bolzano's views on fundamentality, relating them to ongoing debates about grounding and fundamentality."

20. ———. 2022. "A Survey of Bolzano's Theory of Grounding." In *Bolzano's Philosophy of Grounding: Translations and Studies*, edited by Roski, Stefan and Schnieder, Benjamin, 4-34. New York: Oxford University Press.

"Reality is not an unordered blob of phenomena. Instead, the diverse elements of reality are structured by a web of priorities so that not all of them are on a par: some elements hold in virtue of prior elements. The prior elements may be called grounds of the posterior elements that hold because of them; the relation connecting them may be called grounding.

This view, popular in contemporary metaphysics, is as ancient as philosophy itself. It is rooted in ideas that go back at least to Plato and Aristotle and that have remained influential throughout the entirety of Western philosophy until the twenty-first century. Bernard Bolzano's theory of grounding is a peak in the history of these ideas, as it exceeds most earlier theories in scope, depth, and rigour.

Moreover, it anticipates a range of ideas that take a prominent place in the contemporary metaphysical debate.

In this survey paper, we pursue three aims:

- First, we briefly sketch the origins of Bolzano's views on grounding and the role that grounding plays in his philosophy.

- Second, we give an overview of Bolzano's mature conception of grounding, focussing on its most detailed exposition, which can be found in his *Theory of Science*.

- Third, we introduce elements and terminology from Bolzano's conceptual framework that are required to understand his theory of grounding." (p. 4)

"Preamble: One of the liveliest debates in contemporary philosophy concerns the notions of grounding and metaphysical explanation. Many consider these notions to be of prime importance for metaphysics and the philosophy of explanation, or even for philosophy in general, and lament that they had been neglected for far too long.

Although the current debate about grounding is of recent origin, its central ideas have a long and rich history in Western philosophy, going back at least to the works of Plato and Aristotle.⁽¹⁾ Bernard Bolzano's theory of grounding, developed in the first half of the nineteenth century, is a peak in the history of these ideas. On Bolzano's account, grounding lies at the heart of a broad conception of explanation encompassing both causal and non-causal cases. Not only does his theory exceed most earlier theories in scope, depth, and rigour, it also anticipates a range of ideas that take a prominent place in the contemporary debate. But despite the richness and modernity of his theory, it is known only by a comparatively small circle of philosophers predominantly consisting of Bolzano scholars.

This book is meant to make Bolzano's ideas on grounding accessible to a broader audience. The book gathers translations of Bolzano's most important writings on these issues, including material that has hitherto not been available in English. Additionally, it contains a survey article on Bolzano's conception (see Chapter 2) and nine research papers critically assessing elements of the theory and/or exploring its broad range of applications in Bolzano's philosophy and beyond (for a more detailed overview of the book's contents, see Chapter 3)." 22. ———. 2022. "On the Contents of This Volume." In *Bolzano's Philosophy of Grounding: Translations and Studies*, edited by Roski, Stefan and Schnieder, Benjamin, 35-42. New York: Oxford University Press.

"Bolzano's published works do not contain any self-standing treatise on grounding.

What comes closest to this would be a part in his *Theory of Science* (WL II, §§198-222) that is exclusively dedicated to the topic of grounding. But for a full apprehension of Bolzano's views on grounding one has to take into account several other passages-scattered across the *Theory of Science*, but also across

many of his other writings-in which he illuminates his ideas on grounding and/or applies them to a broad range of philosophical issues. Moreover, a complete picture of Bolzano's views should also take into account how some of his ideas significantly changed over the years. So in this book, we not only present the central

part on grounding from the *Theory of Science*, but also gather a selection of further passages on grounding, taking into accounts texts from Bolzano's entire philosophical career." (p. 35)

"This chapter contains translations of excerpts from three texts by Bolzano: the *Athanasia*, the *Treatise of the Science of Religion*, and his *Philosophical Notebooks*." (p. 85)

25. ———. 2022. "[Bolzano's Writings on Grounding] Mature Period: A Theory of Grounding." In *Bolzano's Philosophy of Grounding: Translations and Studies*, edited by Roski, Stefan and Schnieder, Benjamin, 107-218. New York: Oxford University Press.

"This chapter contains translations of texts in which Bolzano develops and applies his mature theory of grounding. The heart of the chapter are excerpts from Bolzano's main work *Theory of Science*, where he gives the most comprehensive account of his conception of grounding and discusses the role of grounding in several philosophical areas ranging from the methodology of science, to the philosophy of causation, to metaphysics. In addition to that, the chapter includes a brief excerpt from a survey of Bolzano's *Theory of Science* and his *Theory of the Science of Religion*, in which Bolzano gives a succinct summary of central ideas of his mature theory. Finally, the chapter includes the complete translation of Bolzano's essay *What Is Philosophy?* which defends a ground-theoretical conception of philosophy." (p. 107)

26. Rumberg, Antje. 2013. "Bolzano's Concept of Grounding (*Abfolge*) Against the Background of Normal Proofs." *Review of Symbolic Logic* no. 6:424-459.

Abstract: "In this paper, I provide a thorough discussion and reconstruction of Bernard Bolzano's theory of grounding and a detailed investigation into the parallels between his concept of grounding and current notions of normal proofs. Grounding (*Abfolge*) is an objective ground-consequence relation among true propositions that is explanatory in nature. The grounding relation plays a crucial role in Bolzano's proof-theory, and it is essential for his views on the ideal buildup of scientific theories. Occasionally, similarities have been pointed out between Bolzano's ideas on grounding and cut-free proofs in Gentzen's sequent calculus. My thesis is, however, that they bear an even stronger resemblance to the normal natural deduction proofs employed in proof-theoretic semantics in the tradition of Dummett and Prawitz."

"Introduction

Bolzano's best-known mathematical work, the *Rein analytischer Beweis* of 1817, promises to deliver a 'purely analytic' proof of a theorem from the theory of equations.⁽¹⁾ He also claims that this proof is not a mere certification (*Gewissmachung*), but rather a ground-revealing proof (*Begrundung*) of this truth.

In this paper I will undertake to explain and assess these claims against the background of his early account of mathematical method and the relation of grounding, with occasional reference to the later development of his thought. I begin with an overview of the *Contributions to a Better-Grounded Presentation of Mathematics*,⁽²⁾ which presents Bolzano's early views on these and related matters." (p. 364)

28. Sandstad, Petter. 2024. "Grounding and Aristotle's *Posterior Analytics*." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 65-81. Cham (Switzerland): Springer.

Abstract: "Abstract Fabrice Correia and Benjamin Schnieder suggest that Aristotle's account of formal causation in the *Posterior Analytics* is a type of grounding. While there are many similarities, I will argue that what Aristotle had in mind differs from contemporary standard accounts of grounding. First, I give a brief account of formal causation as presented in the *Posterior Analytics*. Second, I show that formal causation differs from grounding in at least two crucial respects. (1) Formal causation involves a priority relation between different ontological categories, namely, states of affairs and substantial forms. In allowing for transcategorical grounding, Aristotle's theory is similar to that of Jonathan Schaffer and Bernard Bolzano. (2) Formal causation is not transitive, both because there are no chains of formal causes, and because Aristotle is interested only in the full and ultimate, yet at the same time immediate, ground. There are two further differences: Aristotle

does not think that a conjunction is always grounded in its conjuncts, nor that a universal quantification is always grounded in its instances. His theory is in some sense narrower than grounding, in that it allows only for full immediate grounds. In another sense it is closer to truthmaking, both in that truthmaking is transcategorial and that it does not allow for chains. However, Aristotle's formal cause should rather be seen as a "beingmaker," since truthmaking has to do with linguistic entities and truthbearers. Aristotle's formal cause thus fits well into the framework of grounding, as an immediate full ground, but fits poorly with the standard claims about grounding."

29. Schaffer, Jonathan. 2009. "On What Grounds What." In *Metametaphysics: New Essays on the Foundations of Ontology*, edited by Chalmers, David, Manley, David and Wasserman, Ryan, 347-383. Oxford: Clarendon Press.

"On the now dominant Quinean view, metaphysics is about what there is. Metaphysics so conceived is concerned with such questions as whether properties exist, whether meanings exist, and whether numbers exist. I will argue for the revival of a more traditional Aristotelian view, on which metaphysics is about what grounds what. Metaphysics so revived does not bother asking whether properties, meanings, and numbers exist. Of course they do! The question is whether or not they are fundamental.

In §1 I will distinguish three conceptions of metaphysical structure. In §2 I will defend the Aristotelian view, coupled with a permissive line on existence. In §3 I will further develop a neo-Aristotelian framework, built around primitive grounding relations." (p. 347)

30. Schechtman, Anat. 2023. "Modern." In *The Routledge Handbook of Essence in Philosophy*, edited by Koslicki, Kathrin and Raven, Michael J., 41-52. New York: Routledge.

"The early modern period in the history of philosophy—roughly, from the middle of the seventeenth century to the end of the eighteenth century—was a time of dramatic shifts in philosophical positions and traditions. At the beginning of this

period, the Aristotelian paradigm that shaped most medieval philosophy was still dominant. But early modern thinkers increasingly subjected it to scrutiny, criticism, and creative reinterpretation.

Naturally, discussions of essence by central figures in the period exemplify this dynamic.

My aim here is to survey some of the most important developments, highlighting the ways in which early modern thinkers gradually leave the medieval Aristotelian tradition behind.

A central theme is how differing conceptions of the scope of essence lead to differing conceptions of its theoretical roles." (p. 41)

31. ———. 2024. "Modality and Essence in Early Modern Philosophy: Descartes, Malebranche, and Locke." In *Modality: A History*, edited by Melamed, Yitzhak Y. and Newlands, Samuel, 61-84. New York: Oxford University Press.

"Philosophers in the 17th century engaged in a range of debates about modality, including its nature (what it is for something to be necessary, possible, or impossible), scope (what is necessary, possible, or impossible), and knowability (how, if at all, we can know modal facts). They also debated the explanation or ground of modality: that in virtue of which something is necessary, possible, or impossible. My interest in this essay is to explore this latter debate, and to tentatively defend two theses about it.

The first thesis is that for central philosophers in the period, a range of important modal facts are grounded in essences. That is, what explains why something is necessary, possible, or impossible is that some entities have the essences they do—where an entity's essence, as will be discussed further below, is what it is to be that entity. The second thesis is that as the 17th century progresses, we witness growing reluctance to admit that some facts are necessary, due to growing reluctance to admit that certain properties belong to essences, or even that essences exist." (pp.61-62, a note omitted)

32. Schmid, Stephan. 2024. "Two Kinds of Grounding? Suárez on Natural Resultance and Foundation." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 281-306. Cham (Switzerland): Springer.

Abstract: "In contemporary metaphysics the notion of grounding plays a crucial role, and though its precise meaning is debated, there seems to be a widespread consensus that grounding is the same in all its typical instances. In this chapter I show that the late scholastic philosopher Francisco Suárez (1549–1617) can be seen as challenging this consensus since he gives an altogether different account of the way vital capacities are “grounded” in their underlying soul and the way the truth of a thought is “grounded” in its object: while a vital capacity is something over and above the soul, from which it “naturally results,” the truth of a thought is no additional entity apart from the thought and its object, in which it is “founded.” So, in addition to contributing two intriguing accounts of vital capacities and truth, Suárez’s theories of natural resultance and foundation make an interesting case for the possibility that grounding might not be a single and unified form of metaphysical dependence as contemporary metaphysicians seem to presuppose."

33. Schnieder, Benjamin. 2014. "Bolzano on Causation and Grounding." *Journal of the History of Philosophy* no. 52:309-337.

"This paper is an exploration of Bolzano’s views on causation, which have not been thoroughly examined yet. The paper reconstructs Bolzano’s position, with a focus on his analysis of the concept of causation, on its ontological presuppositions, and on how he relates causation to his theory of grounding.(1) A comparison with standard positions from the contemporary debate on causation will prove his views to be quite original. Moreover, they are a valuable addition to the more recent debate on metaphysical grounding,(2) in which grounding is sometimes informally described as something like metaphysical causation with the exact connection of the two notions seldom being elaborated. Bolzano’s theory explicitly addresses the issue

and takes an innovative stance. However, it will also be revealed that his account is beset with problems. But even if his position should ultimately not be tenable, discussing it can deepen our understanding of problems raised in the current debates about causation and grounding and shed new light on them." (p. 309)

(1) The paper concentrates on general conceptual and metaphysical issues of causation. It will not discuss Bolzano's views on the epistemology of causation, nor his views on detailed matters of fact perhaps better to be treated in physics and its philosophy (such as the question of how causal powers are actually distributed in the world, what kind of basic causal powers there are, etc.).

"Bernard Bolzano believed he can offer an a priori proof of the existence of a fundamental entity, relying on his conception of grounding. It seems fair to say that the argument is a philosophical gem, whether or not one endorses it in its entirety (no vulgar suspense: I will argue we should not follow in

Bolzano's footsteps here). Since the conception of grounding Bolzano works with is, moreover, remarkably modern in spirit, his argument can be treated and discussed like a contribution to the contemporary debate about grounding and fundamentality. This paper will reconstruct Bolzano's reasoning, explain its historical context, and put his argument under scrutiny." (p. 418)

"5 Conclusion

We think that there are different, legitimate definitions of concepts that can go by the name of existential dependence, suited for different theoretical purposes. But we also argued that a definition in terms of grounding or metaphysical explanation, the basic idea of which can be traced back to Aristotle's *Categories* (Section 1), is particularly interesting for ontological inquiries: it yields a notion of dependence which is the converse of productive priority, so that if an entity depends on another, the latter helps bring about the existence of the dependent entity (Section 2).

We discussed the role that conceptual explanations play for such a notion of dependence, and in metaphysics more generally (Section 3). And we defended the definition of dependence in terms of grounding from some recent criticisms (Section 4). We hope to have thereby shown that the definition yields a theoretically fruitful concept that deserves to be in the standard toolkit of ontology." (p. 172)

36. Shatalov, Keren Wilson. 2024. "Aristotle on Non-Substantial Particulars, Fundamentality, and Change." *Archiv für Geschichte der Philosophie*:1-31.

Abstract: "There is a debate about whether particular properties are for Aristotle non-recurrent and trope-like individuals or recurrent universals. I argue that *Physics* I.7

provides evidence that he took non-substantial particulars to be neither; they are instead non-recurrent modes. *Physics* I.7 also helps show why this matters.

Particular properties must be individual modes in order for Aristotle to preserve three key philosophical commitments: that objects of ordinary experience are primary substances, that primary substances undergo genuine change, and that primary substances are ontologically fundamental."

37. Silverman, Allan. 2013. "Grounding, Analogy, and Aristotle's Critique of Plato's Idea of the Good." In *Aristotle on Method and Metaphysics*, edited by Feser, Edward, 102-120. New York: Palgrave Macmillan.

"In what follows, I want to examine some ways in which Schaffer, Fine and Aristotle think about grounding and dependence. In Section 1, I will focus on some problems arising from the manner in which the contemporary metaphysicians characterize their notion of ground. In Section 2, I will explore Aristotle's ideas of focal meaning and especially analogy, as developed in remarks on *energeia* in *Metaphysics Theta* and his criticism of Plato's Idea of the Good in *Nicomachean Ethics* I.6, in the hope that they may help us understand how to think about the relation between ground and the various grounding relations." (pp. 102-103)

38. Sirkel, Riin. 2018. "Essence and Cause: Making Something Be What It Is." *Discipline Filosofiche* no. 28:89-112.

Abstract: "Aristotle frequently describes essence as a "cause" or "explanation" (αἴτιον or αἴτια), thus ascribing to essence some sort of causal or explanatory role. This explanatory role is often explicated by scholars in terms of essence "making the thing be what it is" or "making it the very thing that it is". I argue that this is problematic, at least on the assumption that "making" expresses an explanatory relation, since it violates certain formal features of explanation (especially the requirement that the explanans be distinct from the explanandum). I then consider whether Aristotle is vulnerable to this problem by examining the explanatory role of essence in *Posterior Analytics* and *Metaphysics Z* 17."

39. ———. 2024. "Ontological Priority and Grounding in Aristotle's *Categories*." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 33-63. Cham (Switzerland): Springer.

Abstract: "In the *Categories*, Aristotle intends to ascribe to particular substances ontological priority over all other things, but it is far from obvious what notion of priority would make this plausible. This question is the focus of my paper. I will examine what has been the standard account of his notion of ontological priority—the “modal-existential” account—and the problems it entails, as well as some scholarly alternatives to it. I will defend my own alternative account—the “explanatory-existential” account—which addresses the problems that arise for other proposed accounts, and will make plausible Aristotle's claim that particular substances have priority over all other things. I will argue that he puts forth this notion of priority in *Categories* 12, and that it bears a similarity to the notion of grounding as discussed in contemporary metaphysics."

40. Stang, Nicholas F. 2019. "A Guide to Ground in Kant's *Lectures on Metaphysics*." In *Kant's "Lectures on Metaphysics": A Critical Guide*, edited by Fugate, Courtney D., 74-101. Cambridge: Cambridge University Press.

"The Principle of Sufficient Reason (PSR) says that everything has a reason that fully explains it. Leibniz expresses the PSR in Latin and French, respectively, as the principle that everything has a ratio or raison. When German philosophers of the eighteenth century, heavily influenced by the Leibnizian writings available to them, formulated similar ideas in their native tongue, they translated ratio as Grund and expressed the PSR accordingly as: Everything has a ground that fully explains it. This Principle of Sufficient Ground (*Satz des zureichenden Grundes*) or PSG is, so to speak, the Leibnizian PSR translated into German."

(...)

"It comes as no surprise then that Kant, steeped as he was in German rationalism and its debates, would extensively discuss

the PSG and the notion of ground (*Grund*) in the metaphysics lectures he gave virtually every semester at the University of Königsberg from 1755 until his retirement from teaching in 1796.(1)"

(...)

"While scholars have extensively discussed Kant's treatment of the PSG in the Antinomies chapter of the *Critique of Pure Reason*,(2) and, more recently, his relation to German rationalist debates about it,(3) relatively little has been said about the exact notion of ground that figures in the PSG. My aim in this chapter is to explain Kant's discussion of ground in the lectures and to relate it, where appropriate, to his published discussions of ground." (pp. 74-75)

41. ———. 2024. "Modality in Kant and Hegel." In *Modality: A History*, edited by Melamed, Yitzhak Y. and Newlands, Samuel, 171-206. New York: Oxford University Press.

"Kant and Hegel differ from all these traditional and contemporary views, and from one another, concerning the unity of modality.

According to Kant, modal concepts (categories, as we will see) do not describe properties of objects, but instead express the relation of concepts of objects to our capacities for cognition. The role of the modal categories is to express the relation of a concept of an object to the matter and form of our cognitive capacities: possibility applies to concepts that agree with the form of the relevant cognitive capacity; actuality applies to concepts that agree with the matter of the capacity; and necessity applies to concepts that follow from the matter of the capacity given its form. Since our capacity for cognition has two "stems," sensibility and understanding, this generates a distinction between two kinds of modality: logical modality, which expresses the relation of a concept to the form and matter of the understanding alone, and real modality, which expresses the relation of a concept to the form and matter of understanding and sensibility. What unifies the modal concepts — what makes each of the modal categories *modal*— is that they all express a manner of relating to our cognitive capacities." (pp. 172-173)

42. Steigerwald, Joan. 2015. "Ground and Grounding: The Nature of Things in Schelling's Philosophy." *Symposium* no. 19:176-197.

Abstract: This paper examines the notions of ground and grounding across several of Schelling's works, from the philosophy of nature, through transcendental idealism and identity philosophy, to the Freedom essay and The Ages of the World. It contends that Schelling repeatedly returns to the same problematic, that each attempt to establish a foundation for philosophy is inscribed with the particular and the concrete, so that the work of grounding is also an ungrounding.

It reads the different expressions of Schelling's philosophy against and through one another, arguing that each offers both a foundation and critique of its others."

43. Stern, Robert. 2016. "Kreines on the Problem of Metaphysics in Kant and Hegel." *Hegel Bulletin*:1-15.

Abstract: "This article offers a discussion of James Kreines's book *Reason in the World: Hegel's Metaphysics and Its Philosophical Appeal*. While broadly sympathetic to Kreines's 'concept thesis' as a conceptual realist account of Hegel, the article contrasts two Kantian arguments for transcendental idealism to which Hegel's position may be seen as a response—the argument from synthetic a priori knowledge and the argument from the dialectic of reason—and explores the implications of Kreines's commitment to the latter over the former."

44. Stratmann, Joe. 2018. "Kant, Grounding, and Things in Themselves." *Philosophers' Imprint* no. 18:1-21.

"Despite their differences, proponents of metaphysical one- and two-object interpretations alike claim that appearances are *grounded in things in themselves*. Call this claim the *transcendental grounding thesis*." (pp. 1-2)

(...)

"A significant difficulty in making sense of the transcendental grounding thesis is that it is *prima facie* unclear how to characterize Kant's account of grounding — an account which has yet to be systematically explored in the secondary literature. My strategy in this paper is to begin by elucidating some core features of this account. This will enable us to understand some of the conditions under which different specific kinds of grounding relations obtain. This will, in turn, help to adjudicate the issue of which specific kind of grounding relation obtains between things in themselves and appearances, as well as the dispute concerning the distinctness of things in themselves and appearances." (p. 2, a note omitted)

45. Tahko, Tuomas E. 2013. "Metaphysics as the First Philosophy." In *Aristotle on Method and Metaphysics*, edited by Feser, Edward, 49-67. New York: Palgrave-Macmillan.

"Introduction: Aristotle talks about "the first philosophy" throughout *Metaphysics* – and it is metaphysics that Aristotle considers to be the first philosophy – but he never makes it entirely clear what first philosophy consists of. What he does make clear is that the first philosophy is not to be understood as a collection of topics that should be studied in advance of any other topics.

In fact, Aristotle seems to have thought that the topics of *Metaphysics* are to be studied after those in *Physics* (Cohen 2009). In what sense could metaphysics be the first philosophy? Let me take the liberty of applying the technical jargon of contemporary metaphysics to answer: The first philosophy is an account of what is, or what it means to be, *fundamental*.

Things that are the most fundamental are not *grounded* in anything more fundamental, they are *ontologically independent*. This does not necessarily mean that first philosophy attempts to list the most fundamental things, although this could be a part of the discipline. Rather, the study of fundamentality focuses on giving an account of what it is for something to be fundamental. So, first philosophy studies a certain type of being – the fundamental type, and it may also involve an account of which (kind of)

things are, or could be, fundamental." (p. 49)

46. Tatzel, Armin. 2002. "Bolzano's Theory of Ground and Consequence." *Notre Dame Journal of Formal Logic* no. 43:1-25.

"The aim of the paper is to present and evaluate Bolzano's theory of grounding, that is, his theory of the concept expressed and the relation brought into play by 'because'. In the first part of the paper (Sections 1-4) the concept of grounding is distinguished from and related to three other concepts: the concept of an epistemic reason}, the concept of causality, and the concept of deducibility (i.e., logical consequence). In its second part (Sections 5-7) Bolzano's positive account of grounding is reconstructed in axiomatic form and critically discussed."

48. Textor, Mark. 2022. "Grounding, Simplicity, and Repetition." In *Bolzano's Philosophy of Grounding: Translations and Studies*, edited by Roski, Stefan and Schnieder, Benjamin, 301-318. New York: Oxford University Press.

"The relata of the grounding relation are true propositions (*Sätze an sich*). Let's start therefore by getting clear about those properties of propositions that are of importance for the theory of grounding.

The notion of a proposition cannot be defined, but Bolzano gives his readers pointers towards the intended concept. For example, take a non-indexical sentence like ' $2 + 2 = 4$ '. Its meaning is a proposition: something which is either true or false and never neither.(2) Not all sentences will express a proposition or express a proposition fully, but some do and this will, one hopes, suffice for Bolzano's purposes." 52. Viltanioti, Irini–Fotini. 2012. "Powers as the Fundamental Entities in Philolaus' Ontology." *Journal of Ancient Philosophy* no. 6:1-31.

Abstract: "The main claim of this paper is that powers are the fundamental entities in Philolaus' ontology.

Limiters (περαίνοντα) and unlimiteds (άπειρα) are to be respectively understood as the power to limit and the power to be limited. As powers to do something, limiters and unlimiteds are different from their individual bearers, namely the "things that are" (έόντα). Number or harmony, that is the power to fit together, makes, along with the basic powers to limit and to be limited, things what they are. Philolaus' φύσις should be understood as the outcome of the working of the three other

powers, namely περαινόντα, ἀπειρα and ἄρμονία coming together and coming to be realized (ἀρμόχθη). In other words, φύσις is the state that results from the realization of the three fundamental powers. Philolaus' ἔοντα are to be considered as coming out of the four primary powers and of what Philolaus refers to as ἐστώ. Thus, Philolaus appears to be one of the first power structuralists."

53. Vucu, Simona. 2024. "Thomas Aquinas, Henry of Ghent, and John Duns Scotus on the Causation of Proper and Inseparable Accidents." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 147-176. Cham (Switzerland): Springer.

Abstract: "Medieval philosophers such as Henry of Ghent and John Duns Scotus defended the possibility of what I call self-agency, the view that substances bring about in themselves their own necessary and inseparable features. In this paper, I propose that self-agency should be understood as an attempt to clarify the relationship between what is necessary but still accidental, and what is essential. I explore this view in the context of two objections against the possibility of self-agency: a general one, according to which the relationship between what is essential and what is necessary (but accidental) should not be envisaged in causal terms; and a more specific one, namely, that there is no need to consider this relationship to be a case of efficient causation. Against the first objection, I show that in the thirteenth century medieval philosophers envisaged this relationship in causal terms because of the way they conceived the ontological status of accidents. Against the second objection, I show that while Henry admits the possibility of self-agency as a consequence of his view of the nature of causal powers, Scotus thinks that without self-agency one cannot account for why proper and inseparable accidents are necessarily related to their subject of inherence."

54. Wang, Jennifer. 2016. "Fundamentality and Modal Freedom." *Philosophical Perspectives* no. 30:397-418.

"The claim that fundamentality entails modal freedom (FEMF) may seem attractive.

After all, if an entity ‘need not look outside itself’, how could it modally depend on anything else? Nonetheless, the road from fundamentality to modal freedom is not straightforward.” (p. 397)

(...)

"My aim is not to assess these competing views, about which much has been written. Rather, I will examine the positive reasons that a defender of FEMF may give in favor of her thesis. I begin the next section by saying more about the notion of fundamentality and the relevant types of fundamental entities. In section 3, I give a more careful characterization of modal freedom. I then examine reasons to believe FEMF by way of ‘direct’ and ‘indirect’ routes in sections 4 and 5. Direct routes appeal to the supposed nature of fundamentality, whereas indirect routes make use of principles that appear to be motivated for independent reasons, such as Hume’s dictum that there are no necessary connections between distinct existences. I argue that none of these routes provide motivation for FEMF beyond the intuitions that fundamental entities are ‘self-sufficient’ or ‘need not look outside themselves’. In fact, as I will suggest in section 6, there are positive reasons to hold that the fundamental entities are not modally free." (pp. 397-398)

55. Ward, Thomas M. 2024. "The Incoherence of Ockham’s Ethics." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 225-237. Cham (Switzerland): Springer.

Abstract: "Ockham thinks that God can command creatures to hate him. He also thinks that it is right to obey any divine command. This paper investigates what it is, for Ockham, to obey divine commands, and what makes it right to do so. The most plausible explanations of what makes it right to obey divine commands are God’s goodness and God’s power. The textual evidence in Ockham points towards both, but I judge the preponderance of the evidence to lean in favour of grounding our obligations to obey God on God’s goodness. But whichever of the two we pick, we end up with an incoherent

view. Given some things Ockham says, it should not be possible for Ockham's God to make it right to hate God, yet Ockham also says that this is possible. I see no way to rescue Ockham's ethics from incoherence."

56. Watkins, Eric. 2021. "What real progress has metaphysics made since the time of Kant? Kant and the metaphysics of grounding." *Synthese* no. 198:3213–3229.

Abstract: "This paper argues that, despite appearances to the contrary, Kant and contemporary analytic metaphysicians are interested in the same kind of metaphysical dependence relation that finds application in a range of contexts and that is today commonly referred to as grounding. It also argues that comparing and contrasting Kant's and contemporary metaphysicians' accounts of this relation proves useful for both Kant scholarship and for contemporary metaphysics. The analyses provided by contemporary metaphysicians can be used to shed light on Kant's understanding of what a real conditioning relation is, while Kant's perspective on the practice and goals of metaphysics sheds light on several claims and issues at home in the contemporary debate."

57. Williams, Heath, and Byrne, Thomas. 2022. "Husserl's Theory of Scientific Explanation: A Bolzanian Inspired Unificationist Account" *Husserl Studies* no. 38:171-196.

Abstract: "Husserl's early picture of explanation in the sciences has never been completely provided. This lack represents an oversight, which we here redress. In contrast to currently accepted interpretations, we demonstrate that Husserl does not adhere to

the much maligned deductive-nomological (DN) model of scientific explanation.

Instead, via a close reading of early Husserlian texts, we reveal that he presents a unificationist account of scientific explanation. By doing so, we disclose that Husserl's philosophy of scientific explanation is no mere anachronism. It is, instead, tenable and relevant. We discuss how Husserl and other contemporary thinkers draw theoretical inspiration from the

same source—namely, Bernard Bolzano. Husserl's theory of scientific explanation shares a common language and discusses the same themes as, for example, Phillip Kitcher and Kit Fine. To advance our novel reading, we discuss Husserl's investigations of grounding, inter-lawful explanation, intramathematical explanation, and scientific unification."

58. Yrjönsuuri, Mikko. 2024. "Valid on Formal Grounds." In *Grounding in Medieval Philosophy*, edited by Normore, Calvin G. and Schmid, Stephan, 251-280. Cham (Switzerland): Springer.

Abstract: "Could formal logic be a naturalist field of study? This paper analyses how medieval logicians committed to Aristotelian naturalism thought about the metaphysical grounding of logic. As they assumed, it is at least sometimes a fact that a conclusion follows from some premises; here it is questioned how they thought this fact, or logical validity, to be grounded. The early medieval Arabic tradition (e.g. Ibn Sinā) thought in a way comparable to Immanuel Kant's position that logic is a formal study of intellectual structures, but given their metaphysical realism concerning universals, such intellectual structures may be taken to be natural parts of Aristotelian metaphysics. On the other hand, the early medieval Latin tradition (e.g. Abelard) thought in a way comparable to Bernard Bolzano that the subject matter logic studies is not the intellectual realm, but essentially linguistic facts, taking language to be a natural phenomenon. Robert Kilwardby endeavoured to combine these traditions, but turns out to have taken a stance much closer to Kant, and to have given little importance to linguistic facts in his account of how syllogistic validity and thereby validity in general is grounded. At the same time, Kilwardby's work enhanced the conception of the formality of logic, although he thought that only the syllogistic form is a properly logical form. Analysis of John Buridan's logic shows that he had a generalized conception of logical form that was tightly knit with linguistic form as it is found in mental language, which he took to be a metaphysically natural domain. Unlike Kant and Bolzano, both Kilwardby and Buridan can be viewed as naturalists as concerns the study of formal logic,

inasmuch as they thought that logical validity is grounded in facts that their Aristotelian metaphysics would consider natural."

Annotated bibliography on ontological dependence: A- K

Bibliography

1. Armstrong, Joshua, and Stanley, Jason. 2011. "Singular Thoughts and Singular Propositions." *Philosophical Studies* no. 154:205-222.

Abstract: "A singular thought about an object o is one that is directly about o in a characteristic way—grasp of that thought requires having some special epistemic relation to the object o , and the thought is ontologically dependent on o . One account of the nature of singular thought exploits a Russellian Structured Account of Propositions, according to which contents are represented by means of structured n -tuples of objects, properties, and functions. A proposition is singular, according to this framework, if and only if it contains an object as a constituent. One advantage of the framework of Russellian Structured propositions is that it promises to provide a metaphysical basis for the notion of a singular thought about an object, grounding it in terms of constituency. In this paper, we argue that the attempt to ground the peculiar features of singular thoughts in terms of metaphysical constituency fails, and draw some consequences of our discussion for other debates."

2. Asay, Jamin. 2020. "Truth(making) by Convention." *American Philosophical Quarterly* no. 57:117-128.

Abstract: "A common account of the distinction between analytic and synthetic truths is that while the former are true solely in virtue of meaning, the latter are true also in virtue of

the way of the world. Quine famously disputed this characterization, and his skepticism over the analytic/synthetic distinction has cast a long shadow. Against this skepticism, I argue that the common account comes close to the truth, and that truthmaker theory in particular offers the resources for providing a compelling account of the distinction that preserves the basic ideas behind it, and avoids the standard criticisms facing the distinction. In particular, I argue that analytic truths are truths that ontologically depend in no way whatsoever upon what exists."

3. Azzouni, Jody. 2012. "Simple Metaphysics and "Ontological Dependence"." In *Metaphysical Grounding: Understanding the Structure of Reality* edited by Correia, Fabrice and Schnieder, Benjamin, 234-253. Cambridge: Cambridge University Press.

"I've argued in other work (Azzouni 2010a, 2010b) that ordinary usage admits only two ontological statuses: existence and non-existence.

Further, only things that exist have properties. Truths about those things, therefore, correspondingly correctly describe those properties, and attribute those properties to those things. Anything that doesn't exist has no properties, for anything that doesn't exist isn't in any way at all. Therefore: no thing that doesn't exist can be talked about (because there is nothing *to* talk about). That these sound like evident truisms, and indeed, that they sounded like evident truisms to Plato and Parmenides, isn't an indication that these are constraints on the *meaning* of words like "exist" and "nothing," or phrases like "there is," and "no thing." Nothing that strong follows. It is an indication, however, of an aspect of our *ordinary* understanding of metaphysics, of our ordinary and fundamental understanding of what there is and what there isn't." (p. 235)

4. Banega, Horacio. 2012. "Formal Ontology as an Operative Tool in the Theories of the Objects of the Life-World: Stumpf, Husserl and Ingarden." *Symposium* no. 16:64-88.

Abstract: "It is accepted that certain mereological concepts and phenomenological conceptualisations presented in Carl Stumpf's *Über den psychologischen Ursprung der Raumvorstellung and Tonpsychologie* played an important role in the development of the Husserlian formal ontology. In the third *Logical Investigation*, which displays the formal relations between part and whole and among parts that make out a whole, one of the main concepts of contemporary formal ontology and metaphysics is settled: ontological dependence or foundation (*Fundierung*). My main objective is to display Stumpf's concepts of partial content, independent content, spatial wholes, sound wholes, and the different kinds of connection among parts, in particular, fusion (*Verschmelzung*). Second, I will show how Husserl improved this background, in particular with regards to the exact nature of the theory of manifolds (*Mannigfaltigkeitslehre*), in discussion with Georg Cantor, the father of set theory. Third, I will focus on Ingarden's use of formal ontology and on the different modes of being that can be justified by appealing to the concept of ontological dependence in its Ingardenian variations. If my interpretation is adequate, it should be inferred that formal ontology is the operative theory of phenomenological philosophy, and this must be acknowledged in its full significance with respect to the supposed independence of the phenomenological method since 1913. A further consequence, not developed in this essay, is that formal ontology can be mathematised."

5. Barnes, Elizabeth. 2018. "Symmetric Dependence." In *Reality and Its Structure: Essays in Fundamentality*, edited by Bliss, Ricki and Priest, Graham, 50-69. Oxford: Oxford University Press.

"Metaphysical orthodoxy maintains that the relation of *ontological dependence* is irreflexive, asymmetric, and transitive. The goal of this paper is to challenge that orthodoxy by arguing that ontological dependence should be understood as non-symmetric, rather than asymmetric. If we give up the asymmetry of dependence, interesting things follow for what we can say about metaphysical explanation—particularly for the prospects of *explanatory holism*." (p. 50)

6. Baron, Sam. 2022. "Counterfactuals of Ontological Dependence." *Journal of the American Philosophical Association*.

Not yet published; available at PhilArchive.org.

Abstract: "A great deal has been written about 'would' counterfactuals of causal dependence. Comparatively little has been said regarding 'would' counterfactuals of ontological dependence. The standard Lewis-Stalnaker semantics is inadequate for handling such counterfactuals. That's because some of these counterfactuals are counterpossibles, and the standard Lewis-Stalnaker semantics trivializes for counterpossibles. Fortunately, there is a straightforward extension of the Lewis-Stalnaker semantics available that handles counterpossibles: simply take Lewis's closeness relation that orders possible worlds and unleash it across impossible worlds. To apply the extended semantics, an account of the closeness relation for counterpossibles is needed. In this paper I offer a strategy for evaluating 'would' counterfactuals of ontological dependence that understands closeness between worlds in terms of the metaphysical concept of grounding."

7. Berto, Francesco. 2012. "The Selection Problem." *Revue Internationale de Philosophie* no. 262:519-537.

Abstract: "In *Fiction and Fictionalism*, Mark Sainsbury has recently dubbed "Selection Problem" a serious trouble for Meinongian object theories. Typically, Meinongianism has been phrased as a kind of realism on nonexistent objects: these are mind-independent things, not mental simulacra, having the properties they have independently from the activity of any

cognitive agent. But how can one single out an object we have no causal acquaintance with, and which is devoid of spatio-temporal location, picking it out from a pre-determined, mind-independent set?"

"In this paper, I set out a line of response by distinguishing different ways in which a thing may not exist. I show that the selection problem (a) does not arise for past, currently nonexistent objects; (b) may not arise also for future existents (provided one massages naïve intuitions a bit); and (c) even for mere possibilia; but (d) is a real snag for purely fictional objects, such as Holmes or Gandalf.

As for (d), I propose a solution that forces Meinongianism to introduce a kind of ontological dependence of purely fictional nonexistents upon existents." (p 519)

8. Brody, B. A. 1971. "On the Ontological Priority of Physical Objects." *Noûs* no. 5:139-155.

"Strawson, in Chapter 1 of *Individuals*,⁽¹⁾ had argued that physical objects are ontologically prior to all other particulars. I believe that there is some truth to the position that he advances, but that there are also many false aspects to it. I also believe that there are immense weaknesses in Strawson's argument for his position but that it is possible to construct an alternative argument for the true aspects of it. This paper will argue for these beliefs.

What is meant by "ontological priority"? We shall say that an entity *a* is in a given person's ontology if and only if there is some object *b* identical with *a* such that that person believes that *b* exists and there is no object *c* identical with *a* such that that person believes that *c* does not exist.⁽²⁾" (p. 139)

(1) P. F. Strawson, *Individuals* (Anchor Books: 1963) all page references will be to this edition.

(2) We could not simply say that a is in one's ontology if one believes that a exists. For then, if you believed that the morning star, but not the evening star, existed, that star would both be and not be in your ontology. The complication introduced in the text avoids this opacity problem by saying that the star is not in your ontology. It could be changed (by deleting the last clause) to give a broader notion of one's ontological commitments or (by modifying the first clause) to give an even narrower notion of one's ontological commitments.

It is not necessary, for our purposes, to decide which is the best way for handling this problem.

10. Calosi, Claudio. 2020. "Priority Monism, Dependence and Fundamentality." *Philosophical Studies* no. 177:1-20.

Abstract: "Priority monism (PM) is roughly the view that the universe is the only fundamental object, that is, a concrete object that does not *depend* on any other concrete object. Schaffer, the main advocate of PM, claims that PM is compatible with dependence having two different directions: from parts to wholes for subcosmic wholes, and from whole to parts for the cosmic whole. Recently it has been argued that this position is untenable. Given plausible assumptions about dependence, PM entails that dependence has only one direction, it always goes from wholes to parts. One such plausible assumption is a principle of Isolation. I argue that, given all extant accounts of dependence on the market, PM entails No Isolation.

The argument depends upon a particular feature of the dependence relation, namely, *necessitation* and *its direction*. In the light of this, I contend that the argument is important, insofar as it suggests that we should distinguish dependence from other cognate notions, e.g. grounding. Once this distinction is made, I suggest we should also distinguish between two different notions of fundamentality that might turn out to be not-coextensive."

11. Casey, Jack. 2022. "The Unity of Dependence." *Journal of the American Philosophical Association*:1-18.

First online: 27 January 2022

Abstract: "Most philosophers treat ontological dependence and metaphysical dependence as distinct relations. A number of key differences between the two relations are usually cited in support of this claim: ontological dependence's unique connection to existence, differing respective connections to metaphysical necessitation, and a divergence in their formal

features. Alongside reshaping some of the examples used to maintain the distinction between the two, I argue that the additional resources offered by the increased attention the notion of grounding has received in recent years potentially offer us a way to unite the two relations, promising the attendant benefits parsimony offers, as a result."

12. Chakravartty, Anjan. 2012. "Ontological Priority: The Conceptual Basis of Non-eliminative, Ontic Structural Realism." In *Structural Realism: Structure, Object, and Causality*, edited by Landry, Elaine M. and Rickles, Dean P., 187-206. Dordrecht: Springer.

"In this paper I consider a recent formulation of scientific realism, the core of which amounts to a provocative metaphysical doctrine. The family of views to which this innovation belongs is called "structural realism" (SR); the relevant genus within this family is now commonly referred to as "ontic structural realism" (OSR); and the novel species under consideration here is something that I will call "non-eliminative OSR", to contrast it with its older and more widely problematized sibling species, eliminative OSR. I will argue that the core metaphysical doctrine underlying non-eliminative OSR, advocating an "ontological priority" of the relations of objects and properties over the objects and properties themselves, is no less problematic. The result is a dilemma for those who would subscribe to OSR in either its eliminative or noneliminative forms, in hopes of finding a promising way forward for realism in the context of scientific knowledge." (p. 187)

13. ———. 2017. "Particles, Causation, and the Metaphysics of Structure." *Synthese* no. 194:2273-2289.

Abstract: "I consider the idea of a *structure* of fundamental physical particles (as described, for example, in quantum theory) being *causal*. Causation is traditionally thought of as involving relations between entities—objects or events—that cause and are affected. On structuralist interpretations, however, it is unclear whether or how precisely fundamental particles can be causally efficacious. On some interpretations,

only relations (as opposed to entities) exist; on others, particles are ontologically dependent on their relations in ways that problematize the traditional picture. I argue that thinking about causal efficacy in this context generates an inevitable pattern of reasoning. To assess the cogency of a given structuralist proposal one must take a stand with respect to a significant metaphysical challenge. Two options then emerge: skepticism about the form of structuralism at issue; or a dissolution of the challenge by means of a contentious ontological primitive. I contend that the choice between these options cannot be forced on scientific or philosophical grounds alone."

14. Chisholm, Roderick M. 1983. "Boundaries as Dependent Particulars." *Grazer Philosophische Studien* no. 20:87-95.

"Introduction: Stephan Körner has noted that one way of drawing up a theory of categories will divide all particulars "into (a) a class of independent particulars, i.e. particulars which are ontologically fundamental, and (b) a class of dependent particulars, i.e. particulars which are not ontologically fundamental."(1) The dependent particulars might be said to be "parasitical upon" the fundamental particulars.

I shall here discuss the nature of spatial boundaries, viewing them as dependent particulars."

15. ———. 1994. "Ontologically Dependent Entities." *Philosophy and Phenomenological Research* no. 54:499-507.

"A discussion of the distinction between ontologically dependent and ontologically non-dependent entities presupposes a general theory of categories. I assume that there are four basic types of entity: states; contingent individuals; *abstracta*; and necessary substance. The general theory would involve five dichotomies-five ways of dividing things into exclusive and exhaustive subsets.

The dichotomies are these: (1) Things which are *contingent* and things which are noncontingent or *necessary*; (2) contingent things which are *states* and contingent things which are non-states or *contingent individuals*; (3) contingent individuals which are *boundaries* and contingent individuals which are non-boundaries or *contingent substances*; (4) necessary things which are states and necessary things which are not states but are, nevertheless, *entia per se*; and (5) those *entia per se* which are *abstracta* and that *ens per se* which is *necessary substance*." (p. 499)

16. Correia, Fabrice. 2005. *Existential Dependence and Cognate Notions*. Munich: Philosophia Verlag.

Contents: Introduction 7; 1. Preamble 13; Introductory Break 35; 2. Simple Dependence: Presentation, and Rejection of Some Accounts 39; 3. Metaphysical Grounding 53; 4. Simple Dependence: The Foundational Approach 65; 5. Some Other Notions of Existential Dependence 89; 6. A Cognate Notion: Supervenience 131; Appendix 151; Bibliography 161; List of Figures 165; List of Symbols and Notations 167; List of Named Propositions, Conditions and Rules 169; Index 171.

"It is quite common nowadays to encounter in philosophical writings claims to the effect that certain entities depend for their existence upon certain other entities, that the former cannot exist without the latter. Thus, for instance, it is sometimes claimed that events depend for their existence upon their participants, sets upon their members, particularized properties and relations (tropes) upon their bearers, mental states and events upon physical states and events, boundaries upon the corresponding extended objects, holes upon their hosts.

The notion of existential dependence not only serves to formulate particular philosophical claims. It may also be used to help characterize general philosophical positions, and to define central philosophical concepts. For instance, idealism may be defined as the view according to which the external world depends for its existence upon epistemic subjects; mereological essentialism as the claim that genuine wholes

depend for their existence upon their parts; the thesis of the essentiality of biological origins as the view according to which every organism is existentially dependent upon its biological origins. And according to a certain philosophical tradition, substances are defined as existentially independent entities of a certain sort." (p. 7)

(...)

"My plan is the following. In the Preamble, I introduce notions and principles that will be useful in the rest of this work. After a short break, chapter 2 introduces the simplest notion of existential dependence, presents some existing accounts of this notion and some objections to these accounts. In chapter 3 the crucial notion of grounding is introduced. In chapter 4, I then propose my own account of simple existential dependence, and show how it escapes the difficulties faced by its rivals. Chapter 5 deals with other forms of existential dependence—like generic dependence, disjunctive dependence and temporalized forms of existential dependence—and finally chapter 6 is about supervenience."

17. ——. 2008. "Ontological Dependence." *Philosophy Compass* no. 3:1013-1032.

Abstract: "‘Ontological dependence’ is a term of philosophical jargon which stands for a rich family of properties and relations, often taken to be among the most fundamental ontological properties and relations. Notions of ontological dependence are usually thought of as ‘carving reality at its ontological joints’, and as marking certain forms of ontological ‘non-self-sufficiency’. The use of notions of dependence goes back as far as Aristotle's characterization of substances, and these notions are still widely used to characterize other concepts and to formulate metaphysical claims. This paper first gives an overview of the varieties of these notions, and then discusses some of their main applications."

18. ——. 2021. "Ontological Dependence, Grounding and Modality." In *The Routledge Handbook of Modality*, edited by Bueno, Otávio and Shalkowski, Scott A., 100-113. New York: Routledge.

"Ontological dependence and grounding are two important items in the metaphysician's toolbox: both notions can be used to formulate important philosophical claims and to define other notions that play a central role in philosophical theorising. Philosophical inquiry about ontological dependence and (especially) grounding has been very lively over the past few years, making it difficult to write a short review article on any of them, let alone a short review article on both.

I try to reach a good compromise between a discussion of each notion taken separately and a discussion of how they relate to one another. I begin by introducing the notions and discussing a number of their connections with modality (Sections 9.1 and 9.2), starting with grounding for systematic reasons (some important concepts of ontological dependence are defined in terms of grounding). I then further the discussion of how the notions are connected to each other, by arguing against the view that (partial) grounding is equivalent to (the converse of) ontological dependence between facts (Section 9.3). Finally, I discuss their respective roles in the theory of fundamentality (Section 9.4)." (p. 100 a note omitted)

19. Costa, Damiano. 2019. "An Argument Against Aristotelian Universals." *Synthese* no. 198:4331-4338.

Abstract: "I provide an argument against the Aristotelian view of universals, according to which universals depend for their existence on their exemplifiers. The argument consists in a set of five jointly inconsistent assumptions. As such, the argument can be used to argue in favour of other conclusions, such as that exemplification is no relation or that plausible principles concerning ontological dependence or grounding do not hold."

20. Dumsday, Travis. 2016. "Non-Mereological Pluralistic Supersubstantivalism: An Alternative Perspective on the Matter–Spacetime Relationship." *Canadian Journal of Philosophy* no. 46:183-203.

Abstract: "In both the historical and contemporary literature on the metaphysics of space (and, more recently, spacetime), a core dispute is that between *relationism* and *substantivalism*. One version of the latter is *supersubstantivalism*, according to

which space (or, again, spacetime) is the only kind of substance, such that what we think of as individual material objects (electrons, quarks, etc.) are actually just parts of spacetime which instantiate certain properties. If those parts are ontologically dependent on spacetime as a whole, then we arrive at an ontology with only a single genuinely independent substance, namely the entire spacetime manifold.

This is monist supersubstantivalism. A view on which the parts of spacetime are ontologically prior to the whole has been called *pluralistic supersubstantivalism*.

As currently formulated, supersubstantivalism (in either its monist or pluralistic forms) carries significant advantages and encounters major difficulties. I argue that some of the latter motivate an alternative formulation, *non-mereological pluralistic supersubstantivalism*, according to which spacetime is a real substance, but what we think of as material objects are also real substances, irreducible to and numerically distinct from that larger spacetime manifold and any of its parts.

Yet, the underlying nature of those material objects is ultimately the same type as that of spacetime: at bottom, a particle is just a smaller quantity of spacetime embedded in or contained by or co-located with the larger whole that we would normally think of as 'spacetime,' capable both of genuine movement within/across the larger spacetime manifold and (at least in principle) independent existence from it."

21. Duncan, Michael, Miller, Kristie, and Norton, James. 2021. "Ditching determination and dependence: or, how to wear the crazy trousers." *Synthese* no. 198:395-418.

Abstract: "This paper defends Flatland—the view that there exist neither determination nor dependence relations, and that everything is therefore fundamental—from the objection from explanatory inefficacy. According to that objection, Flatland is unattractive because it is unable to explain either the appearance as of there being determination relations, or the appearance as of there being dependence relations. We show how the Flatlander can meet the first challenge by offering four strategies—reducing, eliminating, untangling and omnizing—

which, jointly, explain the appearance as of determination relations where no such relations obtain. Since, plausibly, dependence relations just are asymmetric determination relations, we argue that once we come mistakenly to believe that there exist determination relations, the existence of other asymmetries (conceptual and temporal) explains why it appears that there are dependence relations."

22. Elpidorou, Andreas. 2018. "Introduction: The Character of Physicalism." *Topoi* no. 37:435-455.

Abstract: "Not many issues in philosophy can be said to match, let alone rival, physicalism's importance, persistent influence, and divisiveness. To a first approximation, physicalism holds that everything that exists in our world is physical.

An acceptance of physicalism commits thus one to a monistic worldview. Despite how variegated existing entities or properties might appear to be, everything that exists in our world is, according to physicalism, the same: namely, physical.

Indeed, it is widely thought that physicalism demands not only that the non-physical (the chemical, the biological, the economic, the social, the mental, etc.) metaphysically depends on the physical but also that the non-physical is nothing over and above the physical. But what type of metaphysical dependence vindicates physicalism?

The aim of this editorial introduction is twofold. First, Sects. 1–8 offer a critical introduction to the metaphysical character of physicalism. In those sections, I present and evaluate different ways in which proponents of physicalism have made explicit the metaphysical dependence that is said to hold between the non-physical and the physical. Some of these accounts are found to be problematic; others are shown to be somewhat more promising. In the end, some important lessons are drawn and different options for physicalists are presented. Second, in Sect. 9, the six papers that comprise the special issue are introduced and summarized.

Each contribution to the special is, in different ways, concerned with explicating the character of physicalism. New ways of

formulating physicalism are assessed; old ways are defended; and the distinctions between physicalism naturalism, and dualism are reconsidered. The special issue is neither the first nor the last word on the topic of the character physicalism. Nonetheless, it offers both an updated appraisal of our current understanding of physicalism and concrete proposals for how to move forward."

23. Erices, Gonzalo Nuñez. 2019. "Boundaries and Things. A Metaphysical Study of the Brentano-Chisholm Theory." *Kriterion: Journal of Philosophy* no. 33:15-48.

Abstract: "The fact that boundaries are ontologically dependent entities is agreed by Franz Brentano and Roderick Chisholm. This article studies both authors as a single metaphysical account about boundaries. The Brentano-Chisholm theory understands that boundaries and the objects to which they belong hold a mutual relationship of ontological dependence: the existence of a boundary depends upon a continuum of higher spatial dimensionality, but also is a *conditio sine qua non* for the existence of a continuum. Although the view that ordinary material objects and their boundaries (or surfaces) ontologically depend on each other is correct, it does not grasp their asymmetric relationship: while the existence of a surface rigidly depends upon the existence of the very object it belongs to, the existence of a physical object generically depends upon having some surface. In modal terms, both are two kinds of *de re* ontological dependence that this article tries to distinguish."

24. Esfeld, Michael, and Lam, Vincent. 2011. "Ontic Structural Realism as a Metaphysics of Objects." In *Scientific Structuralism*, edited by Bokulich, Peter and Bokulich, Alisa, 143-159. Dordrecht: Springer.

"In a first approach, ontic structural realism (OSR) is a realism towards physical structures in the sense of networks of concrete physical relations, without these relations being dependent on fundamental physical objects that possess an intrinsic identity as their *relata*. In that vein, OSR has been developed in recent years as a metaphysics of contemporary fundamental physics, mainly non-relativistic quantum mechanics (QM), relativistic

quantum field theory (QFT) and the general theory of relativity (GTR)." (p. 143)

(...)

"The issue of the relationship between objects and relations within OSR has mainly been addressed in the literature in terms of ontological primacy (Stachel 2006; Ladyman and Ross 2007, Section 3.4; French 2010)." (p. 145)

(...)

"In sum, current fundamental physics does not make an intrinsic identity of the fundamental physical objects, whatever they may be, available. The relations or structures acknowledged in current fundamental physics cannot provide for an identity that distinguishes each object from the other ones either, since they yield no more than what is known as weak discernibility. However, weak discernibility does not contribute to vindicating the idea of relations enjoying ontological primacy over relata in that objects somehow emerge out of relations (4), and the other two versions of OSR – symmetric ontological dependence between objects and relations (3), eliminativism with respect to objects (5) – are not convincing either." (p. 150)

25. Ferguson, Thomas Macaulay. 2016. "Remarks on Ontological Dependence in Set Theory." *Australasian Journal of Logic* no. 13:41-57.

Abstract: "In a recent paper, John Wigglesworth explicates the notion of a set's *being grounded in or ontologically depending on* its members by the modal statement that in any world (possible or impossible), that a set exists in that world entails that its members exist as well. After suggesting that variable-domain S5 captures an appropriate account of metaphysical necessity, Wigglesworth purports to prove that in any set theory satisfying the axiom Extensionality this condition holds, that is, that sets ontologically depend on their members with respect to extraordinarily weak notions of set. This paper diagnoses a number of problems concerning Wigglesworth's formal argument. For one, we will show that Wigglesworth's argument is invalid as it requires an appeal to hidden, extralogical theses concerning rigid designation and the persistence of sets across possible worlds. Having demonstrated the indispensability of these principles to Wigglesworth's argument, we will then show that even granted the enthymematic premises, the argument only proves the ontological dependence of *singletons* on their members and does not extend to sets in general. Finally, we will consider strengthenings of Wigglesworth's reasoning and suggest that even the weakest generalization will bear undesirable consequences."

26. Ferrier, Edward. 2019. "Against the Iterative Conception of Set." *Philosophical Studies* no. 176:2681-2703.

Abstract: "According to the iterative conception, each set is formed out of sets that are, in some sense, prior to it. Because priority plays an essential role in explanations of why contradiction-inducing sets, such as the universal set, do not exist, the success of these explanations depends on our ability to make sense of the relevant priority relation. I argue that attempts to do this have fallen short: understanding priority in a straightforwardly constructivist sense threatens the coherence of the empty set and raises serious epistemological

concerns; but the leading realist interpretations—ontological and modal interpretations of priority—are deeply problematic as well. I conclude that the purported explanatory virtues of the iterative conception are, at present, unfounded."

27. Fine, Kit. 1995. "Ontological Dependence." *Proceedings of the Aristotelian Society* no. 95:269-290.

"There appears to be a distinctively ontological sense in which one thing may be said to depend upon another. What the one thing is will depend upon the other thing, upon what it is. It is in this sense that one is tempted to say that a set depends upon its members or that a particularized feature, such as a smile, upon the particular in which it is found. For what the set is will depend upon its members; and what the feature is will depend upon the particular that instantiates it. (1)

Granted that there is an intelligible notion of ontological dependence, it would appear to be of great importance to the study of metaphysics. Metaphysics has two main areas of concern: one is with the nature of things, with *what* they are; and the other is with the existence of things, with *whether* they are. Considerations of dependence are relevant to both. For central to the question of the nature of any item is the determination of what it depends upon; and if something is taken to exist, then so must any thing upon which it depends. Indeed, it has often been maintained that it is only those things which do not depend upon anything else that can properly be said to exist at all." (p. 269)

(...)

"But how is the notion of dependence itself to be understood? The idea of what something is, its *identity* or *being*, is notoriously obscure; and the idea of the being of one thing *depending* upon that of another is doubly obscure. A natural suggestion at this point is to take the being of something simply to be its existence. Thus in saying that a set depends upon its members, or a feature upon its instantiator, we are taking the existence of the one to depend upon that of the other. Call this the *existential* construal of dependence. Another natural suggestion is to take the dependence between the beings of the

two items, as opposed to the items themselves, to be modal in character. The being of the one will depend upon that of the other in the sense that it is necessary that if the one item has its 'being' then so does the other. Call this the *modal* construal of dependence." (p. 270)

(1) This paper derives from an earlier paper 'Dependent Objects', that was written in 1982 but remained unpublished. Some of the issues raised are discussed at greater length in Fine [1995b]; and no attempt is here made to settle the methodological, as opposed to the conceptual, issues. I should like to thank Ruth Chang and the members of the Wednesday Group at Oxford for helpful comments.

28. ———. 2020. "Comments on Jessica Wilson's "Essence and Dependence"." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine*, edited by Dumitru, Mircea, 471-475. New York: Oxford University Press.

"Jessica Wilson's paper is a wonderfully sympathetic account of my general approach to metaphysics; and there is a special satisfaction to be had in being, not merely understood, but understood so well.

(...)

But her paper is not all praise. For she wishes to criticize my account of ontological dependence in terms of essence - perhaps as part of a larger critique of the use of a general notion of dependence in metaphysics (§ 4). In a number of papers, I have suggested that an object *x* will depend upon an object *y* if and only if *y* figures in the essence of *x*, i.e., if and only if, in giving an account of what *x* is, reference must be made

y. But she thinks that this equivalence may fail in the right to left direction, that an object y may figure in the essence of x without x depending upon y (she may be perfectly happy with the left to right direction, though this is not something that she discusses)." (p. 471)

29. Fontaine, Matthieu, and Rahman, Shahid. 2010. "Fiction, Creation and Fictionality: An Overview." *Methodos* no. 10:1-75.

Abstract: "The philosophical reflection on non-existence is an issue that has been tackled at the very start of philosophy and constitutes since the publication in 1905 of Russell's "On Denoting" one of the most thorny and heated debates in analytic philosophy. However the fierce debates on the semantics of proper names and definite descriptions which took off after the publication of Strawson's 'On Referring' in 1950 did not trigger a systematic study of the semantics of fiction. In fact, the systematic development of a link that articulates the approaches to fiction of logic; philosophy and literature had to wait until the work of John Woods, who published in 1974 the book *Logic of Fiction: A Philosophical Sounding of Deviant Logic*. One of the most exciting challenges of Woods' book relates to the interaction between the internalist or inside-the-story (mainly pragmatist) and externalist or outside-the-story (mainly semantic) points of view. For that purpose Woods formulated as first a fictionality operator to be read as "according to the story ..." in relation to the logical scope of which issues on internalism and externalism could be studied. The discussions on fiction that followed Woods' book not only seem not to fade away but even give rise to new and vigorous research impulses. Relevant fact for our paper is that in the phenomenological tradition too, the study of fiction has a central role to play. Indeed, one of the most controversial issues in intentionality is the problem of the existence-independence; i.e. the purported fact that intentional acts need not be directed at any existent object. Influenced by the work of the prominent student of Husserl, Roman Ingarden (1893-1970), Amie Thomasson develops the phenomenological concept of ontological dependence in order to explain how we can perform inter- and transfictional-reference - for example in

the context of literary interpretation. The main claim of this paper is that a bi-dimensional multimodal reconstruction of Thomasson's-Ingarden's theory on fictional characters which takes seriously the fact that fictions are creations opens the door to the articulation between the internalist and the externalist approaches. We will motivate some changes on the artifactual approach – including an appropriate semantics for the fictionality operator that, we hope, will awaken the interest of theoreticians of literature. The paper could be also seen as an overview of how different concepts of intentionality might yield different formal semantics for fictionality. We will provide a dialogical framework that is a modal extension of a certain proof system developed by Matthieu Fontaine and Juan Redmond. The dialogical framework develops the inferential counterpart to the the bidimensional semantics introduced by Rahman and Tulenheimo in a recent paper."

30. ———. 2014. "Towards a Semantics for the Artifactual Theory of Fiction and Beyond." *Synthese* no. 191:499-516.

Abstract: "In her book *Fiction and Metaphysics* (1999) Amie Thomasson, influenced by the work of Roman Ingarden, develops a phenomenological approach to fictional entities in order to explain how non-fictional entities can be referred to intrafictionally and transfictionally, for example in the context of literary interpretation. As our starting point we take Thomasson's realist theory of literary fictional objects, according to which such objects actually exist, albeit as abstract and artifactual entities. Thomasson's approach relies heavily on the notion of ontological dependence, but its precise semantics has not yet been developed. Moreover, the modal approach to the notion of ontological dependence underlying the Artifactual

Theory has recently been contested by several scholars. The main aims of this paper are (i) to develop a semantic approach to the notion of ontological dependence in the context of the Artifactual Theory of fiction, and in so doing bridge a number of philosophical and logical gaps; (ii) to generalize Thomasson's categorial theory of ontological dependence by reconstructing ontological categories of entities purely in terms of different structures of ontological dependence, rather than in terms of the basic kinds of entities the categorial entities depend on."

31. French, Steven. 2010. "The interdependence of structure, objects and dependence." *Synthese* no. 175:89-109.

Abstract: "According to 'Ontic Structural Realism' (OSR), physical objects—*qua* metaphysical entities—should be reconceptualised, or, more strongly, eliminated in favour of the relevant structures. In this paper I shall attempt to articulate the relationship

between these putative objects and structures in terms of certain accounts of metaphysical dependence currently available. This will allow me to articulate the differences between the different forms of OSR and to argue in favour of the 'eliminativist'

version. A useful context is provided by Floridi's account of the relationship between 'ontic' and 'epistemic' structural realisms and I shall conclude with some brief remarks on possible extensions of OSR into other scientific domains."

32. Galton, Antony. 2014. "On Generically Dependent Entities." *Applied Ontology* no. 9:129-153.

Abstract: "An entity x is said to be generically dependent on a type F if x cannot exist without at least one entity of type F existing. In this paper several varieties of generic dependence are distinguished, differing in the nature of the relationship between an entity and the instances of a type on which it

generically depends, and in the light of this criteria of identity for generically dependent entities are investigated. These considerations are then illustrated in detail in a series of three case studies, covering shapes, linguistic entities such as letters, words and sentences, and collectives. Each case study examines how far the entities involved have robust identity criteria, and to the extent that they do not it is questioned whether they can be regarded as bona fide examples of generic dependent entities.

Finally, in the light of this, a number of possible accounts that may be given of the ontological status of such entities are considered."

Abstract

This dissertation is an investigation of ontological priority. The Introduction argues that although philosophers have often been concerned with the things that are ontologically prior, they have seldom addressed the question of what ontological priority is. ;Part One gives a detailed analysis of what ontological priority is. Chapter 1 notes that there are two competing theories available: according to the first, ontological priority is a dependence relation; according to the second, it is a degrees-of-being relation. Since the two views are in themselves irreconcilable and since there are no good grounds for choosing between them, it is better to find a "higher" theory that encompasses both of them. Chapter 2 lays the groundwork for the development of this "higher" theory by examining the Scotistic notion of "essential order", a notion that includes the two relations that have been called 'ontological priority' as noted in Chapter 1. Chapter 3 adapts Scotus's understanding of essential order to formulate a definition of ontological priority. The definition does not define just one relation; rather, it gives membership criteria for an entire class of "ontological priority relations". ;Part Two examines some of the members of the class of ontological priority relations. Chapter 4 examines dependence and concludes three things: first, that the received

understanding of dependence is incorrect; second, that dependence properly understood is an ontological priority relation; third, that the relation that is usually thought to be dependence is also an ontological priority relation. Chapter 5 examines degrees-of-being. Since the question of what degrees-of-being is is too complicated to deal with in the context of the dissertation, the chapter examines several theories and shows that degrees-of-being is an ontological priority relation according to any of the theories. ;The Conclusion shows some relations among the three ontological priority relations discussed in Part Two. It also shows briefly how the concept of ontological priority relations can be used to talk about the orderings of the universe. Finally, it points the way to further investigation."

35. ———. 2006. "Independence and Substance." *International Philosophical Quarterly* no. 46:147-159.

Abstract: "The paper takes up a traditional view that has also been a part of some recent analytic metaphysics, namely, the view that substance is to be understood in terms of independence. Taking as my point of departure some recent remarks by Kit Fine, I propose reviving the Aristotelian-scholastic idea that the sense in which substances are independent is that they are non-inherent, and I do so by developing a broad notion of inherence that is more usable in the context of contemporary analytic metaphysics than the traditional notion is. I end by showing how non-inherence, while necessary for being a substance, cannot be taken as sufficient without some qualifying remarks."

36. ———. 2006. "Substance and Identity-Dependence." *Philosophical Papers* no. 35:103-118.

Abstract: "The notion of substance has become rather important in recent metaphysical discussions, but there is no consensus on how it is to be understood. In this paper discuss the idea that substance can be defined in terms of identity-dependence. Giving special attention to the work of E.J. Lowe, who is the main advocate of this position, I clarify how the identity-dependence approach ought to be understood and

defend it against an objection having to do with dependence on God. then bring forward difficulties having to do with mereological essentialism and necessity of origins. These difficulties are much more powerful, but it is possible to revise the identity-dependence approach in a way that avoids them."

37. ———. 2012. "On substantial independence: a reply to Patrick Toner." *Philosophical Studies* no. 159:293-297.

Abstract: "Patrick Toner has recently criticized accounts of substance provided by Kit Fine, E. J. Lowe, and the author, accounts which say (to a first approximation) that substances cannot depend on things other than their own parts. On Toner's analysis, the inclusion of this "parts exception" results in a disjunctive definition of substance rather than a unified account. In this paper (speaking only for myself, but in a way that would, I believe, support the other authors that Toner discusses), I first make clear what Toner's criticism is, and then I respond to it. Including the "parts exception" is not the adding of a second condition but instead the creation of a new single condition. Since it is not the adding of a condition, the result is not disjunctive. Therefore, the objection fails."

38. Grimes, Thomas R. 1988. "The Existential Basis of Propositions, States of Affairs, and Properties." *Grazer Philosophische Studien* no. 31:151-163.

"Existentialism, in its more general form, is the view that such things as propositions, states of affairs, and properties are ontologically dependent upon the objects they are directly about. On this view, if Socrates had never existed there would not have been the proposition Socrates is wise, the state of affairs Socrates' being wise, nor the property being such that Socrates is wise.

Existentialism strikes me as a plausible doctrine. Alvin Plantinga, however, is of a differing opinion and has sought to fill the existential vacuum by arguing that it is possible that a singular proposition exists even if the contingent individual it involves does not.(2) In defense of existentialism, I will attempt to show that Plantinga's efforts are not successful, and then give

an argument in favor of the existentialist position." (pp. 151-162, a note omitted)

39. Hiller, Avram. 2013. "Object-Dependence." *Essays in Philosophy* no. 14:33-55.

Abstract: "There has been much work on ontological dependence in recent literature. However, relatively little of it has been dedicated to the ways in which individual physical objects may depend on other distinct, non-overlapping objects. This paper gives several examples of such *object-dependence* and distinguishes between different types of it. The paper also introduces and refines the notion of an *n-tet*. *N-tets* (typically) occur when there are object-dependence relations between *n* objects. I claim that the identity (or, rather, what I call the *n-identity*) conditions for *n-tets* are not grounded in the individual identity conditions of each of the *n* objects, but instead are metaphysically basic. The paper then briefly discusses some ramifications of accepting objectdependence (and *n-tets*) on the philosophy of biology, ethics, and logic."

40. Hinckfuss, Ian. 1976. "Necessary Existential Dependence." *Australasian Journal of Philosophy* no. 54:123-132.

"The notion that one sort of thing depends in some logical way for its existence on the existence of another sort of thing is a common feature of ontological discussions in every field of philosophy. The notion is of importance, for it is often thought that the tracing of these necessary ontological dependencies gives us greater understanding as to the nature of the entities involved. Thus such questions may arise as: In what way, if at all, do such abstract entities such as sentences, propositions and languages depend for their existence on the existence of concrete entities--such as thinking and communicating people--and the linguistic tokens which they manufacture?

In what way, if at all, do the existence of space and time depend on the existence of material objects?

(...)

In this paper, I shall try to render plausible the contention that there is no coherent notion of existential dependence, where this dependence is construed as any sort of logical relationship." (p. 123)

41. Hoeltje, Miguel. 2013. "Introduction." In *Varieties of Dependence: Ontological Dependence, Grounding, Supervenience, Response-Dependence*, edited by Hoeltje, Miguel, Schnieder, Benjamin and Steinberg, Alex, 9-28. Munich: Philosophia Verlag.

"This collection focusses on four notions that have been used to formulate metaphysical claims about the structure of the world: *ontological dependence, grounding, supervenience, and response-dependence*. The collection aims at both providing a useful guide to the novice reader as well as making a contribution to the current debates involving these notions.

To this end, contributions of two different sorts are included.

For each of the four notions, the collection contains a survey paper introducing the pertinent concepts and distinctions, and summarizing the state of the art of the debate. A fifth survey paper, on Aristotle's notion of ontological dependence and its relevance to the notion of a substance, provides some of the historical background. These survey papers thus provide the theoretical basis for the research papers that make original contributions to the current debates." (p. 9)

43. Irmak, Nurbay. 2013. "The Privilege of the Physical and the Status of Ontological Debates." *Philosophical Studies* no. 166:1-8.

Abstract: "Theodore Sider in his latest book [*Writing the book of the world*. Oxford: Oxford University Press 2011] provides a defense of the substantivity of the first-order ontological debates against recent deflationary attacks. He articulates and defends several realist theses: (a) nature has an objective structure, (b) there is an objectively privileged language to describe the structure, and (c) ontological debates are substantive. Sider's defense of metaontological realism, (c), crucially depends on his realism about fundamental languages, (b). I argue that (b) is wrong.

As a result, Sider's metaontological realism fails to establish the substantivity of certain ontological disputes. Nonetheless, I will argue denying metaontological realism does not require giving up on the realism about structure, (a), that most of us would like to preserve: namely the idea that there are objective similarities and differences in the world that we try to wrap our minds around."

44. Jacinto, Bruno. 2019. "Serious Actualism and Higher-Order Predication." *Journal of Philosophical Logic* no. 48:471-499.

Abstract: "*Serious actualism* is the prima facie plausible thesis that things couldn't have been related while being nothing. The thesis plays an important role in a number of arguments in metaphysics, e.g., in Plantinga's argument (Plantinga *Philosophical Studies*, 44, 1–20 1983) for the claim that propositions do not ontologically depend on the things that they are about and in Williamson's argument (Williamson 2002) for the claim that he, Williamson, is necessarily something. Salmon (*Philosophical Perspectives*, 1, 49–108 1987) has put forward that which is, arguably, the most pressing challenge to serious actualists. Salmon's objection is based on a scenario intended to elicit the judgment that merely possible entities may nonetheless be actually referred to, and so may actually have properties. It is shown that predicativism, the thesis that names are true of their bearers, provides the resources for replying to Salmon's objection.

In addition, an argument for serious actualism based on Stephanou (*Philosophical Review*, 116(2), 219–250 2007) is offered. Finally, it is shown that once serious actualism is conjoined with some minimal assumptions, it implies property necessitism, the thesis that necessarily all properties are necessarily something, as well as a strong comprehension principle for higher-order modal logic according to which for every condition there necessarily is the property of being a thing satisfying that condition."

45. Jansson, Lina. 2017. "Explanatory Asymmetries, Ground, and Ontological Dependence." *Erkenntnis* no. 82:17-44.

Abstract: "The notions of ground and ontological dependence have made a prominent resurgence in much of contemporary metaphysics. However, objections have been raised. On the one hand, objections have been raised to the need for distinctively *metaphysical* notions of ground and ontological dependence. On the other, objections have been raised to the usefulness of adding ground and ontological dependence to the existing store of other metaphysical notions. Even the logical properties of ground and ontological dependence are under debate. In this article, I focus on how to account for the judgements of non-symmetry in several of the cases that motivate the introduction of notions like ground and ontological dependence. By focusing on the notion of explanation relative to a theory, I conclude that we do not need to postulate a distinctively *asymmetric* metaphysical notion in order to account for these judgements."

46. Jenkins, C. S. 2011. "Is Metaphysical Dependence Irreflexive?" *The Monist* no. 94:267-276.

"It is very commonly asserted that metaphysical dependence or grounding is an irreflexive relation: that is to say, it *never holds between an item and itself*." (p. 267)

(...)

"Maybe the irreflexivity assumption doesn't require argument?

Perhaps it is reasonable just to assume it in the absence of arguments to the contrary. There are (at least) three possible ways to back up this suggestion.

One could take the irreflexivity claim to be:

1. stipulative,
2. intuitive, or
3. too basic to require justification (at least in the relevant contexts).

If it is taken to be stipulative (i.e. if one takes it to be true by definition that dependence is irreflexive), one runs the risk of discussing something that isn't what everyone else meant by 'dependence', or of discussing something that is less interesting than schmeppendence (a nearby non-irreflexive relation). One can mean whatever one likes by 'dependence', of course, but these risks are to be treated with respect by any serious philosopher.

If one merely takes irreflexivity to be intuitive, however, one is open to the possibility that its intuitiveness might be explained away as being due to quasi-irreflexivity.

What about taking irreflexivity to be too basic to require justification in the relevant contexts?⁸ After all, one must start somewhere if one is to make any progress; one can't argue for all one's assumptions. But one can assert that dependence appears to be irreflexive, or exhibits some features suggestive of irreflexivity, almost as quickly as one can assert that it is irreflexive.

Now that the irreflexivity assumption has been questioned and one obvious motivation for it undermined, it is not good philosophical practice to sweep the challenge back under the carpet." (p. 275, notes omitted)

47. Johansson, Ingvar. 2004. *Ontological Investigations: An Inquiry into the Categories of Nature, Man and Society*. Frankfurt: Ontos Verlag.

Second edition. First edition London: Routledge 1989.

"Foreword to the second edition: After fifteen years, a second edition of *Ontological Investigations* will now appear. It contains three appendices: First, a summary of the conclusions of the book in aphoristic form; second, a piece on universals which provides a

more elaborate defence of my realist point of departure; and, third, an appendix on ontology in information science, a topic which is also addressed in this Foreword." (p. VII)

Chapter 9: "As I indicated at the beginning of chapter 8, I do not regard internal relations as a fundamental category but a specific kind of the truly fundamental category 'existential dependence'. The theory of this category is, I think, first worked out by Brentano and the young Edmund Husserl. But it has not so far, unlike external and internal relations, become common property within philosophy.

This is the reason why I wanted to discuss internal relations before existential dependence. I think the move to the latter concept is so important that I shall make some further introductory remarks before presenting the category of existential dependence." (p. 124)

48. Kanzian, Christian. 2015. "Existential Dependence and other Formal Relations." In *God, Truth, and other Enigmas*, edited by Szatkowski, Mirosław, 183-196. Berlin: de Gruyter.

"As the title of my paper indicates, I will not restrict myself to general considerations concerning formal relations. In my second section I aim to introduce *dependence*, ontological dependence, as another such formal relation. In this section I will spell out what ontological dependence has in common with the other formal relations, and how we can define it amongst the other genera of formal relations.

Having, I hope, sufficiently motivated the argument I am making, I next turn to *existential dependence* in the third section, treating it as an own kind or species of ontological dependence. Continuing the method I employed in section two, I will point out aspects which existential dependence has in common with other species of dependence, and, then, those of its characteristics that are not shared by the other formal relations within the genus of ontological dependence. In the final two sections of my paper I will present a brief overview of certain possible applications of this theory of formal relations, focusing on existential dependence.

With such a theory in hand, we can make a certain specific categorial frame more plausible (section 4). I also believe that formal relations like existential dependence, perhaps, can help us understand central topics in philosophical theology, e.g. of

- God's identity, and of creation. Concerning the latter I make some fragmentary suggestions (in section 5)." (pp. 183-184)
49. Kim, Jaegwon. 1994. "Explanatory Knowledge and Metaphysical Dependence." *Philosophical Issues* no. 5:51-69.

"There is a famous remark Aristotle made about knowledge: "Men do not think they know a thing unless they have grasped the 'why' of it" (*Physics* II, ch. 3; see also *Metaphysics* V, ch. 2). This remark is often quoted by writers on scientific explanation to underline the importance of explanation to scientific knowledge, and why, as philosophers, we should concern ourselves with understanding what explanation is -that is, to show that "analyzing" scientific explanation, or building a "model" of explanation, is a reputable philosophical enterprise." (p. 51)

(...)

"My main proposal, then, is this: *explanations track dependence relations*. The relation that "grounds" the relation between an explanans, *G*, and its explanatory conclusion, *E*, is that of dependence; namely, *G* is an explanans of *E* just in case *e*, the event being explained, depends on *g*, the event invoked as explaining it.

On this proposal, therefore, the simplifying effect of an explanation is seen both in our belief system and in the world: by showing an event to be dependent on another, the explanation reduces the number of independent events in the world, and also the number of independent assumptions we need to accept about the world." (p. 68)

50. Kolb, David. 1975. "Ontological priorities: A critique of the announced goals of "descriptive metaphysics"." *Metaphilosophy* no. 6:238-258.

"Is there a *the* metaphysics of ordinary language? In recent decades philosophers have attempted to obtain "ontological" results by analyzing the language we ordinarily speak, its semantics, and the conditions that make it possible. Peter Strawson's "descriptive metaphysics" is perhaps the most

famous of these attempts; I will try to show in this essay that it does not fulfil its stated purpose.

After a brief review of some of the main theses of *Individuals*, I discuss an ambiguity in Strawson's notion of "ontological priority". This ambiguity seriously weakens Strawson's arguments and raises the question whether "descriptive metaphysics" is metaphysics at all. I then try to outline his project as a whole and show why it might lead to this ambiguity. This involves examining what Strawson means by "other conceptual schemes".

I close with a brief look at similar issues in Strawson's later book, *The Bounds of Sense*.

This essay restricts itself to one author, but it is part of a wider attempt to show that analysis of (ordinary) language yields no necessary metaphysical results except at Kant's price: the elimination of metaphysics by some sort of transcendental philosophy." (p. 238)

51. Koons, Robert C., and Pickavance, Timothy H. 2017. *The Atlas of Reality: A Comprehensive Guide to Metaphysics*. Malden: Wiley Blackwell.

Chapter 3: *Grounding, Ontological Dependence, and Fundamentality*, pp. 47-73.

"Fine (2012a) distinguishes between grounding and ontological dependence. Grounding is an explanatory relation between facts. Ontological dependence is a relation between entities or things: x is dependent on y iff y is contained in the essence of x."

(...)

"So, we might distinguish between the *quiddity* of x (x's species, a nature or what-it-is-to-be x that is shared by things with the same form), and the *haecceity* of x (the thisness of x, what it is to be x in particular). Quiddities are shareable; haecceities are not. If so, we should distinguish between two different kinds of ontological dependence: *quidditistic*

ontological dependence ('q-dependence') and *haecceitistic* ontological dependence ('hdependence').

Socrates is q-dependent on his animality and his rationality, and on his soul and body, but not on his parents, while he might be h-dependent on his parents and on the circumstances of his conception, if we assume that these particular parents and the particular event of his conception are in some sense essential to Socrates' particular individuality or identity. In fact, many metaphysicians (following Kripke 1980) subscribe to what is called origins essentialism, meaning that a thing's particular origin is essential to its individual identity (i.e., part of its haecceity).

So, if we believe in origins essentialism, particular events (like conceptions) might be included in the haecceities of particular things, but not in their quiddities (although the property of having some conception-event or other might be included in the quiddity)." (P. 58)

52. Koslicki, Kathrin. 2012. "Essence, Necessity, and Explanation." In *Contemporary Aristotelian Metaphysics*, edited by Tahko, Tuomas E., 187-206. Cambridge: Cambridge University Press.

£In Section 12.2 of this chapter, I discuss Fine's way of drawing the distinction between what is part of the essence of an object and what merely follows from the essence of an object. Fine's approach to essence and modality has the advantage over the traditional approach to *de re* modality that it is set up to reflect the sensitivity of essentialist truths towards their grounds, viz., the identity of those objects in virtue of which these claims are true. But Fine's approach, as far as I can see, does not settle all the questions we would like to have answered concerning the derivation of propositions stating necessary (but non-essential) features of objects (e.g., the triangle's being three-sided) from propositions stating their essential features (e.g., the triangle's

being three-angled), since the relevant notion of consequence that is needed for this purpose cannot be merely that of logical entailment." (p. 189)

53. ———. 2012. "Varieties of Ontological Dependence." In *Metaphysical Grounding: Understanding the Structure of Reality* edited by Correia, Fabrice and Schnieder, Benjamin, 186-213. Cambridge: Cambridge University Press.

"Surprisingly, despite the central role dependence has played in philosophy since its very inception, this relation has only recently begun to receive the kind of attention it deserves from contemporary metaphysicians. In this chapter, I would like to contribute to the recent surge of interest in this subject by helping to develop a better grasp of the notion of ontological dependence. In doing so, I am not interested primarily in defending particular positions in first-order metaphysics, e.g., trope theory or Aristotelianism about universals. Rather, the focus of this current project is to become clearer about the kinds of dependence relations to which philosophers who assert or deny these positions in first-order metaphysics appeal. I take this project to be a crucial component of defending a realist position in metaphysics, according to which substantive disagreements in ontology are possible." (p 187, a note omitted)

"The purpose of this essay is to provide an opinionated survey of some recent developments in the literature on ontological dependence.(1) Ontological dependence is typically taken to be a relation whose relata are entities."

(...)

"Conclusion: In this essay, I have considered various prominent construals of ontological dependence in the literature: modal vs. non-modal; existential vs. non-existential; as well as rigid vs. generic construals. And while there is of course nothing

wrong in principle with defining whatever technical concept one wishes, the question arises, in the face of this plethora of relations that go under the name of 'ontological dependence', what explanatory tasks these notions are designed to accomplish and how well they in fact meet the desiderata that are set for them. I have identified three potential measures of success by means of which particular accounts of ontological dependence may be evaluated: (i) how well they do in classifying certain paradigmatic cases of ontological dependence in a particular desired way; (ii) whether they allow for the formulation of a plausible independence criterion of substancehood; and (iii) whether they make room for the possibility of substantive non-existential disagreements in ontology over questions of fundamentality. Relative to these three goals, we have seen that modal and existential construals of ontological dependence are open to persuasive counterexamples, while essentialist accounts seem to perform more promisingly. Still, various questions remain to be addressed by essentialist accounts as well: in particular, (i) how to handle the essentiality of origins (if it is in fact part of the essence of certain sorts of entities to have originated from whatever they in fact originated from); (ii) whether and how hylomorphic compounds can be assigned substance status; and (iii) how a distinction may be drawn between what is taken as primitive by a particular theory or conceptual system (e.g., the number 0 or the empty set) and what is genuinely ontologically fundamental. Thus, as is to be expected, more work still lies ahead for those who are sympathetic to essentialist accounts of ontological dependence." (pp. 60-61, a note omitted)

London: Palgrave Macmillan.

"Conclusion: In this chapter, I considered particular attempts by E. J. Lowe and Michael Gorman at providing an independence criterion of substancehood and argued that the stipulative exclusion of non-particulars and proper parts (or constituents) from such accounts raises difficult issues for their proponents. The results of the present discussion seem to indicate that, at least for the case of composite entities, a unity criterion of substancehood might have at least as much, and perhaps more, to offer than an independence criterion and therefore ought to be explored further by neo-Aristotelians in search of a defensible notion of substancehood.

I indicated briefly how such a unity criterion might be used by neo-Aristotelians to support the inclusion of hylomorphic compounds in the category of substance, given the traditional role of form as the principle of unity within the compound." (p. 188)

(...)

"With Chapter 5 ("Ontological Dependence"), I begin Part II ("Substance") whose main focus is on the question of whether concrete particular objects deserve to be assigned the ontologically privileged status of substancehood within a hylomorphic ontology and, if so, according to what notion of "ontological privilege." As noted earlier, this assignment becomes potentially problematic once concrete particular objects

are analyzed as metaphysically complex due to their hylomorphic structure. It is common to conceive of the substances as ontologically independent, according to some

preferred sense of “independence.” But what is this preferred sense of “ontological independence” and do matter–form compounds qualify as substances when we apply this notion of ontological independence to them? This chapter discusses various relations which have been defined in the literature under the heading of “ontological dependence.”

I examine first existential construals of ontological dependence and turn next to construals of ontological dependence which are formulated in terms of a non-modal conception of essence. I argue in this chapter and Chapter 6 that even the most promising ones among these candidate relations are nevertheless open to objections when evaluated against various plausible measures of success. Chapter 5 incorporates material from Koslicki (2012a, 2013a)." (pp. 4-5)

57. Kovacs, David Mark. 2018. "The Deflationary Theory of Ontological Dependence." *Philosophical Quarterly* no. 68:481-502.

Abstract: "When an entity ontologically depends on another entity, the former ‘presupposes’ or ‘requires’ the latter in some metaphysical sense. This paper defends a novel view, Dependence Deflationism, according to which ontological dependence is what I call an aggregative cluster concept: a concept which can be understood, but not fully analysed, as a ‘weighted total’ of constructive (roughly: mereological in the broadest possible sense) and modal relations. The view has

several benefits: it accounts for clear cases of ontological dependence as well as the source of disagreement in controversial ones; it gives a nice story about the evidential relevance of modal, mereological and set-theoretic facts to ontological dependence; and it makes sense of debates over the relation's formal properties. One important upshot of the deflationary account is that questions of ontological dependence are generally less deep and less interesting than usually thought."

58. ———. 2020. "Constitution and Dependence." *Journal of Philosophy* no. 117:150-177.

Abstract: "Constitution is the relation that holds between an object and what it is made of: statues are constituted by the lumps of matter they coincide with; flags, one may think, are constituted by colored pieces of cloth; and perhaps human persons are constituted by biological organisms. Constitution is often thought to be a "dependence relation." In this paper, I argue that given some plausible theses about ontological dependence, most definitions of constitution don't allow us to retain this popular doctrine. The best option for those who want to maintain that constitution is a dependence relation is to endorse a kind of mereological hylomorphism: constituted objects have their constituters as proper parts, along with a form, which is another proper part. The upshot is that constitution theorists who think of constitution as a dependence relation but are reluctant to endorse mereological hylomorphism ought to give up one of their commitments."

"A crucial notion in metaphysics is that of one object *depending for its existence upon* another object - not in a merely causal sense, but in a deeper, quasi-logical sense. (I say 'quasi-logical' because, strictly speaking, logical relations can only obtain between propositions, not worldly objects.) Thus a *substance* is often conceived to be an object which does not depend for its existence upon anything else.(1) Again, *properties* are often said to depend for their existence upon the objects which possess them.(2)" (p. 31)

"The arguments of Chapter 5 more or less take the concept of substance for granted and so part of the aim of Chapter 6 is to provide a rigorous definition of substance, in terms of the crucial notion of existential dependency. At the same time, I begin to build up a picture of the relationships between the category of substance and other categories of entities at the same ontological level—entities such as events, properties, places, and times. This picture is further developed in Chapter 7, where I go on to argue for quite general reasons that certain fundamental kinds of substance—what I call primitive substances—must exist in order to provide the ultimate existential grounding of all concrete existence. Such substances are distinctive in that their identity through time is itself primitive or ungrounded.

However, identifying these substances is a more difficult matter than arguing in a general way for the necessity of their existence." (*Preface*, p. VI)

4. ———. 2004. "Some Formal Ontological Relations." *Dialectica* no. 58:297-316.

Abstract: "Some formal ontological relations are identified, in the context of an account of ontological categorization.

It is argued that neither formal ontological relations nor ontological categories should themselves be regarded as elements of being, but that this does not undermine the claim of formal ontology to be a purely objective science. It is also argued that some formal ontological relations, like some ontological categories, are more basic than others. A four-category ontology is proposed, in which two basic categories of universals and two basic categories of particulars are distinguished in terms of certain formal ontological relations characteristically obtaining between entities belonging to the different categories."

5. ———. 2012. "Asymmetrical Dependence in Individuation." In *Metaphysical Grounding: Understanding the Structure of Reality* edited by Correia, Fabrice and Schnieder, Benjamin, 214-233. Cambridge: Cambridge University Press.

"Identity-dependence would appear to be an asymmetrical, or at least an *anti*-symmetrical relation, with the implication that no two distinct entities can be *each other's* individuators – even if we can allow, as I believe we should, that some entities are *self*-individuating. This point is related to the fact that circular explanations are inadmissible. For identity-dependence is clearly a species of explanatory relation, in the metaphysical – rather than the merely epistemic – sense of 'explanation'. The identity of a death is *explained*, at least partly, by the identity of its subject. As it may otherwise be put, a death has its identity at least partly 'in virtue of' the identity of its subject – and not the other way around." (p. 215)

"In this paper, I shall first of all (in section 1) define various kinds of ontological dependence, motivating these definitions by appeal to examples. My contention is that whenever we need, in metaphysics, to appeal to some notion of existential or identity-dependence, one or other of these definitions will serve our needs adequately, which one depending on the case in hand. Then (in section 2) I shall respond to some objections to one of these proposed definitions in particular, namely, my definition of (what I call) essential identitydependence.

Finally (in section 3), I shall show how a similar approach can be applied in the theory of truthmaking, by offering an account of the truthmaking relation which defines it in terms of a type of essential dependence. I shall also say why I think that this approach is preferable to one which treats the truthmaking relation as primitive. More generally, my view is that accounts of dependence or 'grounding' which treat these notions as primitive are less satisfactory than my own position, which is that in all cases a suitable definition is forthcoming if we look hard enough." (p. 193)

"1. Ontology and Levels

As I have just remarked, it is common in current metaphysics to speak of 'ontological levels'. But levels of what? As I understand it, we should take these to be levels of being, rather than mere levels of description of being. But what exactly is to be understood in this context by a 'level of being'? What I propose is that we should take a 'level of being' to be a level of beings, where 'beings' in the relevant sense are taken to be objects (though one might also want to include properties of objects).

Moreover, I have in mind now only concrete objects, not abstract ones — a distinction that I shall discuss shortly. As well as clarifying what is to be understood by 'being' in this context,

however, we need also to clarify what is to be understood by 'level'. This I propose to do in terms of part–whole relations.

(...)

"But accepting that — by definition, according to my proposal — a whole is always at a 'higher' level than its proper parts, is there anything more that we can say, quite generally, about how objects at different levels are related? I think so, because we can always ask, concerning objects at different levels, what relationships of ontological dependence — or, if this term is preferred, grounding — they stand in to one another. Of particular interest here are dependence relations which are asymmetric (or perhaps anti-symmetric) and which consequently determine an order of ontological priority between the objects so related, with the object depended upon (the 'dependee') having ontological priority over the dependent object (the 'dependor')." (p. 341)

9. MacBride, Fraser. 2004. "Particulars, Modes and Universals: An examination of E. J. Lowe's Four-Fold Ontology." *Dialectica* no. 58:317-333.

Abstract: "Is there a particular-universal distinction? Ramsey famously advocated scepticism about this distinction. In "Some Formal Ontological Relations" E.J. Lowe argues against Ramsey that a particular-universal distinction can be made out after all if only we allow ourselves the resources to distinguish between the elements of a four-fold ontology. But in defence of Ramsey I argue that the case remains to be made in favour of either (1) the four-fold ontology Lowe recommends or (2) the articulation of a particular-universal distinction within it. I also argue that the case remains to be made against (3) a spatio-temporal conception of the particular-universal distinction."

10. McKenzie, Kerry. 2014. "Priority and Particle Physics: Ontic Structural Realism as a Fundamentality Thesis." *British Journal for the Philosophy of Science* no. 65:353-380.

Abstract: "In this article, I address concerns that the ontological priority claims definitive of ontic structural realism are as they stand unclear, and I do so by placing these claims on a more rigorous formal footing than they typically have been hitherto. I first of all argue that Kit Fine's analysis of ontological dependence furnishes us with an ontological priority relation that is particularly apt for structuralism. With that in place, and with reference to two case studies prominent within the structuralist literature, I consider whether any of structuralism's distinctive priority claims may be regarded as warranted. The discussion as a whole has largely negative implications for the radical structuralism of French and Ladyman (including their 'eliminativist' interpretation of it), largely positive implications for the moderate structuralism primarily advocated by Esfeld and Lam, and some broad lessons for contemporary fundamentalist metaphysics as a whole."

11. ———. 2019. "Dependence." In *The Routledge Handbook of Emergence*, edited by Gibb, Sophie, Hendry, Robin and Lancaster, Tom, 36-53. New York: Routledge.

"Dependence is the most general notion under which a host of familiar metaphysical relations between entities – causation, supervenience, grounding, realisation, etc. – fall. In the first section of this chapter, I will offer some preliminary clarifications to outline the territory in a little more detail. Some years back, this would have primarily involved differentiating kinds of dependence in terms of the strength of

the modal operators used and the other details of an analysis deploying them. Now, there has been a proliferation of non-purely modal accounts of dependence. The second section identifies the various reasons that have been offered for this proliferation. The third section discusses a notion of ontological dependence and grounding, each of which draws on an appeal to the essence of the depending, or depended upon, entities. In spite of their popularity,

we will see that such notions are of little assistance in capturing a central case of interest to us: the proper understanding of emergence. In the light of this, the fourth section defends a purely modal treatment of some of the problem cases outlined in the first section and also discusses a non-modal notion of construction. I close with a hypothesis that the combination of three features, a non-dependence account of fundamentality, various notions of construction and purely modal properties, remove the motivation for appeal to an independent account of grounding in this, and perhaps any, area." (p. 36)

12. ——. 2020. "Structuralism in the Idiom of Determination." *British Journal for the Philosophy of Science* no. 71:497-522.

Abstract: "Ontic structural realism (OSR) is a thesis of fundamentality metaphysics: the thesis that structure, not objects, has fundamental status. Claimed as the metaphysic most befitting of modern physics, OSR first emerged as an entreaty to eliminate objects from the metaphysics of fundamental physics. Such elimination was urged by Steven French and James Ladyman on the grounds that only it could resolve the 'underdetermination of metaphysics by physics' they claimed reduced any putative objectual commitment to a merely 'ersatz' form of realism. Few, however, have joined French and Ladyman either in acknowledging that such underdetermination exists or in attributing to it such drastic consequences. However, an alternative view that physics does sanction objects, albeit merely as ontologically secondary entities, represents a different and seemingly less extreme route to the same conclusion regarding the fundamentality of structure. But since what it means to be 'ontologically prior' is itself a vexed philosophical question, a stance must be taken as

to how we are to understand priority before its prospects may be evaluated. In an earlier paper, I outlined how Fine's notion of ontological dependence might be utilized to defend the priority-based approach to structuralism. Since then, however, I have become convinced that that ontological dependence is not a relation of priority after all. As a result, the arguments outlined in that paper stand in need of reassessment.

In this work, I consider the prospects for priority-based structuralism when expressed in the idiom of determination. My conclusion will be that it has yet to be vindicated by our best physical theories, owing to the failure of symmetry structures to determine the world's inventory of fundamental kinds. Nevertheless, the same symmetry considerations point toward there being renewed prospects for eliminativism—an eliminativism, moreover, of more naturalistic appeal than that hitherto associated with OSR."

13. Meixner, Uwe. 1998. "Actual Existence, Identity and Ontological Priority." *Erkenntnis* no. 48:209-226.

Abstract: "The paper first distinguishes ontological priority from epistemological priority and unilateral ontic dependence. Then explications of ontological priority are offered in terms of the reducibility of the actual existence or identity of entities in one ontological category to the actual existence or identity of entities in another. These explications lead to incompatible orders of ontological priority for individuals, properties of individuals and states of affairs. Common to those orders is, however, that the primacy of the category of individuals is abandoned. This primacy is challenged in the paper also by epistemological arguments, and an onto-anthropological

explanation is offered for the very common but false idea that individuals are ontological prior to all other kinds of entities. Finally ontological priority is discussed with respect to a fully specified system of ontological categories."

Abstract: "This paper presents new observations about ontologically dependent objects which cannot have a host-independent spatial location or a physical part structure, namely disturbances (holes, folds, scratches), tropes, and attitudinal objects (claims, thoughts, promises, requests). It proposes an account of such attributively limited objects in terms of Fregean abstraction, which has so far been applied only to abstract objects."

15. Moran, Alex. 2018. "The Paradox of Decrease and Dependent Parts." *Ratio* no. 31:273-284.

Abstract "This paper is concerned with the paradox of decrease. Its aim is to defend the answer to this puzzle that was propounded by its originator, namely, the Stoic philosopher Chrysippus.[*] The main trouble

with this answer to the paradox is that it has the seemingly problematic implication that a material thing could perish due merely to extrinsic change. (For, intuitively, it is not possible for a mere extrinsic change to cause a material thing to cease to be.) It follows that in order to defend Chrysippus' answer to the paradox, one has to explain how it could be that Theon is destroyed by the amputation without changing intrinsically. In this paper, I shall answer this challenge by appealing to the broadly Aristotelian idea that at least some of the proper parts of a material substance are ontologically dependent on that substance. I will also appeal to this idea in order to offer a new solution to the structurally similar paradox of increase. In this way, we will end up with a unified solution to two structurally similar paradoxes."

"This paper is concerned with an ancient puzzle: the paradox of decrease. Consider Dion, a human being, and Theon, one of Dion's large proper parts, identical to all of Dion besides his left foot. Suppose that Dion's left foot is amputated, and that Dion survives. (Suppose also that Dion undergoes no further mereological change.) Intuitively, Theon survives in this scenario as well as Dion; after all, Theon only undergoes extrinsic change. However, if this is right, it follows that post-amputation, Dion and Theon end up composed of the very same matter, whilst occupying exactly the same region of space. Intuitively, however, it is not possible for two material objects to occupy precisely the same spatial region, or be composed of the very same matter, at once.(1)" (pp. 273-2174)

[*] The paradox is reported by Philo of Alexandria, *On the Indestructibility of the World* 48 (von Armin, *Stoicorum Veterum Fragmenta* 2.397); English translation in A.A. Long & D. N. Sedley, *The Hellenistic Philosophers*, Cambridge: Cambridge University press 1987, Vol. 1, pp. 171-172]

16. Morganti, Matteo. 2009. "Ontological Priority, Fundamentality and Monism." *Dialectica* no. 63:271-298.

Abstract: "In recent work, the interrelated questions of whether there is a fundamental level to reality, whether ontological dependence must have an ultimate ground, and whether the monist thesis should be endorsed that the whole universe is ontologically prior to its parts have been explored with renewed interest. Jonathan Schaffer has provided arguments in favour of 'priority monism' in a series of articles (2003, 2004, 2007a, 2007b, forthcoming). In this paper, these arguments are analysed, and it is claimed that they are not compelling: in particular, the possibility that there is no ultimate level of basic entities that compose everything else is on a par with the possibility of infinite 'upward' complexity. The idea that we must, at any rate, postulate an ontologically fundamental level for methodological reasons (Cameron 2008) is also discussed and found unconvincing: all things considered, there may be good reasons for endorsing 'metaphysical infinitism'. In any event, a higher degree of caution in formulating metaphysical claims than found in the extant literature appears advisable."

17. ———. 2014. "Metaphysical Infinitism and the Regress of Being." *Metaphilosophy* no. 45:232-244.

Abstract: "This article offers a limited defense of metaphysical "infinitism," the view that there are, or might be, infinite chains of ontological dependence. According to a widespread presupposition, there must be an ultimate ground of being—most likely, a plurality of fundamental atoms. Contrary to this view, this article shows that metaphysical infinitism is internally coherent. In particular, a parallel with the debate concerning infinitism about epistemic justification is suggested, and an "emergence model" of being is put forward. According to the emergence model, the being of any given entity gradually arises out of an infinite series of progressively less dependent entities—it is not wholly transmitted, as it were, from a basic, ungrounded level to all the dependent ones in a step-by-step fashion. Some objections are considered and rebutted."

18. ———. 2015. "Dependence, Justification and Explanation: Must Reality be Well-Founded?" *Erkenntnis* no. 80:555-572.

Abstract: "Abstract This paper is about metaphysical 'infinetism', the view that there are, or could be, infinite chains of ontological dependence. Its main aim is to show that, contrary to widespread opinion, metaphysical infinitism is a coherent position. On the basis of this, it is then additionally argued that metaphysical infinitism need not fare worse than the more canonical 'foundationalist' alternatives when it comes to formulating metaphysical explanations. In the course of the discussion, a rather unexplored parallel with the debate concerning infinitism about justification is suggested."

19. ———. 2018. "From Ontic Structural Realism to Metaphysical Coherentism." *European Journal for Philosophy of Science* no. 9:1-20.

Abstract: "The present paper argues that the typical structuralist claims according to which invariances, symmetries and the like are fundamental – especially in physics – should not be understood in terms of physical relations being fundamental. Rather, they should be understood in terms of 'metaphysical coherentism' - the idea that object-like parts of reality exhibit symmetric relations of ontological dependence. The view is developed in some detail, in particular by showing that i) symmetric ontological dependence does not necessarily lead to uninformative metaphysical explanations, and ii) metaphysical coherentism strikes the best balance between the requirements of naturalism and those of theoretical consistency – especially in view of the difficulties that structuralists seem to have in accounting for all state-independent properties of particles in relational terms.

On this basis, the coherentist picture is applied to the interpretation of the quantum domain, and contrasted with extant varieties of structuralism, of both the eliminative and the non-eliminative sort, and holism."

"My focus in what follows will be on the claim that truthmaking can play a substantive role in defining an unproblematic notion of *emergence*. While "emergence" and related locutions have been used to express a variety of nonequivalent ideas, in perhaps the most philosophically interesting sense, to say that some property M is *emergent* is to say that while instances of M synchronically depend on instances of other properties, instances of M are truly novel additions to the world; and instances of M are genuine additions to the world, at least in part, in virtue of making a unique and distinctive causal contribution." (p. 113, a note omitted)

(...)

"I will begin by sketching the two central notions of the truthmaking-based precisification of emergence: the notion of being needed as a truthmaker and the notion of ontological dependence." (p. 115)

21. Mount, Beau Madison. 2019. "Antireductionism and Ordinals." *Philosophia Mathematica* no. 27:105-124.

Abstract: "I develop a novel argument against the claim that ordinals are sets. In contrast to Benacerraf's antireductionist argument, I make no use of covert epistemic assumptions. Instead, my argument uses considerations of ontological dependence.

I draw on the datum that sets depend immediately and asymmetrically on their elements and argue that this datum is incompatible with reductionism, given plausible assumptions about the dependence profile of ordinals. In addition, I show that a structurally similar argument can be made against the claim that cardinals are sets."

22. Nelson, Michael. 2013. "Modal Metaphysics. Contingently Existing Propositions." *Canadian Journal of Philosophy* no. 43:776-803.

Abstract: "I argue that propositions are contingent existents. Some propositions that in fact exist might not have existed and there might have been propositions that are distinct from every actually existing proposition. This is because some propositions

are singular propositions, which are propositions containing ordinary objects as constituents, and so are ontologically dependent on the existence of those objects; had those objects not existed, then the singular propositions would not have existed. I provide both a philosophical and technical understanding of the contingent status of propositions."

23. Nolan, Daniel. 2011. "Categories and Ontological Dependence." *The Monist* no. 94:277-301.

"In this paper I want to do two connected things. The first is to explore, in general terms, some of the issues that come up when we start considering ontological categories and questions about relations of dependence between them (either between the members of one and the members of another, or between the categories themselves). The second is to discuss one particular way we could try to illuminate the apparent dependence relationships between categories (or apparent categories): by exploring and tentatively defending a particular account of how ordinary things are related to events, and how we might relate the putative category of 'physical object' (or 'thing', as I will call them) to the putative category of 'event'." (p. 277)

24. Noordhof, Paul. 2019. "Dependence." In *The Routledge Handbook of Emergence*, edited by Gibb, Sophie, Hendry, Robin and Lancaster, Tom, 36-53. New York: Routledge.

"Dependence is the most general notion under which a host of familiar metaphysical relations between entities – causation, supervenience, grounding, realisation, etc. – fall. In the first section of this chapter, I will offer some preliminary clarifications to outline the territory in a little more detail. Some years back, this would have primarily involved differentiating kinds of dependence in terms of the strength of the modal operators used and the other details of an analysis deploying them. Now, there has been a proliferation of non-purely modal accounts of dependence. The second section identifies the various reasons that have been offered for this proliferation. The third section discusses a notion of ontological dependence and grounding, each of which draws on an appeal to the essence of the depending, or depended upon, entities. In

spite of their popularity, we will see that such notions are of little assistance in capturing a central case of interest to us: the proper understanding of emergence. In the light of this, the fourth section defends a purely modal treatment of some of the problem cases outlined in the first section and also discusses a non-modal notion of construction. I close with a hypothesis that the combination of three features, a non-dependence account of fundamentality, various notions of construction and purely modal properties, remove the motivation for appeal to an independent account of grounding in this, and perhaps any, area."

25. Orilia, Francesco. 2016. "Armstrong's Supervenience and Ontological Dependence." In *Metaphysics and Scientific Realism: Essays in Honour of David Malet Armstrong*, edited by Calemi, Francesco Federico, 233-251. Berlin: De Gruyter.

"Let us then turn to the dependence proposal, the idea that FL is (or should be) a way of saying that the supervenient is ontologically dependent on the subvenient.

This option is certainly intriguing and worth exploring, for it seems in line with Armstrong's insistence on (contingent) particulars, universals and states of affairs as somehow fundamental: everything else seems to depend on this basic level." (p. 238)

(...)

"In sum, if we are to understand FL in terms of ontological dependence, as we are trying to do, it seems we should enroll Armstrong in the party of those who do not take ontological dependence as necessarily well-founded. Schaffer 2010 argues from the empirical possibility of gunks, objects made up of smaller and smaller parts ad infinitum, to priority monism, the thesis that the cosmos is a whole on which everything else, qua part, is dependent. But this argument presupposes that the well-foundedness of dependence is taken for granted. However, if we rather take for granted the plausible idea that a complex such as P&Q is dependent on its parts and not vice versa (after all, according to Armstrong, as we have seen, P&Q might fail to exist even if P and Q exist), the possibility of gunky

universals should rather lead us to question the well-foundedness of dependence.

Similarly, well-foundedness should be questioned, given the possibility of gunks, or the possibility of appealing to fact infinitism to account for the relatedness of universals and particulars that brings about states of affairs." (p. 249)

Sigla = FL = "doctrine of the ontological free lunch" ["One may call this view, that the supervenient is not something additional to what it supervenes upon, the doctrine of the ontological free lunch. Like other free lunches, this one gives and takes away at the same time. You get the supervenient for free, but you do not really get an extra entity." D. M. Armstrong, *A World of States of Affairs*, Cambridge: Cambridge University Press 1997, pp. 12-13.]

26. Page, Sam. 2006. "Mind-independence disambiguated: Separating the meat from the straw in the realism/anti-realism debate." *Ratio* no. 19:321-335.

Abstract: "The notion of mind-independence plays a central role in the contemporary realism/anti-realism debate, but the notion is severely ambiguous and consequently the source of considerable misunderstanding.

In this paper, four kinds of mind-independence are distinguished: ontological, causal, structural, and individuating independence. Appreciating these distinctions entails that one can reject the individuating independence of the natural world, and still maintain that the natural world is causally and structurally independent of us. This paper argues that so-called anti-realists, especially Rorty, Putnam, and Goodman, are not opposed to the causal and structural independence of the natural world, as is frequently

alleged, but rather its individuating independence. An acceptance of these points will hopefully put an end to the prevalence of strawmen in the debate, and focus attention on meatier issues."

27. Paolini Paoletti, Michele. 2016. "Non-Symmetrical Relations, O-Roles, and Modes." *Acta Analytica* no. 31:373-395.

Abstract: "I examine and discuss in this paper Orilia's theory of external, non-symmetrical relations, that is based on ontological roles (O-Roles). I explore several attempts to interpret O-Roles from an ontological viewpoint and I reject them because of two problems concerning the status of asymmetrical relations (to be distinguished from non-symmetrical relations simpliciter) and of exemplification as an external, non-symmetrical relation. Finally, following Heil's and Lowe's characterization of modes as particular properties that ontologically depend on their "bearers", I introduce relational modes in order to define a new solution to the problems of the ontological status of both external, non-symmetrical relations and O-Roles. I also deal with five objections raised by Fraser MacBride against relational modes and O-Roles and I elaborate an analysis of the relations of being to the left of and being to the right of."

"Let me now turn to fundamentality – or ontological independence/basicness. An intuitive characterization of fundamentality is the following: an entity is fundamental if and only if (iff) it is needed to ground(1) something in the universe and it is not grounded by anything else. Metaphorically speaking, fundamental entities are all and only those entities that some "lazy" omniscient and omnipotent being would need to invoke in order to ground what happens in the universe." (p. 2

(1) I assume here that something is fundamental iff it is ontological independent (or ontologically basic) – even if there are some modal characterizations of ontological independence according to which the ontological independence of something

does not guarantee its fundamentality. Moreover, as it will become apparent in a few lines, I am not committed here to the idea that fundamentality/ontological independence must be characterized in terms of some primitive relation of grounding. Therefore, my use of the verb "to ground" does not aim at recalling the latter view."

29. ———. 2019. "Respects of Dependence." *Studia Neoaristotelica* no. 16:49-82.

Abstract: "I consider in this paper respects of dependence, namely, the fact that some entities depend on other entities in some respect or another. In the first section, I provide a characterization of contemporary debates on dependence based on respects of dependence. I also single out seven desiderata a good theory of dependence should satisfy and three ways of interpreting respects of dependence. In the second section, I criticize two of such ways and, in the third section, I defend the remaining option, namely, that respects of dependence correspond to different dependence-relations between entities (e.g., existence-dependence, identity-dependence, and so on). In the fourth section, I develop my theory of Respect-of-Dependence (RD) Relations in order to distinguish between partial and full dependence and between specific and generic dependence, and to qualify RD-relations in temporal and modal terms. Finally, in the last section, I anticipate and reply to three objections against dependence pluralism."

30. ———. 2021. "Respects of Dependence and Symmetry." *Studia Neoaristotelica* no. 18:31-68.

Abstract: "In this article I discuss several apparent counterexamples to the asymmetry of ontological dependence. These counterexamples were introduced in discussions about grounding, but they can affect every theory of ontological dependence. I show that, if one adopts metaontological pluralism (i.e., the view according to which there are many dependence relations), one has some advantages when it comes to defending the asymmetry of dependence. In Section 1, I introduce metaontological pluralism and my own version of it, which is based on Respect-of-Dependence Relations (RD-

Relations). I then single out five strategies to deal with apparent cases of symmetric dependence and show that only two of them are available to metaontological pluralists. In Sections 2, 3, and 4 I deal with cases of symmetric dependence by adopting these strategies. Finally, in Section 5, I anticipate and reply to three objections against my account."

31. Pearson, Olley. 2018. "Emergence, Dependence, and Fundamentality." *Erkenntnis* no. 83:391-402.

Abstract: "In a recent paper Barnes proposes to characterize ontological emergence by identifying the emergent entities with those entities which are both fundamental and dependent. Barnes offers characterizations of the notions of fundamentality and dependence, but is cautious about committing to the specifics of these notions. This paper argues that Barnes's characterization of emergence is problematic in several ways. Firstly, emergence is a relation, and merely delimiting relata of this relation tells us little about it. Secondly, the group of entities delimited as dependent and fundamental do not appear to be the group of emergent entities. Rather, some entities appear to be dependent and fundamental and not emergent, whilst other entities appear to be emergent and not dependent and fundamental. The moral drawn is that in order to provide a characterization of emergence one must go beyond what Barnes says explicitly. It is also shown that a potentially fruitful way of doing this would be to further specify the notion of dependence at issue revealing it to be asymmetric and perhaps merely nomological."

33. Poli, Roberto. 2010. "Spheres of Being and the Network of Ontological Dependencies." *Polish Journal of Philosophy* no. 4:171-182.

Abstract: "Ontological categories form a network of ties of dependence. In this regard, the richest source of distinctions consists in the medieval discussion on the divisions of being.

After a preliminary examination of some of those divisions, the paper pays attention to Roman Ingarden's criteria for classifying the various types of ontological dependence. The following are the main conclusions that can be drawn from this exercise. Ingarden suggests that (1) the most general principles framing the categories of particulars are based on couples of mutually opposed principles; (2) the most general among these couples of principles appear to be based on three different types of modalities; (3) subsequent couples of opposed principles do not seem to require the introduction of further types of modalities, and (4) the overall typology shows that there are three spheres of being, respectively composed of ideal entities, real entities and intentional entities as contents of psychological acts."

34. Prescott-Couch, Alexander. 2017. "Explanation and Manipulation." *Noûs* no. 51:484-520.

Abstract: "I argue that manipulationist theories of causation fail as accounts of causal structure, and thereby as theories of "actual causation" and causal explanation. I focus on two kinds

of problem cases, which I call “Perceived Abnormality Cases” and “Ontological Dependence Cases.” The cases illustrate that basic facts about social systems—that individuals are sensitive to perceived abnormal conditions and that certain actions metaphysically depend on institutional rules—pose a challenge for manipulationist theories and for counterfactual theories more generally. I then show how law-based accounts of causal structure can answer such challenges. The moral of the story is that the basic manipulationist idea that our interest in causal structure is driven by our interest in manipulating our environment faces decisive problems in a central domain of application, the social sciences.”

35. Rosen, Gideon. 2010. “Metaphysical Dependence: Grounding and Reduction.” In *Modality: Metaphysics, Logic, and Epistemology*, edited by Hale, Bob and Hoffmann, Aviv, 109-135. New York: Oxford University Press.

“Introduction: This essay is a plea for ideological toleration. Philosophers are right to be fussy about the words they use, especially in metaphysics where bad vocabulary has been a source of grief down through the ages. But they can sometimes be too fussy, dismissing as ‘unintelligible’ or ‘obscure’ certain forms of language that are perfectly meaningful by ordinary standards and which may be of some real use.

So it is, I suggest, with certain idioms of metaphysical determination and dependence. We say that one class of facts *depends upon* or *is grounded* in another.

We say that a thing possesses one property in virtue of possessing another, or that one proposition makes another true. These idioms are common, as we shall see, but they are not part of anyone’s official vocabulary. The general tendency is to admit them for heuristic purposes, where the aim is to point the reader’s nose in the direction of some philosophical thesis, but then to suppress them in favor of other, allegedly more hygienic formulations when the time comes to say *exactly* what we mean. The thought is apparently widespread that while these ubiquitous idioms are sometimes convenient, they are

ultimately too unclear or too confused, or perhaps simply too exotic to figure in our first-class philosophical vocabulary.

Against this tendency, I suggest that with a minimum of regimentation these metaphysical notions can be rendered clear enough, and that much is to be gained by incorporating them into our analytic tool kit. I make this proposal in an experimental spirit. Let us see how things look if we relax our antiseptic scruples for a moment and admit the idioms of metaphysical dependence into our official lexicon alongside the modal notions (metaphysical necessity and possibility, the various forms of supervenience) with which they are often said to contrast unfavorably. If this only muddies the waters, nothing is lost; we can always retrench. If something is gained, however, as I believe it is, we may find ourselves in a position to make some progress. (pp. 109-110)

36. Rosenkrantz, Gary S. 2018. "Of Facts and Things." *International Journal of Philosophical Studies* no. 26:679-700.

Abstract: "This paper examines the ontological status of individual substances; intuitive examples of such entities include particles and living organisms. My aim is to assess the ontological status of individual substances in the light of arguments for an ontology of [concrete] facts, often called states of affairs. Advocates of a fact ontology have argued that these factive entities are the ontologically fundamental beings. I will address the salient question of whether individual substances are reducible to, or eliminable in favor of, facts. I will further address the question of whether individual substances, even if not reducible to facts, are nonetheless ontologically dependent upon facts in a way that undercuts the claim that some individual substances are ontologically fundamental. Finally, I will argue that a persuasive case for the claim that facts are what is ontologically fundamental has yet to be made."

37. Rosenkrantz, Gary S., and Hoffmann, Joshua. 1991. "The Independence Criterion of Substance." *Philosophy and Phenomenological Research* no. 51:835-853.

"According to a traditional view, an individual substance is that which could exist all by itself or which in some sense is "independent." In this paper, we construct a new version of an analysis of the notion of substance in terms of independence, and argue for its adequacy.

It should be noted that our project is to analyze the concept of individual substance as ordinarily understood, paradigm instances of which seem to be particular material objects and persons."

(...)

"For the purposes of our analysis we shall assume (plausibly, we think) that a thing in this ordinary sense, i.e., an individual substance, is not reducible to or identifiable with an entity of another kind or ontological category, e.g., a set or collection of either properties, ideas, sense-data, or events. (This does not rule out the possibility that a substance can be eliminated in favor of an entity of another kind or ontological category."

Since there is considerable disagreement among philosophers about what kinds of entities could exist, and since such disagreement is difficult to resolve, there is an advantage, epistemically speaking, in providing an analysis of substance which is ontologically neutral." (pp. 835-836, notes omitted)

38. Rydéhn, Henrik. 2018. "Grounding and Ontological dependence." *Synthese* no. 198:1231-1256.

Abstract: "Recent metaphysics has seen a surge of interest in grounding—a relation of non-causal determination underlying a distinctive kind of explanation common in philosophy. In this article, I investigate the connection between grounding and another phenomenon of great interest to metaphysics: ontological dependence. There are interesting parallels between the two phenomena: for example, both are commonly invoked through the use of "dependence" terminology, and there is a great deal of overlap in the motivations typically appealed to when introducing them. I approach the question of the relationship between grounding and ontological dependence through an investigation of their modal connections (or lack

thereof). I argue, firstly, that on the common assumption that grounding is factive, it can be shown that no known variety of rigid ontological dependence is either necessary or sufficient for grounding. I also offer some suggestions in support of the claim that this generalizes to every possible form of rigid ontological dependence. I then broaden the discussion by considering a non-factive conception of grounding, as well as by looking at forms of generic (rather than rigid) ontological dependence. I argue that there is at least one form of rigid ontological dependence that is sufficient for non-factive grounding, and that a form of generic dependence may be necessary (but not sufficient) both for factive and non-factive grounding.

However, justifying even these fairly weak modal connections between grounding and ontological dependence turns out to require some quite specific and substantive assumptions about the two phenomena that have only rarely been discussed."

39. Sacchi, Elisabetta, and Voltolini, Alberto. 2012. "To Think is to Have Something in One's Thought." *Quaestio* no. 12:395-422.

"In this paper we will focus on the most basic form of intentionality, namely *reference intentionality* or *aboutness*: the property an intentional event or state (for short: a *thought*) has of *being about*, or *of*, a certain object, the entity thereby labelled the *intentional object*. Hereafter, by "intentionality" we will mean reference intentionality.

Along with a well-honoured tradition, we will accept that intentionality is at least a property a thought holds necessarily, i.e., in all possible worlds that contain it; more specifically, a necessary relation, namely the relation of *existential* dependence of the thought on its intentional object. Yet we will first of all try to show that intentionality is more than that. For we will claim that intentionality is an *essential* property of the thought, namely a property whose predication to the thought is true in virtue of the identity, or nature, of such a thought. More particularly, for us intentionality will again be a relation, yet a relation of *ontological* dependence of the thought on its intentional object; specifically, the relation for the thought of *being constituted* by its object." (p. 395, notes omitted)

40. Schnieder, Benjamin. 2006. "A Certain Kind of Trinity: Dependence, Substance, Explanation." *Philosophical Studies* no. 129:393-419.

Abstract: "The main contribution of this paper is a novel account of *ontological dependence*. While dependence is often explained in terms of modality and existence, there are relations of dependence that slip through the mesh of such an account. Starting from an idea proposed by Jonathan Lowe, the article develops an account of ontological dependence based on a notion of *explanation*; on its basis, certain relations of dependence can be established that cannot be accounted by the modal-existential account.

Dependence is only one of two main topics of this paper, for it is approached via a discussion of the category of *substance*. On a traditional view, substances can be characterised as *independent* entities. Before the background of a modal-existential account of dependence, this idea appears problematic.

The proposed notion of *explanatory* dependence is shown to vindicate the traditional approach to substance."

41. ———. 2020. "Dependence." In *The Routledge Handbook of Metaphysical Grounding*, edited by Raven, Michael J., 107-120. New York: Routledge.

"Not all entities are born equal. Some entities exist only derivatively: they depend for their existence on other, more fundamental entities that make the former exist. To study such existential dependencies is an important task of ontology.

Similarly, not all truths and facts are born equal. Some truths are derivative: they are true because of other, more fundamental truths that make the former true; these latter truths can be called the grounds of the former, and the relation holding between grounds and what they ground can be called grounding. Equally, some facts are derivative: they obtain because of other, more fundamental facts, i.e., their grounds.

As illustrated by these paragraphs, characterizations of existential dependence and of grounding can be phrased in similar terms. Dependent entities are often called derivative and are said to owe their existence to other entities that make them exist, just as grounded facts are often said to be derivative and to owe their obtaining to other facts that make them obtain. That observation motivates the question how exactly the notion of grounding relates to notions of existential dependence (and also other sorts of dependency; more on that in what follows). This is the main concern of this handbook entry.

As to the structure of what follows: In §2, notions of dependence are characterized in a general way. In §3, notions of existential and ontological dependence are introduced. In §4, proposals about how existential dependence relates to grounding are discussed." (p. 107)

42. Schwartzkopff, Robert. 2011. "Numbers as Ontologically Dependent Objects: Hume's Principle Revisited." *Grazer Philosophische Studien* no. 82:353-373.

Summary: "Adherents of Ockham's fundamental razor contend that considerations of ontological parsimony pertain primarily to fundamental objects. Derivative objects, on the other hand, are thought to be quite unobjectionable. One way to understand the fundamental vs. derivative distinction is in terms of the Aristotelian distinction between ontologically independent and dependent objects. In this paper I will defend the thesis that every natural number greater than 0 is an ontologically dependent object thereby exempting the natural numbers from Ockham's fundamental razor."

43. Sethi, Umrao. 2021. "The Varieties of Instantiation." *Journal of the American Philosophical Association* no. 7:417-437.

Abstract: "Working with the assumption that properties depend for their instantiation on substances, I argue against a unitary analysis of instantiation. On the standard view, a property is instantiated just in case there is a substance that serves as the bearer of the property. But this view cannot make sense of how properties that are *mind-dependent* depend for their

instantiation on minds. I consider two classes of properties that philosophers often take to be mind-dependent: sensible qualities like color, and bodily sensations like itches. Given that the mind is never itself literally red or itchy, we cannot explain the instantiation of these qualities as a matter of their having a mental bearer. Appealing to insights from Berkeley, I defend a view on which a property can be instantiated not in virtue of having a bearer—mental or material—but rather in virtue of being the object of a conscious act of perception.

In the second half of the paper, I suggest that the best account of sensible qualities and bodily sensations ultimately makes use of both varieties of instantiation."

Chapter 8: *Ontological Dependence*, pp. 290-323.

45. Smith, Deborah C. 2012. "Rainbows, Time Zones, and Other Mind-Dependent Objects: Making Sense of the Relevant Notions of "Mind-Dependence" in the Debate between Metaphysical Realists and Antirealists." *Open Journal of Philosophy* no. 2:38-44.

Abstract: "In a recent article, Sam Page distinguishes four kinds of mind-(in)dependence: ontological, causal, structural, and individuating. He argues that, despite the fact that the metaphysical realism/antirealism debate has been frequently characterized as a debate between those who accept and those who deny that the world is causally and/or structurally dependent on minds, many antirealists are primarily interested in defending the claim that the world is individually mind-dependent. In this article, I critically examine these differing senses of "mind-dependence" highlighting ways in which they remain ambiguous and identifying various entailment relations between them. I argue that there is reason to believe that ontological dependence, structural dependence, and the only sort of individuating dependence that is relevant to the metaphysical debate are coextensive notions. As such, any argument that succeeds in establishing that it is incoherent to suppose that everything is ontologically and/or structurally dependent

thereby establishes the incoherence of metaphysical antirealism."

46. Steinberg, Alex. 2015. "Priority monism and part/whole dependence." *Philosophical Studies* no. 172:2025-2031.

Abstract: "Priority monism is the view that the cosmos is the only independent concrete object. The paper argues that, pace its proponents, Priority monism is in conflict with the dependence of any whole on any of its parts: if the cosmos does not depend on its parts, neither does any smaller composite."

47. Tallant, Jonathan. 2015. "Ontological Dependence in a Spacetime-World." *Philosophical Studies* no. 172:3101-3118.

Abstract: "Priority Monism (hereafter, 'Monism'), as defined by Jonathan Schaffer (*Philos Rev* 119:131–176, 2010), has a number of components. It is the view that: the cosmos exists; the cosmos is a maximal actual concrete object, of which all actual concrete objects are parts; the cosmos is basic—there is no object upon which the cosmos depends, ontologically; ontological dependence is a primitive and unanalysable relation. In a recent attack, Lowe (*Spinoza on monism*. Palgrave Macmillan, London, pp 92-122, 2012) has offered a series of arguments to show that Monism fails. He offers up four tranches of argument, with different focuses.

These focal points are: (1) being a concrete object; (2) aggregation and dependence; (3) analyses of ontological dependence; (4) Schaffer's no-overlap principle. These are all technical notions, but each figures at the heart of a cluster of arguments that Lowe puts forward. To respond, I work through each tranche of argument in turn.

Before that, in the first section, I offer a cursory statement of Monism, as Schaffer presents it in his 2010 paper, *Monism: The Priority of the Whole*. I then respond to each of Lowe's criticisms in turn, deploying material from Schaffer's 2009 paper *Spacetime: the One Substance*, as well as various pieces of conceptual machinery from Lowe's own works (*The possibility of metaphysics*. Clarendon, Oxford, 1998, 2010) to deflect Lowe's (*Spinoza on monism*. Palgrave Macmillan,

London, pp 92–122, 2012) attacks. In the process of defending Monism from Lowe (*Spinoza on monism*. Palgrave Macmillan, London, pp 92–122, 2012), I end up offering some subtle refinements to Schaffer's (*Philos Rev* 119:131–176, 2010) view and explain how the resulting 'hybrid' view fares in the wider dialectic."

48. Thomasson, Amie L. 1999. *Fiction and Metaphysics*. Cambridge: Cambridge University Press.

Chapter 2. *The nature and varieties of existential dependence*, pp. 24-34.

"I have argued that fictional characters are dependent objects, requiring for their very existence such entities as literary works and the creative acts of an author. But they depend on these in different ways — requiring the creative acts of an author only to come into existence, and works of literature to remain in existence — so that it is misleading to simply speak of these indifferently as dependencies. To unravel the details of the status of fictional objects we must step back to examine the concept of existential dependence in general and to delineate carefully the various forms that this relation can take." (p. 24)

(...)

"Fictional characters provide an especially good motivation for drawing out a theory of dependence, because they exhibit many different sorts of dependence on many different sorts of entities, and because indeed the dependencies supporting them are layered, as they are dependent on literary works, which are themselves dependent on other entities. We can now utilize this system of dependence to return to make the earlier understanding of fictional objects more precise and detailed. The details of the theory of dependence also prove pivotal to understanding the place of fictional characters in a general system of categories in Part II. But it must not be forgotten that the phenomenon of dependence is completely general — many

other types of entities seem to share each of these types of dependence; in fictional characters they are simply combined in an especially interesting way."

49. Todd, Patrick. 2013. "Soft Facts and Ontological Dependence." *Philosophical Studies* no. 164:829-844.

Abstract: "In the literature on free will, fatalism, and determinism, a distinction is commonly made between temporally intrinsic ('hard') and temporally relational ('soft') facts at times; determinism, for instance, is the thesis that the temporally intrinsic state of the world at some given past time, together with the laws, entails a unique future (relative to that time). Further, it is commonly supposed by incompatibilists that only the 'hard facts' about the past are fixed and beyond our control, whereas the 'soft facts' about the past needn't be. A substantial literature arose in connection with this distinction, though no consensus emerged as to the proper way to analyze it. It is time, I believe, to revisit these issues. The central claim of this paper is that the attempts to analyze the hard/soft fact distinction got off on fundamentally the wrong track. The crucial feature of soft facts is that they (in some sense) depend on the future. Following recent work on the notion of dependence, however, I argue that the literature on the soft/hard distinction has failed to capture the sense of dependence at stake. This is because such attempts have tried to capture softness in terms of purely modal notions like entailment and necessitation. As I hope to show, however, such notions cannot capture the sort of asymmetrical dependence relevant to soft facthood. Arguing for this claim is the first goal of this paper. My second goal is to gesture towards what an adequate account of soft facthood will really look like."

50. Tognazzini, Neal A. 2015. "Grounding the Luck Objection." *Australasian Journal of Philosophy* no. 93:127-138.

Abstract: "Many object to libertarianism by arguing that it manages to solve one problem of luck (the threat of determinism) only by falling prey to another (the threat from indeterminism). According to this objection, there is something freedom undermining about the very circumstances that the

libertarian thinks are required for freedom. However, it has proved difficult to articulate precisely what it is about these circumstances that is supposed to undermine freedom—the absence of certain sorts of explanations has perhaps been the most common complaint. In this paper, however, I argue that recent work on the metaphysics of ontological dependence provides the resources for formulating the luck objection in its strongest form."

51. Toner, Patrick. 2011. "Independence accounts of substance and substantial

parts." *Philosophical Studies* no. 155:37-43.

Abstract: "Traditionally, independence accounts of substance have held pride of place. Aristotle, Aquinas, Descartes and Spinoza—among many others—accepted independence accounts in one form or another. The general thrust of such views is that substances are those things that are apt to exist in themselves. In this paper, I argue that several contemporary independence theories of substance—including those of Kit Fine, E.J. Lowe and Michael Gorman—include an *ad hoc* element that renders them

unacceptable. I'll also consider the theories of Hoffman and Rosenkrantz."

52. Tugby, Matthew. 2016. "Universals, Laws, and Governance." *Philosophical Studies* no. 173:1147-1163.

Abstract: "Proponents of the dispositional theory of properties typically claim that their view is not one that offers a realist, governing conception of laws. My first aim is to show that, contrary to this claim, if one commits to dispositionalism then one does not automatically give up on a robust, realist theory of laws. This is because dispositionalism can readily be developed within a Platonic framework of universals.

Second, I argue that there are good reasons for realist dispositionalists to favour a Platonic view. This is because the alternative Aristotelian version of dispositionalism, on which universals are immanent entities, is unstable for various reasons.

My final aim is to address a common criticism facing Platonic theories of laws, which is the problem of how external entities can play an explanatory role where the world's law-like patterns of behaviour are concerned. I argue that the Platonists' response to the one over many problem can help to shed light on this matter, and a possible solution is sketched, one which makes use of the notions of essence, constitution and ontological dependence."

53. Wigglesworth, John. 2015. "Set-Theoretic Dependence." *Australasian Journal of Logic* no. 12:259-176.

Abstract: "In this paper, we explore the idea that sets depend on, or are grounded in, their members. It is said that a set depends on each of its members, and not vice versa. Members do not depend on the sets that they belong to. We show that the intuitive modal truth conditions for dependence, given in terms of possible worlds, do not accurately capture asymmetric dependence relations between sets and their members. We extend the modal truth conditions to include impossible worlds and give a more satisfactory account of the dependence of a set on its members. Focusing on the case of singletons, we articulate a logical framework in which to evaluate set-theoretic dependence claims, using a normal first-order modal logic. We show that on this framework the dependence of a singleton on its single members follows from logic alone. However, the converse does not hold."

54. Wilson M, Jessica. 2020. "Essence and Dependence." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine*, edited by Dumitru, Mircea, 283-300. New York: Oxford University Press.

"What I aim to do in this paper is threefold. First, I'll substantiate my previous claims concerning Fine's approach to metaphysical theorizing, by attention to his accounts of essence and dependence. Second, I'll raise some specific concerns about the general principles Fine takes to schematically characterize these notions. In particular, I'll argue that Fine's essence-based account of ontological dependence is subject to certain counterexamples. The problem, roughly speaking, is that Fine

supposes that an entity's essence makes reference just to what it ontologically depends on, but various cases suggest that an entity's essence can also make reference to what ontologically depends on it. As such, Fine's account of ontological dependence is subject to the same objection he raises against modal accounts of essence and dependence—that is, of being insufficiently general or ecumenical. Third, I'll close by observing that in cases where the target phenomenon admits of highly diverse applications, as is the case with ontological dependence (or the related notion of ground), there is no guarantee that the search for general principles that are both appropriately contentful and appropriately ecumenical will be successful. Even so, the search for such principles is clearly worthwhile; hence whatever the outcome in a given case, in raising to salience the schema-based approach, Fine has here made a lasting contribution." (p. 284)

55. Zhong, Lei. 2021. "Physicalism Without Supervenience." *Philosophical Studies* no. 178:1529-1544.

Abstract: "It is widely accepted that supervenience is a minimal commitment of physicalism. In this article, however, I aim to argue that physicalism should be exempted from the supervenience requirement. My arguments rely on a parallel between ontological dependence and causal dependence. Since causal dependence does not require causal determination, ontological dependence should not require ontological determination either. Moreover, my approach has a significant theoretical advantage: if physicalism is not committed to supervenience, then the metaphysical possibility of *zombies*—which is still wide open after all these years—would pose no challenge to physicalism."

56. Zylstra, Justin. 2014. "Dependence and Fundamentality." *Studia Philosophica Estonica* no. 7:5-28.

Abstract: "I argue that dependence is neither necessary nor sufficient for relative fundamentality.

I then introduce the notion of 'likeness in nature' and provide an account of relative fundamentality in terms of it and the notion of dependence. Finally, I discuss some puzzles that arise

in Aristotle's *Categories*, to which the theory developed is applied."

Annotated bibliography on the history of ontological dependence

Bibliography

1. Berti, Enrico. 2001. "Multiplicity and Unity of Being in Aristotle." *Proceedings of the Aristotelian Society* no. 101:185–207.

Abstract: "I. In analytic philosophy, so-called 'univocalism' is the prevailing interpretation of the meaning of terms such as 'being' or 'existence', i.e. the thesis that these terms have only one meaning (see Russell, White, Quine, van Inwagen). But some analytical philosophers, inspired by Aristotle, maintain that 'being' has many senses (Austin, Ryle). II. Aristotle develops an argument in favour of this last thesis, observing that 'being' and 'one' cannot be a single genus, because they are predicated of their differences (*Metaph.* B 3). III. But 'being' for Aristotle has also a unity, i.e. 'focal meaning', which coincides with substance (*Metaph.* Γ 2), and substance has not only an ontological priority, but also a logical priority, in respect to the other beings, as was shown by G. E. L. Owen. IV. This 'focal meaning' cannot be identified with primary substance, i.e. with the unmovable mover, as some interpreters pretend, because this latter has only an ontological, not a logical, priority in respect to the world. V. The impossibility of this interpretation results from Aristotle's rejection of an essence and a substance of being (*Metaph.* B 4), i.e. the rejection of what the Christian philosophers called *esse ipsum subsistens*."

2. Blank, Andreas. 2009. "Existential Dependence and the Question of Emanative Causation in Protestant Metaphysics, 1570–1620." *Intellectual History Review* no. 19:1-13.

"That the world is dependent on God for its existence is a view that many Scholastic and early modern thinkers took to be a philosophical implication of the biblical creation story. However, they strongly disagreed about how to analyse the relation of existential dependence. Christia Mercer has argued that there is an interesting and little noticed group of humanist Platonists in German philosophy in the one or two generations before Leibniz. In particular, she holds that Platonism was adopted to understand the relation between God and the created world. In support of her view, she has brought to light numerous passages from little-known works by early modern German philosophers prominent in their day,

such as Johannes Micraelius (1597–1658), Johann Adam Scherzer (1628–1683), Erhard Weigel (1625–1699), and Jacob Thomasius (1622–1684). No doubt, the presence of Platonic strands in German philosophy in the generation before Leibniz is a remarkable but little-appreciated fact.

However, I will argue that, if one recalls the revival of metaphysics at Protestant universities in the period between 1570 and 1620, a more complex picture emerges. While Mercer's account focuses on instances where early modern German thinkers seem to accept wholeheartedly Platonic views about the relation between God and the world, there are also critical responses to thinking about this relation in terms of emanative causation. In this article, I will consider some writings by two philosophers who took a critical stance on this issue: Nicolaus Taurellus and Rudolph Goclenius. Taurellus (1547–1606) studied philosophy at the Lutheran University of Tübingen under Jakob Schegk and medicine at Basel.

He held a chair in ethics in Basel, and then from 1580 a chair in medicine and natural philosophy at the University of Altdorf. Goclenius (1547–1628) held a chair in moral philosophy at the University of Marburg, where his long-standing Reformed leanings allowed him to remain in post after the purge of Lutherans from the University in 1605." "The question of what depends on what, and how, is one of the perennial questions of metaphysics, and the early modern period is no exception to this. Much of the central themes in early modern metaphysics are more or less directly connected with issues about ontological dependence. This holds for Descartes's discussion of the mind/body interaction as well as for Spinoza's discussion of the relations between substance, attributes and modes, for Malebranche's theory of occasional causes as well as for Leibniz's theory of pre-established harmony.⁽¹⁾ Obviously, a comprehensive treatment of ontological dependence in early modern metaphysics would have to be extensive, and presumably it would end up being highly redundant since it would have to cover much ground that is already extremely well researched. The present volume does not seek to even come close to such a comprehensive exposition. Rather, it unites a group of essays that deal with some less familiar aspects of the role of the notion of ontological dependence in early modern metaphysics." (p. 17)

(1) For an overview of the role of ontological dependence in early modern theories of substance, see Burkhardt, "Substance, Attributes and Modes."

(...)

"The approaches traced in the present volume thus can be characterized as problem-oriented in two senses: First, they can all be lead as different attempts at integrating dependence relations—the dependence of created beings on God, the dependencies between created beings, the dependencies between the constituents of created beings—with diverging accounts of the nature of individual substances. And second, they all use such a general framework to offer solutions to more specialized ontological problems. I will take these more specialized problems as starting points of the single chapters and will trace the notions of ontological dependence and individual substance within the framework of the solutions to these problems." (p. 19)

4. Bliss, Ricki, and Priest, Graham. 2018. "Metaphysical Dependence, East and West." In *Buddhist Philosophy: A Comparative Approach*, edited by Emmanuel, Steven M., 63-85. Malden: Wiley Blackwell.

"In Section 4.3, we will look at some of the ways in which metaphysical dependence occurs in Eastern traditions, and in Section 4.4 we will look at its occurrence in Western traditions. In Section 4.5 we will spell out some of the ways each tradition can benefit by being informed of the other.

Before we do this, however, there is a necessary preliminary. The views on metaphysical dependence are many, and there is a great variety of answers to central questions such as "What sorts of things is it which are dependent or independent?",

“What is the nature of metaphysical dependence?”, and “What is the reality like that metaphysical dependence structures?” To get some order into the chaos we need a framework in which to fit views. We do this by providing a taxonomy, the subject of Section 4.2.” (p. 63)

(...)

"Conclusion: In this chapter we have looked at the relation (or relations) of metaphysical dependence as they feature in philosophy – both historical and contemporary.

In an essay of this nature we have been able to do little more than sketch briefly some of the terrain; neither have we attempted to resolve any substantial philosophical issues. Our main aim has been to show that the notion of metaphysical dependence is an important feature of both Western and Eastern traditions, and to alert philosophers who are aware of only one side of this divide to the existence of the other. If it serves to bring the two traditions into dialogue, and so advance this central area of metaphysics, we will feel it has achieved its goal." (p. 81)

5. Cohoe, Caleb. 2013. "There Must Be A First: Why Thomas Aquinas Rejects Infinite, Essentially Ordered, Causal Series." *British Journal for the History of Philosophy* no. 21 (838-856).

Abstract: "Several of Thomas Aquinas's proofs for the existence of God rely on the claim that causal series cannot proceed *in infinitum*. I argue that Aquinas has good reason to hold this claim given his conception of causation.

Because he holds that effects are ontologically dependent on their causes, he holds that the relevant causal series are *wholly* derivative: the later members of such series serve as causes only insofar as they have been caused by and are effects of the earlier members. Because the intermediate causes in such series possess causal powers only by deriving them from *all* the preceding causes, they need a first and nonderivative cause to serve as the source of their causal powers."

6. Constantin, Ion. 2012. "Husserl on the World as an Ontologically Dependent Correlate of the Transcendental

Subject." *Linguistic and Philosophical Investigations* no. 11:103-108.

Abstract: "The purpose of this article is to gain a deeper understanding of Husserl's distinction between conceptual and empirical inquiry, his method of reduction, his commitment to idealism, his aim of criticizing epistemological naturalism, and his definition of the transcendent world. The paper generates insights about Husserl's prioritization of immanence, his account of the primal impression, his prioritization of consciousness, and his transcendental idealism. The results of the current study converge with prior research on Husserl's philosophical idealism, his realism, his development of transcendental phenomenology, and his project of philosophical reform."

7. Corkum, Phil. 2008. "Aristotle on Ontological Dependence." *Phronesis* no. 53:65-92.

Abstract: "Aristotle holds that individual substances are ontologically independent from non-substances and universal substances but that non-substances and universal substances are ontologically dependent on substances. There is then an asymmetry between individual substances and other kinds of beings with respect to ontological dependence. Under what could plausibly be called the standard interpretation, the ontological independence ascribed to individual substances and denied of non-substances and universal substances is a capacity for independent existence. There is, however, a tension between this interpretation and the asymmetry between individual substances and the other kinds of entities with respect to ontological independence. I will propose an alternative interpretation: to weaken the relevant notion of ontological independence from a capacity for independent existence to the independent possession of a certain ontological status."

8. ———. 2013. "Substance and Independence in Aristotle." In *Varieties of Dependence: Ontological Dependence, Supervenience, and Response-Dependence*, edited by Hoeltje,

Miguel, Schnieder, Benjamin and Steinberg, Alex, 65-95.
Munich: Philosophia Verlag.

"Individual substances are the ground of Aristotle's ontology. Taking a liberal approach to existence, Aristotle accepts among existents entities in such categories other than substance as quality, quantity and relation; and, within each category, individuals and universals. As I will argue, individual substances are ontologically independent from all these other entities, while all other entities are ontologically dependent on individual substances. The association of substance with independence has a long history and several contemporary metaphysicians have pursued the connection.(1) In this chapter, I will discuss the intersection of these notions of substance and ontological dependence in Aristotle."

9. ———. 2016. "Ontological Dependence and Grounding in Aristotle." *Oxford Handbooks Online in Philosophy*:1-14.

Abstract: "The relation of ontological dependence or grounding, expressed by the terminology of separation and priority in substance, plays a central role in Aristotle's *Categories*, *Metaphysics*, *De Anima* and elsewhere.

The article discusses three current interpretations of this terminology. These are drawn along the lines of, respectively, modal-existential ontological dependence, essential ontological dependence, and grounding or metaphysical explanation. I provide an opinionated introduction to the topic, raising the main interpretative questions, laying out a few of the exegetical and philosophical options that influence one's reading, and locating questions of Aristotle scholarship within the discussion of ontological dependence and grounding in contemporary metaphysics."

10. De Rizzo, Julio. 2021. "Ingarden on the Varieties of Dependence." *European Journal of Philosophy*.

First online 3 October 2021.

Abstract: "In the third chapter of his major work, the *Controversy over the Existence of the World*, Roman Ingarden discusses four varieties of dependence entities might exhibit. The aim of this essay is to explore these varieties and to put the claims Ingarden makes concerning them on a rigorous footing."

11. Di Bella, Stefano. 2005. "Leibniz's Theory of Conditions: A Framework for Ontological Dependence." *The Leibniz Review* no. 15:67-93.

Abstract: "The aim of this paper is to trace in Leibniz's drafts the sketched outline of a conceptual framework he organized around the key concept of 'requisite'. We are faced with the project of a semi-formal theory of conditions, whose logical skeleton can have a lot of different interpretations. In particular, it is well suited to capture some crucial relations of ontological dependence. Firstly the area of 'mediate requisites' is explored - where causal and temporal relations are dealt with

on the basis of a general theory of 'consequence'. Then the study of 'immediate requisites' is taken into account - a true sample of mereological inquiry, where Leibniz strives for a unitary treatment of part-whole relation, conceptual inclusion and inherence. Far from simply conflating these relations one with another and with causality, therefore, Leibniz tried to spell them out, while at the same time understanding them within a single conceptual framework."

12. Edelhoff, Ana Laura. 2020. *Aristotle on Ontological Priority in the Categories*. Cambridge: Cambridge University Press.

Abstract: "The main objective of this Element is to reconstruct Aristotle's view on the nature of ontological priority in the *Categories*. Over the last three decades, investigations into ontological dependence and priority have become a major concern in contemporary metaphysics. Many see Aristotle as the originator of these discussions and, as a consequence, there is considerable interest in his own account of ontological dependence. In light of the renewed interest in Aristotelian metaphysics, it will be worthwhile - both historically and systematically - to return to Aristotle himself and to see how he conceived of ontological priority (what he calls "priority in substance" (*proteron kata ousian*) or "priority in nature" (*proteron tei phusei*)), which is to be understood as a form of asymmetric ontological dependence."

13. Gorman, Michael M. 1994. "Ontological priority and John Duns Scotus." *Philosophical Quarterly* no. 44:460-471.

"The term 'ontological priority' is used fairly often in philosophical discourse.

The ways in which it is used are so varied, however, that it is tempting to suppose that they may have nothing in common. The purpose of this essay is to develop an inclusive definition of ontological priority, one that includes the various uses as special cases, by utilizing John Duns Scotus's concept of 'essential order'.

The interest of such a definition lies not only in the fact that it makes sense of the various meanings usually given to the term

'ontological priority', but also in the fact that it marks out a special class of relations. First, I will discuss the senses usually given to 'ontological priority' in the literature; second, I will consider the problems with defining it; third, I will examine Scotus's notion of essential order; finally, I will use that Scotistic notion to develop an inclusive definition of 'ontological priority'." (p. 460)

14. Imaguire, Guido. 2021. "On the Coherence of Aristotelian Universals." *Synthese* no. 199:7255-7263.

Abstract: "The current interest in the notions of ontological dependence and metaphysical grounding is usually associated with a renewal of interest in Aristotelian metaphysics. Curiously, some authors have recently argued that the Aristotelian view of universals, according to which universals depend for their existence on their exemplifiers, is incoherent from a grounding perspective. In this paper I argue that such criticism is misleading. I shall examine their arguments and clarify the supposed incoherence."

15. Kriegel, Uriah. 2016. "Brentano's Latter-day Monism." *Brentano Studien* no. 14:69-77.

"According to "existence monism", there is only one concrete particular, the cosmos as a whole (Horgan and Potrč 2000, 2008). According to "priority monism," there are many concrete particulars, but all are ontologically dependent upon the cosmos as a whole, which accordingly is the only *fundamental* concrete particular (Schaffer 2010a, 2010b). In essence, the difference between them is that existence monism does not recognize any parts of the cosmos, whereas priority monism does – it just insists that the parts are ontologically dependent upon the whole in this case.

Brentano never maintained either of these views. But in the last two years of his life, he seems to have held the following approximation: *there is only one physical substance*, namely, the material universe as a whole. This is twice removed from existence or priority monism: first, it allows for a plurality of mental substances (souls); secondly, it allows for a plurality of physical accidents, which in Brentano's reistic ontology are also

concrete particulars (see Kriegel 2015). Still, the view that the only physical substance is the universe as a whole is quite radical and finds little precedent in the history of philosophy." (p. 69)

16. Massin, Olivier. 2018. "Brentanian Continua." *Brentano Studien* no. 16:229-276.

"Brentano's theory of continuity is based on his account of boundaries.

The core idea of the theory is that boundaries and coincidences thereof belong to the essence of continua. Brentano is confident that he developed a full-fledged, boundary-based, theory of continuity; and scholars often concur: whether or not they accept Brentano's take on continua they consider it a clear contender. My impression, on the contrary, is that, although it is infused with invaluable insights, several aspects of Brentano's account of continuity remain inchoate. To be clear, the theory of boundaries on which it relies, as well as the account of ontological dependence that Brentano develops alongside his theory of boundaries, constitute splendid achievements. However, the passage from the theory of boundaries to the account of continuity is rather sketchy. This paper pinpoints some chief problems raised by this transition,

and proposes some solutions to them which, if not always faithful to the letter of Brentano's account of continua, are I believe faithful to its spirit.

§1 presents Brentano's critique of the mathematical account of the continuous. §2 introduces Brentano's positive account of continua. §3 raises three worries about Brentano's account of continuity. §4 proposes a Neo-Brentanian approach to continua that handles these worries." (pp. 229-230, a note omitted)

17. Neels, Richard. 2018. "*Phusis*, Opposites and Ontological Dependence in Heraclitus." *History of Philosophy Quarterly* no. 35:199-217.

"In the first section of this paper, I argue for a specific way of understanding Heraclitus's use of *phusis*. For Heraclitus, the character, or *phusis*, of an object is defined by a structure of opposing yet essential properties inherent in that object. In the second section, I use this specific definition of *phusis* to explain the set of Heraclitean fragments that I believe exhibit this understanding of *phusis*. In the third section, I discuss the river fragment and argue that it and some similar fragments also exhibit Heraclitus's notion of *phusis*. In the final section, I argue that the relationship between objects and opposites is one of dependence.

I end by attributing to Heraclitus the *dependence on opposites* thesis, which states that *objects are ontologically dependent for their existence and their identity (that is, their "nature" or phusis) on opposing yet essential properties that are necessarily inherent in them.*" (pp. 199-200)

18. Orilia, Francesco. 2009. "Bradley's Regress and Ungrounded dependence Chains: A Reply to Cameron." *Dialectica* no. 63:333-341.

Abstract: "A version of Bradley's regress can be endorsed in an effort to address the problem of the unity of states of affairs or facts, thereby arriving at a doctrine that I have called fact infinitism. A consequence of it is the denial of the thesis, WF, that all chains of ontological dependence are well-founded or grounded. Cameron has recently rejected fact infinitism by

arguing that WF, albeit not necessarily true, is however contingently true. Here fact infinitism is supported by showing that Cameron's argument for the contingent truth of WF is unsuccessful."

19. Pfeiffer, Christian. 2018. "Aristotle and the Thesis of Mereological Potentialism." *Philosophical Inquiry* no. 42:28-66.

Abstract: "According to Aristotle, the way in which the parts of a whole are is different from the way in which the whole exists. Parts of an object are only potentially, whereas the whole exists actually. Although commentators agree that Aristotle held this doctrine, little effort has been made to spell out precisely what it could mean to say that the parts are only potentially.

In this paper, I shall attempt to elucidate that claim and explain the philosophical motivation behind it. I will argue that the motivation of mereological potentialism is to account for the unity of material substance. For a part to be potentially is, I will argue, a form of ontological dependence of the part on the whole. Potential parts have their being as a possible division of the whole. I will further explain this by specifying how the parts are grounded in the capacities of the whole and how the parts are individuated by the whole."

20. Ruloff, Colin P. 2014. "Divine Thoughts and Fregean Propositional Realism." *International Journal for Philosophy of Religion* no. 76:41-51.

Abstract: "Abstract Anderson and Welty have recently advanced an argument for the claim that the laws of logic are ontologically dependent upon a necessarily existent mind, i.e. God. In this paper I argue that a key premise of Anderson and Welty's argument—viz., a premise which asserts that x is intrinsically intentional only if x is mind-dependent— is false, for on a broadly Fregean account of propositions, propositions are intrinsically intentional but not mind-dependent."

21. Sentesy, Mark. 2018. "The Now and the Relation between Motion and Time in Aristotle: A Systematic Reconstruction." *Apeiron* no. 51:279-323.

Abstract: "This paper reconstructs Aristotle's account of the now to clarify the relationship between motion and the number of time. If time is the number of motion, then the priority of motion can be grasped by examining his theory of number. The paper gives a systematic overview of the now in relation to motion, to the constitution of units, and to number in general. This shows that, for Aristotle, the now is not itself an extended unit, and defends his view against claims that time is implicitly prior to motion. The temporal number is co-constituted by the soul and motion, and the now is key to understanding how this occurs. This paper shows that, just as numbers are generated by the soul, time emerges through the soul's articulation of motion using a now. The now is a limit that marks out and sets up the abstraction of a temporal unit from its underlying motion. This reconstruction provides a strong basis for the claim that time is ontologically dependent on motion, and secondarily on the soul."

22. Snyder, James G. 2011. "Marsilio Ficino and Frane Petrić on the "Ontological Priority" of Matter and Space." *Synthesis Philosophica* no. 26:229-239.

Abstract: "This paper is a comparison of some of the central ontological claims on the nature of prime matter of the Renaissance Platonist Marsilio Ficino, and the nature of space of Frane Petrić, the sixteenth century Platonist from the town of Cres. In it I argue that there are two respects in which the natural philosophies of both Platonists resemble one another, especially when it comes to the ontological status of the most basic substrate of the material world. First, both Ficino and Petrić argue for the basic existence of matter and space. Second, both philosophers attribute an "ontological priority" to

matter and space over what are seen as the fleeting qualities of the material world."

23. Turnbull, Robert G. 1959. "Aseity and Dependence in Leibniz's Metaphysics." *Theoria* no. 25:95-114.

"It is part of my intention in this paper to show that the fundamental features of Leibniz's metaphysics can be properly thought of as emerging from an attempt to make appropriate emendations in the Platonic pattern.

There is a patent similarity between Platonic souls and Leibnizian "metaphysical points"; both are such that their *esse* is *agere*. This comment, at the moment, is not really very illuminating.

It wants exploitation. To exploit it will require our taking a rather circuitous route. We start naturally, I believe, with some critical reflections upon the Platonic doctrine of dependence *per praesentiam*." (p. 97)

24. Unlu, Hikmet. 2020. "Aristotle on Ontological Priority." *Acta Philosophica* no. 1:137-158.

Abstract: "There are several passages in the *Metaphysics* where Aristotle explains ontological priority in terms of ontological dependence, but there are others where he seems to adopt a teleological conception of ontological priority. It is sometimes maintained that the latter priority too must be construed in terms of the former, or that the priorities in question are not both endorsed (or simultaneously endorsed) by Aristotle. The goal of this paper is to show otherwise; I argue that what is at issue are two distinct priorities that Aristotle simultaneously endorses."

25. Vilhauer, Benjamin. 2008. "Incompatibilism and Ontological Priority in Kant's Theory of Free Will." In *Incompatibilism and Ontological Priority in Kant's Theory of Free Will*, edited by Muchnik, Pablo.

"Kant is an incompatibilist about free will and determinism. Like all incompatibilists, Kant thinks that there is a fundamental conflict between determinism and free will. But

like no other incompatibilist, Kant holds both that determinism is true, and that we have free will. Kant thinks that the truth of determinism is demonstrated by the conclusion of the Second Analogy, that is, by the conclusion that the necessitation of all alterations according to causal laws is a condition for the possibility of the experience of objective succession. But he also thinks we have an immediate awareness that we are morally responsible, in a sense that implies that we have free will. This awareness is based on what he describes in the second Critique as a "fact of pure reason." (p. 22)

"The purpose of this paper is to argue that Kant's incompatibilism can only be accommodated if one accepts the "ontological" interpretation of this distinction, i.e. the view that agents qua noumena are ontologically prior to agents qua phenomena.

(...)

This paper has two main parts. In the first part, the ontological interpretation will be described, and an explanation will be given of how it makes room for Kant's incompatibilism. Recent (independent) work by the present author, Eric Watkins, and Robert Hanna will be drawn on to demonstrate that the ontological interpretation can mount a better defense against some traditional objections than has often been thought. In the second part, the two-aspect interpretation of Kant's theory of free will shall be described, and it will be argued that it cannot make room for Kant's incompatibilism." (pp. 23-24)

Linguistic Relativism (Sapir-Whorf Hypothesis) vs. Universal Grammar

Introduction

"Early in the twentieth century, American anthropologist Franz Boas (1858-1942) inaugurated an important expansion of scientific investigation of the languages of native North America. As part of a broad critique of nineteenth-century evolutionary arguments he stressed the equal value of each language type and their independence from race and cultural level. He argued that each language necessarily represents an implicit classification of experience, that these classifications vary across languages, but that such variation probably has little effect on thought or culture.

His student Edward Sapir (1884-1939) accepted the main thrust of Boas' position but came to feel that the closely knit system of categories in a language could represent incommensurable analyses of experience with effects on speakers' conceptual view points and aesthetic interpretations. Gestalt and psychoanalytic psychology and Sapir's own literary efforts also played a role in his thinking on this issue. Sapir's concern was not with linguistic form as such (for example, whether a language uses inflections or not), nor with linguistic content or meaning as such (for example, whether a language could refer to a particular referent), but rather with the formal organization of meaning characteristic of a language, the regular ways meanings are constructed (for example, grammatical categories and patterns of semantic composition). Despite the suggestiveness of his formulation, Sapir provided few specific illustrations of the sorts of influences he had in mind.

Benjamin Lee Whorf (1897-1941), a gifted amateur linguist independently interested in these issues as they related to the nature of science, came into contact with Sapir in 1930 and began developing these views to a more systematic way. He analysed particular linguistic constructions, proposed mechanisms of influence, and provided empirical demonstrations of such influences on belief and behavior. However, his views on this issue are known to us largely through letters, unpublished manuscripts and popular pieces, which has led to considerable debate about his actual position. In this context, the one article on this issue prepared for a professional audience must be given special weight (see Whorf 1956). (1) Whorf argued that each language refers to an infinite variety of experiences with a finite array of formal categories (both lexical and grammatical) by trouping experiences together as analogically 'the same' for the purposes of speech. These categories also interrelate in a coherent way, reinforcing and complementing one another, so as to constitute an overall interpretation of experience. Languages vary considerably not only in the basic distinctions they recognize, but also in the assemblage of these categories into a coherent system of reference. Thus the system of categories which each language provides to its speakers is not a common, universal system, but one peculiar to the individual language, and one which makes possible a particular 'fashion of speaking'.

But speakers tend to assume that the categories and distinctions of their language are natural, given by external reality. Further, speakers make the tacit error of assuming that elements of experience which are classed together on one or another criterion for the purposes of speech are similar in other respects as well. The crux of Whorf's argument is that these linguistic categories are used as guides in habitual thought. When speakers attempt to interpret an experience in terms of a category available in their language they automatically involve the other meanings implicit in that particular category (analogy) and in the overall configuration of categories in which it is embedded. And speakers regard these other meanings as being intrinsic to the original experience rather than a product of linguistic analogy. Thus, language does not so much blind speakers to some obvious reality, but rather it suggests associations which are not necessarily entailed by experience. Ultimately, these shaping

forces affect not only everyday habitual thought but also more sophisticated philosophical and scientific activity. In the absence of another language (natural or artificial) with which to talk about experience, speakers will be unlikely to recognize the conventional nature of their linguistically based understandings." (p. 471)

Notes

(1) "The relation of habitual thought and behavior to language" (1939) reprinted in B. L. Whorf *Language, thought, and reality. Selected writings.* Cambridge: Technology Press of Massachusetts Institute of Technology 1956 pp. 134-159).

From: John A. Lucy, "Sapir-Whorf Hypothesis", in: Edward Craig (ed.) *Routledge Encyclopedia of Philosophy*, London, New York: Routledge 1998.

"The original idea, variously attributable to Humboldt, Boas, Sapir, Whorf, was that the semantic structures of different languages might be fundamentally incommensurable, with consequences for the way in which speakers of specific languages might think and act. On this view, language, thought, and culture are deeply interlocked, so that each language might be claimed to have associated with it a distinctive world view.

These ideas captured the imagination of a generation of anthropologists, psychologists, and linguists, as well as members of the general public. They had deep implications for the way anthropologists should conduct their business, suggesting that translational difficulties might lie at the heart of their discipline. However, the ideas seemed entirely and abruptly discredited by the rise of the cognitive sciences in the 1960s, which favoured a strong emphasis on the commonality of human cognition and its basis in human genetic endowment. This emphasis was strengthened by developments within linguistic anthropology, with the discovery of significant semantic universals in color terms, the structure of ethnobotanical nomenclature, and (arguably) kinship terms.

However, there has been a recent change of intellectual climate in psychology, linguistics, and other disciplines surrounding anthropology, as well as within linguistic anthropology, towards an

intermediate position, in which more attention is paid to linguistic and cultural difference, such diversity being viewed within the context of what we have learned about universals (features shared by all languages and cultures). New work in developmental psychology, while acknowledging underlying universal bases, emphasizes the importance of the socio-cultural context of human development. Within sociolinguistics and linguistic anthropology there has also been increasing attention to meaning and discourse, and concomitantly a growing appreciation of how interpretive differences can be rooted as much in the systematic uses of language as in its structure." (pp. 2-3)

(...)

"The boldness of Whorf's formulation prompted a succession of empirical studies in America in the 1950s and early 1960s aimed at elucidating and testing what now became known as the Sapir-Whorf hypothesis.

Anthropological and linguistic studies by Trager, Hoijer, Lee, Casagrande, and others have been well reviewed elsewhere (see Lucy Language diversity and thought. A reformulation of the linguistic relativity hypothesis chapter 3; and this volume). These studies hardly touched on cognition, but in the same period a few psychologists (notably Lenneberg, Brown, Steffle) did try to investigate the relation between lexical coding and memory, especially in the domain of color, and found some significant correlations (again see Lucy chapter 5). This line of work culminated, however, in the celebrated demonstration by Berlin & Kay (1969) of the language-independent saliency of "basic colors," which was taken as a decisive anti-relativist finding, and effectively terminated this tradition of investigations into the Sapir-Whorf hypothesis. There followed a period in which Whorf's own views in particular became the butt of extensive criticism.

It is clear from this background that the "Sapir-Whorf" hypothesis in its classical form arose from deep historical roots but in a particular intellectual climate. Even though (it has been closely argued by Lucy op. cit.) the original hypothesis has never been thoroughly tested, the intellectual milieu had by the 1960s entirely changed. Instead of empiricism, we now have rationalistic assumptions. Instead of the

basic tenets of structuralism, in which each linguistic or social system must be understood first in internal terms before comparison is possible, modern comparative work (especially in linguistics) tends to presume that one can isolate particular aspects or traits of a system (e.g. aspect or subjecthood) for comparison. The justification, such as it is, is that we now have the outlines of a universal structure for language and perhaps cognition, which provides the terms for comparison. It is true that the assumption of unconscious processes continues, but now the emphasis is on the unconscious nature of nearly all systematic information processing, so that the distinctive character of Whorf's habitual thought has been submerged.

In this changed intellectual climate, and in the light of the much greater knowledge that we now have about both language and mental processing, it would be pointless to attempt to revive ideas about linguistic relativity in their original form. Nevertheless, there have been a whole range of recent intellectual shifts that make the ground more fertile for some of the original seeds to grow into new saplings. It is the purpose of this volume to explore the implications of some of these shifts in a number of different disciplines for our overall view of the relations between language, thinking, and society." (pp. 6-7)"

From: John J. Gumperz and Stephen C. Levinson, *Rethinking Linguistic Relativity*, Cambridge: Cambridge University Press 1996.

Historical roots of the Sapir-Whorf Hypothesis

"In traditional scholarship concerning the intellectual roots of the so-called Sapir -Whorf Hypothesis' -- a term perhaps first used by Harry Hoijer (1904-1976) in 1954 in a paper at a conference devoted to the subject, but probably made more widely known through John B. Carroll's (b. 1916) posthumous edition of Benjamin Lee Whorf's papers in 1956 (cf page 27) -- these are traced largely, but not exclusively, to German language theory of the 17th (e.g., Leibniz) through the early 19th century, which, in Humboldt's version, connects the 'inner form' of a language with the particularity of a world view of the nation that speaks it. This traditional view (surveyed in Koerner 1992) has recently been challenged by Joseph (1996) and, where Whorf's work in general is concerned, by Lee

(1996) in her monograph treatment of Whorf's 'theory complex' (especially Chapter 3). In this short paper the argument is made that these seemingly opposite positions concerning intellectual indebtedness are not necessarily mutually exclusive, but that an allowance should be made for the presence, latent or keenly felt, of two distinct but at least loosely connected layers of influence discernible in the work of North American linguists and anthropologists studying indigenous languages from Whitney to Whorf and his followers. So while the first, perhaps more general and less explicit kind of influence (at least where Whorf is concerned) derives from a fairly long-standing tradition in German philosophy of language, appropriate room should definitely be given to the more immediate sources of the idea that one's native language determines individual and cultural patterns of thought which Joseph (1996) has documented so carefully, this idea held by Herder and, notably, by Humboldt (which he dubs the 'magic key' view), whereby language is seen as embodying the national mind and unfolding in line with the Romantic concept of history, in contrast to the other version (dubbed by him 'metaphysical garbage'), which envisions language developing within an evolutionary view of history and which is seen as introducing obstacles to logical thought. This latter view, Joseph holds, appears to have been commonplace in Cambridge analytical philosophy, represented most prominently by Alfred North Whitehead (1861-1947) and Bertrand Russell (1872-1970), and in Viennese logical positivism, reflected in the work of Rudolf Carnap (1891-1970). Joseph identifies Charles Kay Ogden (1889-1957) as the key link between Cambridge and Vienna, whose influential book of 1923 *The Meaning of Meaning*, co-authored with Ivor Armstrong Richards (1893-1979), subtitled "The influence of language on thought and of the science of symbolism", contains, Joseph demonstrates, many of the positions held by both Whorf and Sapir.

According to Joseph (1996), Sapir's positive review of the same year of Ogden and Richards' influential book marks a turning point from his view of language as a cultural product (as in his 1921 book *Language*, which incidentally was one of the works criticized in Ogden and Richards) to a sort of template around which the rest of culture is structured, as argued in his "The Status of Linguistics as a

Science" (1929), This paper, Joseph suggests, like others of Sapir's writings from 1923 on, takes up the rhetoric of 'metaphysical garbage' almost exclusively. Whorf in turn, drawn by Sapir to structuralism from originally mystical interests in language - beginning with his discovery in 1924 of the quasi-Cabbalistic writings of Antoine Fahre d'Olivet (1768-1825), likewise takes up this 'garbage' line, interweaving it with 'magic key' only in the two years between Sapir's death and his own. Joseph in his important, indeed ground-breaking study on the subject -- also investigates other influences on Whorf, for instance the writings of the analytic philosopher Count Alfred Korzybski (1879-1950), founder of the General Semantics movement in the United States. As a result, my own paper, like my previous research on the subject, can be regarded as dealing more with part of the general intellectual climate that informed American scholarship during much of the 19th and the early 20th century, than with most of the direct, textually traceable sources, of the so-called Sapir-Whorf Hypothesis that Joseph had identified." "Against recent arguments, which define alternative conceptual schemes in terms of failure of translatability and insist that since such schemes cannot be translated, they cannot be made intelligible, I argue that even if Whorf is mistaken about the

Hopi, he does describe, using the same grammatical criteria as Strawson, a scheme radically different to that described in "Individual's" (our scheme). It seems appropriate to mark the difference by "alternative conceptual scheme." Further, I claim that not translation but rather a process of substitution of, or addition to, a first language is the key to understanding a radically different second language."

7. Björk, Ingrid. 2008. *Relativizing Linguistic Relativity: investigating Underlying Assumptions about Language in the Neo-Whorfian Literature* . Uppsala: Uppsala Universitet.

"This work concerns the linguistic relativity hypothesis, also known as the Sapir-Whorf hypothesis, which, in its most general form claims that 'lan-guage' influences 'thought'. Past studies into linguistic relativity have treated various aspects of both thought and language, but a growing body of literature has recently emerged, in this thesis referred to as neo-Whorfian, that empirically investigates thought and language from a cross-linguistic perspective and claims that the grammar or lexicon of a particular language influences the speakers' non-linguistic thought.

The present thesis examines the assumptions about language that underlie this claim and criticizes the neo-Whorfian arguments from the point of view that they are based on misleading notions of language. The critique focuses on the operationalization of thought, language, and culture as separate vari-ables in the neo-Whorfian empirical investigations. The neo-Whorfian stud-ies explore language primarily as 'particular languages' and investigate its role as a variable standing in a causal relation to the 'thought' variable. Tho-ught is separately examined in non-linguistic tests and found to 'correlate' with language.

As a contrast to the neo-Whorfian view of language, a few examples of other approaches to language, referred to in the thesis as sociocultural appro-aches, are reviewed. This perspective on language places emphasis on prac-tice and

communication rather than on particular languages, which are viewed as secondary representations. It is argued that from a sociocultural perspective, language as an integrated practice cannot be separated from thought and culture. The empirical findings in the neo-Whorfian studies need not be rejected, but they should be interpreted differently. The findings of linguistic and cognitive diversity reflect different communicational practices in which language cannot be separated from non-language."

"Intended as a commemoration of the 60th anniversary of Whorf's death, this paper reviews the revival of the thesis of linguistic relativity (the so-called "Sapir-Whorf hypothesis") in linguistics. If the demise of Whorf's hypothesis, in the early Sixties, was tantamount to an irrevocably condemnation by the

philosophical community, then how should philosophers react to the rejuvenation of Whorf's hypothesis?

In my opinion philosophers should take seriously the recent attempts to reformulate that hypothesis in order to avoid oversimplifications. I challenge William Harvey, (*Philosophy Today*, summer 1996, pp. 273-286) by arguing that he is guilty of such an oversimplification."

27. Ellos, William J. 1982. "Benjamin Lee Whorf and ultimate reality and meaning." *Ultimate Reality and Meaning* no. 5:140-150.

"Surface and depth structure forms the central focal point of Whorf's creative work. In his developed system surface language-forms are called phenotypes and depth-elements are termed cryptotypes. Meaning is the interplay between the two. Penotypes are overt categories and cryptotypes are covert categories. Selective categories may be overt or covert but basically they work along lexemic lines. Modulus categories may be overt or covert but basically they work along grammatical lines. Semantic categories tend to be surface groupings of linguistic elements and hence carry no meaning."

"There can be no coherent "Sapir-Whorf" hypothesis. Sapir's mentalism, in contrast to Whorf's associationism, is best understood in the rationalist tradition. His phonology is almost Platonist: "psychological reality" -- i.e., patterns of phonemes -- control both production and perception of speech. His anthropology is also reminiscent of Plato in its insistence on a dialectical relationship with native informants. However his

- epistemological insight that "syntax modulates understanding" resembles a central theme of Wittgenstein's later philosophy."

 36. Goddard, Cliff. 2008. "Whorf meets Wierzbicka: variation and universals in language and thinking." *Language Sciences* no. 25:393-432.

"Probably no contemporary linguist has published as profusely on the connections between semantics, culture, and cognition as Anna Wierzbicka. This paper explores the similarities and differences between her "natural semantic metalanguage" (NSM) approach and the linguistic theory of Benjamin Lee Whorf. It shows that while some work by Wierzbicka and colleagues can be seen as "neo-Whorfian", other aspects of the NSM program are "counter-Whorfian". Issues considered include the meaning of linguistic relativity, the nature of conceptual universals and the consequences for semantic methodology, the importance of polysemy, and the scale and locus of semantic variation between languages, particularly in relation to the domain of time. Examples are drawn primarily from English, Russian, and Hopi."

"The Sapir-Whorf hypothesis (that grammar influences world view) is employed to explain the differences between German, French and English philosophical traditions. German philosophy's idealist, unitary and systematic tendencies are attributed to German's end-verbs, case system, root morphemes and initial qualifiers. French philosophy's dualism and rationalist analysis are ascribed to that language's more abstract signifiers and its description by progressive discrete divisions. And English philosophy's skeptical materialist empiricism is attributed to English's mixing of French and German syntax and lexicons, and to the higher incidence of passive constructions in English."

"The linguistic relativity (Whorfian) hypothesis states that language influences thought. In its strongest form, the hypothesis states that language controls both thought and perception. Several experiments have shown that this is false. The weaker form of the hypothesis, which states that language influences thought, has been held to be so vague that it is unprovable. The argument presented herein is that the weaker Whorfian hypothesis can be quantified and thus evaluated. Models of cognition developed after Whorf's day indicate ways in which thought can be influenced by cultural variations in the lexical, syntactical, semantic, and pragmatic aspects of language. Although much research remains to be done, there appears to be a great deal of truth to the linguistic relativity hypothesis. In many ways the language people speak is a guide to the language in which they think."

47. ———. 1997. "A cross-linguistic study of early word meaning: Universal Ontology and linguistic influence." *Cognition* no. 62:169-200.

"This research concerns how children learn the distinction between substance names and object names. Quine (1969) proposed that children learn the distinction through learning the syntactic distinctions inherent in count/mass grammar. However, Soja et al. (1991) found that English-speaking 2-year-olds, who did not seem to have acquired count/mass grammar, distinguished objects from substances in a word extension task, suggesting a pre-linguistic ontological distinction. To test whether the distinction between object names and substance names is conceptually or linguistically driven, we repeated Soja et al.'s study with English- and Japanese-speaking 2-, 2.5-, and 4-year-olds and adults. Japanese does not make a count-mass grammatical distinction: all inanimate nouns are treated alike. Thus if young Japanese children made the object-substance distinction in word meaning, this would support the early ontology position over the linguistic influence position. We used three types of standards: substances (e.g., sand in an S-shape), simple objects (e.g., a kidney-shaped piece of paraffin) and complex objects (e.g., a wood whisk). The subjects learned novel nouns in neutral syntax denoting each standard entity. They were then asked which of the two alternatives -- one matching in shape but not material and the other matching in material but not shape--would also be named by the same label. The results suggest the universal use of ontological knowledge in early word learning. Children in both languages showed differentiation between (complex) objects and substances as early as 2 years of age. However, there were also early cross-linguistic differences. American and Japanese children generalized the simple object instances and the substance instances differently. We speculate that children universally make a distinction between individuals and non-individuals in word learning but that the nature of the categories and the boundary between them is influenced by language."

of Universal Ontological Knowledge in the Construal of Individuation." In *Language in Mind: Advances in the Study of Language and Thought*, edited by Gentner, Dedre and Goldin-Meadow, Susan, 429-464. Cambridge (MA): The MIT Press.

49. ———. 2007. "Language-Relative Construal of Individuation Constrained by Universal Ontology: Revisiting Language Universals and Linguistic Relativity." *Cognitive Science* no. 31:385-413.

Abstract. "Objects and substances bear fundamentally different ontologies. In this article, we examine the relations between language, the ontological distinction with respect to individuation, and the world.

Specifically, in cross-linguistic developmental studies that follow Imai and Gentner (1997), we examine the question of whether language influences our thought in different forms, like (1) whether the language-specific construal of entities found in a word extension context (Imai & Gentner, 1997) is also found in a non-linguistic classification context; (2) whether the presence of labels per se, independent of the count-mass syntax, fosters ontology-based classification; (3) in what way, if at all, the count-mass

syntax that accompanies a label changes English speakers' default construal of a given entity?

On the basis of the results, we argue that the ontological distinction concerning individuation is universally shared and functions as a constraint on early learning of words. At the same time, language influences one's construal of entities cross-linguistically and developmentally, and causes a temporary change of construal within a single language. We provide a detailed discussion of how each of these three ways language may affect the construal of entities, and discuss how our universally possessed knowledge interacts with language both within a single language and in cross-linguistic context."

"Examining the Sapir-Whorf hypothesis, the author addresses the questions whether language affects perception and whether grammatical categories affect conceptual categories. he argues that advocates of linguistic relativity have attributed to language an unjustified degree of causal efficacy and that linguistic idealism is contradicted by the results of experimental psychology. Then, considering the claimed correlation between grammatical and conceptual categories, he argues that grammar has no metaphysics and does not influence thought. The author concludes that language in use embodies a point of view only in the weak sense that relations and distinctions implicit in necessary concepts constitute a philosophical theory about reality."

61. Langacker, Ronald W. 1976. "Semantic representations and the linguistic relativity hypothesis." *Foundations of Language* no. 14:307-357.

In evaluating the linguistic relativity hypothesis, it is necessary to avoid using terms in such a way as to empty the hypothesis of empirical content; it is also necessary to separate related but distinct issues. There is no reason to accept any strong version of the hypothesis when this is understood to pertain to

differences in cognition due to non-universal aspects of language structure.

Generative grammarians have been led by their orientation and findings to reject the hypothesis, But their ideas on the relation between language and thought have often been confused and burdened by gratuitous assumptions. It is argued that 'semantic representations', the semantic objects determined by linguistic principles, cannot be equated with the primary structures manipulated in cognition, termed 'conceptual structures'. It is further argued, With lexical and grammatical examples from various languages, that semantic representations are not universal, even granted essential uniformity of cognition for all speakers and the viability of an informal notion of semantic equivalence between sentences."

"This paper is concerned with relativism regarding factual knowledge. (Relativism regarding value-judgments is not

discussed.) That position is identified with the view that assertions cannot be judged true or false in themselves, but must be judged with reference to one or more aspects of the total situation in which they are made. Three forms of relativism are discussed: subjective relativism (e.g., C. A. Beard); objective relativism (e.g., J. H. Randall, jr.); conceptual relativism (e.g., B. L. Whorf; T. S. Kuhn). in each case an acceptance of arguments in favor of the position is held to involve prior commitment to a non-relativistic interpretation of some judgments concerning matters of fact; thus, the position is self-limiting."

"Language relativism can be associated with two major conceptions: that "each language has or is a particular spirit" and that "each language has or is a-real or imagined-territory." Spirituality and territoriality combined give rise to the ideology of a language as a realm. This ideology of Modern Greek as a regime language has become dominant after the official establishment of a standard norm (demotic) and the resolution of the perennial "Greek Language Question." As it is evidenced by a host of "language issues" raised in the Greek newspapers since 1976, relativism has determined what counted as a "language issue" that was worth publishing, which language

issues were eligible for public debates, and the extent to which language issues were allowed to penetrate "public opinion".

Abstract: "This paper aims at providing a basic rationale for methodological concerns in empirical investigations of the relation between language and thought. It will be assumed that the existence of such a relationship may be valid, and further that language may assume some causal effect within it. This paper thus revives the notion of linguistic relativity as exposed by Benjamin Lee Whorf (1956). Slobin's 'Thinking for Speaking' research (1996 & 2000) on this topic will be reviewed critically, with the aim of altering the methodology followed so as to avoid circularity of argument. Throughout this paper, I will argue that any empirical research testing the potential influence of language on thinking must (a) provide non- linguistic stimuli, and (b) obtain non- linguistic data, so that test-subjects' cognitive behaviour is not biased at any point by linguistic input during task performance. This paper will present the design of one such experiment. It will then discuss some preliminary results, and suggest potential conclusions."

"Everything leads us to believe that an 'exotic' language produces exotic metaphors, which in turn condition those modes of thought different from our own. Comparative analysis of a metaphorical field common to Greece and China (light and the mirror) shows that the philosophical differences do not proceed from the various material of the metaphors used, but rather from the different attitudes to language. The hypothesis of linguistic relativism far from being either weakened or confirmed by this comparative analysis, appears itself to depend on the manner in which Greek and Occidental thought conceived the relation of thought to language."

Abstract: "The idea that natural languages shape the way we think in different ways was popularized by Benjamin Whorf, but then fell out of favor for lack of empirical support. But now, a new wave of research has been shifting the tide back toward linguistic relativity. The recent research can be interpreted in different ways, some trivial, some implausibly radical, and some both plausible and interesting. We introduce two theses that would have important implications if true: Habitual Whorfianism and Ontological Whorfianism. We argue that these offer the most promising interpretations of the emerging evidence."

"The long tried methods of Indo-European linguistics have proved themselves by the success with which they have been applied to other fields, for instance Central Algonkian and Athabaskan. An increasing interest in linguistics may be noted among workers in anthropology, culture history, sociology, psychology, and philosophy. For all of them linguistics is of basic importance: its data and methods show better than those of any other discipline dealing with socialized behavior the possibility of a truly scientific study of society. Linguists should, on the other hand, become aware of what their science may mean for the interpretation of human conduct in general."

"Three experiments assessed the possibility, suggested by Quine (1960, 1969) among others, that the ontology underlying natural language is induced in the course of language learning, rather than constraining learning from the beginning. Specifically, we assessed whether the ontological distinction between objects and non-solid substances conditions projection of word meanings prior to the child's mastery of count/mass syntax. Experiments 1 and 2 contrasted unfamiliar objects with unfamiliar substances in a word-learning task. Two-year-old subjects' projection of the novel word to new objects respected the shape and number of the original referent. In contrast, their projection of new words for non-solid substances ignored shape

and number. There were no effects of the child's knowledge of count/mass syntax, nor of the syntactic context in which the new word was presented. Experiment 3 revealed that children's natural biases in the absence of naming do not lead to the same pattern of results. We argue that these data militate against Quine's conjecture."

"The thesis of "linguistic relativity" argued for by Whorf is by no means novel. The main elements of Whorf's views can be found as far back as the writings of Wilhelm von Humboldt, and more lately in those of Ernst Cassirer. But among those who have espoused the thesis of linguistic relativity Whorl, at least, has attempted to give some empirical content to the theory through his investigations of certain American Indian languages. And it is to the stimulation of Whorl's writings that the renewed interest in the doctrine of linguistic relativity in the last few years can be traced. In this paper I shall not attempt an exegesis of Wharf's somewhat obscure writings, but rather propose three different interpretations of the notion of linguistic relativity without attempting to relate them to Whorl's writings except in a casual way. My chief concern will be to furnish an analysis or explication of the thesis of linguistic relativity, not a study of Whorl's writings."

"This paper is an attempt to make sense of the idea that different languages embody or reflect different "conceptual schemes," different ways of experiencing or perceiving the world. The following (apparent) dilemma is discussed: if a language is translatable into English it cannot embody a scheme different from ours, but if it is not translatable we cannot know that it embodies a different scheme, even if it does; hence it is impossible to find examples which confirm the thesis that different languages embody different conceptual schemes.

An account of one kind of difference of conceptual scheme is developed which avoids this dilemma."

Semiotics and Ontology: The Rediscovery of John Poinsot (John of St. Thomas)

Introduction

"The seventeenth-century Portuguese Dominican, John of St Thomas or John Poinsot, was a major figure in late scholastic philosophy and theology. Educated at Coimbra and Louvain, he taught both disciplines in Spain: at Madrid, Plasencia and Alcalà. Aspiring to be a faithful disciple of Thomas Aquinas, he published a three-volume *Cursus philosophicus thomisticus* (Thomistic Philosophical Course) and before he died began the publication of a *Cursus theologicus* (Theological Course). His philosophical writing was explicitly on logic and natural philosophy. However, in both his philosophical and theological works, he treated many metaphysical, epistemological and ethical issues. His logic is divided into two parts, formal and material. Of particular interest is his semiotic doctrine which appears in the second part. In natural philosophy, he explained Aristotle with a Thomistic slant. While following Aquinas in theology, John at times developed his master's doctrine along new lines."

From: John P. Doyle, "John of St. Thomas (1589-1644)", - in: Edward Craig (ed.), *Routledge Encyclopedia of Philosophy*, vol. V p. 117-120, New York: Routledge 1998.

"Thus the story even of the sign begins with the discovery of nature as a reality prior to and in various ways escaping human purposes. The story of the sign, in short, is of a piece with the story of philosophy itself, and begins, all unknowingly, where philosophy itself begins, though not as philosophy. To proceed to tell the story of the sign in other ways is of course not impossible; but each such

alternative approach leaves out too many of the pieces needed even for the effort of re-telling the story more succinctly when we turn around to explain what we have discovered - at least if we want to tell the tale in the most convincing and complete manner possible.

Our purpose in these pages, then, is to make the discovery which, we will argue, introduces postmodernity (the end of the story for now) clear and credible, and for this nothing less than a general history of philosophy will do. Even if we do not have to explore every theme of that history, we must yet explain all those themes that pertain to the presupposition of the sign's being and activity, in order to arrive at that being and activity with sufficient intellectual tools to make full sense of it as a theme in its own right. And those themes turn out to be nothing less or other than the very themes of ontology and epistemology forged presemiotically, as we might say, in that laboratory for discovering the consequences of ideas that we call the history of philosophy'. If the discovery of the sign began, as a matter of fact, unconsciously with the discovery of nature, then the beginning of semiotics was first the beginning of philosophy, for only as philosophy are the foundations of semiotics possible - even if semiotics is what philosophy must eventually become, as we shall see. Nothing begins where it ends; the best stories are told not from the middle; and, while the end of a tale may do much to illumine its beginnings, the end is hardly a substitute for the beginning."

From: John Deely, *Four Ages of Understanding. The First Postmodern Survey of Philosophy from Ancient Times to the Turn of the Twenty-First Century*, Toronto: University of Toronto Press 2001, pp. 19-20.

"On the showing of his volumes' titles, Poinsett treats of Logic and Natural Philosophy. As a matter of public avowal he treats neither of Metaphysics nor of Ethics, whence to one inspecting the work superficially will it readily appear that Poinsett has said nothing or next to nothing on these matters. But to anyone who not only looks at the index of questions and articles, but who also reads the text attentively in its entirety, will find that practically everything expounded by modern authors under the title of Ontology can be found in Poinsett under his treatment of Material Logic and under his treatment of causes and the ground of motion in the Natural

Philosophy. Likewise for the fundamentals of Criteriology, which can be found treated in the Second Part of the Logic in the questions on foreknowledge and premises, demonstration and scientific knowledge. The fact that our author does not provide a specific dissertation on Metaphysics and especially on Ethics within the compass of his *Cursus Philosophicus*, while unfortunate from our point of view, should not lead anyone to think that Poincot has written little or nothing on these for matters in other places. Matters pertaining to natural theology and to ethics were left for thematic treatment in the *Cursus Theologicus*, according to the custom of that age, and, specifically, the matters of natural theology to the Commentary on the First Part [Poincot, *Tomus Primus Cursus Theologici* 1637, *Tomus Secundus* 1643], those of Ethics to the Commentary on the Second Part [Poincot *Tomus Quartus* and *Quintus* 1645, *Tomus Sextus* 1649] of the *Summa Theologiae* of St. Thomas, where all these matters are found treated at great length." (p. XII)

From: Beato Reiser, *Editoris Praefatio* to: *Ioannes a Sancto Thoma (Poincot) Ars logica (1631-1632) nova editio a Raiser*, Turin: Marietti 1930.

The name: João Poincot - Joannes de S. Thoma - Juan de Sto Tomás - Jean de St. Thomas - Giovanni di S. Tommaso - John of St. Thomas

"It is not often that a special discussion has to be devoted to the name of the author of a given work, though indeed such a problem is far from unheard-of. There are a number of considerations that make such a discussion useful in the present case. Accordingly, I will proceed to identify the author of our text in two steps: First, by explaining why I have settled on 'John Poincot' as the most appropriate for our purpose of the several variant names he might be and has been called by; Second, by recounting the events of his life in the context of European history of the time.

(...)

The principal posthumous editors of Poinset's works - Reiser in the case of the *Cursus Philosophicus*, the Solesmes editors in the case of the *Cursus Theologicus* - use for their author's name the Latin form "Joannes a Sancto Thoma" ("John of Saint Thomas"). It was this name in this form that Poinset himself attached to the first three volumes he himself edited of his *Cursus Theologicus*.

Nonetheless, the following three posthumous volumes of the *Cursus Theologicus* revert to the variant, "Joannes de Sancto Thoma," which is also the form used on the early editions of the volumes of the *Cursus Philosophicus* one time, in the 1635 Douai edition of the *Artis Logicae Prima Pars*, with the spelling "Johannes..." In personal correspondence, our author often wrote and signed in the vernacular of Spain, "Juan de S. Thoma" (or "Thomas," "Toma," "Tomâs").

The Solesmes editors seem to think that use of the Latin "de" form arose in this case from assimilation to the Spanish version of the Latin "a Sancto Thoma," to wit, "de Santo Thoma" (and "de Sancto Thoma" is not incorrect Latin in any case), but that it was "a Sancto Thoma" that was the form Poinset actually received in religious life.

The surname "Poinset" certainly belonged to our author by birth, but its etymological connotations create yet other problems in the present case, since to modern ears it is unmistakably French in flavor, though our author's father came from Austria while his mother (Maria Garcez) was Portuguese, and he himself was educated in Portugal and Belgium, after which he entered for the rest of his life the heartland of Spain, where he studied, taught, and labored, ending his days in the Council of the King. Living at the time just prior to the emergence of the nation states as we think of them today, Poinset belongs to no "nationality" in the usual sense.

Portuguese by maternal blood, Viennese and French (Burgundian) by paternal blood, Portuguese, Belgian, and Spanish by education, it is very difficult to say how such a man identified himself in the civil order. How would he think of himself? Certainly, no modern category would be the likely answer to that question.

(...)

On all versions, John is the English form of our author's first name. That his family surname was Poinset is equally certain. Hence, for

our English edition of his semiotic, the first such in any language, we thus nominally identify our author." (pp. 421-424, notes omitted)

John Deely, "Editorial Afterword" to the *Tractatus de Signis. The Semiotic of John Poinsett*, Berkeley: University of California Press 1985.

Tractatus de Signis

"The semiotic of John Poinsett here presented autonomously for the first time was disengaged from a larger work entitled the *Ars Logica*, itself but the first two parts of a five-part *Cursus Philosophicus*. Since this work has a considerable historical interest in its own right, and in order to minimize the violence of editing the tractatus de signis into a whole independent of that original context, we have settled on the following manner of presentation.

Putting ourselves in the position of a reader coming to the *Ars Logica* for the first time and interested only in Poinsett's discussion of signs, we asked ourselves: What sections of the work would this hypothetical reader have to look at in order to appreciate that discussion both in its own terms and in terms of the whole of which it originally formed a part? To what extent are these separable philosophically? The pages that follow make up our solution to this problem. We have left Poinsett's text stand virtually entirely according to the order he proposed for it within the *Ars Logica* as a whole. To make this order clear, we have included title pages, and all general statements Poinsett set down concerning the whole (and therefore the *Treatise* as part), inserting where appropriate and to bridge necessary jumps a series of brief comments designated "semiotic markers," designed to show the reader how the rationale of all editing is derived from the original author's own intentions; and second, we have included all and only those sections of the whole which have a direct bearing on understanding the doctrine proposed in the *Treatise on Signs* proper, as the semiotic markers make clear.

In other words, we have tried to provide the reader with a guided tour of the *Ars Logica* that leads directly to an understanding of the doctrine of signs contained in that work, but does so by enabling him or her to appreciate the historical origin of the account in the context of its author's own understanding of previous logical and

philosophical traditions. We have chosen this format as the one best suited, so far as we could judge, to exhibit the unique mediating status Poinset's *Treatise* occupies "archeologically," as it were, in the Western tradition between the ontological concerns of ancient, medieval, and renaissance philosophy, and the epistemological concerns of modern and contemporary thought.

At the end of the work, the reader will find a lengthy "Editorial Afterword" explaining the entire work and giving its background and prospectus, much the sort of materials commonly given in an Introduction to a translated work. The device of the semiotic markers made it possible in this case to bypass the need for lengthy introductory materials enabling the reader to grasp the editorial structure of the whole, yet without of course obviating the need for detailed discussions somewhere of the principles of the English text, and of the historical situation of the author and his work. Thus we have been able to enter simply and directly into the doctrinal content of the main text, without cluttering its entrance with more than a very few lines of contemporary origin.

The reader will also find at the end of the work a complete series of indices to this entire edition, both to its main text (which indices are explained at length in the "Afterword" just mentioned) and to its accompanying editorial materials, followed by a comprehensive list of Bibliographical references. Bibliographical references not complete in the markers or in the notes on the text will be found there. All indexical references to the *Treatise* itself with its attendant parts (i.e., to the bi-lingual portions of this edition) are by page and line numbers, thus providing the reader with the exact place of each reference in this English edition of Poinset's text and, at the same time, the almost exact place in the parallel column of the Latin original. Similarly, all cross references to other parts of Poinset's *Cursus Philosophicus*, as in the running heads of the present edition, are according to the pages, columns (a, b), and lines of the Reiser edition, as set out in the "Abbreviations" immediately preceding this preface." (pp. 1-2)

John Deely, "To the Reader of this Edition", *Tractatus de Signis. The Semiotic of John Poinset*, Berkeley: University of California Press 1985.

Outlines of Formal Logic

"The *Ars Logica* is a long work of 839 double-columned pages, some 280,000 words. Its two main divisions are: *Formal Logic* and *Material Logic*. As John of St. Thomas puts it: "In the first part we deal with everything that belongs to the form of the art of Logic and to prior resolution. These are the things Aristotle dealt with in *De Interpretatione* and *Analytica Priora*, and are customarily taught beginning students in *Outlines*. But in the second part we shall deal with everything that belongs to logical matter, or to posterior resolution, especially as it is in demonstration, towards which Logic is principally ordered." The First Part contains a short text of formal Logic suited for beginners, followed by an explanation for advanced students (in 8 "*Quaestiones Disputandae ad Illustrandum Difficultates Aliquas Huius Textus*," subdivided into 29 articles) of the more difficult points of the short text. Only the short text for beginners is translated in the present volume.

The Second Part is "longer and more diffuse because the matter of any art normally has more things demanding consideration than the form does." The proper matter of the art of Logic will be propositions in which a demonstration can take place. If strict demonstration requires reduction to principles known per se, then the propositions strictly demonstrable must be those that are necessary and per se connected. Now, we know that contingent predicates give contingent propositions. For necessary propositions we need essential or proper predicates. Here then we have a means for discovering necessary matter: unfold the ordered lines of the predicaments, in which all things are reduced to their top genera, and where for each predicament is given the higher and lower predicates between which an essential connection is discovered. However, since predicaments cannot be known without the predicables, which are the modes of predicating essentially or accidentally, these too must be matter for the art of Logic. Thus the matter of Logic contains these three: 1) predicables, the modes of predication; 2) the ten predicaments, the classes and top genera to which all natural things and their essential predicates are reduced; 3) the forming of per se propositions and strict demonstrations. These, then, are the three divisions of *Material Logic*. For the first, John of St. Thomas bases his teaching

on the text of Porphyry. For the last two, on the texts of Aristotle. And as a sort of introduction to the whole of *Material Logic* he considers (in 5 questions and 24 articles) the nature of the science of Logic itself. The most fundamental parts of his *Material Logic* have been translated by Yves R. Simon, John J. Glanville, and G. Donald Hollenhorst.

According to John of St. Thomas, and to Aristotle and St. Thomas before him, Logic deals with the operations of reason. Its "function is to direct the reason lest it err in the manner of inferring and knowing." The natural divisions of Logic then follow the different kinds of mental operations. Thus *Formal Logic* is divided into three books: 1) what pertains to the simple apprehension (first operation of the mind); 2) what pertains to judgment (second operation) ; 3) what pertains to reasoning and inference (third operation). *Material Logic* too, though indirectly of course, is divided according to the mental operations. Its direct object is the matter, taken generally, that the mind deals with, i.e. necessary predicates and their connecting lines. Still, the manner of predicating, the reduction of all essential predicates to the ten predicaments, and the forming of per se propositions and strict demonstrations are mental operations even when they depend on the matter known." (p. 5-6, Notes omitted)

Francis C. Wade, "Introduction" to John of St. Thomas, *Outlines of Formal Logic*, Milwaukee: Marquette University Press 1955.

The Material Logic of John of St. Thomas: Basic Treatises

"We do not need to elaborate on the reasons why the integral translation of a work which fills 839 two-column pages in the latest edition was held impossible. Since a choice had to be made, we turned to the field of material logic, where the shortage of great books is particularly felt. (...) But no more than about three fifths of John of St. Thomas' writings in material logic could be included within reasonable space limits. Our choice was governed by both doctrinal and pedagogical concerns. We made it a rule never to abridge an exposition having the character of a whole. Our shortest units are long articles. In several cases, our unit is a whole

"question." On the subject of demonstration, it is the whole set of "questions" corresponding to the *Posterior Analytics*.

Whoever is aware of the situation of logical studies in our time knows that the most vexing of our problems is the problem of logic itself. Accordingly, much space is given to the issues concerning the object and nature of logic (I). The problem of the universal (II) is obviously of central significance for all logic and for the philosophy of knowledge. The "antepredicamental" discussions (III), consisting principally of an inquiry into analogy, constitute a masterly contribution to the theory of meaning. The doctrine of analogy presented here is the subject of further developments in the articles on the division of being into categories (IV). The long study of the first four categories (IV) is a store of elaborate information on concepts basic in all parts of philosophy and in the interpretation of the sciences. From a certain standpoint, the pages on quantity and on relation can be considered supplementary to the introductory pages on the object of logic. Taken together, these three sections present much material and many precise instruments for the improvement of our ideas on the relations between the logical and the mathematical sciences. Section V is concerned with four timely issues: signification, the relation of knowledge to actual existence, reflection, and formalization. Lastly (VI) we present without any omission John of St. Thomas' treatment of demonstration and science.

(...) Much of the doctrine contained in John of St. Thomas' formal logic is available in the *Formal Logic* of Jacques Maritain. The *Short Treatises* which, from a pedagogical standpoint, constitute the core of John of St. Thomas' teaching in formal logic, have been translated by Francis C. Wade under the title of *Outlines of Logic* (Milwaukee: Marquette University Press, 1955)." (pp. XX-XXI)

Yves R. Simon, "Foreword" to *The Material Logic of John of St. Thomas: Basic Treatises*, Chicago: University of Chicago Press 1955.

Introduction to the Summa theologiae of Thomas Aquinas

"One might expect a Thomist of the strict observance to engage in the kind of close commentary on the text that characterized

Thomas's own commentaries on Aristotle, or Cajetan's on the *Summa*, but in both his philosophical and his theological work, John writes in relative independence of the text that prompts the discussion. He will summarize rapidly the relevant work of Aristotle, and then go on to a discussion guided as much by later controversy as by the text itself. So, too, there is in the theological writings a kind of tour de monde survey of what others have said on the question before launching into his own solution. But the vast theological effort was prefaced by three sizeable Essays: an analysis of the Sentences of Peter Lombard, a discussion of the authority the thought of St. Thomas enjoys in the Church, and the analysis of the *Summa theologiae* translated here. The full title is: *Isagoge ad D. Thomae theologiae. Explicatio connexionis et ordinis totius Summae Theologiae D. Thomae, per omnes ejus materias.*

John's introduction is just that - it is not a commentary or analysis of the text of the *Summa theologiae*, but a bearing of its infrastructure, displaying the ordering principles that brought together the vast treasury of Christian theology in as economical and perspicuous a manner as possible. In many ways, John's task was simple: all he had to do was pick up on the quite overt remarks of St. Thomas as to why a topic or treatise comes before or after others, what the inner ordering of a treatise was, what the ordering of the articles within a question was, and, not to put too fine a point on it, why the objections in a given article come in the order they do. The *Summa theologiae* was written for theological, though not philosophical, beginners, and it aims to give a swift, accurate, and adequate sense of the theological terrain. From that point of view, John can be said to have provided an outline of an outline. This is not to disparage what he has done. There are enormous advantages to being acquainted with the skeleton of the *Summa* before examining the flesh that covers it. There is no need to overstate John's achievement to see it as something for which the neophyte can be grateful and which, even for one who thinks himself an adept, not only reinforces the old sense of the storied order of the *Summa* but, in its hurried and pedestrian prose, contains more than one precious nugget absent from more ambitious commentaries." (pp. IX-X)

Ralph McInerny, "Preface" to *Introduction to the Summa Theologiae of Thomas Aquinas: The Isagoge of John of St. Thomas*, South

Bend: St. Augustine Press 2004.

Poinsot's contribution to logic and semiotic

"Poinsot, so far as present knowledge goes, holds the privileged position in semiotic historiography of being the earliest systematizer of the 'doctrine of 'signs. Not until the work of Peirce in our own day do we again encounter a 'semiotic of comparable energy and scope. In 1632, Poinsot published, as part of his series of courses in philosophy at the University of Alcalá, Spain, a highly original, systematically conceived *Treatise on Signs (Tractatus de Signis)* (1930), which fits exactly 'Locke's definition of semiotic proposed some 58 years later, at the close of his *Essay Concerning Human Understanding* (details in Deely, *Introducing Semiotic. Its History and Doctrine*, Bloomington: Indiana University Press 1982), and taken up again by Peirce.

From this point of view, Poinsot's work provides us with the first of several "missing links" in the history of logic and 'philosophy after 'Ockham (e. 1350), enabling us to trace backwards through the Iberian schools of Coimbra (notably in the work of Petrus Fonseca [1564] and the team of workers he organized, the so-called "Conimbricenses"), Salamanca (Suárez, Soto, and others), and Alcalá, a heretofore largely untold story of developments that are exceptional in import for semiotics (Deely 1982).

Doctrinally, Poinsot's work achieves a new, entirely experiential point of departure for the enterprise of philosophy, and reconciles in so doing the seemingly opposed orders of nature and 'culture. Poinsot begins his *Treatise on Signs* by drawing attention to a central feature of 'semiosis that must, in his opinion, be a first concern of semioticians to safeguard and give adequate account of, namely, the fact that, in our experience, signs bring together natural and social phenomena. The sign, he points out (Book 1, Question I: 646b26-45), is something neither preclusively natural nor preclusively social, but both inclusively, for while all signs as such acquire their signification and actually exist only within some living being's experience, nonetheless, within that very experience, the connection between signs and what they signify sometimes seemsto have roots outside our experience of their connection (the case of "natural" signs), and

other times seems to have no reality other than the one derived from the experience itself of social interaction (the case of customary and stipulated signs). Thus the first task of the semiotician, in Peirce's judgment, is to secure a standpoint superior to the division of being into what exists independently of our 'cognition (ens reale 'mind-independent being') and what exists dependently upon cognition (ens rationis mind-dependent being'). For Peirce, semiotics must take its stand, in the felicitous description by Sebeok, squarely "at the intersection of nature and culture." This simple description of semiotics's initial task already amounts to a revolution within the perspective of natural philosophy or "physics" traditional in Peirce's day. For the sole concern of that tradition was to uncover and explicate the structure of ens reale, which they thought to have achieved, after "Aristotle, with the division of mind independent being into substances, or natural units of independent existence, with their accidents, or various properties and characteristics. Thus, the division of being into the Aristotelian categories of substance and the various types of accident was generally thought to be the permanent achievement of ontology in the Latin age.

Peirce's approach to semiotics entirely undercuts this categorial scheme, going beneath it and beginning with an analysis of experience prior to the possibility of the working out of any such scheme. He establishes a fundamental ontology in just that sense which Heidegger calls for in our own time, namely, an "ontology" that accounts for the categorial interconnections and lays bare the ground of the prior possibility of truth as a "correspondence" between thought and being. Peirce finds this fundamental ontology in our experience of the ways in which things appear to be relative. Peirce observed (following in this Aquinas [*Quaestione disputate de anima* c. 1266: q. 28] and Cajetan [*Commentaria in Summa theologicam*, 1507] before him) that, as a mode of reality, relation is unique in that its essence (*esse ad aliud* 'being between') is separate from its cause or ground of existence (*esse in alio* 'the character or feature upon which a relation is founded'), which is not the case for any other mode of reality. Peirce sees in this the ultimate reason for the possibility of semiosis: relation in what is proper to it, namely, suprasubjectivity or intersubjectivity (*esse ad*), is indifferent to realization now in nature, now in thought, now in both. Relation in

this sense, precisely as indifferent to the opposition of what depends upon and what is independent of cognition, Poinsoot calls *relatio secundum esse* 'relation according to the way it has being' or 'ontological relation' (see Deely 1982).

By contrast, things that are related exist subjectively as something in their own right, not just between other things sustaining them in a derivative way. And yet, if we seek to explain why they are as they are or how they might be altered from their present state, we find it necessary to refer to what the individuals in question themselves are not. Thus, even the individual entities and "natural units" of experience existing in their own right - even substances in Aristotle's scheme, the most absolute of the subjective entities - are seen to be relative when it comes to the question of how they come to be or of how they are to be accounted for. Relativity in this sense, precisely as infecting the whole scheme of categories of cognition-independent existents, Poinsoot termed *relatio secundum dici* 'relation according to the way being must be expressed in discourse', or (synonymously) *relatio transcendentalis* 'transcendental relation'.

With this division of being, then, into transcendental and ontological relation, Poinsoot has two simple "categories" that are exhaustive and exclusive, but whose terms are entirely matters of direct experience (unlike Aristotle's division of being into substance and accident, which was also exhaustive and exclusive, but directly experienced only on the side of certain accidents: comprehensive discussion in Powell [*Freely Chosen Reality*] 1982), and whose relevance to the doctrine of signs is immediate. For all authors agree, and indeed experience makes quite unmistakable, that every sign as such is a relative being (something making known another than itself), and since, by the prior terms of the analysis of relative being, we know that there are only two irreducible types of relativity, it remains only to apply that analysis to our experience of semiosis in order to determine in what precisely a sign consists (the *formalis ratio signi*, as Poinsoot puts it), that is to say, what is it that constitutes a sign in its proper being? The answer to this question is ontological relation, an answer which enables Poinsoot to resolve a number of aporia that have plagued accounts of signifying from ancient times down to the present, and which turn out to be decisive for °epistemology and philosophical thought generally."

From: John Deely, "Poinsot, John", in: General Editor, Thomas A. Sebeok; Editorial Board, Paul Bouissac [et al.] *Encyclopedic Dictionary of Semiotics*, Berlin / New York: Mouton de Gruyter 1986.

"John of St Thomas' logic is divided into two parts. In the first part, his concern is with the formal theory of correct thinking. This part, which includes such medieval items as supposition, exponible and consequences, corresponds especially to the *Summulae Logicales* of Peter of Spain and the *Prior Analytics* of Aristotle. In the larger second part, which corresponds to the *Isagoge* of Porphyry, plus the *Categories* and the *Posterior Analytics* of Aristotle, he deals with material logic, which is a general theory of scientific demonstrations and the necessary connections they involve depending upon their content. Organized according to the three operations of the intellect (simple apprehension, judgment and reasoning) the first part treats of terms, propositions, consequences and syllogisms, along the way attending to definitions, divisions and their various facets. In the second part, John reflects upon the nature of logic itself, which he thinks is at once an art and a science. As science, he says, 'logic is essentially and absolutely in virtue of its own principles speculative, but it takes on the manner of a practical science in so far as it offers rules and direction for speculation itself' (*Ars Logica*, II q.1 a.4). The object of logic is beings of reason, such as species, genus, subject, predicate, antecedent, consequent and so on, formed by the mind's reflections upon its own operations. Such beings of reason, which have some foundation in reality outside the mind, fall under a wider notion that includes beings of reason like chimeras. These last lack such a foundation because they are impossible (that is, self-contradictory) objects. Contrasted with both sorts of beings of reason are real beings which are divided into the various Aristotelian categories.

The categories are the central concern of the second part of John's logic. He rejects Duns Scotus' teaching that ens (being) is said univocally of the categories.. Rather, as Cajetan thought, 'being' as said of the categories is 'formally analogous with an analogy of proper proportionality' (*Ars Logica*, II q.14 a.3). Passing through each category in succession he concurs with Cajetan's interpretation

of Aquinas (*Summa theologiae* Ia. 28.1) to the effect that relation is unique because it can be found in the order either of real being or being of reason. Only relation, since it is not just 'in' something but also 'towards' something, can transcend categorial status and be conceived apart from real existence either in itself (that is, the mode of existence proper to a substance) or in something else (the mode proper to an accident). This thought was to be central to John's doctrine of signs.

The doctrine of signs itself, which in part at least reflects the influence of John's Jesuit teachers at Coimbra, forms a treatise which runs over questions 21-3 in the second part of his logic. Essentially relational, signs are divided first into formal and instrumental, and second into natural, conventional and customary. All signs make something else known: formal signs (for example, a concept or an impressed species) do so without themselves first being known; instrumental signs (such as smoke or a spoken word) are themselves first known and then lead to the knowledge of something else. Natural signs (smoke) differ from conventional signs (words) inasmuch as the former simply arise from causal connections in the natural order while the latter result from human choice. Customary signs also result from choice but can be natural when a custom leads us naturally to its cause. Signs involve two non-reciprocal relations: between the sign and the significate (as in the relation of measured to measure) and between the sign and the cognitive power of a knower (as in the relation of measure to measured). Considered just as such, these relations are not in the line of physical causality but rather in that of intentionality in which the sign substitutes for the significate. Within this line of intentionality the ability of relation to transcend real being and being of reason becomes the basis of a unified semiotic doctrine respecting all signs of whatever sort they are."

2. Ashworth, Earline Jennifer. 1988. "The Historical Origins of John Poinset's *Treatise on Signs*." *Semiotica* no. 69:129-147.

"In 1631-1632 John Poinset (otherwise known as John of St. Thomas) published his *Ars Logica* at Alcalá. From this massive work John Deely has extracted all those parts relating to the theory of signs, and has given them the general heading of *Tractatus de Signis* (*Treatise on Signs*), though it should be noted that the *Treatise on Signs* proper consists of just three Questions related to Aristotle's *Perihermenias*. The project is a valuable one, for Poinset was an interesting writer in his own right who frequently had original observations to make. Deely's contribution, so far as the edition and translation are concerned, is superb; and the book itself is a splendid example of the printer's art. However, I have some very grave reservations about Deely's interpretation of Poinset's work, and it is these reservations that I intend to discuss here. Others (notably Sebeok 1986) have already sung the praises of Deely and Poinset; and as one of the few philosophers who has actually read some of the sixteenth-century authors to whom Poinset was indebted, I feel it incumbent on me to point out that there is another side to the coin. However, I do not intend my remarks to detract in any way from the achievement represented by Deely's version of the *Treatise on Signs*.

I shall first discuss Deely's attitude toward the historical interpretation of Poinset and how it differs from my own. In so

doing, I shall show that there was a tradition of placing the discussion of signs in a Perihermenias commentary. Second, I shall discuss the topic of relations, since Deely claims that the 'revolutionary' nature of Poinot's doctrine of signs stems from his classification of relations. I shall remark that a very similar classification of relations is found in at least one of Poinot's sources, namely Domingo de Soto (1494-1560). Third, I shall discuss the details of the theory of signs as described by some early sixteenth-century writers, and I shall show that the general lines of Poinot's classification are due to Domingo de Soto. Finally, I shall make some remarks about other aspects of the translation and editorial material which seem to need further comment.

"Kant was unaware, as are most academic philosophers today, that late Latin scholastics, especially on the Iberian peninsula, had also struggled for an account of the intellect's ability to order our experience of the real and so constitute a properly scientific object. The results of this effort were, of course, quite unlike those of the Kantian solution and compatible with a completely different view of the natural order. Even more important for the history of Western philosophy, the results were immediately and thoroughly eclipsed by the rise of

Cartesianism. The great scholastic effort to understand how scientific objects are constituted passed from the modern period into intellectual oblivion.

Yet there are ample reasons to think that an exploration of these forgotten, pre-Kantian views might shed some light on contemporary efforts to fashion a postclassical epistemology and philosophy of science. Despite the more primitive cosmology, basic concepts of epistemological theory developed by the Latins are far more easily disengaged from medieval physics than are Kantian concepts from Newtonian mechanics. Kant is committed in principle to the view that space, for example, is mathematizable a priori in a completely deterministic manner. This is a much more wide-ranging and deeply-rooted metaphysical commitment than is the claim, for example, that there are only six observable planets.

What follows is an examination of a generally forgotten theory of objective constitution--one that avoids unnecessary entanglements with the determinism of Newtonian mechanics if only by predating the Cartesian and Kantian turns. It is a theory that in principle allows nature to live by other rules than those of mechanical necessity and one that, I believe, rightly recognizes that nature's laws can suffer exception without thereby destroying the possibility of scientific knowledge. Moreover, it is a 'bridge' theory that unites classical and contemporary philosophic tendencies, for despite its strong medieval roots, it is a theory largely committed to the fundamental insight of modernity that the knower, in some measure, must condition the object known." p. 55

Annotated Bibliography of John Deely. First part: 1965-1998

Introduction

John Deely (1942-2017) was the Rudman Chair in Thomistic Studies at the University of St. Thomas in Houston.

"If there is one notion that is central to the emerging postmodern consciousness, that notion is the notion of sign. And for understanding this notion, nothing is more essential than a new history of philosophy. For the notion of sign that has become the basis for a postmodern development of thought was unknown in the modern period, and before that traces back only as far as the turn of the 5th century AD. Yet the context within which the general notion of sign was first introduced presupposes both the ancient Greek notion of "natural sign" (semeion) and the framework of Greek discussions of nature and mind which provoked the development of philosophy in the first place as an attempt to understand the being proper to the objects of experience. Not only does it emerge that the sign is what every object presupposes, but, in modern philosophy, the conundrum about the reality of the "external world", the insolubility of the problem of how in theory to get beyond the privacy of the individual mind, springs directly from the reduction of signification to representation. So here is one of the ways in which the four ages of this book can be outlined: preliminaries to the notion of sign; the development of the notion itself; forgetfulness of the notion; recovery and advance of the notion. Tracing the development of the notion of sign from its beginning and against the backdrop of Greek philosophy yields an unexpected benefit by comparison with more familiar historical approaches. Every modern history of philosophy has been essentially preoccupied with the separating off

from philosophy of science in the modern sense, especially in and after the seventeenth century. From this point of view, many of the continuing philosophical developments of the later Latin centuries tend to drop out of sight. It has become the custom to present modern philosophy, conventionally beginning with Descartes (17th century), simply as part and parcel of the scientific break with the authors of Latin tradition, and to treat the bringing of nominalism into the foreground of Latin thought by William of Ockham (14th century) as if that were the finale of Latin development.

This hiatus of two and a half centuries in the history of philosophy, however, effectively disappears when we make our way from ancient to modern times by tracing mainly the development of the philosophical notion of signum. From the High Middle Ages down to the time of Descartes we find a lively and continuous discussion of sign which, through a series of important if unfamiliar controversies on both sides of the thirteenth century, leads to a basic split in the closing Latin centuries. On one side stand those who think that the general notion of sign is an empty name, a flatus vocis, a nominalism, no more than a "relation of reason", an ens rationis. On the other side are those who are able to ground the general notion in an understanding of relation as a unique, suprasubjective mode of being, a veritable dual citizen of the order of ens reale and ens rationis alike, according to shifting circumstances.

Modern philosophy, from this point of view, appears essentially as an exploration of the nominalist alternative; and postmodern thought begins with the acknowledgment of the bankruptcy of the modern effort, combined with the determination pioneered by C. S. Peirce to explore the alternative, "the road not taken", the "second destiny" that had been identified in the closing Latin centuries but forgotten thereafter. Peirce's postmodern resumption of premodern epistemological themes produces a number of immediately dramatic and surprising results (beginning with the cure for the pathology dividing our intellectual culture between the personae of Dr. Jekyll and Mr. Hyde).

So derives the title for this work, *Four Ages of Understanding*: ancient Greek thought, the Latin Age, modern thought, postmodern thought. The book is a survey of philosophy in what is relevant to the

"understanding of understanding" from ancient times to the present. It is intended both as a reference work in the history of philosophy and a guide to future research - a "handbook for inquirers" in history, philosophy, and the humanities generally, including historians and philosophers of science. The book also aims to aid in the classroom those professors willing to wean a new generation from the "standard modern outlines" of philosophy's history which serve mainly to support the post-Cartesian supposition that history is of next to no import for the doing itself of philosophy."

From: John Deely - *Four ages of understanding. The first postmodern survey of philosophy from ancient times to the turn of the Twenty-first century*. Toronto: University of Toronto Press 2001. (pp. XXX-XXXI)

5. ———. 1967. "The situation of Heidegger in the tradition of Christian philosophy." *The Thomist* no. 31:159-244.

"This is an essay on the meaning of Being ('das Sein') in the philosophy of Martin Heidegger. its principal conclusion is that with the notion of 'Sein,' Heidegger has picked up again a theme first introduced into Western thought by Averroes and

Aquinas, forgotten after the death of Poincaré in 1644, namely, the reality of 'ens intentionale' as an order of existence irreducibly other than the order of material nature. The point is demonstrated by showing the correspondence of Seidegger's 'Sein/Seiende' distinction with the 'intentionale/entitativum' distinction of Arabic and Latin Aristotelianism."

6. ———. 1967. "The problematic of metaphysical knowledge." *Philosophy Today* no. 11:184-206.

"If metaphysical knowledge is truly a distinct and formally unified cognitive discipline which touches the way things are in some commonly fundamental way, then the nature and extent of such knowing should admit of an at least minimal characterization. With the question of whether there is after all a genuinely metaphysical mode of understanding experience into which our minds can thematically enter explicitly in mind, this essay probes into the problem of establishing a critical point of departure for metaphysical ontology properly and recognizably so called."

7. ———. 1968. "The immateriality of the Intentional as such." *The New Scholasticism* no. 42:293-306.

"This article takes occasion from the discussion of intentionality set forth in chapter 12 of Mortimer J. Adler's recent book, 'The difference of man and the difference it makes,' to clarify a number of points in the classical theory of intentionality which are largely unknown or misrepresented in such current discussions as the one Adler both reports on and extends. It achieves this clarification by a close scrutiny of Adler's text, directing attention at critical points to the signal analyses of Jacques Maritain and Yves Simon which go farther into this problem of intentionality than any other contemporary writings."

8. ———. 1969. "The philosophical dimensions of the origin of species. Part I." *The Thomist* no. 33:75-149.

"This article is a comprehensive assessment of the major writings on natural species from Aristotle to the present, aiming to understand in what sense the ancient views were

transformed after Darwin. It draws a clear distinction between the approach of classical philosophy and that of modern science to the problem of species, coupled with a comparative assessment of the methods of classical vs. modern philosophy in dealing with the question of specific differences in nature. The problems of causality, chance, and progress (evolutionary direction) are discussed in the framework of the species concepts. A detailed analytical outline is given after the conclusion."

9. ———. 1969. "The philosophical dimensions of the origin of species. Part II." *The Thomist* no. 33:251-342.
10. ———. 1969. "Evolution and ethics." *Proceedings and Addresses of the American Philosophical Association* no. 43:171-184.

Reprinted in: John Deely and Raymond J. Nogar (eds.) - *The problem of evolution. A study of the philosophical repercussions of evolutionary science* - New York, Appleton-Century-Crofts, 1973 pp. 187-209.

"This article seeks to determine the nature of the connection between evolutionary and ethical theory. To achieve this it proceeds from a statement of the possible connections to consider the idea of nature seemingly entailed by the data of evolutionary science, delineating here the general notion of good co-entailed, the distinction between physical and moral goodness, the 'naturalistic fallacy', being and ought, the mutual implication of 'natural' and 'positive' law. It concludes with a resolution of the possible connections initially limned."

11. ———. 1971. "Animal intelligence and concept-formation." *The Thomist* no. 35:43-93.

"Beginning from certain remarks on abstraction by Peter Geach, this article outlines a classical view of the highest levels of cognitive organization attainable in principle by animal consciousness, and indicates the indispensable role played by such attainments in the formation of properly intellectual cognition. By a careful culling, the relevant texts from Aquinas' corpus are gathered in a consistent framework and related to

the contemporary conclusions of H. H. Price and M. J. Adler adversative to Geach."

Heidegger 189; Selected bibliography 194; Index of proper names 199-200.

"In making it clear that the essential thought of Heidegger is concerned principally with what scholasticism has referred to in passing (so to speak) as the order of *esse intentionale* strictly understood, however, I intend to make it equally clear that with Martin Heidegger *philosophy itself* has achieved a measure of progress. For if the area of *esse intentionale* has been clearly delimited by the great scholastics, it has been almost entirely neglected or misunderstood by the majority of philosophers; and even in those rare writings, such as the works of John of St. Thomas, where its fundamental structure is rightly characterized, its proper actuality is never rendered fully thematic. Even as the ancients knew full well that the earth was a globe, yet knew nothing of the actual topography of the other side, so is the notion of *esse intentionale* the "*antipodes*" or unexplored region in their metaphysical topography concerned, as it was, principally with tracing the nature of change and the

substance/accident dimension of act-potency compositions, i.e., with *esse entitativum*, rather than with the dimension of intersubjectivity and the then little realized problem of intersubjectivity *par excellence*, the nature of the domination of man's existence by a total view of reality (culture, *Weltanschauung*, etc.) not known to reduce to fact, or of *Historicity*." (...)

Yet however complex and subtle accuracy compels its detailed analyses to be, this book has a simple ground plan. It develops through eight stages, covered by ten chapters:

1. Stage one does no more than place our considerations in the context of contemporary currents of thought, pointing out the difficulty and utility of arriving at a consistent understanding of the direction of Heidegger's thought (Chapters I and II).
2. Stage two consists in a direct consideration of Heidegger's original philosophical experience as providing an approach to the meaning of "Being" in terms of the presence of beings in awareness and social life rather than simply in themselves (Chapter III).
3. Stage three delineates the difficulty of formalizing this experience of intersubjectivity in a definite question serving to guide further inquiry, of translating the mystery of Being into a structured problematic accessible to properly philosophical research (Chapter IV).
4. In stage four are brought out the double set of considerations necessary to analytically adequate the structured unity of Dasein as disclosed by virtue of the fact that Dasein's uttermost (*äusserst*) possibility is at the same time its ownmost (*eigenst*) and *non-relational* (*unbezügliche*) (Chapters V and VI).
5. The fifth stage makes clear that the contribution of Heideggerian thought to the progress of philosophy stems principally from rendering the intersubjective dimension of human reality thematic, from thematizing that dimension of Dasein according to which it enjoys its "objectively scientific priority," as Heidegger puts it, for phenomenological research (Chapter VII).

6. Stage six makes clear the functional interdependence which obtains between the ontic-ontological structure of Dasein's temporal unity and the priority in philosophy of the phenomenological over the metaphysical sense of the Being question (Chapter VIII).

7. Stage seven examines the identity of Heidegger's conception of the phenomenological attitude and research-mode with his thought of Being (*Denken des Seins*) (Chapter IX).

8. The final stage traces the passage from the early to the later Heidegger as necessitated from within by the suppression of the act-potency structures which gave determinateness and direction to the analyses of *Sein and Zeit*, showing that in these terms the celebrated turning in Heidegger's way of thought provides the justification and completes the demonstration of each sequential stage in our Retrieve." (pp. 3-4).

13. ———. 1971. "The myth as integral objectivity." *Proceedings and Addresses of the American Philosophical Association* no. 45:67-76.

"This article attempts a definition and division of myth in order to clarify the relations between mythical thought and critical reflection. By means of this clarification, a further attempt is made to vindicate the uniqueness in principle of objective existence over against that of physical and mental events alike, in terms of the indifference of thought to being and non-being in its relation to objects, an indifference unmistakably exhibited by the functioning of myth in human culture."

14. ———. 1972. "The ontological status of intentionality." *The New Scholasticism* no. 46:220-233.

"In a recent article, Richard Aquila argues that Brentano's intentionality thesis as developed by Chisholm is either devoid of ontological significance, or carries a commitment to non-existent objects. The argument is that a relation, if it is genuine, implies the reality of its term. I show this argument to be mistaken, by pointing out the classical distinction between the formality of a relation, which derives from its being referential, and the reality or existence of a relation, which derives from its

foundation in some subject. In terms of this distinction, it is perfectly possible, under certain privileged conditions (discussed in this article), for a true relation to exist without there having to be any real term for that relation. Hence it is false to assert that the thesis concerning the intentionality of the mental depends for its ontological significance on a commitment to a realm of mind-independent non-existent objects."

15. ———. 1972. "How Language Refers." *Studi Internazionali di Filosofia* no. 4:41-50.

"Assuming language sometimes succeeds in referring to objects, this article considers the question: how is such success possible? What enables language to refer? After showing that behavioral psychology and the theory of meaning as use provide no answer, an answer is drawn (by way of an infinite regress argument) from the dependence of language on an essentially relative entity T, which as such is indifferent to the physical reality of its term. Some implications are developed as critique of views of Frege, Meinong, Russell, Quine, and Wittgenstein; and it is suggested in conclusion that the capacity of language to refer to what does not physically exist is the key to the nature of thought."

"The first part of this book is an initial attempt to establish an outline of the history of logic expressly from the standpoint of a doctrine of signs as defined by John Locke under the heading of semiotic. No effort has been made in this part to explore the standpoint so defined (that is left for the second part). What has been attempted rather is to indicate in a summary fashion and from the point of view of a philosopher a general sketch of the place and circumstances in Western culture where semiotic consciousness was first thematically achieved, to the extent at least that we are able to determine this in the light of the history of logic and philosophy as the "experts" present it to us, supplemented of course by an actual reading, first-hand, of the texts on which the outline relies - not all of which, by any means, have been weighed evenly if at all in the researches so far of the expert historians.

This fact already indicates the extent to which semiotic historiography will be achieved only by upsetting and revising, often in radical ways, the conventional outlines and histories of thought which have become standard fare in the universities of today. The writing of this history eventually must inevitably take the form also of a *structuring anew* of the entire history of ideas and of philosophy, in order to bring to the fore and make explicit the semiotic components latent by the nature of the case (all thought being through signs) in each of the previous thinkers who have wrestled since ancient times with foundational questions of knowledge, experience, and interpretation generally.

(...)

The second part of this book can no longer claim to be historical (though it tries not to be ignorant of history). Insofar as it differs from Part I, it does so under the inspiration of a remark made by Paul Bouissac at the sixth annual meeting of the Semiotic Society of America on the 2nd of October, 1981, in his presentation, "Figurative vs. Objective Semiosis." All previous semiotic "theories," he observed, be they Greimasian, Saussurean, Peircean, Poinsonian, have come to the study of signs late in the day, on the basis of a thoroughly worked out system of concepts, a "pre-existing philosophical paradigm." To this pre-jacent paradigm, then, their subsequent notions of signification were referred and required to conform. The coming of age of semiotic as a perspective in its own right requires exactly the reverse. It can have no paradigm of philosophy given in advance. Beginning with the sign, that is, from the function of signs in our experience taken in their own right (semiosis), it is the task of semiotic to create a new paradigm - its own - and to review, criticize, and correct so far as possible all previous accounts of experience in the terms of *that* paradigm.

These remarks, filled at the time with the passion and life of the speaker, were spontaneous there and poorly paraphrased here. Yet they struck me then and seem to me now with undiminished force exactly *justes*, exactly to capture in a flash of insight the task against whose demands the movement that has grown up around us must finally be measured. To answer Herbert's question (1981), what contributes toward meeting these demands in the work going on today is the revolutionary part of semiotics, what does not so contribute belongs to merely passing fad and fashion.

Like Part I, therefore, Part II of this book is heuristic rather than didactic. It seeks not to outline but to adumbrate the reorientation of thought made possible by the semiotic point of view not (indeed) in all areas, but at least in the area of the foundations of knowledge and experience, and at the interface of modern with (in lieu of the better term yet to be coined) post-modern times. Semiotics is capable of mediating a change of age as profound and total as was the separating off of

- modern times from the Latin era. Then, the cutting edge of transition was modern science, experimental and mathematical, coming of age. Today it is the interpretive activity of the mind becoming conscious of its full range, ground, and instruments, that is, semiotics." (pp. 1-4)

111; 7. Retrospect: history and theory in semiotics 1368.
Prospect: a new beginning for the sciences 171; 9. The quasi-error of the external world 183; 10. How semiotics unifies human knowledge 202; 11. The definition of Human Being 215; References 233; Translators' afterword 260; Dictionary of terms 262; Name Index 266-268.

"The aim of the book, then, is to fill the need for an answer to the question of just what is the essential nature and what are the fundamental varieties of possible semiosis. The substance of the answer to this twofold question is contained in chapters 3 through 6. Corresponding to this answer is the answer in chapter 2 to the prior question of what semiotics itself-the knowledge corresponding to the subject matter-basically is. And bracketing this whole discussion by way of opening and closing is a kind of sociological look at semiotics today in chapter 1, balanced by a historical look at semiotics in retrospect and prospect in chapter 7.

This is a book I have long wanted to write and one that has, for even longer, needed to be written; but, at least for this author, only recently have the essential insight and opportunity come together for expressing in a coherent overall framework the basic concepts of semiotics." (pp. XXIX-XXX)

"This book is the best argument I can make to date that the perspective required to develop a doctrine of signs in the fullness of its proper possibilities implies also an understanding of human experience that will be for the first time integral and adequate to the task of providing the measure of human knowledge in the whole of its extent, as distinguished from imposing upon experience and systems of belief some ideological measure designed to dismiss large parts thereof a-priori. To minimize the difficulty of the argument, the book has been set up in such a way as to emphasize the autonomy of the paragraphs.

The present work is published in the hope especially of drawing other workers into the labor of understanding the human use of signs, recognizing all the while that the work perforce advances along an asymptotic curve ill-suited to dogmatic beliefs of any stripe. A community of inquirers cannot escape from the need to provide its own authority, and at the same time to ground that authority critically on the nodes and intersections of objective being with physical being." (pp. XII-XIII)

"I will proceed in four parts.

In Part I, I will examine the generic element in the semiotic definition of *anthropos* as *animal linguisticum*, that is to say, what is common to zoösemiosis and anthroposemiosis through the action of signs in the building up of "experience" as something in its own right superordinate to the brute secondness of environmental interactions. This I do under the heading of Signification. And here, following up on Sebeok's suggestions, we will see how the basic notion of modeling system extends much wider than the linguistic base assigned to it by the Tartu school.

In Part II, under the heading of Textuality, I will examine, so to say, the linguisticization of the world of experience that is, the species-specific element of experience that makes the human modeling system, or experience anthroposemiotically considered, different from the modeling system of animals employing communication systems lacking the code constitutive of the *signum expertum ad placitum* (the sign experienced linguistically, let us say). This sign will appear as ultimately rooted as such in the relation of signification grasped and deployed in its distinction from the perceptible sign-vehicle and the content signified. We will thereby see how textuality, virtual in the Umwelt, becomes actual through the indefinite decompositions and recompositions of experience linguistically construed by means of the establishment of a praeterbiological code which no longer, as in Sebeok's notion (cf. Baer *Thomas A. Sebeok doctrine of signs* in: *Classics of semiotics*, 1981: 183), adequates the Uexküllian notion (1940) of "meaning-plan", because textuality breaks the proportion between biological heritage and object as such experienced. In a word, we confront in the codes whereby experience is textualized the differentiating factor in the semiotic definition of *anthropos* as *animal linguisticum*.

This examination of code will bring us to the third element in this modeling of anthroposemiosis -- Part III of the essay, examination of the curiously detached domain called "Critick" in the wide and generic sense explained above (§ 17) as taken

from Locke's *Essay*, wherein that equally curiously detached exercise called "criticism" takes place according to various forms. Therein, at one and the same time, what is most distinctive and what is most feeble in anthroposemiosis coincide to create that illusion whereby the literary aspect of semiosis is raised to the Pinnacle of intellectual achievement and treated perversely as a self-contained and autonomous exercise of semiotic competence. Here we will make explicit a point that will have been established virtually in the two previous stages of the discussion: the critical function and faculty is a subspecies of semiotic competence rather than identical with semiotic competence. Subordinate to and subtended by much broader processes of semiosis, criticism in any specific sense owes its validity to its connection with, rather than to its misleading appearance of autonomy within, those processes. It is a question of appreciating the expanse of the framework and depth of the foundation that belongs to semiotics today by birthright as an offspring of the doctrine of signs gestated by the Iberians after 1529 (Soto's *Summulae*), crystallized thematically in Peirce's *Treatise* of 1632, named by Locke in 1690, and implemented by Peirce in its wholesale possibilities with the essay on categories of 1867 and in the many essays thereafter until his death in 1914.

Once the expanse of the framework has been grasped, it will be possible, in a few concluding remarks (Part IV on "Otherness"), to show how "constituting the other" is not unique to anthropology but is rather the basic activity of human intelligence essentially dependent on linguistic means. What is unique and uniquely interesting about anthropology is simply that "the other" is, normally, a conspecific whom we encounter only after socialization to maturity has occurred on the basis of cultural rules and expectations alien to our own socialization."

Stating the question 13; 2. The historical prejudices 27; 3. Outlining Latinity with rinsed eyes 39; 4. The problem of novelty in the writings of Late Latin Scholasticism 53; 5. Locke's proposal for semiotic: what was new and what was not 109; Epilogue to Part I: Further signs 145; Part II: Expanding the speculative links; 6. How do signs work? 151; 7. The Grand Vision 183; 8. Renvoi 201; Transition to the future: the way of signs 245; Appendix 1: Contrasting ontological and Transcendental relatives 249; Appendix 2: Longer Latin citations 255; References 261; Index 295-310.

"This book concerns the theme of new beginnings within philosophy, the changes of age which define philosophical epochs. The theme is taken up not in its full scope as a speculative issue, but concretely in terms of the two most recent such turning points: the origins of modern philosophy out of Latin times and the origins of postmodern philosophy out of modern times. Each of these eras arises out of and defines itself against the backdrop of the paradigm of philosophy accepted in the background period. But what is unusual in the case I am considering is that the modern paradigm was so formed as to conceal from the outset fundamental themes of premodern Latin thought which are, in effect, resumed and foregrounded (with new accents and emphases, to be sure) by the postmodern development. Between the late Latin matrix of early modern philosophy and postmodernism there is a measure of speculative continuity which the classical modern development conceals. That

underarching continuity or subtension is what I want to bring to the surface.

Even so restricted and concretized, the transitions at issue are large. To make their handling manageable, in Part I of the book I have focused on them as they are embodied in key figures: especially René Descartes, 1596-1650, and John Locke, 1632-1704 (and, to a lesser extent, George Berkeley, 1685-1753, and David Hume, 1711-1776), for the understanding of the origins of distinctively modern philosophy; Charles Peirce, 1839-1914, and Martin Heidegger, 1889-1976, for the understanding of the central thrust of postmodernism in philosophy; and John Poincaré, 1859-1942, for demonstrating speculative links which bind the matrix of the two at either end-the dawn and the dusk-of essentially modern philosophy.

Thus there are five key figures in the book, but Poincaré is the central one. He is central, however, not as an isolated thinker but as a representative-a unique and uniquely qualified representative, as the reader will learn-of the Latin Age both in its last phase as providing the matrix of early modern philosophy and in its full extent so far as it was a development of the logical, physical, and metaphysical writings of Aristotle assimilated to the milieu of medieval and renaissance Latin culture. In the same way, Descartes and Locke, Peirce and Heidegger, appear in these pages not as individual thinkers but as paired thinkers representative, respectively, of modernism and postmodernism in philosophy. All five figures, then, are personifications of the theme, and are presented as instantiating it.

(...)

This book sets out to redress the imbalances and correct some distortions, in order to motivate philosophers and historians of philosophy to see and review their materials in a new light-and above all to start reading some new texts which will not only make it possible to tell, but will shortly compel us to tell, a quite different "story of modern philosophy" than the stale one-sided tale we have been repeating to generations upon generations of students since the 1800s." (pp. 3-4)

65. ———. 1994. "Why investigate the common sources of Charles Peirce and John Poinset?" In *Semiotics 1994*, edited by Spinks, Cary William and Deely, John, 34-50. New York: Peter Lang.
66. ———. 1994. "A Morning and Evening Star: Editor's Introduction." *American Catholic Philosophical Quarterly* no. 68:259-278.

"This special issue of the *American Catholic Philosophical Quarterly* devoted to John Poinset is complemented by a mélange of four additional essays in Poinset's honor, three of which appear in *The Thomist*, and one in *The Modern Schoolman*. (1) Given the neglect Poinset's work has suffered throughout the modern period, it is at least surprising to find the 350th anniversary of his death commemorated by such a range of learned essays celebrating his current relevance, and appearing in three of the oldest learned journals in the American Catholic university world (dating back, respectively, to 1927, 1939, and 1920).

Such homage is certainly befitting for the work of a man whose epistemological writings were considered by Jacques Maritain to be the only synthesis capable of bringing the thought of St. Thomas Aquinas effectively to bear on the critical situation as it developed in modernity. (2) My abduction is that the homage may be regarded more as auspicious of what the future holds for Poinset's work in emerging from the shadows of modernity than as redressing a past neglect. These essays in honor of Poinset in the several journals commemorate the past, by they celebrate the future, marking, in fact, a prospect of postmodernity." pp. 259-260.

"The prevalence today of 'semiotics' as the preferred linguistic form for designating the study of signs in its various aspects already conceals a history, a story of the ways in which, layer by layer, the temporal achievement we call human understanding builds, through public discourse, ever new levels of common acceptance each of which presents itself as, if not self-evident, at least the common wisdom. Overcoming such present-mindedness is not the least of the tasks faced by the awakening of semiotic consciousness. (...)

There are a host of reasons, from superficial to profound, that play a role in the current dominance of 'semiotics' as the preferred linguistic form for designating the study of signs. The reversal of dominance in the discursive rivalry between 'semiology' and 'semiotics' as cultural forms of understanding, we want to suggest, is owing to the gradual, not to say grudging, recognition of the comparative depth, scope, and importance of the studies authored, on the one hand, by Ferdinand de Saussure (1857-1913) and those who took their principal inspiration in the study of signs from his work; and, on the other hand, by Charles Sanders Peirce (1839-1914) and those

who took principal inspiration in the study of signs from his work. Saussure, of course, coined the term 'semiologie,' while Peirce, though he did not coin the word 'semiotic,' nonetheless took it over from the desuetude into which it had fallen as a neologism at the end of Locke's *Essay Concerning Human Understanding* of 1690 and put it into current circulation.(*)

"If there is one notion that is central to the emerging postmodern consciousness, that notion is the notion of sign. And for understanding this notion, nothing is more essential than a new history of philosophy. For the notion of sign that has become the basis for a postmodern development of thought was unknown in the modern period, and before that traces back only as far as the turn of the 5th century AD. Yet the context within which the general notion of sign was first introduced presupposes both the ancient Greek notion of "natural sign" (*semeion*) and the framework of Greek discussions of nature and mind which provoked the development of philosophy in the first place as an attempt to understand the being proper to the objects of experience. Not only does it emerge that the sign is what every object presupposes, but, in modern philosophy, the conundrum about the reality of the "external world", the insolubility of the problem of how in theory to get beyond the privacy of the individual mind, springs directly from the reduction of signification to representation. So here is one of the ways in which the four ages of this book can be outlined: preliminaries to the notion of sign; the development of the notion itself; forgetfulness of the notion; recovery and advance of the notion.

Tracing the development of the notion of sign from its beginning and against the backdrop of Greek philosophy yields an unexpected benefit by comparison with more familiar historical approaches. Every modern history of philosophy has been essentially preoccupied with the separating off from philosophy of science in the modern sense, especially in and after the seventeenth century. From this point of view, many of the continuing philosophical developments of the later Latin centuries tend to drop out of sight. It has become the custom to present modern philosophy, conventionally beginning with Descartes (17th century), simply as part and parcel of the scientific break with the authors of Latin tradition, and to treat the bringing of nominalism into the foreground of Latin thought by William of Ockham (14th century) as if that were the *finale* of Latin development.

This hiatus of two and a half centuries in the history of philosophy, however, effectively disappears when we make our way from ancient to modern times by tracing mainly the development of the philosophical notion of *signum*. From the High Middle Ages down to the time of Descartes we find a lively and continuous discussion of sign which, through a series of important if unfamiliar controversies on both sides of the thirteenth century, leads to a basic split in the closing Latin centuries. On one side stand those who think that the general notion of sign is an empty name, a *flatus vocis*, a nominalism, no more than a "relation of reason", an *ens rationis*. On the other side are those who are able to ground the general notion in an understanding of relation as a unique, suprasubjective mode of being, a veritable dual citizen of the order of *ens reale* and *ens rationis* alike, according to shifting circumstances.

Modern philosophy, from this point of view, appears essentially as an exploration of the nominalist alternative; and postmodern thought begins with the acknowledgment of the bankruptcy of the modern effort, combined with the determination pioneered by C. S. Peirce to explore the alternative, "the road not taken", the "second destiny" that had been identified in the closing Latin centuries but forgotten thereafter. Peirce's postmodern resumption of premodern epistemological themes produces a number of immediately dramatic and surprising results (beginning with the cure for the pathology dividing our intellectual culture between the *personae* of Dr. Jekyll and Mr. Hyde).

So derives the title for this work, *Four Ages of Understanding*: ancient Greek thought, the Latin Age, modern thought, postmodern thought. The book is a survey of philosophy in what is relevant to the "understanding of understanding" from ancient times to the present. It is intended both as a reference work in the history of philosophy and a guide to future research - a "handbook for inquirers" in history, philosophy, and the humanities generally, including historians and philosophers of science. The book also aims to aid in the classroom those professors willing to wean a new generation from the "standard modern outlines" of philosophy's history which serve mainly to

- support the post-Cartesian supposition that history is of next to no import for the doing itself of philosophy." (pp. XXX-XXXI)

South Bend: St. Augustine's Press.

Contents: Foreword IX-XIV; Preamble 3; 1. Requirements of the discussion 5; 2. Foundations in Nature for the semiotic point of view 16; 3. The semiosis of sensation 33; 4. From sensation to Umwelt as species-specific objective world 38; 5. How the distinctiveness of semiosis in general possible? 47; 6. A semiosis beyond perception 68; 7. The dependency of understanding on perceptual semiosis 110; 8. Language and understanding as a single semiosis explicated 120; 9. The semiotic animal 124; Appendix Definition of Umwelt 126; Historically layered references 144; Index 168-178.

"This is an essay in what used to be, and still largely is, called the "philosophy of mind", a designation heavy with the dualistic assumptions of classical modernity. When those assumptions wrapped up in that traditional classification are jettisoned in favor of an epistemological paradigm compossible with semiosis, it becomes clear that what we are dealing with is straightforwardly a semiotics of the cognitive activities of living organisms. The following pages are better viewed under this clarification.

Dr. Anthony Russell claimed that the clarification makes of the essay "the first treatment of the distinction between sense and intellect worth reading since the days of Locke and Hume". Be

that as it may, if the reader adjudges the work worth having read, the game shall have been worth the candle.

Semiotics is nothing more or other than the knowledge we develop by studying the action of signs, and it receives its various divisions from the various ways and regions in which that action is verified. This study presupposes nothing more than a notion of sign as one thing standing for another in a relation of *renvoi*, that is to say, an irreducibly triadic relation, actual or virtual, but in the case of cognitive life, it seems, always actual. Such a general notion of sign is verified, at the extremes, in phenomena we call "natural" and in phenomena we call "cultural", as well as in the intermediary phenomena of social interaction such as sociology, for example, studies it. But - and this is one of the more surprising upshots of contemporary semiotic research - the actual proposal of such a general notion of sign appears to be no older than Augustine, and a creation of the specifically Latin Age of philosophical history.

Proposed at the end of the fourth century, the semiotic point of view did not receive a warrant until the early seventeenth century, when it was for the first time demonstrated how the early Latin proposal for a general notion of sign, applicable in a single sense to the extremes of nature and culture, could be vindicated through the fact that relation according to the way it has being is indifferent to whether its subjective foundation or ground be taken from physical interaction and being or from cognitive activity alone. This establishment of a unified object or subject matter for semiotic investigation was in principle revolutionary for our understanding of human experience and the knowledge which derives there-from. It unified in a single instrument or medium the otherwise diverse products of speculative knowledge about the natures of things and practical knowledge about human affairs and the application thereto of speculative knowledge.

The first author who succeeded in giving voice to the underlying unity of the being in relation upon which all action of signs as such depends was John Poinset (1589-1644), an

Iberian philosopher of mixed Burgundian and Portuguese descent. In the text of his *Tractatus de Signis*, published in 1632, the new beginning implicit in the adoption of the semiotic point of view is in two ways at least symbolized. First, the text expressly notes that the sign requires a standpoint superior to the division of being into what is and what is not independent of cognition, which translates, in modern parlance, into a standpoint superior to the confrontation of realism with idealism. Second, the compass of the *Tractatus de Signis* text unites what were, in the then-traditional liberal arts curriculum of the European universities, the opening discussions of logic with the concluding discussions of the theory of knowledge." (pp. IX-X)

12. ———. 2002. "The Absence of Analogy." *The Review of Metaphysics* no. 55:521-550.

"The doctrine of analogy as the Latins came distinctively to develop it pretty much began its philosophical life in the Stagirite's reply to the Parmenidean One doctrine. There is no one way to say being, replied Aristotle, but, on the contrary, many ways; irreducibly many. At least, as we will see, this was the point from which it developed among the Latins after Thomas Aquinas, who took up Aristotle's point more fully and in some strikingly different ways than is suggested by the Greek of Aristotle. We will see that precisely for want of an understanding of the foundational implications of Aquinas's doctrine of analogy and his corollary doctrine of the transcendental "properties" of being, most of his late modern followers, in their battle against Descartes and the idealism in general that became the hallmark of modernity, fell into that trap (native to the way of things) of proceeding "as if a philosophy of being could not also be a philosophy of mind," (*) and quite missed the problem of being-as-first-known, as shall appear." (p. 522)

1. Between and between 117; 2. The egg of postmodernity 119; 3. The egg hatches 125; 4. Skirmishes on the boundary 131; 5. Reality too is a word 140; 6. A modeling system biologically underdetermined 145; 7. *Blickwendung*: a glance in the rear-view mirror 147; 8. Updating the file 150;

Part III. Dialogue between a 'semiotist' and a 'realist'

"A sign is *What?*" A conversation between a 'semiotist' and a 'realist' 157; *Diagram: the semiotic spiral* 164; References historically layered 209; Index 250-267.

"With Peirce, in recovering from the Latins the general notion of sign, (1) and in advancing that notion both by naming distinctively its third term and by shifting the focus from the being to the action of signs (so that it is well understood that, in that spiral of semiosis (2) we call experience, representamen, significate, and interpretant are constantly changing places as abductions give way to deductions and deductions to retroductions provenating yet further abductions, and so on, in a semiosis that *would be* infinite did not death intervene to curtail the process in the individual case), what we were handed was precisely a new set of categories. (3) This "new list", like the categories of Aristotle, purported to contain modes of being as able to exist independently of mind and able to be known

precisely in that dimension of their being; *but unlike* Aristotle's were not restricted to that order of prospective existence, "ens reale". *Like* Kant's categories, the new list purported to reveal the input of mind into objectivity; *but unlike* Kant's was not restricted to the mind-dependent dimension of what is consequently known, "ens rations". In short, by revealing how mind-independent and mind-dependent being *interweave* in the constitution of experience as a semiotic web of relations whose nodes, reticles, or interstices precisely present to us an objective world *both* natural and cultural in its provenance and knowability, the new list of categories carries us forward beyond modernity and not simply back to some older viewpoint ("realism") adequately presaged in both ancient Greek and medieval Latin thought.

In short, semiotics proves for philosophy neither a question of premodern (though it draws on ancient discussion of relation as much as on medieval discussion of sign) nor modern, but precisely postmodern in its positive essence. For semiotics enables us to see clearly what, for philosophy, modernity consisted in, and why modern philosophy proves wanting when it comes to the analysis of science, language, and knowledge - to matters epistemological generally. For all thought is in signs, and signs are sustained by their distinctive action, which is exhibited in but cannot be confined or reduced to language, as semiology and late modern analytic thought (after the "linguistic turn") beguiled their followers into believing." 15. ———. 2003. "The quasi-error of the external world. an essay for Thomas A. Sebeok, in memoriam." *Cybernetics & Human Knowing* no. 10:25-46.

Abstract: "There is a story according to which Professor Sebeok was on a panel of distinguished speakers who received from the audience a challenge to show cause why the basic ideas of semiotics, such as that of Umwelt, were not simply one more version of solipsistic idealism. Each of the speakers in turn addressed the matter, each beginning with a protestation (outdoing in earnestness the previous speaker) to the effect that, Of course, I am not a solipsist. Finally, Tom's turn arrived. He shrugged, and said simply: I'm a solipsist. It was one of those seminal moments, of which Tom created so many, like the time in Toronto where he mentioned in passing in his main remarks that Everyone thinks of language in terms of communication. But language has nothing to do with communication. In the question period, the very first questioner challenged him on the point. You said that language has nothing to do with communication, the audience member reminded him. Why did you say that? Because it doesn't, Tom answered pointedly, and proceeded to call on the next questioner."

statement toward a doctrine of signs (Saussure 1916) 62; Appendix C. The Latin prelude to a doctrine of signs (Poinset 1632) 66; Historically layered references 71; Index rerum 89-96.

"The word 'semiotics' as a matter of interest today can hardly be discussed apart from a consideration as well of its late modern competitor in intellectual culture, 'semiology'. Seldom has the struggle to define the soul of a newly emerging cultural epoch, in the present case 'postmodernism' as bearing on a molting of philosophical tradition itself, been so succinctly encapsulated as in the late 19th and 20th century history and contest between these two terms. To this spectacle we arrive late enough in the game to realize that semiotics is the term that has carried the day, in the sense of portending the main future line of development of the doctrine of signs within intellectual culture.

The formation and origins of semiotics as a dictionary item, that is to say, as a publicly recognized lexical item of natural language, is what will concern us here. We will see that from its earliest appearances in the English tongue the word semiotics has been bound up with a twofold notion or question: What is to be understood by the doctrine of signs? and What name is most proper to understanding the development of such a doctrine?

The word has ancient roots in Greek medicine, we will see; but its late modern/postmodern establishment in English is what will concern us here. I have chosen the device of numbered paragraphs to facilitate the reader's grasp of the investigative steps, empirical in the broad sense, that I have taken by examining sequences of dictionaries to track the emergence and variations on 'semiotics' as an English lexical item in its own right. Whatever its overtones and provenances from the past and from other languages, within neither Greek nor Latin does the term seem ever to have existed as such, certainly not with its definitive (at least for the time of the twenty-first century's first decade!) postmodern significance of the doctrine that signs consist in every case in a triadic relation of referral.

The being of sign as consisting universally in a relation essentially triadic is a postmodern view of premodern provenance, as is coming to be widely known in semiotics, if sometimes to the consternation of Peircean purists who prefer to overlook or deny Peirce's debt to the Latins in this particular; but the appropriation of 'renvoi' as the term properly to name this fundamental recognition is of recent vintage, coming only after Jakobson (1896-1982), indeed, and with certain essential revisions taken into account, (*) to arrive at the henceforward classical formula for sign (the action of which is the subject matter of semiotic investigation): *aliquid alicuique stat pro alio*, 'one thing standing for another to some third party'. This formulation is the latest molting, we will see subsequently, of a distinguished lineage."

(*) See Jakobson "Coup d'œil sur le développement de la sémiotique", in *Panorama sémiotique / A Semiotic Landscape*, Proceedings of the First Congress of the International Association for Semiotic Studies, Milan, June 1974, ed. 21. ———. 2004. "The role of Thomas Aquinas in the development of semiotic consciousness." *Semiotica* no. 152:75-139.

Abstract: "'Semiotic consciousness' is the awareness we have of the role and action of signs in the world. This essay examines the role of Thomas Aquinas (1224/5-1274) in the growth of semiotic consciousness among the Latins, as Charles Sanders Peirce will take up the matter in influencing the twentieth-

century establishment of semiotics as a global intellectual movement. Although Aquinas never focused on the subject of signs for its own sake, he frequently treats of it in relation to other direct investigations in a great variety of contexts. The result of his treatments is to have left a series of texts which, though not without their inner tensions, contain a series of consequences and connections which can be developed into a unified theory of the being constitutive of signs as a general mode. Precisely this theory was spelled out systematically for the first time in the 1632 *Treatise on Signs* of John Poinset, expressly grounded in a pulling together of Aquinas's various texts together with a careful analysis of the role of signs in human experience. The resulting doctrinal perspective proves to have been implicit in Aquinas and to lie at the foundation of Peirce's notion of signs as triadic relations, a notion he took over from the later Latins and developed anew, particularly in shifting the focus from the being to the action proper to signs, or 'semiosis'. It is this appropriation and shift that marks the boundary between modernity and postmodernism in philosophy, with respect to which the writings of Aquinas are like a taproot."

In *Proceedings of the International Congress on Christian Humanism in the Third Millennium: The perspective of Thomas Aquinas*, edited by Pontificia, Academia Sancti Thomae Aquinatis and Società, Internazionale Tommaso d'Aquino, 261-274. Vatican City: Pontificia Academia Sancti Thomae Aquinatis.

"A postmodern humanism consistent with the thought of Thomas Aquinas requires a new definition of human being, one which extends the classical understanding of «rational animal» on the basis of a study of what is distinctively human within the action of signs. Ancient and medieval philosophy was generally "realistic", but failed to distinguish thematically between objects existing as such only in knowledge and things existing whether or not known. The understanding of the human being that accompanied this orientation was expressed in the formula "rational animal"

(animal rationale). Modern philosophy came to an understanding of the difference between objects existing in

knowledge and things existing independently of knowledge, but at the price of failing to show how things can themselves become objects. The understanding of human being that accompanied the modern divorce of objects from things was enshrined in the formula "thinking thing" (*res cogitans*). Philosophy became "postmodern" when, through work recovering and advancing the original semiotic consciousness of the Latin Age systematized in the 17th century work of John of St. Thomas, it became possible to understand how, through the action of signs, objects and things are interwoven in the fabric of human experience that transcends the modern opposition of realism to idealism. The understanding of human being that develops from and together with this postmodern perspective is precisely captured in the formula "semiotic animal" (*animal semeioticum*). "

33. ———. 2005. *Augustine and Poinsot: The Protosemiotic Development*. Sofia: Tip-Top Press.

34. ———. 2005. "Defining the semiotic animal: a postmodern definition of human being superseding the modern definition "Res Cogitans"." *American Catholic Philosophical Quarterly* no. 79:461-481.

"As modernity began with a redefinition of the human being, so does postmodernity. But whereas the modern definition of the human being as *res cogitans* cut human animals off from both their very animality and the world of nature out of which they evolved and upon which they depend throughout life, the postmodern definition as *semeiotic animal* both overcomes the separation from nature and restores the animality essential to human being in this life. Semiotics, the doctrine of signs suggested by Augustine and theoretically justified by Poinsot, developed in our own day after Peirce, introduces postmodernity by overcoming the Kantian epistemological limits on the side of *ens reale* and showing the social constructions superordinate to *ens reale* as essential to animal life."

35. ———. 2005. "Why the semiotic animal needs to develop a semioethics." In *The Semiotic Animal*, edited by Deely, John,

Petrilli, Susan and Ponzio, Augusto, 207-221. Ottawa: Legas Publishing.

"This paper will discuss why the definition of human being as semiotic animal necessarily implies a semioethic, in light of how, as a definition, it both differs from the classical (ancient and medieval) definition of the human being as "rational animal" and replaces the modern definition of human being as "res cogitans". At issue here is the classical distinction between speculative and practical thought, and how the definition of ethics as belonging determinately to the practical sphere is affected by the establishment of semiotics as transcending that classical distinction. I will consider how the perspective of semiotics impacts upon the traditional ideas of ethics, and how these traditional ideas, in turn, are absorbed into or transformed by the notion of a "semioethics"."

"In his *Letter on Humanism* of 1947, Heidegger declared that the subject/object opposition and the terminology that accrues to it had still not been properly addressed in the history of philosophy, and he awaited a proper disquisition that resolved

the problem. To date, that has not been provided. This volume explains and solves the prevailing problems in the subjectivity/objectivity couplet, in the process making an indispensable contribution both to semiotics and to philosophy. This book shows that what is thought to be 'objective' in the commonplace use of the term is demonstrably different from what objectivity entails when it is revealed by semiotic analysis. It demonstrates in its exegesis of the 'objective' that human existence is frequently governed by examples of a 'purely objective reality' -- a fiction which nevertheless perfuses, is perfused by, and guides experience. The ontology of the sign can be mind-dependent or mind-independent, just as the status of relation can be as legitimate on its own terms whether it is found in *ens rationis* or in *ens reale*. The difference in the awareness of human animals consists in this very contextualization that Deely's writings in general have made so evident: the ability to identify signs as sign relations, and the ability to enact relations on a mind-dependent basis. *Purely Objective Reality* offers the first sustained and theoretically consistent interrogation of the means by which human understanding of 'reality' will be instrumental in the survival -- or destruction -- of planet Earth."

Notes 272; References 289; Explanation of reference style (*Historical layering*) 290; Index 323-329.

"The collection is complementary to the sister collection of Robert Innis, *Semiotics: An Introductory Anthology* (Bloomington: Indiana University Press, 1985), which is a superb assemblage of neoclassic authors, contemporary more or less, but most now dead, and mirroring the embryonic stage through which semiotics first established itself on the contemporary scene. The two collections represent, respectively, points of departure, on the one hand, and trajectories of travel since.

There remains to explain the articulation of the parts of the present collection in their specific character.

Part I explains the origin of the term "semiotic" as it comes to us from Locke, and conveys specifically a perspective, as Winance put it (1983: 515), "able to assimilate the whole of epistemology and natural philosophy as well", where "nature" is understood, as Aquinas explained in such a context (c.1269: 1.1.2), "ita quod sub naturali philosophia comprehendamus et metaphysicam" -- "in such a way as to include whatever there is of being".

Part II does not treat of all the main semiotic systems known to exist, but only of those three concerning which programmatic

research statements are as such extant. This part treats therefore of the three main semiotic systems so far explored as such by teams of researchers cognizant of their orientation and concerned to establish it as such. Further frontiers remain, and some of them (by no means all, or even always accurately) have already been indicated in the position paper of Anderson et al. (1984), "A Semiotic Perspective on the Sciences: Steps Toward a New Paradigm".

Part III concerns themes common to the breaking down and breaking through of the confines imposed by the various linguistic paradigms, as semiotics has moved into its broader perspective of development.

Part IV illustrates the penetration of semiotics into some areas already well established in traditional terms. This section is the most incomplete, inasmuch as the influence of semiotics extends to many "traditional spheres" besides those specified here; but we have chosen the readings for this section with an eye to their exploratory merit. The point of the section is to illustrate lines of possible over already achieved development.

Part V, finally, returns to the name, for the purpose of exploring now not its origins, but its future. It might equally well have been titled "Prospective Semiotics".

In short, the volume begins with the text of Locke's original proposal, followed by a philosophical-historical exegesis of that proposal, and develops through a series of essays establishing the connection of the original semiotic perspective to traditional lines of specialized thought (including philosophy itself) and exhibiting the possibilities of that original perspective in more or less detailed applications to major problem areas. The readings globally taken provide, as we have said, a corrective and an enhancement of popular conceptions of semiotic today.

We aim at nothing less than a full-scale "paradigm shift", in the popular consciousness, from the exclusively literary, structuralist, and Saussurean pars to the inclusive biological, philosophical, and Peircean totum." pp. XVI-XVII.

The Frege-Russell 'Is' Ambiguity Thesis

The meaning of the word "is"

This page use the font *Lucida Sans Unicode* for logical symbols.

"One of the most interesting open problems in the history of formal sciences concerns the rise of modern logic epitomized by the Frege-Russell theory of quantifiers. One of the cornerstones of this theory is the distinction between the allegedly different meanings of verbs for being. According to received wisdom, such verbs are multiply ambiguous between the is of predication, the is of existence, the is of identity, and the is of subsumption. This view, also known as the Frege-Russell ambiguity thesis, is built into the notations that have been used in logic since the turn of the 20th century, in that the allegedly different meanings are expressed differently in the usual logical notations. (1) The is of identity is expressed by the identity sign $a = b$, the is of predication by a singular term's filling the argument slot of a predicative expression $P(a)$, the is of existence by the existential quantifier $(\exists x)P(x)$, and the is of subsumption by a general conditional of the form $(\forall x) (x \in S \supset x \in P)$. Both Gottlob Frege and Bertrand Russell attached great importance to the ambiguity of the verb is. During the 20th century it became commonplace to subscribe to this thesis even though it is not necessary or even fully obvious (cf. [Hintikka 1979]; [Mates 1979]). But then again, it turns out that after the Middle Ages no philosopher assumed such multiple ambiguity before the 19th century. What happened? How did the Frege-Russell thesis come about? In what follows, I approach these questions from a historical point of view. I first say a few introductory words about the treatment of existence in Aristotle and Kant, and thereafter focus on the 19th century English

developments in the field of the algebra of logic and on the ideas of George Boole and Augustus De Morgan in particular.

Aristotle considered the Frege-Russell distinction but rejected it. His treatment of existence in the context of a syllogistically constructed science was in rough agreement with the ancient Greek language, in which there were no separate verbs for existence. Existence was expressed by the absolute construction with ἔστιν which looks like a special case of predication, e.g., "Zeus is" as a limiting case of such statements as "Zeus is a god" or "Zeus is powerful". In effect, Aristotle treated the different Frege-Russell senses of different components in the force of ἔστιν. *Each of these components could be absent or present on any one occasion of the use of ἔστιν.* In syllogistic reasoning, existence was sometimes present as part of the force of the predicate term, sometimes absent. The existential force trickled down from the most general terms of the sense in question along a sequence of syllogistic conclusions. Hence, in any one particular science existential force had to be assured, according to Aristotle, only for the widest generic term defining the field of that science:

Thus we assume the meaning alike of unity, straight, and triangular; but while as regards unity and magnitude we assume also the fact of their existence, in the case of the remainder proof is required. [*An. post.*, A 10, 76a, 34-36]

Existence could not serve alone as a predicate term because it would have been too broad a term, not restricted to any one category and thus not an essence of anything [*An. post.*, B 7, 92b, 13-15]. In this sense, according to Aristotle, existence was not a predicate. However, it could be a part of the force of a predicate term.

It is often said that Kant's discussion of existence includes a criticism of the idea that existence is a predicate. In fact, it includes a stronger criticism, namely the rejection of the idea that existence could be even a part of the force of a predicate term. According to Kant, existence adds nothing to a concept of a thing:

'*Being*' is obviously not a real predicate; that is, it is not a concept of something which could be added to the concept of a thing. [...] The

small word 'is' adds no new predicate. [*Kritik der reinen Vernunft*, B 625]

This does not mean that Kant embraced the Frege-Russell thesis. It means that at the turn of the 19th century the notion of existence became homeless, as far as the logical representation of different propositions was concerned. It must be admitted, though, that Kant's criticism served to disassociate the predicative and the existential uses of is from one another. According to Leila Haaparanta, Kant seems to have inspired the Frege-Russell distinction [Haaparanta 1986].

After Kant the next major development in logical theory was the algebra of logic that originated in England around the mid-19th century.(2) The following two ideas came to the forefront:

- 1) the operators corresponding to the syllogistical standard forms of universal and particular judgments were treated as duals;
- 2) universal judgments were taken to be relative to some universe of discourse and were inevitably taken as the non-existence of exceptions in that domain.

Because of the duality, existential quantifier expressions came to express existence. The homeless notion of existence thus found a new home, no longer in the predicative *is* but in the existential quantifier.

Before moving on to take a closer look upon the ideas of Augustus De Morgan and George Boole, it is important to acknowledge that neither of them introduced existential or universal quantifiers, and therefore they must not be regarded as early pioneers of the predicate calculus. However, at least De Morgan seems to have been aware of at least some of the difficulties that arose in the absence of quantifiers [Goerge C. Smith (ed.), *The Boole-De Morgan Correspondence: 1842-1864*, Oxford: Clarendon Press 1982, p. 24]." (pp. 255-257)

Notes

- (1) Stanislaw Leśniewski's notation provides an important exception here.

(2) Strictly speaking it was upon Leibniz's initiative that the idea of an algebraic structure of logic began to grow -- even though it was Boole who really started its systematic development.

From: Risto Vilkkio, "Existence, Identity, and the Algebra of Logic", in Benedikt Löwe, Volker Peckhaus, and Thomas Räscher (eds.), *Foundations of the Formal Sciences. The History of the Concept of the Formal Sciences*, London: College Publications 2006, pp. 255-265.

"Being" From a linguistic point of view

"Nowadays, logicians tend to draw a sharp distinction between the 'existential' function of 'the verb *to be*' and, its various 'predicative' or 'copulative', functions. The philosophical importance of this distinction lies in the fact that most modern philosophers would say that existence cannot be predicated of objects in the same sense as their various attributes, or properties, but is presupposed in the identification of objects or in any reference to them. (...)

It is worth noting, however, that in English 'the verb to be' is not used as freely in existential sentences as it was in Greek: it is such sentences as *God is* (where 'the verb to be' is perfectly normal in Greek) that have mainly interested philosophers. What would generally be described as the 'existential' use of 'the verb to be' in English is not common except with a locative or temporal complement. Examples of this usage are (i) There are lions in Africa, and (ii) The accident was yesterday. We shall discuss such 'existential' sentences presently.

Among the 'predicative' uses of 'the verb to be' logicians customarily distinguish: (a) the *identification* of one entity with another ($a = b$: e.g. *That man is John*); (b) *class-membership* ($b \in C$: e.g. *John is a Catholic*, 'John is a member of the class of persons characterized as Catholic'); and (c) *class-inclusion* ($C \subset D$: *Catholics are Christians*, 'The members of the class of persons characterized as Catholic are included among the members of the class of persons characterized as Christians').

Though logically important, the distinction between class-membership and class-inclusion does not appear to be of any

syntactic significance in most languages. The distinction between 'characterizing' and 'sortal' sentences (...) is, however, of considerable importance: cf. *Apples are sweet* and *Apples are fruit*. The former tend to have an 'adjectival' predicate (in languages where one can draw a distinction between 'adjectives' and 'verbs'), and the latter a nominal predicate. The syntactic analysis of sentences with nominal predicates (e.g. *Apples are fruit*, *John is a soldier*, *Mary is still a very young girl*) is a very complex matter: we shall not go into the question here. We will disregard the differences between various subtypes of nominal predicates and treat them all like 'adjectival' predicates. For terminological convenience, we will refer to both classes of sentences (whether they are 'characterizing' or 'sortal', and regardless of any other differences) as *attributive*." (pp. 388-389)

From: John Lyons, *Introduction to Theoretical Linguistics*,
Cambridge: Cambridge University Press 1968.

The history of the concept of "being" and the "Is" ambiguity thesis

"This history involves more changes and contrasts than one might perhaps expect. For one thing, we twentieth-century philosophers are wont to approach the notion of being by means of the Frege-Russell ambiguity thesis. As we all know this thesis concerns the notion of being, as codified in verbs for being in languages like the English *is*, German *ist* or the ancient Greek *estin*. What it asserts is that these verbs are multiply ambiguous. We have to distinguish (according to this thesis) from each other the *ises* of existence, identity, predication and subsumption. Indeed we are in fact supposed to have learned to distinguish them from each other in practice, for we have all been taught to use first-order logic as our canonical notation in logic and logical analysis. It is in order for me to emphasize the word ambiguity here. Every half-way sensitive analyst (or perhaps I should say, every sensible analyst) will grant that verbs for being like the English *is* are used in different ways on different occasions. What the Frege-Russell thesis does, is to blame these differences in use on the ambiguity of a single word, instead of explaining the difference in use away in some other way, for instance by reference to the context of use.

The Frege-Russell ambiguity thesis has played a major role in twentieth-century philosophy. With his usual modesty, Russell (1914, p. 50) called it "the first serious advance in real logic since the time of the Greeks". One of the many surprises in my brief history of the concept of being is how recent a belief in the Frege-Russell thesis is in the history of philosophy. As far as I know, it is not found in a clear form before the nineteenth century. Its genesis needs and deserves a closer scrutiny, but apparently different versions of the ambiguity thesis were adopted independently of each other by different thinkers. Some historians assign the credit (or the blame) for introducing the distinction between the existential *is* and the predicative *is* to Kant. (But see below.) In contrast, the thesis is conspicuous by its absence from such philosophers as Aristotle.

(...)

As was indicated, it has been claimed that the Frege-Russell distinction can be traced back to Kant and his thesis that "existence is not a predicate". Meinong's case shows that this cannot be the full story. For one important thing, even though he adopted a part of the Frege-Russell distinction, at the same time existence was in a sense a predicate according to Meinong. After all, only existential judgements were for him contingent." (pp. 29-31)

From: Jaakko Hintikka, "Meinong in a Long Perspective," *Grazer Philosophische Studien* 50, 1995, pp. 29-45.

Charles H. Kahn on "Being" in Ancient Greek

"I am not myself a linguistic relativist. I want, in effect, to defend the concept of being against its modern detractors. What I hope to do in this paper is to show that when the Greek concept of being (as introduced by Parmenides and developed by Plato) is properly understood it represents a valid and indeed inevitable topic for philosophic inquiry. It turns out, in fact, to be fundamentally the same topic that is pursued in the modern ontological tradition of Frege, the early Wittgenstein, and Quine. And it also turns out to be very different from the questions of personal existence and the human condition which dominate that other school of modern ontology associated with the name of Heidegger. (2)

In order to meet the challenge of linguistic relativism, we must first give an adequate account of the linguistic functions of the verb 'be,' (*eimi* in ancient Greek), and then show that these functions provide the basis for a coherent concept and a clear philosophical question. Let me briefly indicate in advance what I take the solution to be. The concept of being in Greek philosophy refers to the nature of reality or the structure of the world, in the very general sense of 'the world,' which includes whatever we can know or investigate and whatever we can describe in true or false statements. The question of being is then: How must the world be structured in order for inquiry, knowledge, science, and true discourse or, for that matter, false discourse to be possible?

On this view of the concept of being, the key notion is that of truth -- the goal of science and the aim of declarative speech. If the claims of linguistic relativism have seemed plausible in regard to the concept of being, that is due in part to the fact that they rely upon an inadequate account of the functions of the verb 'be,' an account in which the connections with truth and falsehood -- what I call the 'veridical' uses of the verb are generally overlooked. Once we put the notion of truth at the heart of the Greek concept of being, the internal coherence and general significance of this concept will become clear. I have argued elsewhere that this concept of being does not rest on an illegitimate confusion, since it brings together three distinct notions -- existence, predication, and truth -- which belong together in any ontology or in any metaphysical scheme. (3) At the same time it is important to recognize that these three notions *are* distinct, and that the distinction between them was not always clearly seen in Greek philosophy, precisely because the same verb *eimi*, and its participle *on*, was used to express all three. Here, as elsewhere, it is important to give the devil his due; if we do not, as the saying goes, he will take more than his share. In defending the concept of being against the charge of linguistic confusion, it is important to recognize the genuine possibilities for confusion that were latent in the multiple usage of the verb. If we bear in mind the distinctions between existence, predication, and truth, and recognize that these distinctions were often overlooked because of a single linguistic expression for all three, we will be in a better position to interpret a number of perplexing passages in Plato, Aristotle, and

Parmenides, for we will be in a position to articulate some problems more clearly than the Greek philosophers were able to do. My guess is that the same may be true for Indian philosophy, for the basic functions of the verb *as* in Sanskrit seem to be very nearly the same as those of *eimi* in Greek. If my linguistic analysis of the verb 'be' is adequate for Greek, it (or a similar analysis) ought to be adequate for Sanskrit. And if the linguistic analysis of 'be' can shed useful light on the Greek concept of being, the same relation ought to hold between an analysis of the Sanskrit verb and the Indian concept of being.

Since I am not an Indologist, I offer this parallel only for what it may be worth, as a heuristic hypothesis and as a challenge to Sanskrit scholars and specialists in Indian philosophy. I shall limit myself to the Greek material, and proceed in two steps. First I shall report some of the results of the linguistic analysis of the Greek verb which I have published elsewhere. Then I shall apply this analysis to the interpretation of two key passages for the development of the terminology and concepts of Greek ontology. The first passage is from the poem of Parmenides, where the concept of being makes its first appearance in the philosophical tradition of the West. The second passage is Plato's initial exposition of the doctrine of Forms in the *Phaedo*, where we have the first full-scale statement of Plato's own ontology.

I begin, then, by summarizing some results of the linguistic analysis. One central feature of my account is the claim that the verb 'be' in Greek -- and, I dare say, in Indo-European generally -- is primarily and fundamentally a copula and not a verb of existence, as comparative linguists have usually held. There is no evidence for the traditional assumption that the verbal root *es* originally meant only existence (or the like) and gradually declined into the use as "mere copula." By claiming that the copula uses the primary, I mean, not only that they are factually (or statistically) predominant from the earliest texts, but also that they provide the only possible point of departure for a theoretic account of the whole system of uses for the verb. I do not claim that the copula uses are older than the others, but only that *if* we regard them as older we can understand how the other uses *could* have developed from them. Talk of "development" here is a mere theoretical convenience, like a myth of creation or an original social compact, a conceptual device that serves to clarify the

relations of logical priority and dependence between different factors in a complex system.

From the point of view of the language, then, the primary or central use of the verb is as a copula. (4) By a copula use I mean an occurrence of the verb with a predicate adjective ("I am tall"), a predicate noun ("I am a man"), or a prepositional phrase ("I am in the conference room"). The copula use includes the so-called 'is' of identity: "I am C.K." ; "I am the first speaker this afternoon." The verb 'be' as copula in Indo-European is characterized by two features which are important for the philosophical development. The first I call the *locative*, the second the *durative* aspect. By the locative feature I mean the fact that the verb serves for predication in general, not only with nominal predicates (predicate nouns and adjectives or participles) but specifically for statements of place, like "We are in this room." This locative use seems so essential to the meaning of the verb that we find Aristotle saying that most people believe that whatever is, is somewhere; what is nowhere is nothing: for Greek common sense, a thing cannot really *be* unless it is somewhere. Beginning with Plato, some philosophers will deny the necessity of this connection between being and being in some place. But it has a strong intuitive hold on the Greek feeling about "what is."

The second feature of the Indo-European copula, the durative aspect, is even more decisive for the Greek view of being. This is the aspect which contrasts 'be' with 'become,' *eimi* with *gignomai* as copula verb (and *as* with *bhu* in Sanskrit). What is at issue here is not simply the aspectual opposition familiar in comparative linguistics, where the present-imperfect stem is contrasted with aorist and perfect, but a more general linguistic contrast between being in a state or being in a place, on the one hand, and change of state or change of place on the other hand. This general aspectual contrast is best described as an opposition between *stative* and *mutative*, or *static* and *kinetic*. We can illustrate the opposition in English by contrasting "I am tired" with "I become tired," "I am tall" with "I grow tall," "I am in Canada" with "I go to Canada" or "I arrive in Canada." This aspectual contrast seems to be much more general than Indo-European, for it is founded in the nature of things, and there is likely to be some expression for it in every language. But it is characteristic of Indo-European that the root *es* is typically, and in

Greek almost exclusively, used to express the stative aspect, whereas a variety of other copulas are used for predication with a mutative nuance (there is no single root for 'be'. There is no *single* Indo-European word for 'become,' as there is a single root for 'be'). There is, in short, an essential connection in Indo-European between the idea of being and the idea of stability or remaining in the same state.

So far we have considered only the copula or predicative uses of 'be.' There are of course other, non-copulative uses, of which I will mention only two. One is the existential use, or rather the family of uses with an existential sense. As an example we may take the familiar Homeric verse, "There is a city Ephyre in the corner of horse-nourishing Argos." The connection of this existential use with the copula construction ("Ephyre is a city," "Ephyre is in Argos") is fairly obvious. Other existential uses are farther removed from the copula construction, but I shall not go into these complications here.

Finally we have what I call the veridical use, where 'be' expresses neither predication nor existence but the truth of a statement or a belief. The standard veridical construction is of the form "Things are as you say," *esti tauta houto hosper su legeis*, or for short, *esti tauta* or *esti houto*. Curiously enough, the ancient veridical use has recently had a vigorous revival in colloquial English: "Tell it like it is." The distinctive features of the veridical construction are (1) that the verb is not construed with a predicate but with an implied or explicit comparison to a clause of saying or thinking ("it is ... like you say"), and (2) that the underlying subject of the verb is a sentence or a sentential content roughly speaking, a proposition: the 'it' refers to a sentence, expressed or understood. The importance of this veridical use in ancient Indo-European is reflected by the widespread use of the root *es*, and above all its participial derivatives (from *sant*), in the sense of 'truth': in Greek *ontos*, *toi onto*, 'truly' ; *legein ta onta* 'state the facts' ; in archaic English we find 'sooth' for 'truth' ; and in Sanskrit there are the familiar derivatives of *sat* (e.g., *satya*) in the same sense.

So much for the linguistic preliminaries. We have first the copula uses with their locative connotation or locative application and their durative-stative aspect. We have next the existential uses; and, finally, the veridical construction with the related uses of the

participial forms to mean 'truth.' Now my claim about the philosophic development of the Greek concept of being is roughly this: the last-named use must be placed first. The point of departure for the philosophers is the veridical use and the notion of truth. Philosophers are primarily concerned with knowledge or the search for knowledge, and hence with truth in speech and in thought. But as the veridical construction shows, the concept of truth involves some kind of correlation or 'fit' between what is said or thought, on one side, and what is, or what is the case, or the way things are, on the other side. Let us call this the correlation between assertion and reality, where 'assertion' is used neutrally both for saying that it is so and for thinking that it is so ; and 'reality' is used simply as a convenient abbreviation for the fact that it is so or what happens to be the case. In saying that the concept of truth implies a correlation or a 'fit' in this sense between assertion and reality, I think we beg no metaphysical questions. We simply articulate the connection of ideas expressed in the Greek locutions *esti tauta* and *esti houto*. And precisely the same connection is expressed in the modern locution "Tell it like it is."

So we see how the philosophers' interest in knowledge and truth, taken together with the use of 'be' and its participle to mean 'truth' or 'what is so,' immediately leads to the concept of being as reality. I repeat, I am using 'reality' here not in any large metaphysical sense but simply as a convenient term in the hermeneutical metalanguage: as a mere name or counter for the facts that make true statements true and false statements false, or for whatever it is "in the world" (for whatever "is the case") that makes some assertions and some judgments correct and others mistaken. If I assert either in thought or in speech that the sun is shining, and if what I assert is true, then the corresponding 'reality' is simply the fact that the sun is shining.

So far I have said nothing about 'be' as verb of existence or as copula. I have shown only that starting from the veridical locutions and the notion of being as truth we immediately get to the related notion of being as reality, in a suitably loose and generalized sense of 'reality.' I think that these two notions, together with the locative idea that whatever is, is somewhere, and with the durative-stative aspect of the verb, are all we require for interpreting Parmenides' notion of being. Of course, we can easily see how the existential and copula uses of

'be' will also turn up, if we think of the reality in question as expressed by a subject-predicate sentence-for instance, by the sentence "The sun is shining." For if this sentence is true, then its subject (the sun) must exist. And the sentence uses the copula verb 'is' to predicate something of this subject, namely that it is shining, or that its light reaches us. So when we are talking about truth and reality, the existential and copulative uses of 'be' are never far away. But I insist that if we begin to interpret the concept of being by looking for existential or copula uses of the verb, we will not only make unnecessary trouble for ourselves; we may miss the real point. We will not only play into the hands of the linguistic relativists; we will fail to grasp the essential features of the Greek concept of being." (pp. 32-36)

Notes

(2) I shall not dwell here upon the contrast between the Greek and the Heideggerian conceptions of Being. See my remarks on "static being and personal Dasein" in *The Verb 'Be' in Ancient Greek* (Dordrecht : Reidel, 1973), pp. 415-19.

(3) In addition to Chapter 8 of *The Verb 'Be' in Ancient Greek*, see "On the Theory of the Verb 'to be,'" in *Logic and Ontology*, ed. Milton K. Munitz (New York : New York University Press, 1973), pp. 1-20. In these studies I was primarily concerned with the unity of the linguistic system of the verb as ordinarily used. By contrast, the present paper deals explicitly with the special quasi-technical use of the verb and its nominal derivatives (*by* and *obcria*) to formulate the philosophic concept of Being. I thus return to the topic originally sketched in "The Greek Verb 'to be' and the Concept of Being," *Foundations of Language* 2 (1966): 245-65.

(4) This linguistic claim that the copula uses are fundamental for the system of the verb as a whole is logically independent of my claim that, as a fact in the history of philosophy, the idea of truth (and falsehood) associated with the veridical uses is the primary notion for the development of the metaphysical concept of Being in Plato and Parmenides. Either claim might be in error without the other thesis being affected either way. But of course there is some connection between the function of copula and the veridical idea. See

my remarks on the notion of truth-claim implicit in the copula use, *The Verb 'Be' in Ancient Greek*, pp. 186-91, 407f.

From: Charles H. Kahn, "Linguistic Relativism and the Greek Project of Ontology", in Mervyn Sprung (ed.), *The Question of Being*, University Park: University of Pennsylvania Press 1978, pp. 31-44.

ἔστι in Ancient Greek

"Whether ἔστι is orthotone ((ἔστι) or enclitic depends solely on its position: ἔστι when initial (or quasi-initial: see below), otherwise ἐστι. This is both stated by ancient grammarians and confirmed by linguistic theory ; (1) the modern differentiation between ἔστι copula, ἐστι to affirm existence or possibility, is mistaken. (2)

The accentual treatment of verbs in Greek will originally have been the same as in Sanskrit: all finite verbs in independent clauses unaccented when not initial, accented only when initial. Most unaccented verbs acquired an accent under the rule of limitation, and became thereby orthotone; (3) the few forms short enough to remain unaccented acquired an accent by analogy with related forms which were not. Only two tenses are capable of remaining unaccented in all their forms, the pres. indic. of εἶμι and of φημι; and these are precisely the two tenses which could be enclitic in historical Greek. (4) Their enclisis is a survival from the old universal enclisis of verbs; it should operate, therefore, in the same way in which that enclisis operated, in accordance with position. (5)

According to Herodian (i. 553) ἔστι is orthotone not only when initial but also after οὐ, καί, εἰ, ἀλλά, ὡς, τοῦτο. If this is true, it means that the original initial accentuation was extended, surprisingly, to a number of quasi-initial positions.(6) But it may, in part at least, be false: the Homeric scholia (BT *On Iliad* I. 63 ; cf. A on 6. 152) say expressly that ἔστι is orthotone only when initial and after οὐ." (pp. 425-426)

Notes

(1) See Wackernagel, '*Der griechische Verbalakzent*' *Zeitschrift für vergleichende Sprachforschung*, 23, [1877], 457 ff., (= *Kleine Schriften*, 1955, 1058 ff.); I give only the barest essentials.

(2) I say 'modern' (it was propounded by Gottfried Hermann, *De emendanda ratione graecae grammaticae pars I.* [Lipsia, 1801], 84 ff.), but it seems to have its root in antiquity: I notice at the last moment (what the handbooks ignore) that Eustathius (*On Iliad.*, p. 880. 22, discrepantly with his remarks *On Odyssey.* p. 1600. 53) and Photios (s.v. ἔστιν) record a view that the accent varies with the meaning (paroxytone ἔπειδα ἔν ἀποφαινώμθα περί του ὡς ὑπάρχει [ἀποφαινόμεθα αυτοι περί τοῦ ὑπάρχειν τι Phot.], οἷον ἔστι πόλις Ἐφύρη, oxytone ὅταν πρόσ ἐρώησιν ἀποκρινώμεθα); cf. also schol. T *On Iliad.* 23. 157 and 549. There seem to have been divergent practices; but we shall do well to prefer that which linguistic theory shows to have been original.

(3) Hence their recessive accent (which was then universalized in all positions: e.g. initial γνοιέσ [Sanskrit *jñeyás*] supplanted by γνίοεσ from enclitic γνοιεσ).

(4) Enclisis of φημι is perhaps the surest token that enclisis of εἶμι is not conditioned by its 'weakness of meaning' as copula.

(5) The original orthotone accents should have been (on the analogy of Sanskrit) εἶμι (έσσι) ἔστ᾽ἔστο ἔν ἐσμέν ἐστ᾽ εἶσι and similarly φημι etc.; but all save ἔστι are traditionally oxytone (εἶμι, φημί, etc.). Influence of the enclitic forms in all but the commonest case? But there is some evidence for initial φῆμι: Tyrannion cited by Eustathius *On Odyssey*, p. 1653, 58.

(6) 'Surprisingly', for this 'quasi-initial' position is precisely the position (second in their clause) to which enclitics tend.

Annotated bibliography on the Frege-Russell 'Is' ambiguity thesis

Bibliography

1. Angelelli, Ignacio. 2015. "The Meaning(s) of "Is": Normative vs. Naturalistic Views of Language." In *The Road to Universal Logic: Festschrift for the 50th Birthday of Jean-Yves Beziau. Volume II*, edited by Koslow, Arnold and Buchsbaum, Arthur, 171-179. Cham (Switzerland): Birkhäuser.

Abstract: "One of the founders of modern logic, G. Frege, has insisted on the variety of meanings of the little word "is." He explicitly distinguished four such meanings (sheer predication or subsumption, identity, assertion, and existence); a fifth meaning (subordination) follows from Frege's new theory of predication. It is part of the Fregean doctrine that special symbols corresponding to different meanings of "is" are to be used. Such distinctions have been strongly challenged by J. Hintikka, in a twofold way: theoretically and historiographically. Neither challenge is regarded as successful. Behind the conflict on "is" two opposite conceptions of language may be perceived: language as culture versus language as nature ("natural language")."

2. Boger, George. 2018. "Existential Import and an Unnecessary Restriction on Predicate Logics." *History and Philosophy of Logic* no. 39:109-134.

Abstract: "Contemporary logicians continue to address problems associated with the existential import of categorical propositions. One notable problem concerns invalid instances of subalternation in the case of a universal proposition with an

empty subject term. To remedy problems, logicians restrict first-order predicate logics to exclude such terms. Examining the historical origins of contemporary discussions reveals that logicians continue to make various category mistakes. We now believe that no proposition per se has existential import as commonly understood and thus it is unnecessary to restrict first-order predicate logics to non-empty classes. After introducing the problem, we trace some nineteenth century treatments of the issue to locate a source of misconstruing propositional import in misconceptions of 'implies' and 'affirms' and name the process/product fallacy, along with the translation of categorical sentences using quantifiers and accommodating an empty class. Next we treat some metalogical matters to orient our discussion by which we provide a more precise nomenclature about 'sentence' and 'proposition' to correct previous misconceptions; here we uncover a common category mistake in respect of a proposition's efficacy. The semantic distinction between agent and force is helpful in this connection. We conclude by showing that logicians have reinserted existence as a predicate, a position previously excised by Kant, and that the Frege-Russell ambiguity thesis applies only to relationships within a categorical sentence between grammatical predicate and subject."

3. Corazza, Eros. 2018. "Names, Identity, and Predication." *Philosophical Studies* no. 175:2631–2647.

Abstract: "It is commonly accepted, after Frege, that identity statements like "Tully is Cicero" differ from statements like "Tully is Tully". For the former, unlike the latter, are informative. One way to deal with the information problem is to postulate that the terms 'Tully' and 'Cicero' come equipped with different informative (or cognitive) values. Another approach is to claim that statements like these are of the subject/predicate form. As such, they should be analyzed along the way we treat "Tully walks". Since proper names can appear in predicative position we could go as far as to dismiss the sign of identity altogether, some told us. I will try to discuss the advantages and/or disadvantages of this approach and investigate whether Frege's view that the 'is' of identity must be

distinguished from the 'is' of predication (copula) can be reconciled with the fact that names can appear in predicative position."

7. Haaparanta, Leila. 1985. *Frege's Doctrine of Being*. Helsinki: Acta Philosophica Fennica.

Contents: Preface 3; A note on the textual references and the bibliography 5; I. Introduction 9; II. The interpretational framework 27; III. The origin of the thesis concerning the ambiguity of the word 'Is' 47; IV. Identity and predication 59; V. Existence 128; VI. Concluding remarks 159; Bibliography 162; Index of names 179.

"The purpose of this work is to clarify the philosophical basis of Frege's doctrine concerning the word 'is'. Frege's doctrine of being is partly considered in its historical setting, formed mainly by Leibniz and Kant. Since the ambiguity thesis is one of the cornerstones of Frege's new logic, this work will, to some extent, help to indicate how Frege arrived at his great logical innovation. I shall proceed by first presenting a short survey of the different approaches to Frege's philosophy and thereafter outlining Frege's historical setting (Chapter II.1.). Then I shall present the main features of Frege's view of logic (Chapter II.2.). After that, I shall say a few words of the history of the word 'being' in philosophical and philological literature and study Frege's texts concerning the ambiguity doctrine (Chapter

III). In Chapter IV there is a discussion on Frege's distinction between identity and predication with reference to Leibniz's and Kant's thought and some remarks are also made on class-inclusion. In Chapter V there are comments on Frege's doctrine of existence with reference to Kant's ideas. Finally, I shall make some concluding remarks on Frege in a wider historical context (Chapter VI). Chapter II will give the interpretational framework for considering Frege's doctrine of being. Chapters IV and V are meant to show how this general hypothesis works in the textual material and thereby to yield a detailed interpretation of Frege's view." (pp. 16-17)

From the General Introduction by Leila Haaparanta and Jaakko Hintikka: "In her article 'Frege on Existence' Leila Haaparanta emphasizes that Frege's greatest insight was the idea of first-order language, which, to a large extent, motivated the rest of his innovations. Haaparanta focuses her attention on Frege's concept of existence, which receives special attention in Frege's thought in connection with the thesis concerning the ambiguity of such words for being as the English 'is'. The ambiguity thesis was an important part of the Fregean paradigm of first-order logic. Haaparanta argues that Frege does not only assume the word 'is' to be ambiguous but that he considers 'exists', or the 'is' of existence, to be an equivocal word. She suggests that the equivocality view has a metaphysical and epistemological background in Frege's thought. Her paper thus pushes a great deal further the suggestions of Jaakko Hintikka mentioned earlier in this Introduction." (p. 6)

"Meinong's thought is considered in relation to several major conceptual problems, including the Frege-Russell thesis that words like *is* are multiply ambiguous and Aristotle's treatment of existence. This treatment leads to a problem of how to interpret quantifiers. The three main possible interpretations are: (i) quantifiers as ranging over actual individuals (or individuals existing in some one world); (ii) quantifiers as ranging over a set of possible individuals; (iii) quantifiers merely as a way of specifying the interdependencies of the concepts (forms) specified by syllogistic terms. The subsequent history of philosophers' and logicians' treatments of existence is characterized by a tension between (i)-(iii). Meinong's position is in the main (iii) whereas Russell in his *On Denoting* defended (i). The contrast between (i) and (iii) has a counterpart in nineteenth-century discussions about foundations of mathematics."

"One of the characteristic features of contemporary logic is that it incorporates the Frege-Russell thesis according to which verbs for being are multiply ambiguous. This thesis was not accepted before the nineteenth century. In Aristotle existence could not serve alone as a predicate term. However, it could be a part of the force of the predicate term, depending on the context. For Kant existence could not even be a part of the force of the predicate term. Hence, after Kant, existence was left homeless. It found a home in the algebra of logic in which the operators corresponding to universal and particular judgments were treated as duals, and universal judgments were taken to be relative to some universe of discourse. Because of the duality, existential quantifier expressions came to express existence. The orphaned notion of existence thus found a new home in the existential quantifier."

27. Mion, Giovanni. 2019. "Hintikka on the "Kant–Frege View": A Critical Assessment." *Logica Universalis* no. 13:171-178.

Abstract: "In "Kant on Existence, Predication, and the Ontological Argument" (1981), Hintikka argues that the so-called "Kant–Frege view" (i.e., the claim that Kant is a forerunner of Frege's treatment of existence)

is wrong, for its supporters erroneously assume that for Kant 'is' is ambiguous.

In this paper, I will first critically evaluate Hintikka's arguments against the Kant–Frege view. Then, I will attempt to prove that Kant's claim that existence is not a real predicate and Frege's claim that existence is a quantifier are in fact logically interdependent. Finally, I will use the Kant–Frege view in order to reconcile the various claims that Kant makes about existence."

29. ———. 1924. "Some Meanings of the Word *Is* [Second version]." *Journal of Philosophy* no. 21:365-377.

Expanded version of the article published in 1915 (reprinted in Justus Buchler and Benjamin Schwartz, eds., *Obiter Scripta. Lectures, Essays and Reviews by George Santayana*, New York: Scribner's Sons, 1936, pp. 189-212); reprinted also in: Martin A. Coleman (ed.), *The Essential Santayana: Selected Writings*, Bloomington: Indiana University Press, 2009, pp. 138-148.

"This selection first appeared in *The Journal of Philosophy* (21 [1924]: 365-77), A shorter version with the same title was published in 1915 (*The journal of Philosophy, Psychology, and Scientific Methods*, 12 (1915 1:66-68). As early as 1914 Santayana had intended the article as the first chapter of his *Realms of Being*. The 1924 article was republished in *Obiter Scripta*, and in a letter to the editors of that volume Santayana wrote: "I am also glad that you have rescued the '*Meanings of*

the Word "Is". On re-reading that article, I feel that it contains my whole philosophy in a very clear and succinct form; I was dissuaded by a friend from putting it into *The Realm of Essence*, and also by my own feeling that it covered too much ground to go into that volume. Here [in *Obiter Scripta*] it is in its place." (*The Letters of George Santayana*, Book Five, 1933-1936: *The Works of George Santayana*, Volume V, Book Five, Cambridge: The MIT Press, 2003, p. 158). The seven meanings of the word "is" that Santayana distinguished demonstrate different realms of being that make up his ontological system." (M. Coleman, p. 138 of the 2009 reprint)

30. Vilkkio, Risto. 2006. "Existence, Identity, and the Algebra of Logic." In *Foundations of the Formal Sciences. The History of the Concept of the Formal Sciences*, edited by Löwe, Benedikt, Peckhaus, Volker and Räscher, Thomas, 255-265. London: College Publications.

"One of the most interesting open problems in the history of philosophy concerns the genesis of contemporary logic epitomized by the Frege-Russell theory of quantifiers. One of the cornerstones of this theory is the distinction between the allegedly different meanings of ordinary-language verbs for being. According to the received view, such verbs are multiply ambiguous between the is of predication, the is of existence, the is of identity, and the is of subsumption. This assumption (a.k.a. Frege-Russell ambiguity thesis) is built into the notations that have been used in logic since Frege and Russell, in that the allegedly different meanings are expressed in the usual logical notations differently. It turns out that no philosopher before the 19th century assumed the Frege-Russell thesis.

It can be shown that Aristotle considered the Frege-Russell distinction but rejected it. He treated existence as a part of the force of a predicate term. Some people have ascribed it to Kant. However, it is false to say that Kant created, or maintained, the Frege-Russell thesis. His discussion of existence is often said to include a criticism of the idea that existence is a predicate. Strictly speaking it includes a stronger criticism, viz. the rejection of the idea that existence could be as much as a part of

the force of a predicate term. Hence, after Kant the notion of existence became an orphan, as far as the logical representation of different propositions in syllogistic logic was concerned.

The next main development in logical theory was the algebra of logic that originated in England around the mid-19th century. The following two ideas came to the forefront: (1) the operators corresponding to our universal quantifier and existential quantifier were treated as duals; (2) universal quantifier expressions were taken to be relative to some universe of discourse, and was inevitably taken as the non-existence of exceptions in that domain. Because of the duality, existential quantifier expressions came to express existence. The orphaned notion of existence thus found a home, no longer in the predicative is but in the existential quantifier. This helps to explain the independent discovery of quantifiers by Frege and by Peirce.

This paper concentrates on what happened to the notion of existence after Kant and before Frege. Particular attention is paid to the English developments around mid-19th century and to the work of George Boole and Augustus De Morgan in particular."

31. Wiggins, David. 1995. "The Kant–Frege–Russell View of Existence: Toward the Rehabilitation of the Second-Level View." In *Modality, Morality and Belief. Essays in Honor of Ruth Barcan Marcus*, edited by Sinnott-Armstrong, Walter, Raffman, Diana and Asher, Nicholas, 93-115. Cambridge: Cambridge University Press.

"At the acme of the influence in philosophical logic of Russell and Frege, few can have predicted that, after their deaths, the idea that they both sought to discredit of existence as a first-level concept (or property of individuals) would so soon be restored.

(...)

This was that the existence of an item (or items) x of level n is always a property of x 's concept, which is a level $(n + 1)$ concept, not a level $(n + 2)$ property of x itself. But the situation

nobody predicted would appear to be the actual one. As something believed and positively advocated in its Fregean purity, the Frege-Russell view has virtually disappeared from sight.

Such an outcome might prompt an adherent of the Frege-Russell view to try to refute the new first level doctrine. But, in the absence of any attempt to refurbish the Frege-Russell account or resolve its difficulties, that would be absurdly premature. It would be still more premature to try to explore the relation of the restated Frege-Russell account to the substitutional interpretations of quantifiers whose possibility our admired honorand has so long and persistently defended against cavil and misrepresentation. The most I shall attempt here is to make the Frege-Russell view visible again. (pp. 93-94)

Language as Calculus *vs.* Language as Universal Medium

Introduction

"An initial reference-point in this area is provided by Leibniz's distinction between two components of his ambitious project in mathematical logic or, rather, project to create a mathematical logic. On the one hand, Leibniz proposed to develop a *characteristica universalis* or *lingua characteristica* which was to be a universal language of human thought whose symbolic structure would reflect directly the structure of the world of our concepts. On the other hand, Leibniz's ambition included the creation of a *calculus ratiocinator* which was conceived of by him as a method of symbolic calculation which would mirror the processes of human reasoning.

When Leibniz's project began to be realized in the nineteenth century, its two components were taken up by different research traditions. The 'algebraic' school represented by Boole, Peirce, and Schröder sought to develop in the spirit of Leibniz's *calculus ratiocinator* mathematical techniques by means of which different kinds of human reasoning could be mastered. In contrast, Frege himself noted, his *Begriffsschrift* was to be primarily a *characteristica universalis* in Leibniz's sense, a *Formelsprache des reinen Denkens* (cf. here Sluga, "Frege against the Booleans", *Notre Dame Journal of Formal Logic*, 28, 1987, pp. 80-98). Admittedly, Frege made claims for it also as a *calculus ratiocinator*, but those claims were not met with enthusiasm. Husserl contradicted them, apparently thinking (as Tarski did later) that a *lingua universalis* cannot be purely formal. In any case, as Jourdain snidely noted, Frege's formalism was singularly clumsy as a means of actual reasoning: "... using Frege's symbolism as a calculus would be rather

like using a three-legged stand-camera for what is called 'snap-shot photography' (Jourdain, "Preface" to Louis Couturat, *The algebra of Logic*, 1914 pp. III-X). Subsequent attempts to find specific help for the purpose of concrete work in logic or in the foundations of mathematics have tended to confirm rather than to disconfirm Jourdain's judgment. The theoretical interest of Frege's ambitious project is due to its being an attempted *characteristica universalis* or at least *lingua characteristica mathematicae*, not to its being a viable *calculus ratiocinator*." (pp. IX-X)

From: Jaakko Hintikka, *Lingua Universalis vs. Calculus Ratiocinator. An Ultimate Presupposition of Twentieth-Century Philosophy*, Dordrecht: Kluwer 1997.

"Answering Schröder's criticisms of *Begriffsschrift*, Frege states that, unlike Boole's, his logic is not a *calculus ratiocinator*, or not merely a *calculus ratiocinator*, but a *lingua characterica*.⁽¹⁾ If we come to understand what Frege means by this opposition, we shall gain a useful insight into the history of logic. The opposition between *calculus ratiocinator* and *lingua characterica* has several connected but distinct aspects. These various aspects, most of the time not stated by Frege, have to be brought out by a study of his work. From Frege's writings a certain picture of logic emerges, a conception that is perhaps not discussed explicitly but nevertheless constantly guides Frege. In referring to this conception I shall speak of the universality of logic.

This universality of Frege's *lingua characterica* is, first, the universality that quantification theory has in its vocabulary and that the propositional calculus lacks. Frege frequently calls Boole's logic an 'abstract logic' (2), and what he means by that is that in this logic the proposition remains unanalyzed. The proposition is reduced to a mere truth value. With the introduction of predicate letters, variables, and quantifiers, the proposition becomes articulated and can express a meaning. The new notation allows the symbolic rewriting of whole tracts of scientific knowledge, perhaps of all of it, a task that is altogether beyond the reach of the propositional calculus. We now have a *lingua*, not simply a *calculus*. Boole's logic, which cannot claim to be such a *lingua*, remains the study, in ordinary language, of algebraic relations between propositions. This

study is carried out in ordinary language and is comparable to many branches of mathematics, say group theory. In Frege's system the propositional calculus subsists embedded in quantification theory; the opposition between *lingua* and *calculus* is, in this respect, not exclusive, and that is why Frege writes that his own logic is not merely a *calculus ratiocinator*.(3) However, the opposition between *calculus ratiocinator* and *lingua characterica* goes much beyond the distinction between the propositional calculus and quantification theory. The universality of logic expresses itself in an important feature of Frege's system. In that system the quantifiers binding individual variables range over all objects. As is well known, according to Frege, the ontological furniture of the universe divides into objects and functions. Boole has his universe class, and De Morgan his universe of discourse, denoted by '1'. But these have hardly any ontological import. They can be changed at will. The universe of discourse comprehends only what we agree to consider at a certain time, in a certain context. For Frege it cannot be a question of changing universes. One could not even say that he restricts himself to one universe. His universe is the universe. Not necessarily the physical universe, of course, because for Frege some objects are not physical. Frege's universe consists of all that there is, and it is fixed." (pp. 324-325)

Notes

(1) Schröder's criticisms are contained in his review of *Begriffsschrift*, published in *Zeitschrift für Mathematik und Physik* 25 (1880), *Historisch-literarische Abtheilung*, 81-94. Frege's reply was an address to a learned society, delivered on 27 January 1882 and published in its proceedings, 'Über den Zweck der Begriffsschrift', *Sitzungs-berichte der Jenaischen Gesellschaft für Medicin und Naturwissenschaft für das Jahr 1882* (Jena 1883), pp. 1-10, reprinted in Gottlob Frege, *Begriffsschrift und andere Aufsätze*, Hildesheim 1964, pp. 97-106. [English translation by Terrell Ward Bynum in: Gottlob Frege, *Conceptual Notation, and Related Articles*, Oxford: Clarendon Press 1972, reprinted 2000, pp. 90-100] On the origin of the expression '*lingua characterica*' see Günther Patzig's footnote 8, on p. 10 of Gottlob Frege, *Logische Untersuchungen*, Göttingen 1966.

(2) See, for instance, Frege's comments on Boole in 'Über den Zweck der Begriffsschrift' (mentioned in footnote 1), pp. 1-2.

(3) In 'Über die Begriffsschrift des Herr Peano and meine eigene', *Berichte über die Verhandlungen der Königlichen Sächsischen Gesellschaft der Wissenschaften zu Leipzig, Mathematisch-physische Classe* 48 (1897), 361-378, [English translation in: Gottlob Frege, *Collected Papers on Mathematics, Logic and Philosophy*, edited by Brian McGuinness, Oxford: Basil Blackwell 1984, pp. 234-248]. Frege writes on p. 371: "Boole's logic is a calculus ratiocinator, but no lingua characterica; Peano's mathematical logic is in the main a lingua characterica and, subsidiarily, also a calculus ratiocinator, while my Begriffsschrift intends to be both with equal stress." Here the terms are used with approximately the meanings given in the present paragraph: Boole has a propositional calculus but no quantification theory; Peano has a notation for quantification theory but only a very deficient technique of derivation; Frege has a notation for quantification theory and a technique of derivation.

From: Jean van Heijenoort, "Logic as Calculus and Logic as Language", *Synthese* 17, 1967, pp. 324-330.

"Sir Isaiah Berlin has shown how to understand Tolstoi on the basis of the insight that Tolstoi was a fox who believed that he was a hedgehog (1). It is time we realize similarly what Frege was: a semanticist who did not believe in semantics. This insight we owe largely to van Heijenoort, who describes it by speaking of two conceptions of language and logic (2). He called them conceptions of logic as language and logic as calculus. More generally, and perhaps a shade more aptly, we might label them conceptions of language as the inescapable medium of communication (in brief, "language as medium") and language as calculus.

The most general form of the former I can think of is that we cannot according to this view get "outside" our language, as it were look on it from outside. The reason is that the results of all such "viewing" must be expressible in our language. Now this language presupposes in all its uses certain semantical relations (relations of representation) between language and reality. (Otherwise we could not use language in our transactions with reality.) But since these semantical relations

are presupposed in each and every use of language, they cannot be expressed in language. Any attempt to do so involves a circularity and hence results in nonsense or tautology.

I am not putting forward these views as being unchallengeable. Indeed, they are challenged by the view of language and its logic as calculus. According to this view we can do all or most of the things the contrary opinion deemed impossible. Among other things, we can think of the representative relationships between language and the world as being varied radically and in a large scale. The point of using the term "calculus" is hence not to compare language to an uninterpreted calculus, a mere game with characters, but to emphasize that language, including our very own home language, is in principle freely reinterpretable like a calculus, at least for the purposes of a semanticist.

As van Heijenoort already pointed out, the development of all systematic logical semantics (model theory) thus presupposes some variant of the view of language as calculus. For one of the leading ideas of all model theory is to vary the interpretation of some part of the language in question in a way the view of language as medium does not countenance. As we saw, the stronger forms of this view even forbid saying anything significant and nonvacuous about the basic semantical relationships (relationships of naming, reference, or otherwise named representation)." (pp. 716-717)

3. Cohen, Jonathan. 1954. "On the Project of a Universal Character." *Mind* no. 63:49-63.

Reprinted in: *Knowledge and Language. Selected Essays of L. Jonathan Cohen*, Edited and with an introduction by James Logue, Dordrecht: Kluwer, 2002 pp. 1-14.

"During the last thirty years or so the practice has grown up among logicians of attributing the project of a universal character to Leibniz alone among seventeenth century thinkers. This attribution is to be found, for instance, in L. S. Stebbing's *Modern Introduction to Logic*, (1) in Cohen and Nagel's *Introduction to Logic and Scientific Method*, (2) in M. Black's *Nature of Mathematics*, (3) in J. H. Woodger's *Axiomatic Method in Biology*, (4) and in O. Neurath's introductory article in the *International Encyclopaedia of Unified Science*. (5) And it dates, I suspect, from the publication of C. I. Lewis's *Survey*

of *Symbolic Logic* in 1918. Lewis mentioned that Leibniz acknowledged a debt in this connexion to Raymond Lully, Athanasius Kircher, George Dalgarno and John Wilkins. But he considered their writings contained "little which is directly to the point". (6) In this Lewis was obviously right with regard to Leibniz's conception of a calculus of reasoning, but wrong, as I shall try to show, with regard to the project of a universal character, which seems in fact to have been an intellectual commonplace in seventeenth century Western Europe. This somewhat neglected by-way of philosophical history is worth a brief review, I think, not only in order to fix more precisely the respect in which Leibniz was the only seventeenth century precursor of modern symbolic logicians, but also because it draws attention to an early widespread philosophical muddle about the construction of artificial languages."

"This paper discusses Jean van Heijenoort's (1967) and Jaakko and Merrill B. Hintikka's (1986, 1997) distinction between logic as a universal language and logic as a calculus, and its applicability to Edmund Husserl's phenomenology. Although it is argued that Husserl's phenomenology shares characteristics with both sides, his view of logic is closer to the model-theoretical, logic-as-calculus view. However, Husserl's philosophy as transcendental philosophy is closer to the

universalist view. This paper suggests that Husserl's position shows that holding a model-theoretical view of logic does not necessarily imply a calculus view about the relations between language and the world. The situation calls for reflection about the distinction: It will be suggested that the applicability of the van Heijenoort and the Hintikka's distinction either has to be restricted to a particular philosopher's views about logic, in which case no implications about his or her more general philosophical views should be inferred from it; or the distinction turns into a question of whether our human predicament is inescapable or whether it is possible, presumably by means of model theory, to obtain neutral answers to philosophical questions. Thus the distinction ultimately turns into a question about the correct method for doing philosophy."

"One can distinguish two different approaches toward language in Leibniz's work. On one hand, he considers natural language insufficient and would like to replace it by a 'rational' language (*lingua philosophica*), while on the other hand, he is an empirical researcher of language who collects phenomena from the most diverse languages in order to compare them with other languages. The literature about Leibniz highlights only these two aspects of his work, and usually considers them to be

incompatible. The relationship between Leibniz's remarks about '*characteristica universalis*' and his theories about natural language is explored. Even though Leibniz did not produce an explicit theory about this relationship, a difference between these two is clearly implied in his remarks. Natural language and *characteristica* are to Leibniz, basically different in their existence, their function, and their performance. Nevertheless, they both form integral components of Leibniz's monad theory."

28. Goldfarb, Warren. 2001. "Frege's Conception of Logic." In *Future Pasts. The Analytic Tradition in Twentieth Century Philosophy*, edited by Floyd, Juliet and Shieh, Sanford, 25-41. Oxford: Oxford University Press.

"The first task is that of delineating the differences between Frege's conception of logic and the contemporary one. I shall start with the latter. Explicit elaborations of it are surprisingly uncommon. (In most writing on issues in philosophical logic, it is implicitly assumed; yet many textbooks gloss over it, for one pedagogical reason or another.) There are various versions; I will lay out the one formulated by Quine in his textbooks (1) as it seems to me the clearest.

On this conception, the subject matter of logic consists of logical properties of sentences and logical relations among sentences. Sentences have such properties and bear such relations to each other by dint of their having the logical forms they do. Hence, logical properties and relations are defined by way of the logical forms; logic deals with what is common to and can be abstracted from different sentences. Logical forms are not mysterious quasi-entities, à la Russell. Rather, they are simply schemata: representations of the composition of the sentences, constructed from the logical signs (quantifiers and truth-functional connectives, in the standard case) using schematic letters of various sorts (predicate, sentence, and function letters). Schemata do not state anything and so are neither true nor false, but they can be interpreted: a universe of discourse is assigned to the quantifiers, predicate letters are replaced by predicates or assigned extensions (of the appropriate r-ities) over the universe, sentence letters can be

replaced by sentences or assigned truth-values. Under interpretation, a schema will receive a truth-value. (pp. 25-26)

(...)

Such a schematic conception is foreign to Frege (as well as to Russell). This comes out early in his work, in the contrast he makes between his *Begriffsschrift* and the formulas of Boole: "My intention was not to represent an abstract logic in formulas, but to express a content through written signs in a more precise and clear way than it is possible to do through words." (2) And it comes out later in his career in his reaction to Hilbert's *Foundations of Geometry*: "The word 'interpretation' is objectionable, for when properly expressed, a thought leaves no room for different interpretations. We have seen that ambiguity [*Vieldeutigkeit*] simply has to be rejected." (3) There are no parts of his logical formulas that await interpretation. There is no question of providing a universe of discourse. Quantifiers in Frege's system have fixed meaning: they range over all items of the appropriate logical type (objects, one place functions of objects, two place functions of objects, etc.). (p. 27)

(...)

On Frege's *universalist conception*, then, the concern of logic is the articulation and proof of logical laws, which are universal truths. Since they are universal, they are applicable to any subject matter, as application is carried out by instantiation. For Frege, the laws of logic are general, not in being about nothing in particular (about forms), but in using topic-universal vocabulary to state truths about everything. (p. 28)

(...)

My central aims in this paper have been to delineate Frege's universalist conception of logic and contrast it with a more familiar one, to show that this conception connects with many other points in Frege's philosophy, and to suggest that the conception is a well-motivated one, given the nature of Frege's project. Of course, today most of us would find the schematic conception (or some variant of it) far more natural, if not

unavoidable. But I hope to have caused us to reflect on how much else has to shift in order to make it." (p. 41)

"From my observations, several corollaries follow for the recent discussions concerning Frege in the literature.

For instance, the truly interesting historical problem is not to find anticipations of Frege on sense and reference in earlier philosophers or, more generally, to study Frege's theory in its relation to his predecessors. The fascinating novelty which I for one would very much like to understand better is how Frege came upon his ideas about extensional logic, ideas which were radically different from the great majority of traditional philosophers. Furthermore, the deep objects of comparison and contrast in twentieth-century philosophy are not later theories of senses (or their partial dispensability as in Kripke) or other theories of intensional contexts but those recent findings which challenge Frege's treatment of first-order logic.

Among these targets of challenge, the most important ones are probably the paucity of Frege's ontology (set of categories represented by his primitive symbols), the so-called Frege principle (1), and the Frege-Russell claim that ordinary-language words like the English "is" and the German "ist" are ambiguous between the "is" of existence, identity, predication,

and subsumption (2). In some ways, the true import of Frege's tacit first-order semantics is best seen from the criticisms to which these three cornerstones of Frege's semantics have been subjected." p. 722

"Patzig has argued that Frege's use of the phrase 'lingua characterica' constitutes an insufferable pleonasm that no-one with first-hand knowledge of Leibniz's writings would have committed. On this he bases an argument to show that Frege's knowledge of Leibniz was weak and garnered from secondary sources. I show that this claim ignores certain crucial Leibniz quotes by Frege which he could have found only in the Gerhardt edition of Leibniz's mathematical works and his correspondence, and lay the foundation for an analysis of the historical influence of Leibniz on the development of Frege's thought."

"This paper examines the question, whether and to what degree Leibniz's project of an ideal language -- of a "lingua

characterica" which at the same time can also function as a "calculus ratiocinator" -- had an influence on Frege's project of a "Begriffsschrift". It concludes that not only are there sufficient conceptual similarities to warrant an hypothesis of historical connection, but that there are also historical indications in Frege's own writings to that effect."

"This paper defends an interpretation of Husserl's theory of language, specifically as it appears in the Logical Investigations, as an example of a larger body of theories dubbed 'language as calculus'. Although this particular interpretation has been previously defended by other authors, such as Hintikka and Kusch, this paper proposes to contribute to the discussion by arguing that what makes this interpretation plausible are Husserl's distinction between the notions of meaning-intention and meaning-fulfillment, his view that meaning is instantiated through meaning-intending acts of transcendental consciousness, and his view that the content of meaning-intending acts is ideal meaning simpliciter. As well, the paper argues that the phenomenological method of reduction itself presupposes the notion that reality as such can be reached by subtracting the influence of the language of the natural attitude and its ontological commitments and it, thus, presupposes the conception of language as a reinterpretable calculus." The Problem of Universals: the Contemporary Debate

Formal Ontology and the Theory of Universals

"The central feature of a formal ontology is how it represents the nexus of predication, which depends on what theory of universals it assumes.

The three main theories of universals are nominalism, conceptualism, and (logical or natural) realism.

The analysis of the fundamental forms of predication of a formal ontology may be directed upon the structure of reality or upon the structure of thought.

Natural realism, and in particular Aristotle's ontology, is directed upon the structure of the natural world, and the preeminent mode of being is that of concrete individual things, or primary substances. There are two major forms of natural realism, moderate realism and modal moderate realism.

Aristotle's moderate natural realism has two types of predication: predication of species and genera (natural kinds), and predication of properties and relations.

Kant's and Husserl's categorial analyses, unlike Aristotle's, are directed upon the structure of thought and experience rather than upon the structure of reality. The categories function on this account to articulate the logical forms of judgments and not as the general causes or grounds of concrete being.

Husserl's formal ontology is based on a transcendental logic in which the laws and rules of logic are justified in terms of subjective analyses

of presumed *a priori* structures that provide the evidence for the objective versions of those of those laws and rules.

There are two problems regarding the completeness of a formal ontology: first, the problem of the completeness of the categories of an ontology, and second, the problem of the completeness of the deductive laws that are based on those categories.

Set theory provides only an external semantics for a formal ontology; unless that ontology is set theory itself, which has no nexus of predication, and hence strictly speaking is not a formal ontology. An incompleteness theorem for a formal ontology based a set-theoretic semantics need not show that the ontology is incomplete with respect to an internal semantics. In particular, sometimes general models are a better representation of a formal ontology's internal semantics than are so-called "standard" models.

Conceptual realism is a, formal ontology framed within the context of a naturalistic epistemology and a naturalistic approach to the relations between language, thought, and reality as based on our scientific knowledge of the world.

Conceptual realism is based on a conceptualist account of the speech and mental acts that underlie reference and predication. It is directed in that regard primarily upon the structure of thought. But, because its methodology is based on a linguistic and logical analysis of our speech and mental acts, it is not committed to a phenomenological reduction of those acts. Nor does it preclude such a reduction.

Conceptual realism contains both a natural realism and an intensional realism, each of which can be developed as separate subsystems that are compatible within the larger framework, one containing a modern form of Aristotelian essentialism, and the other containing a modern counterpart of Platonism based on the intensional contents of our speech and mental acts." (pp. 23-24)

Two volumes

3. ———. 1986. "In Defence of Structural Universals." *Australasian Journal of Philosophy* no. 64 (1):85-88.

"1. *The central issue*. At the heart of David Lewis' case against structural universals lies his contention that two different things cannot be composed of exactly the same parts.

Here is what I take to be a counter-example to his principle. Let a and b be two particulars, and R be a non-symmetrical relation. Let it be the case that a has R to b , and that b has R to a . We have two distinct states of affairs ('two different things'), yet, in a clear sense of the word 'composed', they are composed of exactly the same parts: a , b and R .

The two states of affairs may be called *structures*. In his important recent book *The Categorical Structure of the World* (1983, Section 101), Reinhardt Groomsman offers the following identity-conditions for structures. S_1 and S_2 are the very same structure if and only if (a) they contain- the very same nonrelational parts; (b) they contain the very same relations;

(c) *the same parts stand in the same relations to each other.* In my counter-example, the two structures contain the very same non-relational parts, the very same relations, but it is not the case that the same parts stand in the same 'relation to each other.

My counter-example to Lewis' principle was chosen because, although it involves structures, it does not involve structural universals. This shows, I think, that the difficulty raised by Lewis is best thought of as an argument against postulating any universals, structural or otherwise; or, at least, as an argument against postulating relations which are universals.

Lewis, of course, would not allow the counter-example. By far the simplest way for him to deal with it is by adopting a philosophy of what, following D. C. Williams (1953) , and, more recently, K. K. Campbell (1981) , he calls 'tropes'. Tropes are properties and relations, but they are properties.' and relations conceived not as universals but as particulars.;-On this; view 'of relations, my alleged counter-example becomes two states of affairs, $a c_1 b$, and $b c_2 a$, where c_1 and c_2 are not identical, although they may, resemble exactly. (The *universal R* perhaps reduces to an equivalence-class of exactly resembling tropes.) Given this account, I have certainly not produced a counter-example to Lewis' view that two different things cannot: be composed of exactly the same things.

But is not the dispute now a stand-off? Lewis can use his principle against a philosophy of universals. I can use universals to produce a counter-example to his principle. Indeed, is not Lewis close to begging the question against me?

It may be replied that Lewis' view is the more economical. He puts forward an attractive-sounding principle. I have to deny that the principle holds in

all cases, and my reason is that it is defeated by those suspicious characters: universals.

To this I reply that economy in a metaphysics can only be judged, as Mark Johnston has put it to me, 'in the end-game'. For myself, I believe that universals are great explainers. The

loss on the roundabouts as a result of having to deny Lewis' principle may well be made up with interest on the swings. In any case, as the great Dr. Tarrasch said, 'before the end-game, the Gods have placed the middle-game'.

What it would be nice to have, but what I cannot supply, is formal description of an operation which will take one from any unordered set of universals to possible structural universals which involve nothing but members of the set.' (I say 'possible' in order to respect the Principle of Instantiation which I believe should apply to all universals.) Such an operation will permit the one universal in the original set to appear in more than one 'place' in the structural universal. (E.g. an F having R to an F which has R to a third F.) A parallel is the way that, in a set of sets, the very same individual may be found as a member of different sub-sets." pp. 85-86.

4. ———. 1989. *Universals. An Opinionated Introduction*. Boulder: Westview Press.

Contents: Preface XI-XII; 1. The problem 1; 2. Primitive natural classes 21; 3. Resemblance nominalism 39; 4. Particulars as bundles of universals 59; 5. Universals as attributes 75; 6. Tropes 113; 7. Summing up 135; references 131; Index 145.

"This book is intended to be intelligible to the advanced undergraduate student and should also be suitable for graduate seminars. However, I hope that it will also be of interest to professional philosophers, particularly those who are sympathetic to the project of an empirical metaphysics. Since the publication of my book *Universals and Scientific Realism* in 1978, although my views have remained the same in broad outline, I have become aware of various mistakes and omissions in what I said then. The present work, therefore, besides introducing the topic, tries to push the subject further ahead.

I now think that a particular type of moderate Nominalism, moderate because it admits properties and relations, but a Nominalism because it takes the properties and relations to be particulars rather than universals, can be developed as an important and quite plausible rival to a moderate Realism

about universals. In the earlier book I gave such a Nominalism only brief consideration. By contrast, in this work a battle between Nominalists and Realists over the status of properties and relations becomes one main theme.

In general, I have largely confined myself to moderate Nominalisms and moderate Realisms. That host of contemporary philosophers who unreflectively substitute classes of particulars for properties and relations I take to be immoderate Nominalists. However, many of the arguments that I bring against the more moderate Natural Class theory are also arguments against this orthodoxy." (From the Preface)

"It is time to bring the matter to a conclusion. Metaphysicians should not expect any certainties in their inquiries. One day, perhaps, the subject will be transformed, but for the present the philosopher can do no more than survey the field as conscientiously as he or she can, taking note of the opinions and arguments of predecessors and contemporaries, and then make a fallible judgment arrived at and backed up as rationally as he or she knows how.

Of all the results that have been argued for here, the most secure, I believe, is the real existence of properties and relations. Whether they be universals or particulars is a more delicate matter, and just what properties and relations are required may be obscure, and in any case not for the philosopher to determine. But I hope that the arguments of Chapters 2 and 3, criticizing the versions of the Natural Class and Resemblance theories that try to do without properties and relations, will be thought weighty. Blobs are out; we require layer cakes. Reality must have more fundamental structure than the stricter Nominalisms allow. The introduction of properties and relations then involves, I argued, the admission of states of affairs (facts) into our ontology." p. 135

(...)

"Therefore, the fate of the Universals theory may turn on the questions of the inexact resemblance of universals and of the nature of laws. But if both questions go as I surmise that they

will go, the Universals theory seems ahead of even the best Trope theory.

Drawing a figure from the game of chess, Mark Johnston has suggested to me that the dispute between a suitably sophisticated theory of universals and a suitably sophisticated theory of tropes can only be decided in the end game. Maybe. We are probably only at the beginning of the middle game as yet.

We have seen in Chapter 6 the remarkable way that the Universals and Trope theories, when thought through, turn out to run parallel in many respects. We may in the end have to reconsider an idea of H. H. Price's (*Thinking and experience*, Hutchinson, 1953, Ch. 1, pp. 30-32) that Universals and Resemblance theories are no more than "alternative languages," although, unlike Price, we will surely need to move to a trope version of a Resemblance theory.

At any rate, the Problem of Universals is alive and well and may commend itself to those happy few who feel the intellectual fascination in what D. C. Williams called "grubbing around in the roots of being." p. 139

7. Bacon, John. 1986. "Armstrong's Theory of Properties." *Australasian Journal of Philosophy* no. 64 (1):47-53.

"At the heart of D. M. Armstrong's theory of universals in [N], [U] and [L] is a set of basic theses about monadic universals, or properties, as he calls them. The theses lay down the *a priori* conditions under which a one, place predicate simple or compound) may stand for a property. Thus there are predicates standing for no property. We may nevertheless say for convenience that they stand for 'features', without here attempting a closer semantic analysis of this way of speaking. The rough idea is that a 'feature' is a class-concept. As (placeholders for) one-place predicates, I use F, G.

That F is a property or a universal will be expressed by the (closed) sentence UF. The theory of U, of universalhood, is the metaphysical core of Armstrong's theory of universals. My purpose here is to clarify the core so far as formal means - permit."

11. Bochenski, Joseph M., Church, Alonzo, and Goodman, Nelson. 1956. *The Problem of Universals. A Symposium*. Notre Dame: Notre Dame University Press.

Contents; Alonzo Church: Propositions and Sentences 3; Nelson Goodman: A World of Individuals 15; Joseph Bochenski: The Problem of Universals 35-54.

"The papers contained in this publication were read at the Aquinas Symposium sponsored by the Department of Philosophy of the University of Notre Dame on March 9-10, 1956. Leo R. Ward, C.S.C., of the University of Notre Dame, coordinator of the Aquinas Symposium, had invited scholars representing several divergent views on the nature of Universals to present, within the limits of a relatively short paper and a subsequent discussion period, some aspects of the problem of Universals. Response to his invitation was very gratifying.

Out of the meeting came three papers that literally make up a symposium: Professor Alonzo Church of Princeton University, Professor Nelson Goodman of the University of Pennsylvania,

and Professor I. M. Bochenski, O.P., of the University of Fribourg and Visiting-Professor at the University of Notre Dame read papers that converge on the Problem of the Universals from three different philosophic positions. Professor Richard McKeon of the University of Chicago was the discussion leader at all of the sessions. These papers, with a minimum of editing by the respective participants, are now made available in this edition."

"In this paper I wish to consider the merits of Realist theories of predication vis-à-vis three varieties of Nominalism, which Armstrong has dubbed Predicate Nominalism, Resemblance Nominalism, and Ostrich Nominalism) In Part I, I shall argue that Ostrich Nominalism is the most satisfactory position of these four, and that the Realist view favored by Armstrong and many others is prone to the same fundamental difficulty as the other two varieties of Nominalism. In Part II, I shall consider difficulties for the argument of Part I."

17. Cocchiarella, Nino. 1986. *Logical Investigations of Predication Theory and the Problem of Universals*. Napoli: Bibliopolis.

"Predication theory has been a subject of philosophical concern since at least the writings of Plato and Aristotle. It is in its way the locus of a number of philosophical issues both in

metaphysics and epistemology, not the least of which is the problem of universals.

The latter problem, sometimes all too simply put as the question of whether there are universals or not, is especially germane to the notion of predication since a theory of universals is at least in part a semantic theory of predication; and it is just to such a theory that we must turn in any philosophical investigation of the notion of predication.

In doing so, however, we need not assume the truth or superiority of any one theory of universals over another. Indeed, an appropriate preliminary to any such assumption might well consist of a comparative analysis of some of the different formal theories of predication that can be semantically associated with these different theories of universals: for just as the latter provide a semantics for the former, it is only through the logical syntax of a formal theory of predication that the logical structure of a theory of universals can be rendered perspicuous. That, in any case, is the principal methodological assumption for the approach to the problem of universals we shall undertake in the present monograph where we will be more concerned with the construction and comparison of the abstract logical systems that may be associated with different theories of universals than with the metaphysical or epistemological issues for which they were originally designed. It is our hope and expectation, however, that these comparative formal analyses will be instrumental toward any philosophical decision as to whether to adopt a given theory of universals or not.

The original use of the term "universal" goes back to Aristotle according to whom a universal is that which can be predicated of things (*De Interpretatione*, 17 a 39). We shall retain the core of this notion throughout this essay and assume that whatever else it may be a universal has a predicable nature and that it is this predicable nature which is what constitutes its universality.

Nothing follows from that assumption, however, regarding whether a universal is (1) merely a predicate expression (nominalism) of some language or other; (2) a concept

(conceptualism) in the sense of a sociobiologically based cognitive ability or capacity to identify, collect or classify, and characterize or relate things in various ways; or (3) a real property or relation existing independently of both language and the natural capacity humans have for thought and representation (realism). We propose to take each of these interpretations or theories of universals seriously in what follows at least to the extent that we are able to associate each with a formal theory of predication. Our particular concern in this regard, moreover, will be with the explanation each provides of the predicable nature of universals, i.e., of that in which the universality of universals consists.

Our discussion and comparison of nominalism, conceptualism and realism, accordingly, will not deal with the variety of arguments that have been given for or against each of them, but with how each as a theory of universals may be semantically associated with a formal theory of predication. Our assumption here, as indicated above, is that insofar as such an associated formal theory of predication provides a logically perspicuous medium for the articulation of the predicable nature of universals as understood by the theory of universals in question, then to that extent the formal theory may itself be identified with the explanation which that theory of universals provides of the predicable nature of universals. It is in the sense of this assumption, moreover, that we understand a philosophical theory of predication to be a formal theory of predication together with its semantically associated theory of universals." pp. 11-12.

19. Forrest, Peter. 1986. "Ways Worlds Could Be." *Australasian Journal of Philosophy* no. 64 (1):15-24.
20. ———. 1986. "Neither Magic nor Mereology: A Reply to Lewis." *Australasian Journal of Philosophy* no. 64 (1):89-91.

"In 'Against Structural Universals', David Lewis provides an important critique of the theory of structural universals developed by D. M. Armstrong, and which I use in 'Ways Worlds Could Be'. Lewis' chief criticism is based on the thesis

that the only unanalysable, sui generis, mode of composition is that of mereology. (1) I call that the Either Mereology or Magic Thesis. Lewis claims that the 'generation of sets out of their elements is not some unmereological form of composition'. He, rightly in my opinion, treats a set as the mereological sum of unit sets. And -- here' I disagree -- he insists that the generation of unit sets is 'not composition at all.'

In reply to Lewis I shall attack the Either Mereology or Magic Thesis by arguing:

(1) That it does not follow from a conceptual analysis. (2)

(2) Although it has considerable prima facie appeal it is not robust enough to be used to argue against structural universals and (3) Lewis himself is committed to counter-examples to it.

I conclude that Either Mereology or Magic Thesis is merely an interesting conjecture, which would hold for some ontologies, but which Lewis should not advance and which has no power to refute my own theory of possibility."

(1) Against Structural Universals', this issue of the *Australasian Journal of Philosophy* pp. 25-46 .

(2) Nor is it obvious that Lewis intended it to be.

21. Gosselin, Mia. 1990. *Nominalism and Contemporary Nominalism. Ontological and Epistemological Implications of the Work of W. V. O. Quine and of N. Goodman*. Dordrecht: Kluwer.
22. Hale, Bob. 1987. "Abstract Objects." In. Oxford: Basil Blackwell.
23. Hochberg, Herbert. 1988. "A Refutation of Moderate Nominalism." *Australasian Journal of Philosophy* no. 66 (2):188-207.

"Russell offered what has become a classic argument for the existence of universal properties in his 1911 paper 'On the Relations of Universals and Particulars. (1) My concern in this paper is not with the cogency of the argument he offered there, but with a moderation of the nominalist's position that concedes a point to Russell. (1) Some nominalist's have recently

acknowledged Russell's claim that a universal 'connection' or 'relation' of similarity is involved in taking qualities to be particular-instances, or 'quality-moments' in Husserl's terminology, and have argued as follows. The realist recognises particulars and universals. In addition, the realist acknowledges a universal connection or tie or nexus or predication relation - exemplification, say. Thus, the realist recognises three distinct kinds of things: particulars, universal qualities (including relations) and a connection between particulars and universals. The 'moderate' nominalist recognises particular quality-instances and a universal connection - exact similarity. Consequently, Russell's argument, at best, does not force a universal *relational quality* upon the nominalist, but merely forces the nominalist to recognise *a universal connection* that is a correlate of the realist's exemplification connection, and not of the realist's universal qualities and relations.(2) In a way, the modification of the nominalist's position is a tribute to Bradley's 'paradox', which can be taken to force one to recognise, as Russell sometimes did, that there is a basic predication relation that cannot be included as a relation among relations without initiating a vicious regress. (3)

The moderate nominalist can then reject Russell's claim that a universal relational quality must be recognised. Since the similarity relation is the analogue of the realist's exemplification connection, it is not a 'standard' universal. And, as any view must recognise such a connection, giving Bradley his due, the nominalistic advocate of quality-instances merely recognises, in his way, what the realist must also recognise: a 'connection' exemplification 'tie' (or several 'ties'): the nominalist recognises particular quality-instances and a universal 'similarity tie'. Thus, while Russell's argument is neither blocked nor denied, it is seemingly deprived of its sting.

I shall argue that the moderate nominalist's argument fails for a number of reasons. (It is worth noting that Wilfrid Sellars has long advocated a variant of this kind of nominalism, though he sought to avoid *explicitly* accepting either a universal tie or quality-instances.) (4) One reason the argument fails is that it

tries to avoid one kind of entity by giving another type of entity a two-fold function. The realist's exemplification connection performs only one function. It serves to connect particulars to universals so that we have states of affairs (5) to provide truth conditions for atomic sentences. In short, it combines elements into complexes. The nominalist's connection is *not merely a connection* in that sense. It not only connects exactly similar quality instances into what we may call 'similarity-facts', but, by so doing, it provides the qualitative content for an object. This is readily seen when we note that the realist's connection *may or may not obtain*, in the sense that a state of affairs may or may not obtain, *given the elements - the particular and the quality* - that enter into it. The nominalist's similarity fact must obtain, given the elements that enter into it, and is thus necessary, just as the similarity relation may be said to be 'internal', as opposed to an 'external' tie of exemplification. Thus, the relation of exact similarity is quite different from a connecting tie like exemplification." pp. 188-189

(1) Russell's classic argument will not do as it was presented. It will do in an amended form. On this point see my 'Russell's Proof of Realism Reproved', *Philosophical Studies* 37, 1980.

(2) I am indebted to D. M. Armstrong for calling my attention to this variant of nominalism and to discussion of it with him.

(3) Russell's concern with the Bradley paradox was partially responsible for his holding, in the manuscript of 1913 entitled *Theory of Knowledge*, that facts involved logical forms which were not constituents. See Chapter VII of the manuscript, published as vol. 7, *The Collected Papers of Bertrand Russell*, ed. E. Eames et. al. (London: 1984).

(4) On Sellars' nominalism see my 'Logical Form, Existence, and Relational Predication', in *Foundations of Analytic Philosophy*, ed. H. Wettstein, et. al. (Minneapolis: 1981), reprinted in my book *Logic, Ontology and Language* (Munich: 1984).

(5) Questions arise regarding 'possible' facts or states of affairs that do not 'obtain'. Such issues, though relevant to the dispute

- between realists and nominalists, will be avoided in this paper.
24. Jacquette, Dale. 2006. "Bochenski on Property Identity and the Refutation of Universals." *Journal of Philosophical Logic* no. 35:293-316.

"An argument against multiply instantiable universals is considered in neglected essays by Stanislaw Lesniewski and I. M. Bochenski. Bochenski further applies Lesniewski's refutation of universals by maintaining that identity principles for individuals must be different than property identity principles. Lesniewski's argument is formalized for purposes of exact criticism, and shown to involve both a hidden vicious circularity in the form of impredicative definitions and explicit self-defeating consequences. Syntactical restrictions on Leibnizian indiscernibility of identicals are recommended to forestall Lesniewski's paradox."

Revised edition (Original edition: *Ontologie und logistische Analyse der Sprache Eine Untersuchung zur zeitgenössischen Universaliendiskussion* - Wien, Springer-Verlag, 1963).

Contents: 0. Introduction 1; Part One: The logistic analysis of language and the relation of representation. 1. A philosophical revolution 23; 2. From the theory of knowledge to the logical analysis of language 30; 3. From the psychological concept to the graphical sign 38; 4. The relation of representation 51; Part Two: The relation of representation of predicate signs and contemporary views on universals. 5. Bertrand Russell 66; 6. Ludwig Wittgenstein 80; 7. Rudolf Carnap 86; 8. Stanislaw Lesniewski 102; 8. W. V. Quine and N. Goodman 127; 10. The

interpretations of predicate signs 161; 11. Conclusion 180; Bibliography 188; Index of names 201; Index of subjects.

"It is the aim of the present study to introduce the reader to the ways of thinking of those contemporary philosophers who apply the tools of symbolic logic to classical philosophical problems. Unlike the "continental" reader for whom this work was originally written, the English-speaking reader will be more familiar with most of the philosophers discussed in this book, and he will in general not be tempted to dismiss them indiscriminately as 'positivists and 'nominalists'. But the English version of this study may help to redress the balance in another respect. In view of the present emphasis on ordinary language and the widespread tendency to leave the mathematical logicians alone with their technicalities, it seems not without merit to revive the interest in formal ontology and the construction of formal systems.

A closer look at the historical account which will be given here, may convince the reader that there are several points in the historical development whose consequences have not yet been fully assessed: I mention, e.g., the shift from the traditional three-level semantics of sense and denotation to the contemporary two-level semantics of representation; the relation of extensional structure and intensional content in the extensional systems of Wittgenstein and Carnap; the confusing changes in labelling the different kinds of analytic and apriori true sentences; etc. Among the philosophically interesting tools of symbolic logic Lesniewski's calculus of names deserves special attention. Despite the pioneering efforts of Professor C. Lejewski, philosophers still have not caught on to it so far." (from the Preface).

Second revised edition 1976.

"Few philosophical issues have proved as persistent as the problem of universals. In virtually every period in the history of philosophy the existence of universals has been a central focus of philosophical concern; and like any recurrent issue, the problem has received different interpretations in different historical contexts. It is, nonetheless, possible to abstract a common theme from the variety of interpretations; for whatever else has been at issue, the concept of a multiply exemplifiable object has always been pivotal in the debate over

universals. One party to the dispute (the *Platonist* or *metaphysical realist*) contends that our ordinary notions of property, action, relation, and kind all presuppose an ontology of multiply exemplifiable objects. Different objects, realists have claimed, can *possess* one and the same property; different persons can *perform* one and the same action; different things can *belong to* one and the same kind; and different n-tuples (i.e., pairs, triples, etc.) of objects can *enter into* one and the same relation. According to the realist, their jointly possessing, performing, belonging to, and entering into are all cases of multiple exemplification; and what they jointly possess, perform, belong to, or enter into is *a universal*.

Nominalists, on the other hand, have denied the possibility of multiple exemplification and with it the reality of universals. Some have agreed that objects can and do possess properties, enter into relations, and perform actions, but have contended that it is impossible for different objects to possess numerically one property, for different persons to perform numerically one action, and for different n-tuples of objects to enter into numerically one relation; whereas, other nominalists have refused to attribute any ontological status whatever to properties, actions, kinds, and relations." pp. 3-4

 38. Mellor, D.H. 1992. "There Are No Conjunctive Universals." *Analysis* no. 52:97-103.

"In short, just calling particulars and universals 'parts' of facts will not distinguish them even from functions like conjunctions, negation and disjunction, let alone from each other. Nor will it tell us whether there are conjunctive universals. For the answer to that question will now depend on whether the specifically universal type of parts of facts includes non-ultimate parts. If it does, there will be conjunctive universals; if not, not. So to say that there are such universals, just because parts are generally taken to include non-ultimate parts, would simply beg the question. Moreover this answer to it will now give advocates of conjunctive universals far more than they want. (...)

I conclude that none of Oliver's models of how particulars and universals constitute facts will tell us whether, and if so why, there are conjunctive universals." p. 99

Tropes by Chris Daly 140; XII. Properties by D. M. Armstrong 160; XIII. Modal realism at work: properties 173; XIV. New work for a theory of Universals by David Lewis 188; XV. Causality and properties by Sydney Shoemaker 228; XVI. Properties and predicates by D. H. Mellor 255; Notes on Contributors 268; Select bibliography 270; Index of Names 275-276.

"Particular objects have *properties*, respects in which they may be alike or differ. People running are alike in motion, if not in shape or size, and differ in that respect from people standing still; spheres are alike in shape,

not in size or motion, and differ in that respect from cubes; and so on. Similarly with *relations*. Take Don and his son Bill, and Kim and her daughter Ann. Don's parent -- child relation to Bill holds also between Kim and Ann. In this respect these so-called *ordered* pairs-written (Don,Bill) (Kim,Ann) -- are like all other parent-child pairs, and differ from any other pair, like (Don, Ann) or the child-parent pair (Bill,Don), whose first member is not a parent of the second.

Similarly with relations of three or more particulars. These are respects which ordered triples, quadruples etc. (n-tuples in general) may be alike or differ. Suppose Don is older than Kim, who is older than Bill, who is older than Ann. Then (Don,Kim,Bill) and (Ann,Bill,Don) are alike in that the middle member of each triple is *between* the other two in age -- if not perhaps in height or weight -- and differ in this respect from triples, like (Don,Bill,Kim), whose members are not ordered by age. Describing relations in this way, as properties of n-tuples of particulars, if of course

course artificial, but the artifice has a point. The point is to remind us that properties and relations raise similar questions, about what it is for particulars and groups of particulars to differ or to be alike, questions that are best tackled together. And the answers to these questions matter both themselves and

in their implications, e.g. for *change*: since to change in some respect is just to differ in that respect at different times. Thus a particular that differs in colour but not in shape at different times thereby changes its colour but not its shape, just as Bill's outgrowing his father is (Don,Bill) changing by ceasing to be an instance of the *taller than* relation. In what follows, we shall usually work with properties for ease of presentation. When what we say about properties does not apply to relations we shall say so and when there is something distinctive to be said about relations we shall say it.

The most important questions about the kinds of sameness, difference and change that properties embody concern their reality and objectivity. Do particulars change or stay the same, resemble or differ from each other, independently of how we think of or describe them? That is, do properties exist in their own right-and if so which?

But if these are the important questions about properties, they can hardly be our first ones. For just as we cannot know that unicorns do not exist (but that if they did they would do so independently of our thinking so) without knowing what unicorns are, so we cannot know whether and which properties exist without knowing what properties are. So our first question is this: what sort of entities are properties like running and relations like being taller than?

This question involves at least two comparisons. First, how do properties relate to the predicates that apply to the particulars (and n-tuples of particulars) which have those properties: how are running and being taller than related to what 'runs' and 'is taller than' mean? And second, how do properties differ from and relate to the particulars that have them?

These questions would be hard enough to answer if everyone agreed on the meanings of predicates, on what fixes their meanings and on the nature of the particulars they apply to. But these too are contentious matters, a fact which complicates our questions by making answers to them parts of semantic and metaphysical package deals, which need to be assessed *en bloc*.

This fact, and the long history of the subject, also makes different writers use different terms for what we are calling 'properties', 'predicates' and 'particulars'-and also use these terms to mean different things. So to help readers understand the readings that follow and relate them to each other, we shall note in passing some of these other uses." (from the Introduction).

Contents: Preface and acknowledgements VII; 1. The problem(s) of universals 1; 2. Extreme nominalism and properties 23; 3. Moderate nominalism and properties 50; 4. Minimalist realism: Wolterstorff's kinds and Armstrong's properties 74; 5. Traditional realism: properties are abstract objects 97; 6. Traditional realism: issues and objections 114; 7. The individuation of particulars 140; Notes 158; Bibliography 170; Index 181.

"This book is a study in analytic ontology with a focus on issues and options at the core of the problem of universals. The problem of universals is actually a cluster of related issues central to debates among extreme nominalists, moderate nominalists and advocates of various forms of realism about the ontological status of properties. The book is intended to be an introduction to the topic and I have aimed the level of exposition at upper level undergraduates, graduate students and professional philosophers, and I believe the book should be of value to all three groups. Given the intended audience, the book is an introduction, not in the sense of being aimed at beginning students in philosophy, but in the sense of seeking to focus on the most important issues central to the subject matter. Because of this focus and space limitations, I have of necessity refrained from addressing certain topics in the study

of universals that have been prominent in the past ten years, specifically: the relationship between higher and lower order universals; the relationship between universals and causation, laws of nature and scientific explanation; the use of moderate (especially trope) nominalism to do work in various areas of philosophy. As interesting as these topics may be, those who study them bring to their reflections positions on the more fundamental topics about universals. And, often, philosophers who discuss these current issues seem unfamiliar with or inadequately appraised of important distinctions and arguments at the core of those more fundamental topics. For these reasons, I have chosen to focus in this book on those subjects that have been of perennial importance to the study of universals. There is a gap in the recent literature in these areas on which I focus, and I have tried to make a contribution to filling that gap." (from the Preface).

"Recently D. H. Mellor (1) has revived an argument of Ramsey's against the existence of complex universals. Although he believes in simple universals, Mellor argues that negative, disjunctive and conjunctive universals do not exist. I will show that his argument rests on a contentious identity criterion for facts. Despite the recent renewal of interest in a metaphysics of facts, conspicuously little has been said about the relationship between a fact and its constituents. I sketch three models of this relationship, only one of which sanctions the identity criterion. It turns out that this model does not fit Mellor's interpretation of Ramsey's theory of facts. I conclude by showing that Ramsey's argument does nothing to rule out one kind of conjunctive universal." p. 88

"In this article I address the Problem of Universals by answering questions about what facts a solution to the Problem of Universals should explain and how the explanation should go. I argue that a solution to the Problem of Universals explains the facts the Problem of Universals is about by giving the truthmakers (as opposed to the conceptual content and the ontological commitments) of the sentences stating those facts. I argue that the sentences stating the relevant facts are those like "a has the property F", that is, sentences stating that a particular has a certain property. Finally I show how answering these questions in this way transforms the Problem of Universals, traditionally conceived as the One over Many, that is, the problem of explaining how different particulars can have the same properties, into the Many over One, that is, the problem of explaining how the same particular can have different properties. The Problem of Universals is the problem of the Many over One."

"The somewhat dusty problem on which I engage us here is about as inclusive and 'ontological' as any, and I would introduce it by developing some implication of the remark that our philosophical object, the world, and each part of it, is (naturally enough) a totality of what is. The italicized phrase at once brings to the pedagogic mind certain further catchwords which point up the contrast between what a thing is and that it is. The 'what' here however has itself stood for two meanings. By 'what it is' we may mean it, the thing, the particular case it is, the individual subject, denoted by an ordinary proper name, so that what exists when Socrates exists is Socrates; but

we may mean again its nature, the kind it is, the character generally said to be connoted by a common noun or conveyed by descriptive adjectives and denoted by an abstract noun, so that to answer what exists when Socrates exists is to say that it is a man, is wise, is snubnosed, and so forth, or even that the 'what' of it is Humanity, Wisdom, Snubnosedness, etc. The dichotomy here is sometimes signaled by distinguishing within the import of the present 'what', considered in contrast with the 'that', a narrower sense of 'what' which we pedagogues sometimes express by '(the) such', viz., the kind or character, in contrast with '(the) this', viz., the case or instance. The, problem of universals, which is the clearer and easier of the problems associated with the opposition of 'essence and existence', is that of the real distinction and connection of the two referents of our more inclusive 'what', the such and this, and especially the assessment of the view that these involve an entity of one category, an abstract universal, which inheres in or qualifies an entity of another category, a concrete particular."

EDITOR'S NOTE: This article by the late Professor Donald C. Williams (1899-1983) dates from about 1959.

The Philosophy of Bernard Bolzano: Logic and Ontology

Some appreciations of Bolzano's philosophy

"Bernhard Bolzano's *Wissenschaftslehre*, published in 1837, a work which in its treatment of the logical 'theory of elements' far surpasses anything that world-literature has to offer in the way of a systematic sketch of logic. Bolzano did not, of course, expressly discuss or support any independent demarcation of pure logic in our sense, but he provided one de facto in the first two volumes of his work, in his discussions of what underlay a *Wissenschaftslehre* or theory of science in the sense of his conception; he did so with such purity and scientific strictness, and with such a rich store of original, scientifically confirmed and fruitful thoughts, that we must count him as one of the greatest logicians of all time.

He must be placed historically in fairly close proximity to Leibniz, with whom he shares important thoughts and fundamental conceptions, and to whom he is also philosophically akin in other respects." (Chapter Ten, Appendix: References to F. A. Lange and B. Bolzano, § 61, p. 142)

From: Edmund Husserl, *Logical Investigations*, vol. I, *Prolegomena to a Pure Logic* [1900], London and New York: Routledge 1970.

"While the idealists were removing every trace of objectivity from Kant's semantics, there was in a corner of the Austro-Hungarian empire, ignored by the leaders of German philosophy, a Czech priest by the name of Bernard Bolzano, who was engaged in the most far-reaching and successful effort to date to take semantics out of the swamp into which it had been sinking since the days of Descartes. Bolzano was the first to recognize that transcendental philosophy

and its idealistic sequel were a *reductio ad absurdum* of the semantics of modern philosophy. He was also the first to see that the proper prolegomena to any future metaphysics was a study not of transcendental considerations but of what we say and its laws and that consequently the *prima philosophia* was not metaphysics or ontology but semantics. The development of these ideas in his monumental *Wissenschaftslehre* and in a variety of other writings established Bolzano as the founder of the semantic tradition. Bolzano's philosophy was the kind that takes from and then gives life to science. His approach to semantics was developed in dialectical interplay with the decision to solve certain problems concerning the nature of mathematical knowledge. Kant had not even seen these problems; Bolzano solved them. And his solutions were made possible by, and were the source of, a new approach to the content and character of a priori knowledge." (p. 23)

From: J. Alberto Coffa, *The Semantic Tradition from Kant to Carnap. To the Vienna Station*, Cambridge: Cambridge University Press 1991.

"Bernard Bolzano was a lone forerunner both of analytical philosophy and phenomenology.

Born in Prague in the year when Kant's first Critique appeared, he became one of the most acute critics both of Kant and of German Idealism. He died in Prague in the same year in which Frege was born; Frege is philosophically closer to him than any other thinker of the nineteenth or twentieth century.

Bolzano was the only outstanding proponent of utilitarianism among German-speaking philosophers, and was a creative mathematician whose name is duly remembered in the annals of this discipline. His *Wissenschaftslehre* (Theory of Science) of 1837 makes him the greatest logician in the period between Leibniz and Frege.

The book was sadly neglected by Bolzano's contemporaries, but rediscovered by Brentano pupils: its ontology of propositions and ideas provided Husserl with much of his ammunition in his fight against psychologism and in support of phenomenology, and through Twardowski it also had an impact on the development of logical semantics in the Lwow-Warsaw School." (p. 823)

From: Wolfgang Künne, "Bolzano, Bernard" in: Edward Craig (ed.), *Routledge Encyclopedia of Philosophy*, vol. II p. 823-827, New York: Routledge 1998.

An overview of Bolzano's philosophy

"It is as logician, methodologist, and epistemologist that Bolzano, after a long period of neglect, regained philosophical attention in the twentieth century. Mainly in order to combat radical skepticism, he found it necessary to base his teachings in these fields on certain ontological conceptions. He was convinced that there exist truths-in-themselves (*Wahrheiten an sich*) prior to and independent of language and man. These truths he carefully distinguished from truths expressed in words and conceived truths. The set of truths-in-themselves is a subset of the set of propositions (in-themselves) (*Sätze an sich*), again to be distinguished from propositions expressed in words and conceived propositions. Propositions consist of terms (ideas-in-themselves, *Vorstellungen an sich*).

These are likewise to be distinguished, on the one hand, from the words or word sequences by which they are denoted and, on the other, from subjective ideas that occur in our mind. Although linguistic entities and conceived entities exist concretely, terms, propositions, and truths do not. Terms were equally carefully distinguished from their objects, whether or not these objects themselves existed concretely. Though Bolzano was a Platonist (in the modern sense), his ontology was rather remote from that of Plato or, for that matter, from that of Immanuel Kant, in spite of the common *an sich* terminology.

Beyond these negative determinations, Bolzano had little positive to say on the ontological status of terms and propositions except that they are the matter (*Stoff*) or sense (*Sinn*) of their correlates in language and thought.

Terms can be either simple or complex and either empty (*gegenstandslos*) or nonempty (*gegenständlich*); if nonempty, they are either singular or general. Examples of empty terms are -1 , 0 , Nothing, Round Square, Green Virtue, and Golden Mountain; absolutely simple terms are Not, Some, Have, Be, and Ought, but

Bolzano was uncertain about others. Simple, singular terms he called intuitions (*Anschauungen*).

Propositions are composed of terms and are perhaps best regarded as ordered sequences of terms, while the content (*Inhalt*) of a proposition is the (unordered) set of the simple terms out of which the terms constituting the proposition are composed. The content of a complex term is similarly defined. The terms 3^5 and 5^3 are different, though they have the same content. The terms 2^4 and 4^2 are different, though they have not only the same content but even the same object. With this conception of content, the traditional doctrine of the reciprocity between the extension of a term (the set of objects falling under it) and the content of a term can easily be seen to be invalid.

Among Bolzano's many idiosyncratic convictions, perhaps the most interesting, but also the most strange to the modern mind, was his belief that each branch of science has a unique, strictly scientific presentation, which for him meant not only a unique finite axiom system (a belief he shared with many) but also an essentially unique entailment (*Abfolge*) of each theorem of this science by the axioms, a belief which might well be unique to Bolzano.

This relationship of entailment, as presented by Bolzano, is very peculiar and obscure. Bolzano was never quite sure that he understood it himself, though he was convinced that there objectively must exist some such relationship, that each science must have its basic truths (*Grundwahrheiten*) to which all other truths of that science stand in the peculiar relation of consequence (*Folge*) to ground (*Grund*). Bolzano was constantly struggling to differentiate this relation of entailment from the relation of derivability (*Ableitbarkeit*), which was the basic relation of his logic. Though he did not succeed in putting his theory of entailment into consistent and fruitful shape,- and could not possibly have done so, in view of the chimerical character of his goal,- his acumen, mastery of the contemporary logical and methodological literature, intellectual honesty, and lifelong self-criticism more than made up for his numerous shortcomings. Bolzano remains a towering figure in the epistemology, logic, and methodology of the first half of the nineteenth century." (p. 647)

From: Yeoshua Bar-Hillel, *Bolzano, Bernard*, in: Paul Edwards (ed.), *The Encyclopedia of Philosophy*, New York: Macmillan 1967, vol. 2, pp. 337-338; Second edition: Donald M. Borchert (ed.), New York: Thomson Gale 2006, vol. 1, pp. 646-648.

"Bolzano's philosophy is notable for its clarity and for his reliance on logical argument. This, his monadological metaphysics and his many-sidedness helped to earn him his sobriquet of 'the Bohemian Leibniz'. Bolzano's stalking horse was Kant, whom he respected as an important philosopher but with whom he disagreed on many fundamental matters. A follower, Franz Prihonsky, collected his critical discussions of Kant into a volume entitled *Neue Anti-Kant*. So Neurath's epithet about Austrian philosophy being spared Kant is wrong: Bolzano took Kant very seriously, but disagreed with him.

The most characteristic doctrine of Bolzano's philosophy is his semantic Platonism, which anticipates that of Frege. Bolzano distinguished mental judgements and linguistic sentences (*Sätze*) from what he called *Sätze an sich*, which I shall call 'propositions'. Likewise he distinguished mental ideas (*Vorstellungen*) and linguistic names from *Vorstellungen an sich*, which I shall call 'concepts'. The *an sich* entities, propositions and concepts, are abstract and timeless: they are the meanings of linguistic expressions and the contents of significative mental acts. Bolzano had an argument against scepticism which he thought proved the existence of true propositions. Suppose there were no truths. Then the proposition that there are no truths would be a truth, so by *reductio* there is at least one truth. Since any proposition *p* is distinct from (though equivalent to) the proposition that it is true that *p*, it follows for Bolzano that there are infinitely many truths, and these are all abstract propositions (in themselves). Some years later Dedekind produced a similar (and similarly flawed) argument to try and show the existence of an infinite set. It is important that for Bolzano false propositions have the same ontological status as true ones, and objectless concepts have the same status as concepts under which objects fall.

This Third Realm of the in-itself is brilliantly wielded by Bolzano to define and explain truth and falsity, logical truth and logical falsity, logical consequence, compatibility, derivability, analyticity, logical

analyticity, probability, degrees of derivability and probabilistic inference. His definition of logical consequence differs little from that of Tarski, which it anticipated by about a century, and his theory of logical truth anticipates that of Quine. In logic it seems to have been Bolzano's fate to have invented wheels that others more famously reinvented after him. Had his views been widely known and available in readable texts in or shortly after his lifetime, I estimate that the advance of logic would have been accelerated by at least thirty, perhaps even fifty years. Where he falls short of Frege is that he does not have the concept of a formal system, where axioms are laid down and theorems follow by precisely defined syntactic rules of inference. Bolzano on the other hand prefers to work throughout with semantic concepts. The most important of these is the idea of *variation*. If we take a proposition and consider some logical part of it, whether a concept or another proposition, then we can consider what happens when we allow this part to vary and consider the range of its possible variants. For example if we take the proposition *John loves Mary* then we could replace *John* by *Fred*, *Harry*, *Elisabeth* etc., usually providing only that the name replacing John always denotes, and consider various properties of the class of variants so obtained. It is amazing how many different logico-semantic concepts Bolzano can define using this one idea. In one respect though he remains old-fashioned and Leibnizian, namely in his affection for the subject,- predicate form of propositions. The basic form of proposition for Bolzano is A has b, where A is the subject-concept and b is an abstract name for a predicate-concept, e.g., instead of *This is red* he would say *This has redness*. He even thought that every proposition could be tortured into this form. Our recent relational example would be *John has love for Mary*. Two philosophically interesting concepts are truth and existence. For *It is true that it rains in Spain* Bolzano has *The proposition that it rains in Spain has truth* and for *Tigers exist* he has *The concept of tiger has objectuality*, meaning that at least one thing falls under it. The latter analysis will evoke memories of Kant and Frege: like them Bolzano considers existence a second-level concept. Even non-existence has subject,- predicate form: *There are no unicorns* becomes *The concept of unicorn has objectlessness*.

Metaphysically Bolzano was an atomist and monadist, his monads, unlike those of Leibniz, having a physical location. Taking the idea of atoms as physical points seriously led him into an odd theory of contact. At a point on its surface a physical body may have an atom (and so be closed there) or lack an atom (or be open there). Consider now two non-overlapping bodies in contact at a certain point. If they were both open there they would fail to be in contact there, since there would be a spatial point between them that neither occupies. If they were both closed there they could not be in contact without sharing a point, in which case they would overlap. Hence contact can only take place where one body is open and the other is closed. Bolzano's chief metaphysical work was *Athanasia, or Reasons for the Immortality of the Soul*. Here he took the standard view that the soul is a monad and hence indestructible. The book contains an ontology of substance and accidents, which he calls *adherences*." (pp. 112-114)

From: Peter Simons, "Bolzano, Brentano and Meinong: Three Austrian Realists", in: Anthony O'Hear (ed.), *German Philosophy Since Kant*, Cambridge: Cambridge University Press 1999, pp. 109-136.

"[Bolzano] composed his two main works from 1823 though 1841: the *Wissenschaftslehre* (4 vols., 1837) and the posthumous *Grössenlehre*.

(...)

Bolzano recognized a profound distinction between the actual thoughts and judgments (*Urteile*) of human beings, their linguistic expressions, and the abstract propositions (*Sätze an sich*) and their parts which exist independently of those thoughts, judgments, and expressions. A proposition in Bolzano's sense is a preexistent sequence of ideas-as-such (*Vorstellungen an sich*).

Only propositions containing finite ideas-as-such are accessible to the mind. Real things existing concretely in space and time have subsistence (*Dasein*) whereas abstract objects such as propositions have only logical existence. Adherences, i.e., forces, applied to certain concrete substances give rise to subjective ideas, thoughts, or

judgments. A subjective idea is a part of a judgment that is not itself a judgment. The set of judgments is ordered by a causal relation.

Bolzano's abstract world is constituted of sets, ideas-as-such, certain properties (*Beschaffenheiten*), and objects constructed from these. Thus, sentence shapes are a kind of ideas-as-such, and certain complexes of ideas-as-such constitute propositions. Ideas-as-such can be generated from expressions of a language by postulates for the relation of being an object of something. Analogously, properties can be generated by postulates for the relation of something being applied to an object.

(...)

In the *Grössenlehre* Bolzano intended to give a detailed, well-founded exposition of contemporary mathematics and also to inaugurate new domains of research. Natural numbers are defined, half a century before Frege, as properties of "bijective" sets (the members of which can be put in one-to-one correspondence), and real numbers are conceived as properties of sets of certain infinite sequences of rational numbers. The analysis of infinite sets brought him to reject the Eudidean doctrine that the whole is always greater than any of its parts and, hence, to the insight that a set is infinite if and only if it is bijective to a proper subset of itself. This anticipates Peirce and Dedekind. Bolzano's extension of the linear continuum of finite numbers by infinitesimals implies a relatively constructive approach to nonstandard analysis. In the development of standard analysis the most remarkable result of the *Grössenlehre* is the anticipation of Weirstrass's discovery that there exist nowhere differentiable continuous functions.

The *Wissenschaftslehre* was intended to lay the logical and epistemological foundations of Bolzano's mathematics. A theory of science in Bolzano's sense is a collection of rules for delimiting the set of scientific textbooks. Whether a class of true propositions is a worthwhile object of representation in a scientific textbook is an ethical question decidable on utilitarian principles.

Bolzano proceeded from an expanded and standardized ordinary language through which he could describe propositions and their parts. He defined the semantic notion of truth and introduced the

function corresponding to a "replacement" operation on propositions. One of his major achievements was his definition of logical derivability (*logische Ableitbarkeit*) between sets of propositions: B is logically derivable from A if and only if all elements of the sum of A and B are simultaneously true for some replacement of their non-logical ideas-as-such and if all elements of B are true for any such replacement that makes all elements of A true. In addition to this notion, which is similar to Tarski's concept of consequence of 1936, Bolzano introduced a notion corresponding to Gentzen's concept of consequence. A proposition is universally valid (*allgemeingültig*) if it is derivable from the null class. In his proof theory Bolzano formulated counterparts to Gentzen's cut rule.

Bolzano introduced a notion of inductive probability as a generalization of derivability in a limited domain. This notion has the formal properties of conditional probability. These features and Bolzano's characterization of probability density by the technique of variation are reminiscent of Wittgenstein's inductive logic and Carnap's theory of regular confirmation functions.

The replacement of conceptual complexes in propositions would, if applied to a formalized language, correspond closely to a substitution-semantic conception of quantification. His own philosophical language was based on a kind of free logic. In essence, Bolzano characterized a substitution-semantic notion of consequence with a finite number of antecedents. His quantification over individual and general concepts amounts to the introduction of a non-elementary logic of lowest order containing a quantification theory of predicate variables but no set-theoretical principles such as choice axioms. His conception of universal validity and of the semantic superstructure of logic leads to a semantically adequate extension of the predicate-logical version of Lewis's system S5 of modal logic without paradoxes. It is also possible to simulate Bolzano's theory of probability in a substitution-semantically constructed theory of probability functions. Hence, by means of an ontologically parsimonious superstructure without possible-worlds metaphysics, Bolzano was able to delimit essentially the realms of classical logical truth and additive probability space." (pp. 93-94)

From: Jan Berg, "Bolzano, Bernard", in: Robert Audi (ed.), *The Cambridge Dictionary of Philosophy. Second Edition*, Cambridge: Cambridge University Press 1999.

The importance of Bolzano's logic

"Why look back now? Let me start by stating my non-historian's view of the modern history of logic. Like many scientific disciplines, flourishes while being ill-defined. Despite textbook orthodoxy, the issue what logic should be about is a legitimate topic of discussion, and one to which answers have varied historically. One key topic is reasoning: its valid laws for competent users, and perhaps also its sins: mistakes and fallacies. But the modern core also includes independent concerns such as formal languages, their semantic meaning and expressive power. Moreover, the modern research literature, much of it still in a pre-textbook stage, reveals a wide range of topics beyond reasoning and meaning, dealing with general structures in information, and many-agent activities other than reasoning, such as belief revision or communication. Thus, the agenda of logic keeps evolving, as it should. In this light, going back to the pioneers is not just a matter of piety, but also of self-interest.

One striking feature of older literature is its combination of issues in logic with general methodology of science. One sees this with Bolzano, Mill, or Peirce, but also with major modern authors, such as Tarski, Carnap, or Hintikka. The border line between logic and philosophy of science seems arbitrary. Why have 'confirmation', 'verisimilitude', or 'theory structure' become preserves for philosophers of science, and not for logicians? This separation seems an accidental feature of a historical move, viz. Frege's 'contraction of concerns', which tied up logic closely with the foundations of mathematics, and narrowed the agenda of the field to a point where fundamentalists would say that logic is the mathematics of formal systems. Admittedly, narrowing an agenda and focusing a field may be hugely beneficial. Frege's move prepared the ground for the golden age of logic in the interbellum, which produced the core logic curriculum we teach today. At the same time, broader interests from traditional logic migrated, and took refuge in other disciplines. But as its scientific environment evolved in the 20th century, logic became subject to other influences than mathematics and

philosophy, such as linguistics, computer science, AI, and to a lesser degree, cognitive psychology and other experimental disciplines.

Compared with Frege, Bolzano's intellectual range is broad, encompassing general philosophy, mathematics, and logic. This intellectual span fits the above picture. Even so, I am not going to make Bolzano a spokesman for any particular modern agenda. The current professional discussion speaks for itself. But I do want to review some of his themes as to contemporary relevance.

Incidentally, the main sources for the analysis in my 1985 paper, besides reading Bolzano himself, have been Kneale & Kneale 1962, and Berg 1962. After the Vienna meeting this autumn of 2002, I learnt about Rusnock 2000, whose logic chapters turned out sophisticated and congenial.

A short summary of Bolzanian themes:

- We quickly enumerate those points in Bolzano's logical system that are the most unusual and intriguing to logicians. These will return at lower speed in later sections.
- The systematic idea of decomposing propositions into general constituents is linguistically attractive, and reminiscent of abstract analyses of constituent structure in categorial grammars (Buszkowski 1997, Moortgat 1997, van Benthem 1991).
- In doing so, looking at different ways of setting the boundary between *fixed* and *variable* vocabulary in judging the validity of an inference is another innovation, which ties up with the recurrent issue of the boundaries of 'logicality'.
- Moving to logical core business, acknowledging different styles of reasoning: 'deducibility', 'strict deducibility', or statistical inference, each with their own merits, is a noteworthy enterprise quite superior to unreflected assumptions of uniformity.
- As to detailed proposals, consider Bolzano's central notion of deducibility. It says that an inference from premises φ to a conclusion Ψ is valid, given a variable vocabulary A (written henceforth as $\varphi \Rightarrow A \Psi$) if (a) every substitution instance of the

A's which makes all premises true also makes the conclusion true, and (b) the premises must be consistent. Clause (a) is like modern validity, modulo the different semantic machinery, but with a proviso (b) turning this into a non-monotonic logic, the hot topic of the 1980s. Moreover, the role of the vocabulary argument A making inference into a ternary relation really, will also turn out significant later.

- But also other notions of inference are reminiscent of modern proposals trying to get more diversity into how people deal with large sets of data, such as 'strict deducibility': using just the minimal set of premises to get a given conclusion.
- Bolzano's statistical varieties of inference involve counting numbers of substitutions that make a given statement true. Such connections between qualitative logic and quantitative probability were still alive in Carnap's inductive logic, a fringe topic at the time, but they are coming back in force in modern logic, too.
- Very striking to logicians at the interface with AI is Bolzano's formulation of systematic properties of his notions of inference, such as versions of transitivity or the deduction theorem, some depending on the fixed/variable constituent distinction. No truth tables, model-theoretic semantics, and their ilk, but instead, some of the more sophisticated structural theory of inference that came in fashion in the 1980s.

All these themes do, or should, occur in modern logic! Let's take them up now one by one." (pp. 12-14)

"In an introductory chapter, Bolzano defines a science as an "aggregate of truths whose known portion is important enough to be set forth in a special book" and logic as the science which deals with the division of the domain of all truths into suitable parts, and supplies the rules for the composition of the respective treatises. These rules and the division of the domain of all truths are discussed in the final, fourth volume of the German edition. But before the domain of truths can be divided into sections, and treatises written, a sufficient number of truths must first be discovered. Accordingly, the theory of science proper is preceded by a book entitled *Erfindungskunst* (Heuristic), which is concerned with the discovery of truths. This section, in turn, presupposes a discussion of the conditions of human knowledge in general. But epistemology can be transacted only if it is preceded by a theory concerning the entities which are known, namely propositions in themselves and their terms (Theory of Elements). Finally, the first section of the work is the Theory of Fundamentals, in which Bolzano undertakes to prove that there are truths in themselves and that some of them can be known." (pp. XXVIII-XXIX)

From: George Rolf, *Editor's Introduction*, to: Bernard Bolzano, *Theory of Science*, Berkeley: University of California Press 1972.

The main thesis contained in the *Theory of Science* consists in a clear distinction between psychology and logic. This work, as well as Bolzano's other works on logic, was given little consideration by his contemporaries. Husserl was the first to point out the exceptional importance of Bolzano's conception, considering him as "one of the greatest logicians of all times".

In Bolzano's view, logic is "a theory of science" -- *Wissenschaftslehre*, which explains the title of the above cited treatise on logic.

The work is divided into five parts:

- 1) *Fundamentallehre* -- fundamental theory. In this part Bolzano points out that truths must be considered in themselves -- *Wahrheiten an sich*, separating the logical content from the corresponding logical process.
- 2) *Elementarlehre* -- elementary theory. In this part he treats of the theory of representations of sentences and deductions. Here also Bolzano admits, as he did for truth, that there are "representations in themselves -- *Vorstellungen an sich* and "sentences in themselves" -- *Sätzen an Sich*.
- 3) *Erkenntnislehre* -- the theory of knowledge. That is the theory of the conditions that truth must conform to in relation to human intelligence.
- 4) *Erfindungskunst* -- the art of discovering truth.
- 5) *Eigentliche Wissenschaftslehre* -- the theory of science proper. This part is concerned with "truth" in the field of special sciences.

The three fundamental concepts on which Bolzano's theory is based are: "sentence in itself", "representation in itself", and "truth in itself".

By "sentence in itself" he understands that which can be thought in a sentence, irrespective of the fact whether this sentence has been thought or not, expressed or not. In this way, he marks a fundamental distinction between thinking a sentence and the sentence itself. The "sentence in itself" is neither representation, nor judgement; Bolzano does not specify what such a sentence is, but he says what it is not. A "sentence in itself" has no existence whatsoever,

since only thought sentences or asserted sentences exist in the mind of the one who thinks; the sentence is the content of thought, which content has no real existence. So, for instance, the sentence "life is not the greatest good of all" is a "sentence in itself", when we consider only its significant content -- its sense --, irrespective of the fact whether it is true or false.

As to the "representation in itself", this does not exist in us, it exists independently of the subject's consciousness; therefore, although several subjects may have the same representation, it is not multiplied but unique, and this is, in fact, Bolzano's argument in favour of the objectivity of representation. Let us take the above quoted sentence, "life is not the greatest good of all"; "life" and "the greatest good of all" are representations in themselves and are elements of the given sentence. The sum of representations in a sentence forms its content. This "objective representation" does not need, like the "proposition in itself" or the objective proposition, a subject who should think of, or express it but, like the latter, "it is not anything existing and yet it is a certain something" -- *Zwar nicht als etwas Seiendes, aber doch als ein gewisses Etwas* (*Wissenschaftslehre*, vol. 1, p. 217). More precisely "representation in itself" consists of something but not of something existing. Therefore "representations in themselves" are neither true nor false.

The third of Bolzano's concepts is "truth in itself", which expresses something as it is, irrespective of whether it was or not thought or expressed by some one. The object of truth needs nothing of what exists. So, for instance, the truth that "truth is nothing existing", does not require any real object (*op. cit.*, vol. I, p. 112).

After this analysis of significations Bolzano proceeds to the examination of other logical concepts, of logical value, logic relation and deduction, and he comes to the conclusion that logic is a science of meaning. This is pure logic -- *Die reine Logik* -- independent of psychology, with an a priori value, but not in the Kantian sense.

Husserl will be influenced by these basic ideas of Bolzano's philosophy and in this way will attempt to definitely eliminate psychologism in logic." (vol. III, pp. 354-355)

Bolzano's contribution to logic

"The *Wissenschaftslehre* [WL] (1837) by Bernard Bolzano (1781-1848) is one of the masterpieces in the history of logic. In this encyclopedic work Bolzano intended to construct a new and philosophically satisfactory foundation of mathematics. The search for such a foundation brought forth valuable by-products in logical semantics and axiomatics. For example, Bolzano introduced the notion of abstract, non-linguistic proposition and described its relations to other relevant notions such as sentence, truth, existence and analyticity. Furthermore, he studied relations among propositions and defined highly interesting notions of validity, consistency, derivability and probability, based on the idea of "replacing" certain components in propositions. In set theory, he stated the equivalence of reflexivity and infiniteness of sets and considered isomorphism as a sufficient condition for the identity of powers of infinite sets. He conceived of a natural number as a property characterizing sets of objects, even though he did not base his development of arithmetic on this notion, and analyzed sentences about specific numbers in a way reminiscent of Frege and Russell. In a posthumous manuscript from the 1830's (recently published) he developed a theory of real numbers, which differs from those of Dedekind, Weierstrass, Méray and Cantor. Bolzano's real numbers may be identified with certain sequences of rational numbers.

Logic in Bolzano's sense is a theory of science, a kind of metatheory, the objects of which are the several sciences and their linguistic representations. This theory is set forth in Bolzano's monumental four-volumes work *Wissenschaftslehre* (hereafter referred to as *WL*). Bolzano's very broad conception of logic with its strong emphasis on methodological aspects no doubt accounts for the type of logical results which he arrived at. The details of his theory of science proper are given in the fourth volume of the *WL* and belong to the least interesting aspects of his logic. On the other hand, Bolzano's search for a solid foundation for his theory of science left very worthwhile by-products in logical semantics and axiomatics. His theory of propositions is the starting-point of these results.

Bolzano became more and more aware of the profound distinction between the actual thoughts of human beings and their linguistic expressions on the one hand, and the abstract propositions and their components which exist independently of these thoughts and expressions on the other hand. Furthermore, he imagined a certain fixed deductive order among all true propositions. This idea was intimately associated with his vision of a realm of abstract components of propositions constituting their logically simple parts.

For the following presentation of Bolzano's theory of propositions I have to define some terms. A concrete sentence occurrence is a sequence of particles existing in space and time, arranged according to the syntactic rules of a grammar, and contrasting with its surroundings. A simple sentence shape, on the other hand, is a class of similar concrete occurrences of simple sentences. A compound sentence shape is built up recursively from simple sentence shapes by means of syntactic operations. Not every compound sentence shape has a corresponding concrete sentence occurrence. Two compound sentence shapes may be considered identical if they are built up from identical simple sentence shapes in the same way. Two simple sentence shapes are identical if they contain the same sentence occurrences.

Now consider the compound sentence containing the following concrete sentence occurrence: 'a simple sentence shape is a class of similar sentence occurrences or it is not the case that a simple sentence shape is a class of similar sentence occurrences'. In another sense one could say that this sentence shape, which is an abstract logical object outside of space and time, contains two sentence occurrences, i.e., two abstract "occurrences" of the simple sentence shape containing the following concrete inscription: 'a simple sentence shape is a class of similar sentence occurrences'. In the following, I will use the expression 'sentence occurrence' exclusively in the first, concrete sense.

Bolzano's notion of abstract non-linguistic proposition (*Satz an sich*) is a keystone in his philosophy and can be traced in his writings back to the beginnings of the second decade of the 19th century. I shall try to characterize Bolzano's conception of propositions by means of certain explicit assumptions. These assumptions also give

information about the relation between propositions and other logically interesting objects.

In his logic Bolzano utilizes a concept which is an exact counterpart of the modern logical notion of existential quantification. Therefore, he could have stated that (1) There exist entities, called 'propositions', which fulfill the following necessary conditions (2) through (15). (Cf. *WL* 30 ff.)

Thus, propositions possess the kind of logical existence developed in modern quantification theory. However, (2) A proposition does not exist concretely in space and time (*WL* 19).

According to Bolzano, both linguistic and mental entities such as thoughts and judgments are concrete (*WL*, 34, 291). Hence, propositions could not be identified as concrete linguistic or mental occurrences. Furthermore, (3) Propositions exist independently of all kinds of mental entities (*WL* 19).

Therefore the identification between propositions and mental dispositions sometimes made in medieval nominalism cannot be applied to propositions in Bolzano's sense.

A proposition in Bolzano's sense is a structure of ideas-as-such. Hence, an idea-as-such (*Vorstellung an sich*) is a part of a proposition which is not itself a proposition (*WL* 48). But to be able to generate propositions we have to characterize ideas-as-such independently of propositions. This is in fact implicit in Bolzano. He worked extensively with the relation of being an object of an idea as-such, which corresponds in modern logic to the relation of being an element of the extension of a concept. In terms of this relation, taken as a primitive by Bolzano, certain postulates may be extracted from his writings which concern the existence and general properties of ideas-as-such.

Independently of human minds and of linguistic expressions there exists a collection of absolutely simple ideas-as-such. As examples Bolzano mentions the logical constants expressed by the words 'not', 'and', 'some', 'to have', 'to be', 'ought' (*WL*, 78); but he admits being unable to offer a more comprehensive list. He seems to mean that each complex idea *A* can be analyzed into a sequence *S(A)* of simple ideas which would probably include certain logical constants.

I shall call this sequence $S(A)$ the 'primitive form' of A. The manner in which a complex idea is built up from simple ones may be expressed by a chain of definitions. So it appears that some complex ideas behave somewhat like the open formulas of a logical calculus. Bolzano assumes that two ideas are strictly identical if and only if they have the same primitive form ((*WL* 92, 119, 557).'' (pp. 147-150)

From: Jan Berg, *Bolzano's Contribution to Logic and Philosophy of Mathematics*, in: R. O. Gandy, J. M. Hyland (eds.), *Logic Colloquium '76*, Amsterdam: North Holland 1977, pp. 147-171.

Bolzano's contribution to semiotics

"The Prague philosopher, Bernard Bolzano, in his major work the *Theory of Science* (1837), mainly in the last two of the four volumes, reserves much space for semiotics. The author frequently cites Locke's *Essay* and the *Neues Organon*, and discovers in Lambert's writings "an semiotics many very estimable remarks", though these are of little use "for the development of the most general rules of scientific discourse", one of the aims Bolzano sets himself (par. 698).

The same chapter of *The Theory of Science* bears two titles, one of which, -- *Semiotik* -- appears in the table of contents (vol. IV, p. XVI), the other of which -- *Zeichenlehre* -- heads the beginning of the text (p. 500); paragraph 637, which follows, identifies both designations -- the theory of signs or semiotics (*Zeichenlehre Oder Semiotik*). If, in this chapter and in several other parts of the work, the author's attention is held above all by the testing of the relative perfection of signs (*Vollkommenheit oder Zweckmässigkeit*) and particularly of signs serving logical thought, then it is in the beginning of the third volume that Bolzano tries to introduce the reader to the fundamental notions of the theory of signs throughout par. 285 (pp. 67-84) which overflows with ideas and is titled "the designation of our representations" (*Bezeichnung unserer Vorstellungen*).

This paragraph begins with a bilateral definition of the sign, "An object through whose conception we wish to know in a renewed fashion another conception connected therewith in a thinking being, is known to us as a *sign*". A whole chain of geminate concepts follows, some of which are very new, while others, referring back to

their anterior sources, are newly specified and enlarged. Thus Bolzano's semiotic thoughts bring to the surface the difference between the meaning (*Bedeutung*) of a sign as such and the significance (*Sinn*) that this sign acquires in the context of the present circumstance, then the difference between the sign (1) produced by the addresser (*Urheber*) and (2) perceived by the addressee who, himself, oscillates between understanding and misunderstanding (*Verstehen und Missverstehen*). The author makes a distinction between the thought and expressed interpretation of the sign (*gedachte und sprachliche Auslegung*), between universal and particular signs, between natural and accidental signs (*natürlich und zufällig*), arbitrary and spontaneous (*willkürlich und unwillkürlich*), auditory and visual (*hörbar und sichtbar*), simple (*einzel*) and composite (*zusammengesetzt*, which means "a whole whose parts are themselves signs"), between unisemic and polysemic, proper and figurative, metonymical and metaphorical, mediate and immediate signs; to this classification he adds lucid footnotes on the important distinction to be made between signs (*Zeichen*) and indices (*Kennzeichen*) which are devoid of an addresser, and finally on another pressing theme, the question of the relationship between interpersonal (*an Andere*) and internal (*Sprechen mit selbst*) communication." (pp. 202-203 of the reprint)

Bolzano's ontology

"The first basic notion of Bolzano's ontological system is the part relation. Its domain, i.e., the set of all objects bearing it to something, embraces concrete substances, abstract objects, and collections. The converse domain of the part relation, i.e., the set of all objects to which it is borne, contains collections only.

Some collections are concrete entities existing in space and time, the rest are abstract sums or other sets. Concrete sums are composed of substances and adherences, i.e., forces. Forces applied to certain substances give rise to subjective ideas or judgements. Further results of such applications are the concrete sentence occurrences. A subjective idea is a part of a judgement which is not itself a judgement. The set of judgements is ordered by a special causal relation.

Bolzano's abstract world is constituted of sets, abstract sums, certain attributes (i.e., properties or relations), ideas-as-such, and objects constructed on the basis of these entities. Thus, sentence shapes are a kind of properties, and certain complexes of ideas-as-such constitute propositions. The notion of an idea-as-such can be constructed from expressions of a language by means of axioms for the relation of being an object of something. Analogously, properties can be generated by axioms for the relation of something being applied to an object. The converse of this relation, i.e., the relation of an entity having a property, and the relation of being an object of an idea-as-such are fundamental ontological constants of Bolzano's.

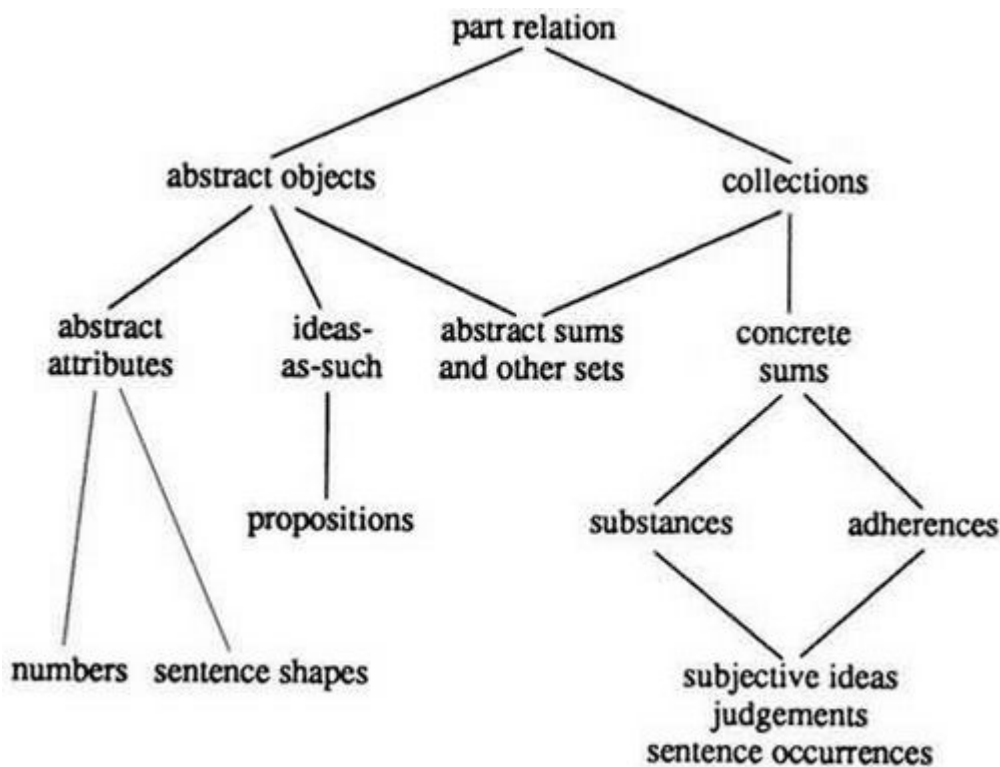

Natural numbers are defined as properties of bijective sets, and real numbers are essentially conceived of as properties of sets of certain infinite sequences of rational numbers. The analysis of infinite sets leads to a generalization of the part relation by scrapping the doctrine that the whole is always greater than any of its parts. The extension of the linear continuum of finite numbers by infinitesimals within the coarsest free algebraic filter settles definite limits to Bolzano's approach to analysis.

A part relation in a narrower sense, viz., the relation of being a subsequence of a sequence of abstract objects, holds among ideas-as-such and propositions. Furthermore, the relation of derivability holds among propositions, and true propositions are ordered by the relation of entailment.

Among the relations holding between the constituents of the concrete world and the abstract world there are the relations of a substance having a property or being an object of an idea-as-such. Moreover, the relations of an idea-as-such or proposition being the subject matter of a subjective idea or a judgement, respectively,

establish ontologically important connections between the abstract world and the concrete world.

The main features of Bolzano's ontology may be schematized as follows:

(...)

The question whether a rational reconstruction of Bolzano's ontology is possible will be sustained like a pedal point throughout the present study. In many respects, indeed, his ontological system is a model of thrift, comprehensiveness, and deductive cogency. He shows us how to grasp a self-contained, abstract "third" world (in Popper's sense) embracing the realms of classical logical truth and additive probability spaces without indulging in possible worlds, states of affairs, facts, and all that. Admittedly, from a modern point of view certain aspects of his ontology may look like Dr. Johnson's dog walking on its hind legs: it is not always done quite well, but you are surprised to find it done at all. To rational bipeds of our time it should be more instructive, though, to watch this performance rather than amazing at metaphysical cephalopods wallowing in clouds of

ontological splendors, or gazing at recondite cogitators crawling on all fours through a self-induced verbal fog." (pp. 31-32)

(...)

"Ontology without possible worlds.

A minimal requirement for pursuing philosophy of science and mathematics is the access to sentence (or formula) shapes, an adequate truth definition, substitution, and some set-theoretic principles. The first three notions allow a semantic demarcation of the

realms of classical logical truth and additive probability spaces. Apart from syntactic identity, the strongest semantic principle of individuation for sentence shapes is logical equivalence. If one should insist on abstract objects with stronger semantic identity conditions, as Bolzano did for reasons of philosophical foundations, then non-linguistic propositions may be tendered.

Bolzano proceeded from an expanded and standardized ordinary language by means of which he could describe the universe of propositions and their parts. We have seen that this exposition can be organized into explicit postulate systems. The existence of propositions and their parts being thus guaranteed, Bolzano defined the semantic notion of truth and introduced the function corresponding to a "replacement" operation on propositions. He could also easily have rendered an exact definition of the notion of a sentence shape. The replacement of conceptual complexes in propositions enabled him to develop the essential parts of classical logic and probability theory without resorting to ontologically lavish constructions.

Bolzano's notion of proposition offers an interesting alternative to the corresponding concepts developed in modern possible-world semantics. (For a lucid survey, see Edgar Morscher, *Propositions and all that: Ontological and epistemological reflections*, in: L. M. de Rijk (ed.), *Logos and Pragma. Essays on the Philosophy of Language in Honour of Professor Gabriel Nuchelmans*, Nijmegen, 1987, pp. 241-257) According to a representative theory of this kind, a proposition is a function sending possible worlds onto truth-values. A possible world is a maximally consistent set of states of affairs. A

state of affairs is somehow conceived of as being built up from members of the domain of individuals and their attributes. Moreover, a fact is a real state of affairs. Thus, a concrete object and its attributes can be parts of a state of affairs. For example, the concrete individual Kurt Waldheim and the property of being the 42nd president of the United States of America would, according to this view, be parts of the state of affairs that Kurt Waldheim is the 42nd president of the U.S.

The main flaws of this approach to the ontology of propositions are, first, that propositions expressed by logically equivalent sentences conflate and, second, that a concrete object can never be part of a state of affairs which is not a fact. For example, the real Kurt Waldheim can never be part of the state of affairs of someone being the 42nd president of the U.S.

The latter obstacle can be removed by representing concrete things by bundles of world-lines, i.e., by sets of sets of world-points. The real Kurt Waldheim, e.g., is thereby represented by a bundle of world-lines which will never enter into a state of affairs containing the property of being the 42nd president of the U.S. The fictitious Kurt Waldheim figuring in such a state of affairs branches off from the bundle representing the real Kurt Waldheim at a certain space-time point in the world of 1993. In view of the highly abstract character of this approach, an alternative remedy might be to leave states of affairs unanalyzed and take them as primitive entities. From the ontological point of view, however, we could then as well get on directly with propositions.

An attempt to evade the former difficulty of propositions conflating under logical equivalence of the corresponding sentences by proffering new categories of intensional objects will be a great expense to unyielding ontologists. One device may be to take the functions sending the possible worlds onto truth-values in intension. Hence, a practicable theory of propositions based on a possible-world semantics would have to postulate the existence of sets of sets of world-points, and moreover of properties, relations, and function concepts. An attempted entity-saving measure of introducing the attributes by functions in extension from possible worlds onto sets of individuals or sets of n-tuples of individuals would be redundant,

however, since attributes are parts of the constituents of possible worlds.

An ontology based on Bolzano's system of propositions would only have to postulate the existence of one category of intensional objects, namely ideas-as-such, and could otherwise employ purely extensional set-theoretic and algebraic methods. A possible objection to Bolzano's ontology might be raised on account of the fact that it cannot yield the semantics of epistemic and other non-classical logics. In these regions outside the analysis of the foundations of science and mathematics, it may be argued, real philosophy begins with the search for new semantic superstructures while the metaphysical dusk of possible worlds approaches."

Bolzano on the limits of knowledge

Bolzano, whose concept 'truths in themselves' was employed by Husserl (...), set himself the task of clarifying the concept of unknowability and of finding out whether it has any instances. The § 314 of his *Wissenschaftslehre* bears the title: "Whether our ability to know has definite limits" ("Ob es bestimmte Grenzen für unser Erkenntnisvermögen gebe?"). The target of Bolzano's criticism is Kant, as the next paragraph (315) makes clear: "The doctrine of the critical philosophy on this" ("Die Lehre der kritischen Philosophie hierüber").

One would expect that Hartmann carefully studied Bolzano's reasoning before presenting his own theory. At least, he should have commented on Bolzano's arguments, and tried to refute them. One's expectations grow higher due to his citation of Husserl, who obviously received the concept of truths in themselves from Bolzano (Husserl praised Bolzano in the first volume of his *Logische Untersuchungen*). However, nothing seems to indicate that Hartmann was familiar with Bolzano's reasoning against unknowability in § 314.(11) The *Wissenschaftslehre* which Hartmann had thoroughly studied is that of Fichte (cf. *Die Philosophie des deutschen Idealismus*, pp. 45–80). This is not only a scholarly point,

because Bolzano's analysis of the knowability problem is one of the most remarkable ever presented of it and his arguments present a severe challenge to anybody who thinks that human knowledge has absolute limits. Bolzano's contribution was unknown to Hartmann — but surely not unknowable.

According to Bolzano, there is an infinite number of true propositions. But, because we have a finite capacity of comprehending these propositions, it may be asked whether our ability to know has definite limits and whether we are able to determine these. Before answering this question, says Bolzano, we first have to clarify what we understand by such limits to our ability to know and by their determination.(12) One may determine the limits of a certain power either completely or incompletely. Complete determination concerns everything that the power can and cannot bring about, whereas incomplete or partial determinations concern only something the power can or cannot accomplish. A complete determination of our ability to know should characterize in a perfect way the totality of the truths which we know and of the truths we are not able to know; otherwise a determination of this ability is incomplete. It is the complete determination that is needed: certain sentences, which truthfully state what we are able to know and what not. 'Knowledge' here means true justified belief. One may speak of the (public) knowledge of the whole of humanity or of all finite minds in the cosmos, or of the (personal) knowledge of some individual. The question of the determination of the limits of knowledge concerns *criteria* which allow us to decide whether *answering* a given *question* does not exceed our ability to know. If such criteria could be given, we would be able to abstain from a spurious search. The criteria should concern knowability in principle and not only what is presently or up to now unknowable. The fact that we have not been able to know a certain truth up to the present time does not imply that this will also be impossible for us in the future. The criteria should characterize a class of truths which we not only do not know at present, but will never know, at least as long as we are human beings.(13)

After these considerations, it should be clear enough what is being searched for. There are three possible ways of proceeding:

- 1) *enumerating* all unknowable truths
- 2) *indicating* unknowables by giving a property which characterizes them
- 3) *looking* for such propositions the truth or falsity of which is not only unknown but will never be found out.(14)

This means that we may use either an *extensional* or an *intensional* procedure. It is clear that procedure 1) is self-refuting, Bolzano claims: if we know that the propositions p_1, \dots, p_n are true and unknowable to us, then they must be knowable to us.(15) It is more difficult to see that procedure 2) is also a dead end. In indicating unknowables, we have to use such characterizations as

All A's are unknowable to us.

No truths of the form 'A is X' are knowable to us.(16)

But these kinds of statements are illegitimate and self-contradictory, according to Bolzano. If we can characterize a thing by a property (say 'A'), then we know something of it, at least what it has in common with other things. However, the sentence "We cannot know anything of A" is a sentence about A, so that it is a contradiction to say that one does not know of A at all, i.e., that one cannot express any true proposition about it.

It may be said that, by claiming something to be unknowable, one does not mean that none of its properties are known, or that no proposition can be expressed about it. It may be claimed that a thing is unknowable to us if we cannot specify any of its *real* properties. Bolzano refutes this claim as follows: the property 'A' by which we comprehend a thing, is a real property of that thing, because the features of that thing are such as belong only to things which are subsumable under 'A.' For instance, colour belongs to the properties of a star. Somebody could claim that it is not a real property, because only physical properties (mass, density, heat) are real. If nothing else than the colour were known of a star, it would then be unknown, and might remain unknowable as to its real properties. Bolzano's argument means that the claim "All stars whose properties other than colour cannot be known are unknowable to us" is self-refuting. If we identify a distant star by virtue of its colour (e.g., Vega as being

blue), then that colour is a genuine feature of the star, because it belongs only to those things which have the same colour. Accordingly, the property “stars whose properties other than colour cannot be known” (A) *fails to characterize* something genuinely unknowable.

A further claim would be to say that an unknowable thing is unknowable due to such real properties which are not subsumable under ‘A.’ This claim may be expressed as follows:

All such properties (‘X’) as do not belong to the property ‘A,’ by which we characterize the ‘A’-things, are unknowable to us.

No truths of the form ‘All A’s are X’ are knowable to us, to the extent that ‘X’ is not included in the content of ‘A.’(17)

Thus, the adjectives of our language might in principle fail to attain the richness of the properties characteristic of things in the world, and we would be unable to acquire knowledge of all objective properties. Admittedly, says Bolzano, there may be properties of things which are not included in our designations. But then the truth of a proposition concerning these properties should be proved on the basis of the special character of these designations. Can such a special character of designations be known? If it can be known, then it is a contradiction to maintain that it is unknowable.(18) On the other hand, if one does not come to know those properties which are not included in the content of ‘A,’ then one has no reason to assume their existence.(19) For instance, there is no reason to assume that there may be colours outside the reach of our colour-words.

Bolzano applies the above considerations to a criticism of Kant’s hypothesis that there are things in themselves which are in principle unknowable. According to him, that hypothesis is self-contradictory: the proposition that insensible things cannot be the contents of our synthetic judgments *is itself a synthetic judgment* about them.(20) Bolzano also criticizes Kant’s distinction between sensible and insensible objects, because he thinks that it is in some respects misleading.(21) Furthermore, he criticizes Kant’s antinomies. According to Bolzano, the proofs which Kant presented for the theses and antitheses contain many errors.(22)

The third possibility of showing that knowledge has absolute limits is not self-refuting, as the other two are in Bolzano's analysis. This possibility is based, like the first one, on extensional considerations. The main idea is to *suggest candidates* — propositions the truth or falsity of which can never be discovered. Bolzano's objection to this procedure is that it is *difficult to prove* statements concerning unknowability. The fact that we have up to now been unable to decide whether the property 'B' belongs or does not belong to the things of class 'A' does not entitle us to conclude that we will never have any reason for such a decision. In order to make the difficulty clearer, Bolzano studies two different possibilities: the connexion between the concepts 'A' and 'B' may be

- (i) purely conceptual, or
- (ii) empirical.

In the first case, the history of mathematics can teach us about many questions which could not be decided for centuries but in the end were decided by suitable means. Nobody can be sure that a conceptual connexion not yet known cannot be discovered by the painstaking analysis of the concepts involved and their comparison not only with each other but also with related concepts.(23) In so far as empirical questions are concerned, nobody can anticipate the rich possibilities of future experience. Bolzano's example is an especially happy one: it is not known what the moon's inhabitants look like (the *Wissenschaftslehre* appeared in 1837). A modern example would be the question whether there are intelligent beings in other planetary systems. According to Bolzano, all possible "proofs" of unknowability are in fact based on a questionable argument from the limitations of the present state of knowledge to an unsurpassable limitation.(24)

Bolzano then considers a possible objection: because his analysis results in the impossibility of giving a limitation of our ability to know, this result itself seems to be a kind of limitation of this ability. His answer to the objection is the following: he does not maintain that it will never be possible to set a limit to knowability — only that he does not himself know of such a limit. Furthermore, the result that it is impossible to differentiate knowability from unknowability can be considered as an indication of a truth concealed for ever *only under the presupposition* that there really is an absolute limit of

knowledge. Bolzano does not subscribe to this presupposition; he thinks rather that we cannot draw the limit between knowability and unknowability simply because there *is no such limit*. Human knowledge can be enriched *ad infinitum*.(25)" (pp. 103-106)

Notes

(11) Hartmann knew Bolzano's theories of sentences in themselves and truths in themselves, and eagerly accepted them; cf. *Grundzüge einer Metaphysik der Erkenntnis*, p. 25 and "Die Erkenntnis im Lichte der Ontologie," *Kleine Schriften* I, p. 134. Cf. also J. N. Mohanty *Nicolai Hartmann and Alfred North Whitehead. A Study in recent Platonism* (1957), p. 42: "Bolzano's doctrine of 'Satz an sich' is accepted with admiration ..." Selected Bibliography on Bernard Bolzano's Contributions to Logic and Ontology. First Part: A - B

Biographies

1. Morscher, Edgar. 2008. *Bernard Bolzano's Life and Work*. Sank Augustin: Academia Verlag.

Table of contents: Preface 9; Introduction 13; 1. Bolzano's life and scientific career 17; 2. Bolzano's removal from Office and the "Bolzano Trial" 23; 3. A short survey of Bolzano's work 29; 4. Logic 33; 5. Epistemology and philosophy of science 75; 6. Ethics 89; 7. Aesthetics 107; 8. Political and social philosophy 113; 9. Philosophy of religion and theology 125; 10. Metaphysics 135; 11. Philosophy of nature and of physics 139; 12. Philosophy of mathematics 141; 13. Metaphilosophy and history of philosophy 149; 14. The so-called Bolzano Circle and Bolzano's influence on the development of the sciences and on intellectual history 151; Appendix: A formal reconstruction of Bolzano's method of idea-variation and of his definitions of logical truth and of logical consequence 159; Bibliography 169; Index of names 207.

"Despite the enormous increase of interest in Bolzano's philosophy during the last decades, an up-to-date monograph on Bolzano's philosophy is still a desideratum. The last book that might be called a monograph on Bolzano's philosophy dates from almost 100 years ago; it is Shmuel Hugo Bergmann's *Das philosophische Werk Bernard Bolzanos* (Halle/S. 1909), written in the spirit of the Brentano school, in particular of Bergmann's teacher Anton Marty.

When I was invited by the Editors of the *Stanford Encyclopedia of Philosophy* to contribute the entry on Bernard Bolzano, I took it as a challenge for starting my long-standing plan to write a monograph on Bolzano's philosophy. The present book is, to be clear, merely the first step toward this end. In this respect I can benefit from the generous copyright regulations of the Stanford Encyclopedia of Philosophy which allow the entries to appear also in print. The author welcomes any kind of comments and criticism to the present printed version of the Internet article in order to take them into consideration in his projected monograph on Bolzano's philosophy.

(...)

I dedicate this book to the greatest and most meritorious Bolzano scholar ever, Jan Berg, without whom Bernard Bolzano would not be seen as the outstanding philosopher as we now know him to be." (From the Preface)

2. Rusnock, Paul, and Šebestik, Jan. 2019. *Bernard Bolzano: His Life and Work*. New York: Oxford University Press.

Contents: A Note on Citations XIII; Acknowledgements XV; Preface XVII; Chronology XX; Extracts XXXI-XXXII; Introduction 1; 1. Bolzano's Life 5; 2. Ethics 83; 3. Political Philosophy 105; 4. Philosophy of Religion 139; 5. Catholicism and the Catholic Church 167; 6. Logic 187; 7. Theory of Knowledge 337; 8. Ontology and Metaphysics 405; 9. Mathematics 502; 10. Aesthetics, the Science of Beauty 544; Afterword 595; Bibliography 599; Index of Persons 647; Index of Subjects 653-667.

"In the English-speaking world, Bolzano is best known for his work in logic and mathematics. There are certainly things of great importance and beauty in these parts of his work. We have already written, each of us, on these matters, and will have more to say about them in this book. But a faithful portrait of Bolzano cannot limit itself to this, for until he was 40 years old, he was only able to pursue these subjects in his spare time. With his considerable gifts in these non-controversial areas, he certainly might have led a distinguished life of speculation as a

mathematician or philosopher. Instead he chose quite deliberately to plunge into the turbulent political life of his homeland, applying his formidable intelligence, energy, and determination to the reform of his society and its institutions. It is here that we shall begin." (p. 3)

Bibliographies

1. Lapointe, Sandra 2019. Bernard Bolzano. *Oxford Bibliographies Online*: 1-13.

"Introduction

Bernard Bolzano's (b. 1781-d. 1848) originality and numerous anticipatory insights have deserved him a unique position in the history of philosophy. While scholarship trudged for more than a hundred years after his death, in the second half of the 20th century, Bolzano emerged at once as the most significant logician between Leibniz and Frege, one of Kant's most scrupulous and formidable critics, and what may have been one of the greatest single influences on Brentano's students, in particular Twardowski and Husserl, beside Brentano himself. For a variety of reasons—e.g. methodological and thematic proximity—analytic philosophers have found in Bolzano a congenial interlocutor. As a result, most commentaries and discussions tend to focus on aspects of Bolzano's views on logic and its philosophy, in particular his treatment of questions relating to analyticity, deducibility, and grounding in his *opus magnum*, the *Theory of Science* (1837). But the wealth of ideas we find throughout his work is far from exhausted. Because Bolzano research is young, there still subsist substantial gaps in the literature. More importantly, perhaps, there is ample space for reassessments of standard interpretations. The present bibliography is designed so as to both provide interested researchers and prospective scholars with a sense of those issues that constitute the poles of current discussions and leave room for ulterior updates."

4. "Bolzano and Analytic Philosophy." 1997. *Grazer Philosophische Studien* no. 53:1-266

Edited by Wolfgang Künne, Mark Siebel, Mark Textor.

Proceedings of the International Symposium held in Hamburg 3rd-5th January 1997.

Contents: Preface; VI; Dagfin Føllesdal: Bolzano's Legacy 1; Jan Berg: Bolzano, the Prescient Encyclopedist 13; Jan Šebestik: Bolzano, Exner and the Origins of Analytical Philosophy 33; Paul Rusnock: Bolzano and the Traditions of Analysis 61; Peter Simons: Bolzano on Collections 87; Ali Behboud: Remarks on Bolzano's Collections 109; Mark Siebel: Variation, Derivability and Necessity 117; Edgar Morscher: Bolzano's Method of Variation: Three Puzzles 139; Rolf George: Bolzano's Programme and Abstract Objects 167; Mark Textor: Bolzano's Sententialism 181; Wolfgang Künne: Propositions in Bolzano and Frege 203; Michael Dummett: Comments on Wolfgang Künne's Paper 241; Carsten Uwe Gieske: Bolzano's Notion of Testifying 249-266.

"From January 3rd to January 5th 1997 the international symposium *Bolzano and Analytical Philosophy* took place in Hamburg.

(---)

Michael Dummett once called Bernard Bolzano the "great-grandfather of analytical philosophy".[*] The aim of the symposium was to explore whether Bolzano's analytical great-grandchildren can still learn from their Bohemian ancestor. We hope the symposium will stimulate further systematic and exegetical research in this area." (from the *Preface*)

[*] Michael Dummett, *Origins of Analytic Philosophy*, Cambridge (MA): Harvard University Press 1993, p. 171.

5. "Bernard Bolzano." 1999. *Revue d'Histoire des Sciences* no. 52:339-506

The following contributions are in English:

Charles Chihara: Frege's and Bolzano's rationalist conceptions of arithmetic 343; Joëlle Proust: Bolzano's theory of representation 363; Johannes Hafner: Bolzano's criticism of indirect proofs 385; Paul Rusnock: Philosophy of mathematics: Bolzano's responses to Kant and Lagrange 399.

6. "Bolzano and Kant." 2012. *Grazer Philosophische Studien* no. 85

Guest Editor: Sandra Lapointe.

Table of Contents: Sandra Lapointe: Introduction 1; Sandra Lapointe: Is Logic Formal? Bolzano, Kant and the Kantian Logicians 11; Nicholas F. Stang: A Kantian Reply to Bolzano's Critique of Kant's Analytic-Synthetic Distinction 33; Clinton Tolley: Bolzano and Kant on the Place of Subjectivity in a *Wissenschaftslehre* 63; Timothy Rosenkoetter: Kant and Bolzano on the Singularity of Intuitions 89; Waldemar Rohloff: From Ordinary Language to Definition in Kant and Bolzano 131-149.

7. Adair-Totef, Christopher. 2002. "Bolzano's *Gesamtausgabe*." *British Journal for the History of Philosophy* no. 10:127-133

"Shortly after Bolzano's death there was an attempt to collect his works as a *Gesamtausgabe*, but there was little interest. Another attempt was made to honour the sixtieth anniversary of his death in 1908 but that also failed.

The *Wissenschaftslehre* was republished in four volumes in the early 1930s, but it was not until the late 1960s that a number of international Bolzano scholars succeeded in planning the Bernard Bolzano *Gesamtausgabe*. The first of a projected 100+ volumes appeared in 1969 – an introductory book that was a biography. The *Gesamtausgabe* is composed of four series:

I Writings (*Schriften*);

II Posthumous writings (*Nachlaß*);

III Correspondence (*Briefwechsel*);

IV Documents (*Dokumente*)." (p. 128)

(...)

"Bolzano's *Wissenschaftslehre* was published in four volumes in Germany in 1837. It consists of five Books: Theory of Fundamentals, Theory of Elements, Theory of Knowledge, Heuristic, and Theory of Science Proper.

In the first book Bolzano defines *Wissenschaftslehre* as the attempt to provide an account of science in general. Its function is not to discuss any individual sciences but rather to determine the rules by which all truths can be determined to belong to the individual sciences. He acknowledges that he is using science and doctrine in slightly unusual terms but insists that his account is superior to either Fichte's or Hegel's. Bolzano maintains that Fichte's *Wissenschaftslehre* offers a mistaken attempt to provide a doctrine of knowledge in general. Bolzano does admit that he does not really understand Fichte's philosophy. Bolzano also admits to a similar lack of comprehension of Schelling and Hegel.

Bolzano uses a number of technical terms. One is a 'proposition in itself' (*Satz an sich*) which he takes to be an assertion that something is or is not the case. A proposition in itself need not

be uttered or even thought. In a similar vein Bolzano speaks of 'truth in itself' (*Wahrheit an sich*) or 'objective truth' that does not have real existence in contrast to recognized truths that do exist. And, there are 'representations in themselves' (*Vorstellungen an sich*). Examples of ideas in themselves would be 'Caius' and 'wisdom' in the proposition 'Caius has wisdom'. Representations in themselves have neither truth nor existence. Much in the first three books appears to be an attack on Kantian philosophy – he has no use for Kant's psychology and his *Ding an sich*. But, these books are not simply negative. He claims to have shown that there are truths and that we can recognize them and he sets out the conditions under which we can recognize them." (p. 129)

8. Bar-Hillel, Yehoshua. 1950. "Bolzano's Definition of Analytic Propositions." *Methodos*:32-55

Published also in *Theoria* 16, 1950, pp. 91-117.

Reprinted in: Y. Bar-Hillel, *Aspects of language. Essays and lectures on philosophy of language, linguistic philosophy and methodology of linguistics*, Jerusalem: The Magnes Press - The Hebrew University, 1970, pp. 3-28.

"In view of recent discussions on the nature of analytic truth, it should be rather interesting to inquire into the treatment which this subject received by the most outstanding logician of the first half of the 19th century, the Austrian philosopher, theologian, and physicist Bernard Bolzano.

Our investigation will turn upon section 148 of Bolzano's four volumed masterwork *Wissenschaftslehre* (1837). Only occasionally shall we need to refer to other parts of this work. This section, headed "Analytic or Synthetic Propositions", comprises pages 83-89 of the second volume and is divided into three subsections of less than two pages altogether, followed by four annotations, filling the next five pages. I dwell so long upon these bibliographical particulars only to bring into full light the wealth of systematic and historic material contained in these few pages.

1. Pre-History.

Bolzano's aim, in § 148, was to define a concept which could serve as an adequate explication for what is now commonly termed 'logical truth'. Though this aim is nowhere explicitly stated, there can be no doubt about it, just as Kant before him and many logicians after him doubtless aimed at the same target when they proposed their respective definitions.

Bolzano devotes the greater part of his fourth annotation the discussion of many such attempts made by his predecessors and contemporaries. He mentions *Aristotle, Locke, Crusius* (the German logician of the first half of the 18th century who was probably the first to use the terms 'analytic' and 'synthetic' in their Kantian senses), Kant and many other minor philosophers. He easily succeeds in proving the inadequateness of Kant's two definitions for 'analytic', the one given in his *Logik* and equating, in effect, Analytic (1) with Identical, the other much better known in the introduction to the *Critique of Pure Reason*, where he proposes to call propositions 'analytic', whose predicate-concept is contained (perhaps in a hidden manner) in the subject-notion. Bolzano points out (p. 87) the vagueness of the term 'contained' and argues that, according to a quite natural interpretation of this term, the proposition « The father of Alexander, King of Macedonia, was King of Macedonia » ought to be analytic, a consequence which Kant certainly did not intend to be drawn.

But to even more refined versions of Kant's definition, given by some of his followers, replacing the vague 'contained' by more concise terms, such as those making use of 'essential characteristics', Bolzano objects that only one type of proposition conforms to them, namely 'A (which is B) is B'. But should not, continues Bolzano, also propositions of the type 'Every object is either B or non-B' be counted among the analytic propositions?

Having thus convinced himself of the inadequateness of all prior approaches, he started to attack the subject along a new and highly original line." (pp. 3-4 of the reprint).

9. ———. 1952. "Bolzano's Propositional Logic." *Archiv für Mathematische Logik und Grundlagenforschung* no. 1:65-98

Reprinted in: Y. Bar-Hillel, *Aspects of language. Essays and lectures on philosophy of language, linguistic philosophy and methodology of linguistics*, Jerusalem: The Magnes Press - The Hebrew University, 1970, pp. 33-68.

"1848 is a remarkable year not only in general history; in the history of human culture and thought it will be remembered also as the birth year of *G. Frege*, "the greatest logician of the 19th century", (2) and should be remembered as the year in which the death of the greatest logician between Leibniz and Frege, the Czech Bernard Bolzano, occurred. So far, little has been done to evaluate his important contributions to logical theory, (3) and I hope that the present article will help to undo this undeserved wrong.

The purpose of this article is very restricted: only a small part of Bolzano's investigations will be dealt with, i.e. his propositional logic, and even this in a limited degree. This theory is in my opinion not only a master-work of outstanding historical interest, I also believe that it contains many features neglected even by modern symbolic logic and nevertheless worthy of close study. I am convinced that such a study will considerably enrich our logical technique and terminology.

Since our principal aim is to emphasize the impact which Bolzano's ideas should have on contemporary logic, I shall allow myself to depart, sometimes considerably, from his original account and even to disregard parts of his theory unacceptable to us which do not play any decisive role in its construction, all this, of course, after due warning shall have been given.

I shall summarize the contents of §§147, 154-160 of Bolzano's *Wissenschaftslehre* (1837), with which alone this study is concerned, in 28 definitions and 95 theorems. Most of these theorems will not be proved, for the sake of brevity, but the reader will, in general, be able to supplement the proofs by himself. Many definitions and a few theorems will be illustrated by simple examples. Major departures from Bolzano's original account will be specially mentioned and justified.

In the second part of the study I shall outline the place of Bolzano's contribution within the framework of modern semantics, by its detailed comparison with the corresponding parts of R. Carnap's two volumes of *Studies in Semantics*. This comparison will give us a certain perspective on the bearing of Bolzano's highly original innovations for modern research, and on the other hand enable us to see clearly the precise nature of some of his shortcomings." (pp. 33-34)

(1) This article has been written as an outcome of conversations with Professor Hugo Bergman of the Hebrew University, Jerusalem, and a joint reading of the relevant passages of Bolzano's *Wissenschaftslehre*. It is to Professor Bergman that I owe the general ideas on which this paper is based.

(2) According to A. Tarski, *Introduction to Logic*, 1941, p. 19.

(3) The following is a list of the most important articles dealing mainly with Bolzano's contributions to logic which have appeared in the last two decades:

W. Dubislav Bolzano as Vorlaufer der mathematischen Logik", *Philosophisches Jahrbuch der Görres-Gesellschaft*, vol. 44 (1931), pp. 448-456.

H. Scholz, "Die Wissenschaftslehre Bolzanos", *Semesterberichte*, 9. Semester, 1936/37, pp. 1-53.

H. Scholz, "Die Wissenschaftslehre Bolzanos", *Abhandlungen der Fries'schen Schule*, n. s. vol. 6 (1937), pp. 399-472.

H. R. Smart, "Bolzano's Logic", *The Philosophical Review*, vol. 53 (1944), pp. 513-533.

I have not been able to get hold of Scholz's second article, but since it is, according to the *Journal of Symbolic Logic*, only a somewhat broader version of his first article, the loss is probably not too great. My quotations from Scholz will therefore refer always to his first article.

10. ———. 2006. "Bolzano, Bernard." In *Encyclopedia of Philosophy: Second edition. Vol. 1*, edited by Borchert, Donald M., 646-648. New York: Thomson Gale

First edition 1967.

"Bernard Bolzano, a philosopher, theologian, logician, and mathematician, was born in Prague, where his father, an Italian art dealer, had settled; his mother was a German merchant's daughter. Bolzano studied mathematics, philosophy, and theology in Prague and defended his doctor's thesis in mathematics in 1804; he was ordained a Roman Catholic priest the following year. Shortly thereafter he was appointed to a temporary professorship in the science of religion at Karlova University in Prague and two years later was given a newly established chair in this field. Some time later he was accused of religious and political heresy and was removed from his teaching position in December 1819. Bolzano spent much of his time thereafter with the family of his friend and benefactor, A. Hoffmann, at their estate in southern Bohemia. He had difficulty getting his later publications through the Metternich censorship. Some of his books were put on the Index, and many appeared only posthumously. Some manuscripts are yet to be published; the most important of these are in the National Museum and the University Library in Prague, others are in the Österreichische Nationalbibliothek in Vienna. In December 1848, Bolzano died of a respiratory disease from which he had suffered for most of his life." (p. 646)

11. Behboud, Ali. 1997. "Remarks on Bolzano's Collections." *Grazer Philosophische Studien* no. 53:109-115

"With his "zoology of general kinds of collective entities"[*], Peter Simons has sketched - in a very helpful way - some main alternatives for possible interpretations of Bolzano's collections. As he pointed out, we may not have more than just a best fit - and, in fact, he proposes that Bolzano's account is "a distinct and distinctive theory of collections". I do agree with Simons that there are many difficulties we have to face when we try to fit Bolzano's account into one of our theories. Also, ignoring the considerable historical interest for the moment, the price the technical inconveniences as well as the conceptual complexities which such a fit might require in the end could be too high to be of any practical interest. Nevertheless, I would like to try my luck for a best fit. (1)" (p. 105)

(1) Simons is clearly right that Bolzano does not develop a systematic theory of collections. However, collections play a fundamental role for Bolzano (even beyond his mathematical theories), since anything whatsoever is either a collection or an "atom" (*einfach*). So it is no surprise that the notion of a collection is almost ubiquitous in Bolzano's works.

[*] P. Simons, *Bolzano on Collections*, (1997), p. 87.

12. Bellomo, Anna, and Massas, Guillaume. 2021. "Bolzano's Mathematical Infinite." *The Review of Symbolic Logic*:1-55

Abstract: "Bernard Bolzano (1781–1848) is commonly thought to have attempted to develop a theory of size for infinite collections that follows the so-called part–whole principle, according to which the whole is always greater than any of its proper parts. In this paper, we develop a novel interpretation of Bolzano's mature theory of the infinite and show that, contrary to mainstream interpretations, it is best understood as a theory of infinite sums. Our formal results show that Bolzano's infinite sums can be equipped with the rich and original structure of a non-commutative ordered ring, and that Bolzano's views on the mathematical infinite are, after all, consistent."

13. Benoist, Jocelyn. 2002. "Husserl and Bolzano." In *Phenomenology World-Wide: Foundations, Expanding Dynamisms, Life-Engagements. A Guide for Research and Study*, edited by Tymieniecka, Anna-Teresa, 98-100. Dordrecht: Kluwer

"Bolzano's influence on Husserl has recently come to be appreciated at its true worth. It is actually an extremely important one.

Husserl recalls that he attended a lecture given by Brentano on *The Paradoxes of the Infinite*. But he may also have heard of Bolzano from his mathematics professor Karl Weierstrass. Papers written by the Brentanist Benno Kerry (*Ueber Anschauung und ihre psychische Verarbeitung* 1885-1891) also had a certain bearing on Husserl's knowledge of Bolzano. The insightful discussion of the Bolzanian thesis of "representations without object" to be found in Twardowski's book *On Content*

and Object of Presentations succeeded in interesting Brentano's pupil in that author definitively.

The psychological point of view adopted by Husserl in the *Philosophy of Arithmetic* does seem to be very far removed from that of Bolzano. However, on the other hand, Husserl's break with psychologism, which took place during the years 1894-1896, appears to have had a direct bearing on Husserl's better acquaintance with Bolzano's *Wissenschaftslehre* during that period. We now know that in 1896 Husserl gave a course which was not, as is commonly believed, a draft of the *Prolegomena*, but was rather a survey of Bolzano's *Wissenschaftslehre*. [*]

What really matters is that the break with Brentanian psychologism was indeed a Bolzanian move. Such a move allows us to speak of a "Bolzanian tum" in Husserl's thought, taking place around 1896. From that point of view, Husserl's thought, "phenomenology", may and must be understood as a (quite strange) kind of compromise between Brentanian descriptive psychology and Bolzanian propositionalism." (p. 98)

[*] E, Husserl, *Logik. Vorlesung 1896*, edited by Elisabeth Schuhmann, Dordrecht: Springer 2001.

14. Benthem, Johan van. 1984. *Lessons from Bolzano*. Stanford: Center for the Study of Language and Information, Leland Stanford Junior University

"Bernard Bolzano's contributions to logic, largely unnoticed in the 19th century, have been receiving ever more attention from modern logicians (cf. Scholz, 1937; Berg, 1962; Corcoran, 1975). As a result, it has already become something of a commonplace to credit Bolzano with the discovery of the notion of logical consequence in the semantic sense. Now, this particular attribution, whether justified or not, would at best establish a historical link between modern logical concerns and Bolzano's work. The purpose of the present note, however, is to bring out three important aspects of that work that are still of contemporary systematic interest. No detailed textual study of Bolzano is needed to substantiate our suggestions. We shall

refer to well-documented 'public' aspects of the 'Wissenschaftslehre' (Bolzano, 1837), pointing out their more general logical significance." (p. 1).

15. ———. 1985. "The Variety of Consequence, According to Bolzano." *Studia Logica* no. 44:389-403

Abstract: "Contemporary historians of logic tend to credit Bernard Bolzano with the invention of the semantic notion of consequence, a full century before Tarski. Nevertheless, Bolzano's work played no significant role in the genesis of modern logical semantics. The purpose of this paper is to point out three highly original, and still quite relevant themes in Bolzano's work, being a systematic study of possible types of inference, of consistency, as well as their meta-theory. There are certain analogies with Tarski's concerns here, although the main thrust seems to be different, both philosophically and technically. Thus, if only obliquely, we also provide some additional historical perspective on Tarski's achievement."

16. ———. 2003. "Is There Still Logic in Bolzano's Key?" In *Bernard Bolzano's Leistungen in Logik, Mathematik und Physik*, edited by Morscher, Edgar, 11-34. Sankt Augustin: Academia Verlag

"Bolzano is widely seen as the philosopher of abstract propositions, far removed from psychological blemishes. Nevertheless, many themes in this paper suggest links with the actual reasoning performed by non-Platonic humans like us. We saw this with attention to diverse styles of task-dependent reasoning, with degrees of logicity for the expressions of

natural language that we actually use, with inferences transferring information across discourse situations, with global architecture of reasoning styles, or with mixtures of such neatly compartmentalized logical activities as semantic evaluation and proof. When we take all this seriously, it becomes hard not to go one step further, and do something which Frege has forbidden - but probably also Bolzano: take the psychological facts seriously. All the above topics border on cognitive science and the experimental study of human reasoning, and the eventual agenda of modern logic will also have to come to better terms with that than the by now pretty stale slogan of 'anti-psychologism'.

Conclusions.

We have surveyed some aspects of Bolzano's logic from a modern standpoint, stressing in particular his different styles of consequence, the essential ternary nature of consequence when language is taken into account, and the mixed notion of consequence in a model. In all three cases we included some new technical observations to show that the issues are still alive. But the more general thrust is this.

Bolzano's work remains interesting for logic today, both in its general sweep, and in some of its details. Partly, it is attractive precisely because it is so non-mainstream, and hence valuable for modern agenda discussions. Its themes crossing logic and philosophy of science reflect current rapprochements, while its thrust also seems to fit with some themes from AI. Classical mathematical logic has had an Austrian icon in Kurt Gödel: modern logic might consider at least having a Czech-Austrian patron saint." (pp. 30-31).

17. ———. 2013. "Bernard Bolzano's *Wissenschaftslehre*." *Topoi* no. 32:301-303

"In this review, I will focus on Mr. Bolzano's thoughts about logic, even though he offers much more than that to readers interested in theory of science and general philosophy. Modern logic has become more and more technical, cutting itself loose from its broader origins as the study of reasoning, and philosophers of logic slavishly play up to this trend by devising

ever more arcane criteria of 'logicality' that apply only to a small elite of 'logical constants', making it harder and harder for new themes to enter the field. Refreshingly, Mr. Bolzano does none of this. He resolutely ignores received wisdom in logic textbooks, and deftly avoids entanglement in the scholasticism of our modern age. Instead, he just goes back to what logic is about, and rethinks it afresh." (p. 301)

18. Berg, Jan. 1962. *Bolzano's Logic*. Stockholm: Almqvist & Wiksell

Contents: Preface 5; Introduction 7; Abbreviations 12; I. Bolzano's life and work 13; II. A logical frame 33; III. Bolzano's fundamental notions 41; IV. Bolzano's logic of variation 92; V. Other logical theories 146; VI. Bolzano's logic of entailment 151; VII. Bolzano's philosophy of mathematics 165; Bibliography 179; Index of proper names 213-214.

"Bernard Bolzano made essential contributions to, *inter alia*, theology, logic, and mathematics. For political reasons, however, he was prevented from influencing to a full extent the age in which he lived. As a mathematician his name has survived, although many of his most remarkable results were not published until a century after their conception. As a logician he has begun to appear again in scattered articles and comments. In this study I have tried to give an exposition and evaluation of the main ideas of his logic from a modern viewpoint.

Important parts of Bolzano's theories of logic and semantics were new with him, and when these ideas reappear later they were independent of him. This position, in part outside of the historical development, makes it highly pertinent to compare Bolzano's theories directly with modern logic. When tracing the lineage of some of Bolzano's ideas I have even projected the earlier theories onto a modern scheme of reference.

In the first chapter I shall briefly mention the genesis of Bolzano's main works. But I am not primarily interested in the genetic aspect of Bolzano's theories. Therefore, as often as possible I shall consider Bolzano's various formulations of his ideas as if they were parts of a simultaneous whole.

My analysis of Bolzano's achievements in logic, semantics, and mathematical philosophy is based on his mature production after 1820, when he started writing his *magnum opus*, the *Wissenschaftslehre*. The works chiefly consulted are:

(1) *Wissenschaftslehre*, I-IV (Bolzano (15) mostly abbreviated "WL"). [Names followed by parenthesized numerals refer to the bibliography; see the last paragraph of this introduction.]

(2) *Der Briefwechsel B. Bolzano's mit F. Exner* (Bolzano (54), "BE").

(3) *Erste Begriffe der allgemeinen Grössenlehre* (Bolzano (78), "AG").

(4) *Reine Zahlenlehre. Erster Abschnitt. Von dem Begriffe, den allgemeinsten Beschaffenheiten und der Bezeichnungsart der Zahlen* (Bolzano (79), "RZ").

(5) *Unendliche Grössenbegriffe* (Bolzano (81), "UG").

(6) *Bolzano's Wissenschaftslehre und Religionswissenschaft in einer beurtheilenden Uebersicht* (Bolzano (z5), "WU").

(7) *Einleitung zur Grössenlehre* (Bolzano (83), "EG").

(8) *Paradoxien des Unendlichen* (Bolzano (45), "PU").

For (3)-(5) and (7) I have utilized Bolzano's unpublished manuscripts. In general I have presupposed that some editions of (1), (2), and (8) are accessible to the reader.

Chapter I presents in a concentrated form some biographical and bibliographical facts about Bolzano. The manuscripts used are described and dated. Some topics lying outside of logic proper and dealt with in published or unpublished works of Bolzano are also touched upon. The most representative portraits of Bolzano - one of which has not been published before - are reproduced.

Chapter II describes the logical machinery to be used in the formalization and the comparative analysis of Bolzano's logic. This chapter may be read cursorily and used as future occasion may require. The system expounds the so-called elementary

logic, i.e., classical predicate logic of first order with identity. In view of its simplicity and non-controversial character, elementary logic seems at present to be an expedient object for comparison in research in the history of logic. To be sure, we know nothing for certain about the future of logic; maybe the logics of tomorrow will differ greatly from those of today. However, it is likely that our elementary logic will be translatable into or representable within these conceivable new systems. But there is always the possibility that new systems of logic will promote a deeper understanding of certain features of the objects analysed.

Chapters III-VII expound those aspects of Bolzano's theories of logic, semantics, and mathematical philosophy which seem to me fundamental. Certain sections of these chapters are subdivided into two parts; part A describes Bolzano's ideas and part B offers commentaries on A. In order to shorten the exposition, definitions and arguments are sometimes formalized even in A, and sometimes auxiliary notions not found in Bolzano are introduced with explicit caution. In doing so I have always attempted to stay within or very close to Bolzano's sphere of ideas. This does not mean, of course, that I have always followed the order in which Bolzano presents his definitions and theories in the *Wissenschaftslehre* or elsewhere. Nor have I stinted myself at times in giving very free paraphrases of Bolzano's mode of expression. In proving theorems I try to reproduce Bolzano's line of thought without copying his manner of speaking. In part B, Bolzano's logic is compared with modern theories. I attempt to show how certain gaps could be filled in and how Bolzano's theories could be elaborated and made more precise. Moreover, under B some forerunners of Bolzano and selected parts of the modern literature concerning him are discussed.

In the annotated bibliography, part A embraces the literature on Bolzano and his own works. References to part A are given by names followed by numerals within parenthesis. References to part B of the bibliography are effected by placing a "B" after the parenthesized numerals. In references to manuscripts, folio

numbers are qualified by "r" and "v", meaning, as usual, recto and verso respectively." (*Introduction*).

20. ———. 1967. "What Is a Proposition?" *Logique et Analyse* no. 39/40:293-306

"Certain theories of modern logic have the purpose of defining interesting classes of linguistic expressions, such as the set of sentences of a language, or relations between expressions, such as derivability among formulas. Other theories aim at describing semantic relations between linguistic expressions and nonlinguistic objects, such as the relation of being the meaning of an expression. Yet a third kind of theories may give a direct analysis of non-linguistic objects which could stand in semantic relations to linguistic expressions.

This paper first propounds and discusses certain constructions of the second kind and then attempts an explication of the third kind of the notion of non-linguistic proposition. However, only a limited class of propositions (called "elementary propositions") will be explained, viz., propositions corresponding to the sentences of a language of elementary logic. Admittedly, this explication will have merely a remote connection with the problems of ordinary language. On the other hand, a tradition of logical semantics has accumulated since the 19th century dealing with technical and more or less formalized languages, and it may be worth while to attempt a solution of some problems encountered in such studies.

In writing this paper I have profited from comments and criticism of Professor A. Wedberg, University of Stockholm." (p. 293)

21. ———. 1972. "Bolzano's Theory of an Ideal Language." In *Contemporary Philosophy in Scandinavia*, edited by Paul,

Anthony, Olson, Raymond and Wright, Georg Henrik von, 405-415. Baltimore: John Hopkins Press

"In his logical inquiries Bolzano employed a partly formalized language embracing an ordinary language extended by constants, variables, and certain technical expressions. In the second volume of the *Wissenschaftslehre* he investigated the relations of this semiformalized philosophical language to colloquial language (WL, sections 127-46, 169-84). He believed that all sentences of colloquial language were 'reducible' to sentences of certain canonical forms expressed in the philosophical language. These canonical sentences were said to mirror their corresponding propositions in the sharpest way.

Had Bolzano's theory of reduction been completely developed it might have resulted in the construction of an ideal language for philosophical analysis. In this ideal language, however, sentences of canonical form would not play quite the same role as the atomic sentence forms on the basis of which more complex forms are built up in modern quantification theory. It seems, on the contrary, that Bolzano intended even the most complicated sentences to have canonical forms or to be reducible to sentences having such form.

This paper attempts a reconstruction of an extensional Bolzanian ideal language on the level of elementary logic. After some preliminary explanations of fundamental notions in Bolzano's logic, the main points of his theory of reduction of sentences are described. Two principles that determine the construction of an elementary Bolzanian ideal language emerge from the exposition. We then move toward building such a language and begin by modifying the standard representation of elementary logic, replacing the universal and existential quantifiers by Hilbert's ϵ -operator. By further modifications of both the syntax and the underlying semantics, a logical language satisfying the two principles is obtained." (pp. 405-406)

22. ———. 1977. "Bolzano's Contribution to Logic and Philosophy of Mathematics." In *Logic Colloquium '76*, edited by Gandy,

Robin O. and Hyland, John Martin, 147-171. Amsterdam: North-Holland

"The *Wissenschaftslehre* was intended merely as a prelude to Bolzano's work on mathematics. His main ambition was to recreate the whole body of contemporary mathematics in accordance with the vision of an abstract hierarchy of true propositions. For Bolzano this task implied the creation of entirely new foundations for certain branches of mathematics, as may be seen from his highly interesting efforts directed toward basing geometry on topological concepts.

In carrying out this program, most of the means of expression of modern quantification theory were in essence available to Bolzano.

He came very close to modern notions of satisfaction, logical truth, consistency and logical consequence. On the other hand, the formal deductive machinery of quantification theory is practically non-existent in Bolzano's works. This syntactic machinery appears only in Frege, who created the first strictly logistical system at the end of the 19th century. Bolzano's lack of interest in developing particular logical calculi most probably stems from his aspects of logic and mathematics and of science in general.

The notion of calculus in the modern logistical sense was first clearly considered by Leibniz. His basic dream was of an effectively decidable, interpreted calculus embracing all "eternal" truth. Bolzano was justifiably critical of this overambitious program and presented instead his own theory of the *Abfolge* structure of nonlinguistic propositions, thereby taking his stand away from that line of development in logic which leads to modern syntactic concept formation. A reason for Bolzano's general lack of interest in questions of logical syntax was no doubt his profoundly intensional, non-linguistic approach to logic.

Bolzano's central thesis, that there are abstract objects which differ from both mental occurrences and all kinds of linguistic expressions, has been advocated by later philosophers of the

German-speaking countries, inter alia by Lotze, Brentano in his earlier period, Meinong and Frege. Lotze and Frege never refer to Bolzano's work, though, and the others protested their independence of Bolzano. Husserl admits that he received vital influences from Bolzano, but his notions of "ideal" objects derive from Lotze's and not from Bolzano's logic.

Among the great Western philosophers Bolzano is perhaps the least influential. In epistemology, logic and mathematics his most fervent disciples were not able to propagate his ideas with sufficient vigor.

His keen criticism of German idealistic philosophy and his important discoveries in logic: semantics and mathematical philosophy silently died away.

A contributing cause of Bolzano's lack of influence on the development of the philosophical disciplines was, of course, the fact that most of his works were, for political reasons, published anonymously in editions not easily accessible. Furthermore, an immense number of unpublished manuscripts in a partly almost indecipherable handwriting is to be found in archives in Prague and Vienna. Several unfruitful attempts have been made in the last 150 years to bring out more or less complete editions of Bolzano's works. It is to be hoped that the latest venture launched in Stuttgart, West Germany, will prove more successful." (pp. 170-171)

"1. Introduction

In this paper a language L^* of elementary logic satisfying the following two conditions will be constructed:

(C 1) each expression in L^* consists of an n -ary function symbol \mathbf{f} applied to n arguments ($n > 0$);

(C 2) if in L^* \mathbf{f} is a predicative function symbol, \mathbf{t}_i a term, and J an interpretation for a particular i ($1 < i < n$) under which \mathbf{t}_i is empty, then $\mathbf{f}(\mathbf{t}_1 \cdots \mathbf{t}_n)$ is false under J .

Here \mathbf{f} is a predicative function symbol of L^* if \mathbf{f} under a suitable mapping, corresponds to a predicate of one of the standard versions of elementary logic.

The language L^* differs from standard representations of elementary logic in that it replaces the universal and existential quantifiers with Hilbert's ε -operator and modifies both the syntax and the underlying semantics accordingly. An elementary logic with a non-trivial existence predicate is in itself interesting, and when combined with a logic of terms can be utilized for research in the history of logic. (Cf. Berg [1972]."

25. ———. 1987. "Bolzano and Situation Semantics: Variations on a Theme of Variation." *Philosophia Naturalis* no. 24:373-377

"The distinction between logical and non-logical notions plays a significant role in Bolzano's theory and he is fully aware of its importance even though he has to admit that various scholars may differ in their opinion on what a *logical idea* is (WL § 148.3). Tarski has tried to clarify the distinction between logical and non-logical notions (Adam Tarski, *What are logical notions?* History and Philosophy of Logic, 7, 1986, pp. 143-154). A notion of Euclidean geometry, e.g., is invariant under all similarity transformations, and a topological notion is invariant

under all continuous transformations. Analogously, a *logical notion* may be conceived of as a concept which is invariant under all bijective mappings of the domain of individuals onto itself. (In this sense even the classical reduction problem of critical realism can be solved: A physical notion is a concept invariant under a Galilei or a Lorentz transformation.)

It is possible to vary not only the non-logical ideas-as-such contained in propositions but even some or all logical ideas. Actually, such a variation is implied by the algebraic approach to logic. The propositions of Bolzano correspond to the values of the propositional variables of modern logic. (p. 374)

(...)

Bolzano seems to have intended, however, variation exclusively over non-logical ideas-as-such. That he did not allow a variation of the copula is abundantly clear from his way of introducing the notion of variation in his *Einleitung zur Grossenlehre* (Bolzano (2A7), p. 62). Here he presupposes that only the subject and predicate ideas of a proposition or parts thereof be varied. Furthermore, his proofs of certain variation-logical theorems show that he would not allow a variation of the logical constants of negation, truth, and the copula in the form of an inclusion between ideas-as-such (WL §§ 154.19, 155.21)." (p. 375)

26. ———. 1987. "Is Russell's Antinomy Derivable in Bolzano's Logic?" *Philosophia Naturalis*:406-413

"In his encyclopedic work *Wissenschaftslehre* Bernard Bolzano expounded a theory of logical truth which constitutes an outstanding achievement in the history of Western thought. This informal theory is essentially based on a substitutional truth-value semantics without certain existence presuppositions and contains a general proof theory. In his substitutional semantics Bolzano introduced notions such as universal validity, consistency, consequence, analyticity, and probability by means of the technique of variation of concepts. In his proof theory he treated the notion of entailment, which is a generalization of a special case of the relation of logical consequence, and studied proof trees generated by the relation

of entailment which exhibit the objective connection between all true propositions. In view of this wealth of important notions it seems worthwhile to investigate the possibility of a consistent reconstruction of Bolzano's logic. In particular, it must be examined how his theory fares with a fundamental set-theoretic antinomy such as that of Russell." (p. 406)

(...)

"There is, therefore, no such thing as an idea of all ideas which are not objects of themselves, and Bolzano could scarcely be blamed for having no idea of something which does not exist in any sense at all. Under a reasonable interpretation of Bolzano's theory of ideas-as-such there is no trouble-maker around who could generate an antinomy analogous to that of Russell." (p. 411)

27. ———. 1987. "Bolzano on Induction." *Philosophia Naturalis* no. 24:442-446

"Bolzano combined the fundamental notions of his theory of probability and his proof theory to achieve a logical analysis of the principles of induction. The relation between the conclusion and the premisses of an inference of incomplete induction or analogy is an interior probability relation in Bolzano's sense. The principles of induction endow the relation between the premisses and the conclusion with the character of a relation between ground and consequence. From Bolzano's subsumption of the rule of incomplete induction under the syllogistic rule of Barbara, it follows that this relation is a special case of Bolzanian derivability." (p. 442)

Contents: Vorwort der Herausgeber [Edgar Morscher] 7;
Einleitung von Edgar Morscher 13;

Jan Berg: Ontology Without Ultrafilters and Possible Worlds 29

Introduction 31; § 1. Collections, sets, and sums 34; § 2.
Numbers, infinite sets, and infinitesimals 39; § 3. Ontology

without ultrafilters 48; § 4. Ideas, properties, and intuitions 52; § 5. Propositions, sentences, and judgements 64; § 6. Validity, derivability, and entailment 79; § 7. Substances, adherences, and causes 88; § 8. Ontology without possible worlds 91;

List of special symbols 95; References 97-100.

"The first basic notion of Bolzano's ontological system is the part relation. Its domain, i.e., the set of all objects bearing it to something, embraces concrete substances, abstract objects, and collections. The converse domain of the part relation, i.e., the set of all objects to which it is borne, contains collections only.

Some collections are concrete entities existing in space and time, the rest are abstract sums or other sets. Concrete sums are composed of substances and adherences, i.e., forces. Forces applied to certain substances give rise to subjective ideas or judgements. Further results of such applications are the concrete sentence occurrences. A subjective idea is a part of a judgement which is not itself a judgement. The set of judgements is ordered by a special causal relation.

Bolzano's abstract world is constituted of sets, abstract sums, certain attributes (i.e., properties or relations), ideas-as-such, and objects constructed on the basis of these entities. Thus, sentence shapes are a kind of properties, and certain complexes of ideas-as-such constitute propositions. The notion of an idea-as-such can be constructed from expressions of a language by means of axioms for the relation of being an object of something. Analogously, properties can be generated by axioms for the relation of something being applied to an object. The converse of this relation, i.e., the relation of an entity having a property, and the relation of being an object of an idea-as-such are fundamental ontological constants of Bolzano's." (p. 31)

(...)

"The question whether a rational reconstruction of Bolzano's ontology is possible will be sustained like a pedal point throughout the present study. In many respects, indeed, his ontological system is a model of thrift, comprehensiveness, and deductive cogency. He shows us how to grasp a self-contained,

abstract "third" world (in Popper's sense) embracing the realms of classical logical truth and additive probability spaces without indulging in possible worlds, states of affairs, facts, and all that. Admittedly, from a modern point of view certain aspects of his ontology may look like Dr. Johnson's dog walking on its hind legs: it is not always done quite well, but you are surprised to find it done at all. To rational bipeds of our time it should be more instructive, though, to watch this performance rather than amazing at metaphysical cephalopods wallowing in clouds of ontological splendors, or gazing at recondite cogitators crawling on all fours through a self-induced verbal fog." (p. 33)

29. ———. 1992. "The Connection Between Bolzano's Logic of Variation and His Theory of Probability." In *Bolzano's Wissenschaftslehre 1837-1987. International Workshop*, 107-120. Firenze: Leo S. Olschki

"In his monumental four-volume work *Wissenschaftslehre* (1837) - in the sequel denoted by 'WL' - Bolzano introduced several new concepts for the analysis of the structure of scientific theories. In particular, he tried to lay down a logically satisfactory foundation of mathematics and the theory of probability. During the search for such a foundation he became aware of the distinction between the actual thoughts of human beings and their linguistic expressions on the one hand, and abstract propositions (*Sätze an sich*) and their components which exist independent of these thoughts and expressions on the other hand.

Bolzano described the relations of propositions to other relevant notions such as those of sentence, truth, existence, and analyticity. Furthermore, he studied relations among propositions and defined highly interesting notions of validity, consistency, derivability, and probability, based on the method of «replacing» certain components in proposition. A proposition in Bolzano's sense is a structure of ideas-as-such (*Vorstellungen an sich*). According to Bolzano, each complex idea-as-such can be analyzed into a sequence of simple ideas which include certain logical constants such as those expressed by the words 'not', 'and', 'some', 'all', 'to have', or 'ought' (WL §§ 61, 78.1, 116.3). The manner in which a complex idea-as-such is

built up from simple ones may be expressed in a language by a chain of definitions." (p. 1907)

30. ———. 1994. "The Ontological Foundations of Bolzano's Philosophy of Mathematics." In *Logic and Philosophy of Science in Uppsala*, edited by Prawitz, Dag and Westerståhl, Dag, 265-271. Dordrecht: Kluwer

"The basic notion of Bolzano's ontological system is the part relation.

Its domain embraces concrete substances, abstract objects, and collections; the converse domain contains collections only.

Some collections are concrete entities existing in space and time, the rest are abstract sets.

Bolzano's notion of a set implies that a set cannot be a member of itself. Hence, there is no danger of an antinomy similar to that of Russell arising in Bolzano's ontological system of sets.

Bolzano's abstract world is constituted of sets, certain attributes (i.e., properties and relations), ideas-as-such, and objects constructed on the basis of these entities. Thus, certain complexes of ideas-as-such constitute propositions. The notion of an idea-as-such can be constructed from expressions of a language by means of axioms for the relation of being an object of something. Analogously, properties can be generated by axioms for the relation of something being applied to an object. The converse of this relation and the relation of being an object of an idea-as-such are fundamental ontological constants of Bolzano's." (p. 265)

31. ———. 1997. "Bolzano, the Prescient Encyclopedist." *Grazer Philosophische Studien* no. 53:13-32

Abstract: "In his *Wissenschaftslehre* Bernard Bolzano tried to lay down a logically satisfactory foundation of mathematics and theory of probability. Thereby he became aware of the distinction between the actual thoughts and judgments of human beings, their linguistic expressions and the abstract propositions (*Sätze an sich*) and their components (*Vorstellungen an sich*). This ontological distinction is

fundamental in Bolzano's thinking paired with a universal world view in the sense that philosophy, mathematics, physics and metaphysics should be build upon the same logical foundations. Bolzano's enterprise is sketched in the light of examples from his logical semantics, proof theory, number theory, theory of truth and his variation logic."

32. ———. 2000. "From Bolzano's Point of View." *The Monist. An International Quarterly Journal of General Philosophical Inquiry* no. 83 (1):47-67

"I am going to present logic, logical semantics, ontology, proof theory, the foundations of mathematics, and certain aspects of the philosophy of nature from Bolzano's point of view.

In his monumental four-volume work *Wissenschaftslehre* (1837) Bolzano introduced several new concepts for the logical analysis of the structure of scientific theories. In particular, he tried to lay down a logically satisfactory foundation of mathematics and the theory of probability.

During the search for such a foundation he became aware of the distinction between the actual thoughts and judgements of human beings, their linguistic expressions, and the abstract propositions (*Sätze an sich*) and their components which exist beyond space and time. This ontological distinction is fundamental in Bolzano's philosophy. In his terminology, real things have actuality whereas abstract objects have logical existence bare of actuality.

Bolzano worked extensively with the relation of being an object of an idea-as-such (a *Vorstellung an sich*). The object of an idea-as-such can be either an abstract object or a concrete object existing in space and time.

The relation of being an object of an idea-as-such corresponds in modern semantics to the relation of being an element of the extension of a concept." (47)

(...)

"Bolzano is indubitably one of the greatest philosophers of the German language. His world view was a universal one in the

sense that philosophy, mathematics, physics, and metaphysics should build upon the same logical foundations. In fact, he already recognized many of the essential things to come in logic and the foundations of mathematics." (p. 67)

33. ———. 2003. "Bolzano's Heuristics." In *Bernard Bolzano's Leistungen in Logik, Mathematik und Physik*, edited by Morscher, Edgar, 35-56. Sankt Augustin: Academia Verlag

"In the fourth part of the *Wissenschaftslehre* [WL], contained in the third volume of the original 1837 edition, Bolzano treats *heuristics* or the "art of discovery", i.e., the "rules to be observed in the search for new truths" (§ 9. Note 3; cf. also § 15.2). The first main section of Bolzano's heuristics embraces the *general rules* of this discipline (§§ 325 -348).

Logic in Bolzano's sense is a theory of science the objects of which are the different sciences and their linguistic representations (§ 15). According to Bolzano a science is a set of true propositions (*Sätze an sich*) worthy of representation in a textbook. Logic or the *theory of science* is a set of rules which are necessary and sufficient for a representation to satisfy certain criteria concerning scientific textbooks (§ 1). In view of this very broad conception of logic it is fairly obvious that heuristics is an integrant part thereof." (p. 35)

This paper was already presented in 1991 at the International Bolzano Symposium in Salzburg, but has never been published since.

34. ———. 2003. "The Importance of Being Bolzano." In *Bernard Bolzano's Leistungen in Logik, Mathematik und Physik*, edited by Morscher, Edgar, 153-166. Sankt Augustin: Academia Verlag

"1. Logical consequence

Ever since Aristotle philosophers have occupied themselves with the question whether a given statement follows from another statement. The first published precision of this notion in modern times was undertaken by the Polish logician Alfred Tarski in 1936. Accordingly, a closed formula F is a logical consequence of a set of formulas F if and only if F is true under every interpretation of the nonlogical constants under which all

elements of F are true. Logical constants are inter alia connectives of sentential logic (expressed by words like "not", "and", "or", "if - then") and quantifiers of predicate logic (such as "for all" and "there is"); hence, the interpretation of these constants is determined.

But who conceived this notion of logical consequence (mutatis mutandis) already a hundred years earlier?'

Right: The Bohemian philosopher, ontologist, logician, mathematician and theologian Bernard Bolzano!

Upon substitution of abstract nonlinguistic propositions for closed formulas and variants of propositions for interpretations, we get precisely a special case of Tarski's notion of logical consequence. (A variant of a proposition P is a proposition identical with P up to at least one nonlogical component.) Incidentally, at the university of Warsaw Tarski was a student of Lukasiewicz's who lectured inter alia on Bolzano's logic.

Just like Bolzano Tarski admitted being unable to exactly distinguish between logical and nonlogical constants. Not until thirty years later did he formulate a necessary condition for the property of being a logical constant. Furthermore, if all constants of the formal language in question were regarded as logical, the notion of material implication, would emerge. Even this weakest of all notions of consequence was introduced by Bolzano and is playing an important role in some of his deduction rules.

Tarski presupposed a fixed domain as a realm of reference for the interpretations. Even Bolzano did not conceive of a combined quantification over domains and components of propositions. (By introducing a predicate for domains and letting the quantifiers refer to this predicate, however, one can represent all theorems of the model theory developed later on.)

Nowadays we know, of course, that Tarski's notion of logical consequence is unsuitable if the set-theoretic language is enlarged by a generalized existence quantifier expressing that there is an absolutely infinite class C (in the sense that C does

not include exactly K elements for any cardinal number K). This esoteric fact of modern set theory cannot, however, diminish our appreciation of Bolzano's achievement.

2. Analytic propositions

A fundamental distinction in Kant's Critique of Pure Reason is that between analytic and synthetic judgements. In modern logical semantics analyticity is often considered a relation between a sentence S , a set of definitions, and a language L . For instance, one can say that S in L is analytic with respect to D if S is a logical consequence of D in L which embraces S and the elements of D .

But who formulated an analogous explication of analyticity within the system of abstract propositions already in the 1830s?

Right: Bernard Bolzano!" (pp. 153-154)

(...)

"6. Situation semantics

In modern so-called situation semantics, established at the beginning of the 1980s by the American logician and linguist Jon Barwise, a notion of consequence is introduced which is stronger than that of Tarski. In situation semantics certain set-theoretic structures are considered models and a situation is a partial submodel thereof. The primitive notion is the confirmation of a sentence in a model by a situation. For example, a sentence of the form of " A or not A " is a logical consequence of any sentence in the sense of Tarski but not a strong consequence of it.

But who discovered this notion of strong consequence even a hundred years earlier?

Right: Bernard Bolzano!

In his logic Bolzano considered not only the variants with respect to the sequence of all nonlogical components of propositions but also the variants with respect to all subsequences. By that counterparts of main laws of situation semantics turn into theorems of Bolzano's logic." (p. 156)

(...)

17. Estimation

Thus some outstanding achievements of Bolzano's on the fields of logic, semantics, and mathematics have been delineated. The fact that the connection of most of these achievements with modern research remained unknown until the 1960s is due to the circumstance that the study of Bolzano's work took a new turn then and that eventually editions of the often hardly legible manuscripts of the literary remains could be published in the *Collected Works of Bernard Bolzano*.

Moreover, particularly in Bolzano's logical semantics there are many original ideas which have no precise affinity with modern theories. In addition to that he accomplished extensive investigations into concepts of epistemology, philosophy of nature, physics, metaphysics, ethics, and theology." (p. 165)

"In my contribution I would like to draw attention to the views on the ideal of mathematization held by B. Bolzano, a later follower of Leibnizian rationalism.

This analysis will show the evolution of conceptions elaborated in the epoch of *mathesis universalis* on this topic in a period basically influenced by the philosophy of Kant and other representatives of German classical philosophy." (p. 291)

(...)

"The discussions concerning the acceptability of the fifth postulate of Euclid's *Elements* and the various attempts to prove it, seem to him to be clear evidence that the problem in question does not lie in the demonstration of the certainty of

this postulate, but in finding the objective ground of its validity. In his work *Die drey Probleme der Rectification, der Complanation und der Cubirung* (1811), he claims that we cannot accept as a basic truth any proposition which admits a further ground of its truth. Bolzano does not doubt that this postulate is true, requiring only to have its validity grounded in an objective way, independently of our subjective feeling of certainty." (p. 291)

(...)

"Bolzano's conception, which extends and modifies the Leibnizian project of mathematization is explicitly proclaimed in part II, "On the mathematical method", of his *Beyträge zu einer begründeteren Darstellung der Mathematik* (1810) and further elaborated in other mathematical works, especially in his *Einleitung zur Grossenlehre*, and in the *Wissenschaftslehre*, where the logical aspects of mathematics and its methodology are taken into consideration." (p. 292)

38. ———. 1998. "Bernard Bolzano. A Historian of Logic." *History of Science and Technology* no. 31:121-130
- Abstract: "Bolzano's *Theory of Science (Wissenschaftslehre)* contains a great amount of very valuable information concerning the development of logic from its beginnings in Aristotle till the post-Kantian period. In a critical exposition Bolzano presents views of his predecessors and compares them with his own standpoint. The paper presents a selective survey of various conceptions developed by Aristotle, G. W. Leibniz and his followers G. Ploucquet, J. H. Lambert and S. Maimon together with their Bolzanian interpretation. The historical analyses in his principal logical work are, thus, at the same time a witness of his own opinions toward different topics in logic."

"In 'De Veritate: Austro-Polish contributions to the theory of truth from Brentano to Tarski' Jan Wolenski and Peter M. Simons related an intriguing story of the "Austro-Polish obsession with truth". Wolenski and Simons mention the Bohemian philosopher Bernard Bolzano several times, with particular reference to absoluteness and sempiternity of truth in Twardowski and Lesniewski.

(...)

In the following I wish to point out three issues. First, in the so-called prelogistic writings the early Lesniewski defines truth of sentences in such a way that truth conditions are the same - *mutatis mutandis* - as Bolzano's.

Secondly, from this point of view the links between the early and the late Lesniewski, in this case between some parts of his early writings and some aspects of Ontology, are closer than they are commonly believed to be. Thirdly, in this perspective it can be shown that some of Bolzano's views come near to Lesniewski's Ontology. In discussing Bolzano's views I shall mostly follow Casari's reading of Bolzano's *Wissenschaftslehre*." (p. 115)

40. ———. 2006. "Sempiternal Truth. The Bolzano-Twardowski-Lesniewski Axis." In *The Lvov-Warsaw School: The New Generation*, edited by Jadacki, Jacek Jusliuz and Pasniczek, Jacek, 371-399. Amsterdam: Rodopi

"Twardowski [*] had revived Bernard Bolzano's ideas on the subject [eternity and sempiternity of truth], and, mainly thanks to him, these became known in the Lvov-Warsaw School (see, for instance, Jadacki 1993, p. 191). There is no doubt that Lesniewski knew Twardowski's ideas and it seems evident that the latter influenced him: Lesniewski's results are mostly compatible with the "absolutistic" content of Twardowski's 1900 article. And, similarly, no doubts can be raised about the

Bolzanian origin of the aspects of eternity and sempiternity of truth defended by Twardowski in *Relative Truths* (see, for instance, Wolenski and Simons 1988, p. 430, n. 24; and Simons 1992, Ch. 2, p. 15, n. 11; see also Smith 1988, p. 325): though his name is not quoted, traces of Bolzano's legacy can be found even in the examples given by Twardowski, some of which are the same as used by Bolzano in his *Wissenschaftslehre*. Yet, since Bolzano, Twardowski and Lesniewski supported different theories of meaning with different ontological presuppositions, "sempiternity of truth" actually stands for three different conceptions. This paper is a survey of these three conceptions. I suggested elsewhere a comparison between Bolzano and the early Lesniewski as to their theories of meaning and truth, claiming the possibility of a (direct or indirect) influence of Bolzano upon Lesniewski. The analysis presented here is also meant as a contribution to the picture sketched there." (p. 372, notes omitted)

"I have previously discussed in several papers specific Bolzanian elements present in the Polish tradition. This paper will not, for the most part, add anything in particular to that. The new - and rather blunt hypothesis to be put forward here is that, despite appearances, Twardowski also contributed *de facto* to slowing down the reception of Bolzano's most modern logical discoveries. For in Poland Bolzano was to remain one logician among many for rather long. It was chiefly thanks to two factors that Bolzano's star could, slowly, begin to rise in Poland, or, at least, that the fundamental achievements of his logic could be known. One factor is antipsychologistic (more precisely Platonistic) influence coming from Husserl and from Twardowski's student Lukasiewicz. The other factor is the change in the conception of logic which took Polish logic from, say, Sigwart, to Tarski through Lesniewski and Lukasiewicz," (p. 55)

"In "Troubles with Truth-making: Necessitation and Projection." *Erkenntnis* 64: 61-74 (2006a, and in "Truth-Making without Truth-Makers." *Synthese* 152: 21-46 (2006b), Benjamin Schnieder criticizes truthmaking as a relation between entities in the world and the truths those entities 'make true'. In (2006b), his criticism exploits a notion of conceptual explanation that is very similar to Bolzano's grounding. In the first part of this paper, I offer an analysis of Bolzano's grounding. I discuss some open problems and argue that Bolzano's grounding is not a systematization of the ordinary notion of 'because' as others have maintained, but of

the technical notion of explanatory proof in the context of an axiomatic conception of (proper) science. On the basis of this analysis, in the second part, I offer a critical discussion of Schnieder 2006b's arguments against truthmaking. I conclude that the latter are not very effective from a methodological point of view and that Bolzano's original position fares better in this respect; still, truthmaker theorists will be able to defend truthmaking only at a high price."

"Thanks to a handful of publications from the last decade, however, Bolzanian metaphysics has begun to receive more attention than ever before.(1)

It is not difficult to show why Bolzanian metaphysics matters. Bolzano's logic builds on firm ontological and mereological foundations. Logic as a science has a realm of its own, that of the *an sich*, in the strong sense that logic is the science of a special kind of object, namely, propositions-in-themselves and ideas, and their qualities. Furthermore, the edifice of logic rests on a mereological conjecture regarding the basic form of propositions and is constructed by exploiting mereological relations between propositions and ideas, plus a device of semantic ascent, involving very special ideas with very special qualities, called symbolic ideas.

The first and main aim of this essay is to present an overview of Bolzano's universe from the point of view of his metaphysics and its relationship to logic, relying fundamentally on his major work, the *Wissenschaftslehre*. This I shall do in sections II–VI. Although these sections are chiefly intended as an exposition of the state of the art on the matter, I shall make no secret of preferring a reading of Bolzano as a "Platonistic nominalist," as Textor puts it—as a Platonist about propositions and a nominalist about properties. (2) My second aim, in sections VII–IX, shall be to answer the open question of whether in

Bolzano there is any “ontology of truth,” as one may call it, though with some hesitation.” (pp. 167-168)

"Which form does the propositional content take that is judged when a given speaker sincerely utters a sentence in order to assert a singular existential statement? Two thought-provoking answers to this question have been proposed by Bernard Bolzano and, when commenting upon Bolzano's proposal, by Edmund Husserl. In Section 1 of this paper the author clarifies what he means by "singular existential statements". In Section 2 Bolzano's proposed analysis is sketched. In Section 3 the author exposes the earlier Husserl's conception of "logical reflection" and draws upon it to explain why Husserl, around 1900, subscribed to Bolzano's proposal. Following this, he reconstructs and considers in detail the later Husserl's

discussion of that proposal and Husserl's own mature theory of singular existential statements as manifested in a 1917/18 lecture series, both of which shed light upon a conception that is of central importance for Husserlian phenomenology: the conception of "noematic sense" (Section 4)." (p. 71)

"Bernard Bolzano and Edmund Husserl both present some form of ontological framework for logic rather than a linguistic framework. Their works predate the pragmatic and semantic theories of Tarski and Carnap. Bolzano's *Wissenschaftslehre* appeared in 1837. (2)And Husserl's major logical thinking was formulated before 1935. (3) But neither of them seem receptive to a semantic foundation for logic, because of their rationalist-platonist leanings. Both strongly oppose the view that logic is taken from psychological experience by generalization. They have a viewpoint which is perhaps closer to the classical outlook than to either of the others, since they consider the foundation of logic to be the acceptance of meanings as entities — entities which are in some important ways related to actual and possible being and its structure.

Bolzano and Husserl each make crucial modifications on traditional platonism as a philosophy of logic. A basic thesis which they both do accept is that the logical entities such as the proposition with its elements and its relations are ideal unities, which are independent of their being thought. But the logical entities are not platonic forms in which spatio-temporal existences "participate" — nor are they determined by spatio-

temporal existence in any way. They are independent of the subject or knower as well as of the facts of material existence.
(4)

Thus the logical entities are what they are whether they ever come to expression or not. They have a character similar to that of numbers or other "abstract" mathematical objects, but it cannot be said that they arise in experience as abstractions from the empirical world. Although there is disagreement about the question of abstraction in Bolzano — with some Bolzano commentators such as Rolf George seeing little difference between Bolzano and Carnap — this tendency to read Bolzano's work as if he were a pragmatist obscures the originality of Bolzano.(5)

His differences from semantic and empiricist thinking are well worth investigating. Husserl's approach too deserves consideration for its uniqueness. Crediting Bolzano with giving a starting point in philosophy of logic, Husserl "discovered" Bolzano and brought his work out of obscurity. He makes use of the work of Bolzano however, only to transform it thoroughly. If certain common themes are selected for exposition, the positions of Bolzano and Husserl are both seen to be modifications of the classical platonism. This provides a basis for a comparison of Bolzano and Husserl." (pp. 3-5).

(2) Bolzano's work under consideration is *Theory of Science*, ed. and trans. by R. George (Berkeley, 1972), hereafter cited simply as Bolzano. English paginations are used, but section numbers apply to all German editions as well. The *Theory of Science* is a condensation of *Wissenschaftslehre*, vols. 1-4 (Sulzbach, 1837). R. George follows in large measure the F. Kambartel edition of Bolzano's *Wissenschaftslehre* vols. 1-2, entitled *Grundlegung der Logik* (Hamburg, 1963) in which Bolzano's original has been condensed, with the omitted passages summarized by the editor.

(3) Works by Husserl principally under consideration are *Logische Untersuchungen* (1900 and 1913), trans. by J. N. Findlay (New York, 1976); and *Formale und Transzendente Logik* (1929), trans. by D. Cairns (Hague, 1969).

(4) See: U. Neemann, *Bernard Bolzanos Lehre von Anschauung und Begriff in ihrer Bedeutung für erkenntnistheoretische und pädagogische Probleme* (Paderborn, 1972) pp. 81 and 144. for discussions of how Bolzano's logical entities differ from Plato's forms and from Kant's subjective categories.

(5) See: R. George, "Editor's Introduction" in Bolzano's *Theory of Science*, (Berkeley, 1972) p. xxx. Also note J. Berg, *Bolzano's Logic* (Stockholm, 1962) pp. 49-50, where he expresses the view that Bolzano takes logical entities as abstractions.

Selected Bibliography on Bernard Bolzano's Contributions to Logic and Ontology. Second Part: C - Geo

Studies on Bolzano's Logic and Ontology

1. Cantù, Paola. 2011. "Bolzano Versus Kant: Mathematics as a Scientia Universalis." In *Mind, Values, and Metaphysics: Philosophical Essays in Honor of Kevin Mulligan. Vol. 1*, edited by Reboul, Anne. Dordrecht: Springer.

Abstract: "The chapter will discuss some changes in Bolzano's definition of mathematics attested in several quotations from the *Beyträge*, *Wissenschaftslehre* and *Größenlehre*: Is mathematics a theory of forms or a theory of quantities? Several issues that are maintained throughout Bolzano's works will be distinguished from others that were accepted in the *Beyträge* and abandoned in the *Größenlehre*.

Changes will be interpreted not only as a consequence of the new logical theory of truth introduced in the *Wissenschaftslehre* but also as a consequence of the overcome of Kant's terminology, and of the radicalization of Bolzano's anti-Kantianism.

It will be argued that Bolzano's evolution can be understood as a coherent move, if one compares the criticism on the notion of quantity expressed in the *Beyträge* with a different and larger notion of quantity that Bolzano developed already in 1816. This discussion is based on the discovery that two unknown texts mentioned by Bolzano can be identified with works by von Spaun and Vieth. Bolzano's evolution will be interpreted as a radicalization of the criticism of the Kantian definition of

mathematics and as an effect of Bolzano's unaltered interest in the Leibnizian notion of *mathesis universalis*. As a conclusion, it will be argued that Bolzano never abandoned his original idea of considering mathematics as a *scientia universalis*, i.e. as the science of quantities in general, and it will be suggested that the question of ideal elements in mathematics, which has been interpreted as a main reason for the development of a new logical theory, can also be considered as a main reason for developing a different definition of quantity."

2. Casari, Ettore. 1989. "Remarks on Bolzano's Modalities." In *Atti del Convegno Internazionale di Storia della Logica: le teorie della modalità*, edited by Corsi, Giovanna, Mangione, Corrado and Mugnai, Massimo, 319-322. Bologna: CLUEB.

"1. *The Roots of Bolzano's Interest in Modalities*.

From an autobiographical note quoted by Winter ([1], p.32), we learn that as Bolzano was 17 years old and began to read the *Kritik der reinen Vernunft*, he was soon strongly attracted by the distinctions of Judgments into a priori and a posteriori and into analytic and syntetic as well as by the distinction of representations into Intuitions and concepts, whereas he was very hurtled by the immediate use, without any previous explanation, of the concepts of experience and of necessity. A significant part of Bolzano's work may be seen as an attempt to clarify the preceding notions and to substantiate their distinctions. In particular, his theory of (absolute) modalities is his answer to the question about necessity, an answer which he derives from his answer to the question about experience. Necessity is indeed first reduced to necessary truth; this latter is identified with true proposition in Itself which doesn't

depend upon experience; depending upon experience is identified with containing intuitions; intuitions are a logically well defined kind of representations In themselves (Ideas).

Bolzano's theory of modalities has been scarcely considered up to now; the most careful analysis has been done by E. Morscher ([2], pp.87-92). In the following we will embed Bolzano's theory of the absolute modalities, as presented mainly in the *Wissenschaftslehre* §182, into the general framework of his logic we have reconstructed elsewhere ([3], [4]) and which will be only sketched here. We will not consider his theory of relative modalities." (p. 319)

(...)

"*Last Remarks*. As alluded to in §1, Bolzano's primary interest was in the notion of necessary truth. The whole of his modal theory, although interesting in many respects, is far from being satisfactorily refined. So, for instance, we remark that according to Bolzano, every standard proposition whose subject is unobjectual [*gegenstandlos*], that is, referring to no object, is false, it follows that all such propositions are possible (although their being true may be Impossible). That truth is a quality and that there is an Idea which refers to it, are, of course, rather disquieting assumptions. From their discussion in [4], it follows that a very important question is whether the idea [*p*], which refers to *p*, has also *p* as its part. In the present context, the question presents itself, in particular, with respect to the problem about the conceptuality of a proposition having the idea [*p*] as its subject, under the hypothesis of the conceptuality of the proposition *p* and vice versa; a problem which immediately arises, when considering, for instance, iterated modalities." (p. 323)

"In the following, the attempt is done to clarify some significant features of Bolzano's logical system with particular attention to its development in the *Wissenschaftslehre* (WL). This system is viewed as a theory trying to identify certain quite general properties, relations and operations of *things [Dinge]*, in the most general and unbiased sense of this word. For sake of simplicity and determinateness of the formulations, the current logical symbolism is *used*. The point of view of the theory is *elementary*, that is to say, we always work with *particular notions* about the things without allowing us any consideration of *arbitrary notions* about the things. 'x', 'y', 'z', ... are used as variables for things." (p. 55)

5. ———. 2016. *Bolzano's Logical System*. Oxford: Oxford University Press.

"As already mentioned, many specialist studies have analysed many of the questions that arise from the first three parts of Bolzano's work, as well as providing comprehensive expositions of them, often very successfully. Yet, it seems to us that there remains room for a more systematic reconsideration of Bolzano's logical thought.

This book is concerned precisely with this aim. In undertaking this task, the book is intended as an exploration, not so much of the more specifically discursive aspects of Bolzano's logical thought—already amply studied—as much as one aimed at identifying the singularly coherent and systematic nature of the logic presented in the *Wissenschaftslehre*.

In order to render as visible as possible the systematic nature of that logic, I have decided to present it within a formal system. Despite being surprising even to me, it has become clear that in pursuing this aim, it is sufficient to adopt the approach of the predicate calculus with identity and choice operator, that is, enlisting the wellknown Hilbert's epsilon calculus. As this book reveals, the formalization of Bolzano's logic in this calculus emerges quite effortlessly." (Preface, p. VIII)

6. ———. 2017. "Husserl and Bolzano." In *Essays on Husserl's Logic and Philosophy of Mathematics*, edited by Centrone, Stefania, 75-91. Springer.

Abstract: "The paper examines the all too often neglected role of the Czech philosopher and mathematician Bernard Bolzano for Husserl's work, from ca. 1893–1894 onwards. Husserl himself finds it important to stress in an appendix to chapter 10 of the *Prolegomena to Pure Logic* that his investigations are not "in any sense mere commentaries upon, or critically improved expositions of, Bolzano's thought patterns", but that they "have been crucially stimulated by Bolzano...".

The paper examines early Bolzano's ideas on the ground-consequence relation, Bolzano's logical universe as presented in his masterpiece, the monumental *Wissenschaftslehre*, the role of Hermann Lotze in making Husserl receptive for Bolzano and, finally, a lecture course on logic held by Husserl at the

University of Halle in 1896 [*], working out just what Husserl is taking, and not taking, from Bolzano."

7. Cellucci, Carlo. 1992. "Bolzano and Multiple-Conclusion Logic." In *Bolzano's Wissenschaftslehre 1837-1987. International Workshop, 179-189*. Firenze: Leo S. Olschki.

"The aim of this paper is to assess Bolzano's logical work in the light of contemporary logical developments. This has been done before by others, most recently by van Benthem, (1) but everybody has his own approach and my approach -- whatever its value -- will be somewhat different from the current one. Make no mistake, I am not going to discuss once again to what extent Bolzano anticipated modern logic. On the contrary I will try to show how far he was from modern logic. In order to do so I will compare Bolzano with the tradition of multiple-conclusion logic." (p. 179)

8. Centrone, Stefania. 2010. "Functions in Frege, Bolzano and Husserl." *History and Philosophy of Logic* no. 31:315-336.

Abstract: "This explorative article is organized around a set of questions concerning the concept of a function. First, a summary of certain general facts about functions that are a common coin in contemporary logic is given. Then Frege's attempt at clarifying the nature of functions in his famous paper *Function and Concept* and in his *Grundgesetze* is discussed along with some questions which Frege's approach gave rise to in the literature. Finally, some characteristic uses of functional notions to be found in the work of Bernard Bolzano and in Edmund Husserl's early work are presented and elucidated."

"4. Bernard Bolzano

In this section, I want to show that the set–theoretical notion of a function is implicitly at work in Bolzano’s logic of variation. Bolzano’s own use of the term ‘function’ is not pertinent here, for he employs this term only in the context of ‘x is a function of y_1, y_2, \dots, y_n ’ where the correlated entities are what he calls *Größen* (magnitudes).(24) Thus, Bolzano’s usage of the term (unlike Frege’s) is restricted to the field of mathematics. The entities his logic of variation is concerned with are not magnitudes, but propositions and their non-propositional parts." (p. 325)

9. ———. 2016. "Early Bolzano on *Ground-Consequence* Proofs." *The Bulletin of Symbolic Logic* no. 2:215-237.

Abstract: "In his early *Contributions to a Better-Grounded Presentation of Mathematics* (1810) Bernard Bolzano tries to characterize rigorous proofs (*strenge Beweise*). Rigorous is, prima facie, any proof that indicates the grounds for its conclusion. Bolzano lists a number of methodological constraints all rigorous proofs should comply with, and tests them systematically against a specific collection of elementary inference schemata that, according to him, are evidently of ground-consequence-kind. This paper intends to give a detailed and critical account of the fragmentary logic of the *Contributions*, and to point out as well some difficulties Bolzano's attempt runs into, notably as to his methodological ban on 'kind crossing'."

11. Chihara, Charles. 1999. "Frege's and Bolzano's Rationalist Conceptions of Arithmetic." *Revue d'Histoire des Sciences* no. 52:343-361.

Abstract: "In this article, I compare Gottlob Frege's and Bernard Bolzano's rationalist conceptions of arithmetic. Each

philosopher worked out a complicated system of propositions, all of which were set forth as true. The axioms, or basic truths, make up the foundations of the subject of arithmetic. Each member of the system which is not an axiom is related (objectively) to the axioms at the base. Even though this relation to the base may not yet be scientifically proven, the propositions of the system include all of the truths of the science of arithmetic. I conclude the article by analyzing the respective views of Frege and Bolzano in the light of Gödel's first incompleteness theorem."

12. Chisholm, Roderick M. 1986. "On the Positive and Negative State of Things." In *Non-Existence and Predication*, edited by Haller, Rudolf, 97-106. Amsterdam: Rodopi.

Abstract: "Following Balzano, I suggest that there are two types of entity: those that are states of other things and those that are not. The second type includes, not only substances, in the traditional sense, but also such abstract objects as numbers, attributes and propositions. It is argued that the theory of states, when combined with an intentional account of negative attributes, will yield a theory of negative entities and of events."

13. ———. 1986. "The Self in Austrian Philosophy." In *Von Bolzano zu Wittgenstein. Zur Tradition der österreichischen Philosophie = From Bolzano to Wittgenstein. The Tradition of Austrian Philosophy*, edited by Nyíri, János Kristóf 71-74. Wien: Hölder-Pichler-Tempsky.

Reprinted in: R. M. Chisholm, *On Metaphysics*, Minneapolis: University of Minnesota Press, 1989, pp. 156-161.

"Bolzano's definition of substance provides us with a kind of key to the conceptions of the self in Austrian philosophy. His definition is as clear as anyone could possibly wish. He says that there are two kinds of things: (I) those things that are states or conditions of other things ("Beschaffenheiten von anderen Dingen"); and (II) those things that are not states or conditions of other things: "the latter are what I call *substances*."(1) Examples of things that are states or conditions of other things are "the color, smell and weight of a body," the beliefs that a particular person has, the sensations that he has,

and the actions that he performs. Examples of substances-of things that are not states or conditions of other things -are physical bodies and selves.

Bolzano says, in Leibnizian fashion, that, if there are things that are states or conditions of other things, then there are things that are not states or conditions of other things.(2) If we use the term "substance" in the way he suggests, then we need not ask whether a given philosopher believes in substances; we need ask only what the things are that function for him as substances." (p. 156 of the reprint)

15. ———. 1991. "Bernard Bolzano's Philosophy of Mind." *Philosophical Topics* no. 19:207-216.

"The views of Bernard Bolzano (1781-1842) concerning the nature of psychological properties and the nature of what it is that has those properties are of first importance to philosophy. I shall discuss some of them here in the hope that what I say may lead to a more systematic study and evaluation.

Bolzano's best known works are the *Theory of Science* [Wissenschafteslehre], first published in 1837, and *The Paradoxes of the Infinite* [Paradoxien des Unendlichen], first published in 1851. The present topic is discussed in detail in *Athanasia: Or Grounds for the Immortality of the Soul*, published in 1838.(2) This work has not been translated into English." (p. 205, note 1 omitted)

(...)

"Bolzano, then, is concerned with presenting considerations which, he thinks, indicate that only simple substances can think. In order to avoid a fundamental misunderstanding, we must be clear about one fundamental point. In setting out on his investigations, Bolzano assumes that it is not known that thinking things are identical with physical bodies. Hence he does not presuppose the thesis according to which we are identical with our bodies or with some proper part of our bodies. Others, of course, may presuppose the contrary of this thesis. But any *criticism* of Bolzano that is based upon the contrary thesis and that does not include a positive defence of this contrary thesis would be question begging." (p. 207)

16. Claas, Jan. 2021. "Leibniz and Bolzano on Conceptual Containment." *European Journal of Philosophy*:1-19.

Abstract: "Philosophers often rely on the notion of conceptual containment and apply mereological terminology when they talk about the parts or constituents of a complex concept. In this paper, I explore two historical approaches to this general notion. In particular, I reconstruct objections Bernard Bolzano puts forward against a criterion that played a prominent role in the history of philosophy and that was endorsed, among others, by Leibniz. According to this criterion, a concept that represents objects contains all and only the concepts that represent properties the objects must have in order to be represented by the former concept.

Bolzano offers several counterexamples and arguments against the criterion. I argue that while some of them presuppose a strongly mereological understanding of containment, which Leibniz is not committed to, one of them also succeeds without relying on demanding mereological principles."

17. Coffa, J. Alberto. 1982. "Kant, Bolzano and the Emergence of Logicism." *Journal of Philosophy* no. 74:679-689.

"Bolzano was the first to recognize the fallacy behind the principle of synthetic judgments. The crucial step in Kant's inference for the need to appeal to intuition in synthetic judgments was the premise that from concepts alone only analytic knowledge can be derived. Astonishingly, there isn't a single argument in the Critique for this claim; all Kant says about it is that "it is evident" (A47, B64).(6) What is evident, instead, is that Kant had confused true in virtue of concepts with true in virtue of definitions, or, in his own language, he had erroneously identified judgments whose predicate is not contained in their subject-concept with judgments that extend our knowledge (*Erweiterungsurteile*). Against this, Bolzano was the first to make a point that even Frege would miss: that Kant's analytic judgments, far from exhausting the grounding power of the conceptual resources of our language, mobilize only a very modest fraction of them, the logical concepts. Bolzano's characterization of analyticity is well known, and it has often been noted that it anticipates not Frege's proof-theoretic treatment but the more modern semantic approach by means of interpretations. What is less well known is the reasoning that led Bolzano to this proposal. After reviewing a number of attempts to explain the point of Kant's notion of analyticity, Bolzano comments that "none of these explanations singles out what makes these [analytic] propositions important. I believe that this consists in the fact that their truth or falsity does not depend upon their constituent representations but remains unaltered, whatever changes one may make in some of these representations . . . This is the ground of my preceding definition."(7) Thus, the reason why Bolzano came to his celebrated insight on the semantic characterization of logical truth is that he saw that Kant's analytic judgments, far from being those grounded on the information implicit in the constituent concepts, were grounded on only a few of those concepts, thus concluding that a proper definition of analyticity should emphasize the extent to which all other concepts are to be ignored." (p. 684)

(6) For a very modest effort toward an argument, see Ak 20, 340.

18. ———. 1991. *The Semantic Tradition from Kant to Carnap*. Cambridge: Cambridge University Press.

Second Chapter: *Bolzano and the Birth of Semantics* pp. 22-40.

"While the idealists were removing every trace of objectivity from Kant's semantics, there was in a corner of the Austro-Hungarian empire, ignored by the leaders of German philosophy, a Czech priest by the name of Bernard Bolzano, who was engaged in the most far-reaching and successful effort to date to take semantics out of the swamp into which it had been sinking since the days of Descartes. Bolzano was the first to recognize that transcendental philosophy and its idealistic sequel were a *reductio ad absurdum* of the semantics of modern philosophy. He was also the first to see that the proper prolegomena to any future metaphysics was a study not of transcendental considerations but of what we say and its laws and that consequently the *prima philosophia* was not metaphysics or ontology but semantics. The development of these ideas in his monumental *Wissenschaftslehre* and in a variety of other writings established Bolzano as the founder of the semantic tradition.

Bolzano's philosophy was the kind that takes from and then gives life to science. His approach to semantics was developed in dialectical interplay with his decision to solve certain problems concerning the nature of mathematical knowledge. Kant had not even seen these problems; Bolzano solved them. And his solutions were made possible by, and were the source of, a new approach to the content and character of a priori knowledge. We shall illustrate the point by focusing on one of Bolzano's favorite mathematical topics, the calculus." (p. 23)

Also published in: Merrilee H. Salmon (ed.), *The Philosophy of Logical Mechanism*, Dordrecht: Springer 2011, pp. 29-40.

Abstract: "Bolzano's *Wissenschaftslehre* was published in 1837, although most of it seems to have been written during the decade 1820–1830. John Stuart Mill's *System of Logic* was published in 1843, but had been in gestation or preparation since 1825. Neither author seems to have exercised any influence on the other, and in their views about the fundamental nature of logical and mathematical reasoning they notoriously represented very different trends. Bolzano sought to direct philosophers' attention away from mental processes towards relationships between ideas in themselves and between propositions in themselves, while Mill's logic insisted on a study of the mental process which takes place whenever we reason, of the conditions on which this process depends, and of the steps of which it consists. But in their views about the methodology of natural science the divergences are much more finegrained. Both assign a central role to the search for causes and both discuss the same basic procedures for the discovery of these. It is just that Bolzano shows a greater sensitivity than Mill does to the inherent difficulties of the enterprise."

20. Corcoran, John. 1975. "Meanings of Implication." *Diálogos* no. 9:59-76.

Reprinted in: R. I. G. Hughes (ed.), *A Philosophical Companion to First-order Logic*, Indianapolis: Hackett 1993, pp. 85-100.

"In philosophical and mathematical discourse as well as in ordinary scholarly contexts the term 'implies' is used in several clear senses, many of which have already been noticed and explicated. The first five sections of this article codify and interrelate the most widely recognized meanings. Section 6 discusses a further significant and common use. Section 7 discusses and interrelates Tarski's notion of logical consequence, the "model-theoretic" notion of logical consequence, and Bolzano's two grounding relations. The eighth section employs the use-mention distinction to separate the three common grammatical categories of 'implies'. Section 8 also shows that criteria based on use-mention are not reliable

indications of intended usage of 'implies'. The ninth and last section relates the above to the counterfactual and gives reasons for not expecting to find 'implies' used to express counterfactuals. A summary is provided."

"Summary and Conclusion: In the first five sections we have distinguished twelve uses of the term 'implies'. At the outset we distinguished: implies₁ (truth-functional), implies₂ (logical consequence) and implies₃ (logical deducibility). Next we distinguished three elliptical or enthymematic varieties of implication: C-implies₁, C-implies₂ and C-implies₃. In none of these six senses did "A implies B" presuppose the truth of A. Then we discussed the cases wherein "A implies B" is used to mean "The-fact-that-A implies B," which does presuppose the truth of A. We paraphrased the latter as "A is true and A implies B" where 'implies' indicates any of the previous six senses of the term. Thus, at that point, twelve senses of implies were distinguished, six which do not presuppose the truth of the implying sentence and six which do. Of the six which do, three are enthymematic.

In addition, the three original senses were carefully distinguished and interrelated, and possible causes of confusion were identified.

Then, building on some off-hand observations of Russell, we related the truth-functional use of 'implies' to two further notions which have been used as explications of traditional logical consequence. We also brought in Bolzano's relative implication and his two grounding relations.

We argued briefly that counterfactuals are not normally expressed using 'implies' and that the distinction between use and mention cannot be used as a test for distinguishing different meanings of 'implies'.

Use of 'implies' as a transitive verb taking a human subject has been ignored."

21. de Jong, Willem R. 2001. "Bernard Bolzano, Analyticity and the Aristotelian Model of Science." *Kant-Studien* no. 91:328-349.

"In this article I intend to make clear that Bolzano's perception and use of the distinction in question [analytic-synthetic] should also be understood in the framework of this model of science. The effect of doing so is to render more comprehensible Bolzano's highly personal and, in its application, upon first acquaintance rather strange characterization of the analytic-synthetic distinction. This characterization can then also be placed more easily in its historical context. [Joëlle] Proust aside, most interpreters have looked somewhat askance at Bolzano's notion of analyticity. And most of them seem not to be able to go on and do much with this apparently anomalous element in Bolzano's thinking. (4)

In § 2 Bolzano is presented as an adherent of the Aristotelian model of science. Section 3 discusses briefly Kant's view of the analytic-synthetic distinction; Bolzano studied it thoroughly. In § 4 his criticism of Kant's notion of analyticity is considered, while in § 5 and § 6 Bolzano's own characterization of this distinction is discussed. Section 7 connects Bolzano's notion of analyticity with his view of derivability or (logical) inference. In the following two sections this theme is further elaborated and developed in the light of the Aristotelian model of science and the notion of scientific demonstration implicit in it. Finally, § 10 presents some conclusions." (pp. 328-329)

22. ———. 2010. "The Analytic-Synthetic Distinction and the Classical Model of Science: Kant, Bolzano and Frege " *Synthese* no. 174:237-261.

Abstract: "This paper concentrates on some aspects of the history of the analytic-synthetic distinction from Kant to Bolzano and Frege. This history evinces considerable continuity but also some important discontinuities. The analytic-synthetic

distinction has to be seen in the first place in relation to a science, i.e. an ordered system of cognition. Looking especially to the place and role of logic it will be argued that Kant, Bolzano and Frege each developed the analytic-synthetic distinction within the same conception of scientific rationality, that is, within the Classical Model of Science: scientific knowledge as *cognitio ex principiis*. But as we will see, the way the distinction between analytic and synthetic judgments or propositions functions within this model turns out to differ considerably between them."

23. Detlefsen, Michael. 2010. "Rigor, Re-proof and Bolzano's Critical Program." In *Construction. Festschrift for Gerhard Heinzmann*, edited by Bour, Pierre Edouard, Rebuschi, Manuel and Rollet, Laurent, 171-184. London: King's College Publications.

"Introduction

The so-called critical movement in nineteenth and twentieth century foundational thinking⁽¹⁾ was described by the American mathematician George Miller (1863–1951) as one in which “[o]ur geometric intuitions are forced into the background” [27, p. 530] as, more and more, “logical deductions from definitions” (*loc. cit.*) take their place.

The main sources of this movement, as both Miller and others described them, were the widely advertised problems concerning geometrical intuition as a guide to our thinking about continuity and differentiability. As mathematicians became increasingly sensitive to the press of these problems, they also “naturally became . . . more exacting in regard to rigor” (*loc. cit.*), and this renewed emphasis on rigor became the central element of nineteenth and early twentieth century attempts to “arithmetize” mathematics.

How the notion of rigor mentioned was conceived and what its principal benefits were taken to be are prime concerns for me here. A better understanding of these matters should contribute to a better understanding of rigor and its motives and benefits overall. Therewith, I believe, should also come a fuller appreciation of the attention given to rigor by nineteenth

century foundational thinkers. These at any rate are my chief goals here." (p. 171)

(1) "Critical" was the term that was used by Felix Klein (cf. [20]) and various other writers (cf. e.g. [22]), F. Engel ([8]), J. Merz (cf. [25] and [26]), C. Keyser (cf. [17], [18] and [19]) and G. Kneebone (cf. [24]) to describe the proposals in the nineteenth century that called for the reformation of proof practices in mathematics, particularly analysis.

24. Drozdek, Adam. 1997. "Logic and Ontology in the Thought of Bolzano." *Logic and Logical Philosophy* no. 5:3-18.

"Logic and theology were two domains of great importance to Bolzano. His attempt to reconcile the demands of these two domains led Bolzano to very strong logical realism, or, objectivism, whereby theology could be put on a firm ground. The paper analyzes the problem of objective concepts, propositions, and truths, with an attempt to give an interpretation of these entities, to account for their puzzling ontological status in Bolzano's system.

Bolzano is one of the forerunners of modern logic; however, his logical, and also mathematical, discussions were conducted in the context of very serious concern about the ontological status of the logical constructs. In the context of logic, he discusses the problem of propositions (*Sätze*) and their special category, namely truths; and ideas (*Vorstellungen*), and their special categories, namely intuitions (*Anschauungen*); and concepts. What is interesting in Bolzano's analyses is the considerable effort he devotes to distinguishing subjective propositions and ideas from objective propositions and ideas, the latter also called propositions and ideas in themselves. What is particularly puzzling in Bolzano's philosophy is the ontological status of the latter. According to Bolzano, objective propositions and ideas do not exist, they are not real, and yet they make logic possible." (pp. 3-4)

25. Dubucs, Jacques, and Lapointe, Sandra. 2006. "On Bolzano's Alleged Explicativism." *Synthese. An International Journal for Epistemology, Methodology and Philosophy of Science* no. 150:229-246.

Abstract: "Bolzano was the first to establish an explicit distinction between the deductive methods that allow us to recognise the certainty of a given truth and those that provide its objective ground. His conception of the relation between what we, in this paper, call "subjective consequence", i.e., the relation from *epistemic reason* to consequence and "objective consequence", i.e., grounding (*Abfolge*) however allows for an interpretation according to which Bolzano advocates an "explicativist" conception of proof: proofs par excellence are those that reflect the objective order of grounding. In this paper, we expose the problems involved by such a conception and argue in favour of a more rigorous demarcation between the ontological and the epistemological concern in the elaboration of a theory of demonstration."

26. Duhn, Anita von. 2001. "Theoretical Laws and Normative Rules: Kant and Bolzano's Views on Logic." In *Kant und die Berliner Aufklärung. Akten des 9. Internationalen Kant-Kongresses. Band V: Sektionen XV-XVIII*, edited by Gerhardt, Volker, Horstmann, Rolf-Peter and Schumacher, Ralph, 3-12. Berlin: Walter de Gruyter.

"Does logic instruct us how to think correctly? If so, what place does methodology have in logic? Is logic an instrument which provides rules for correct thinking or a system of proof for scientific theories, or is the doctrine of method merely an appendix to a doctrine of elements? The question whether logic is an *organon* is related to the question whether logical laws are theoretical truths or normative laws. Kant and Bolzano agree that logical laws basically provide us with truths, but that they can be apprehended as telling us how to think. (1) So a theoretical judgment that something is the case precedes the normative judgment that we may or should do something about it. Does it follow that Kant and Bolzano also agree on the question of whether logic is an *organon* which instructs us how to think? I will show that despite their divergent positions on logic, both authors claim that we apply normative rules because they are true." (p. 3)

(1) Kant and Bolzano agree with Husserl and Frege, who thought that a normative act, such as demanding or permitting,

presupposes a theoretical act, such as judging or believing and that every law that states what is can be apprehended that one ought to think in accordance with it. Cf. Frege (1893) *Grundgesetze der Arithmetik*, intro. XV; Husserl (1900) *Prolegomena*, §§ 3, 13-14. I discuss this issue in "Is logic a theoretical or practical discipline? Kant and/or Bolzano", to appear in the *Archiv für Geschichte der Philosophie*. [vol. 84, no. 3 (2002) pp. 319-333]

27. ———. 2003. "Bolzano's Account of Justification." In *The Vienna Circle and Logical Empiricism: Re-evaluation and Future Perspectives*, edited by Stadler, Friedrich, 21-33. Dordrecht: Kluwer.

"Bolzano investigated the following problem. How can we determine whether or not a certain truth is basic without recourse to subjective criteria based on intuition or immediate perceptual knowledge? For him, the criterion of self-evidence is not a means for justifying propositions because it does not provide us with a scientific proof presenting the objective reasons for a proposition, reasons that hold independently of our knowledge.(1) Bolzano intended to provide a workable alternative to the criterion of intuitive self-evidence, and claims that we have to search for proof even of self-evident propositions – at least until it becomes clear that and why no proof could be required.(2)

I reconstruct Bolzano's account of justification, which is designed to replace the criterion of self-evidence and provide a scientific basis for the demonstrative sciences. I then argue that although Bolzano succeeded in devising a procedure for grounding truths, his theory fails on the account that it implicitly reintroduces an epistemological problem." (p. 21)

28. Dummett, Michael. 1997. "Comments on Wolfgang Künne's Paper." *Grazer Philosophische Studien* no. 53:241-248.

Comments on: W. Künne, *Propositions in Bolzano and Frege* (1997).

"Entertaining and judging (§§ 1,3)

I feel some doubt about Wolfgang Künne's definition (E1)

x is a subjective idea

iff

x is not a judgement &

possibly for some y (y is a judgement and x is part of y).

A judgement must be some particular person's judgement, and occur at a particular time. Künne might now be judging that Bolzano misunderstood Kant; but suppose he is not. Are we to say that Künne now has a subjective idea of misunderstanding on the strength of the fact that he might be making that judgement?

The awkwardness arises from the difficulty of fitting (merely) entertaining or grasping a proposition into Künne's Figure 1. A proposition is indeed always something that it is possible to judge; but " X entertains the proposition P " cannot be defined as "Possibly X judges that P ". Entertaining a proposition has to be acknowledged as a type of mental act in its own right, and as one more generic than judging: one that, like judging, has a proposition as its object (content, matter). Failure to

acknowledge this leads to the complications of Figure 5." (p. 241)

29. Etchemendy, John. 1990. *The Concept of Logical Consequence*. Cambridge: Harvard University Press.

Chapter 3: *Tarski on Logical Truth*, pp. 27-50.

"Though my concern in this book is not historical, a few preliminary words should be said about the complicated heritage of the model-theoretic definitions of the logical properties. As I mentioned, these definitions are generally credited to Tarski's 1936 article, and for the purposes of this book, there is no need to question this attribution.

What is clearly right about it is that Tarski's article contains the only serious attempt to state, in its most general form, the analysis underlying the standard definitions, and to put forward a detailed philosophical justification for that analysis. It is, so to speak, the philosophical locus of the model-theoretic definitions.

From a historical point of view, though, attributing the definitions to Tarski alone oversimplifies the situation a great deal.⁽⁴⁾ For one thing, most of the main features of the analysis were anticipated, in various different ways, by earlier authors, including Bolzano (1837), Padoa (1901), Bernays (1922), Hilbert and Ackermann (1928), and Gödel (1929). Of all of these, Bolzano's discussion is by far the most extensive; in Chapter 3, I will briefly describe his account and motivate certain features of Tarski's analysis by comparing it with Bolzano's." (p. 7)

(4) For a more detailed discussion of the historical relationship between Tarski's analysis and the model-theoretic definitions, see Etchemendy (1988).

"I approach Tarski's account of logical truth and logical consequence indirectly, by considering first a simpler account developed by Bolzano nearly a century earlier.⁽¹⁾ The two accounts are remarkably similar; indeed, Tarski initially entertains what is, for all intents, precisely the same definition as Bolzano's, but modifies it for reasons I will eventually

explain. But in spite of the striking similarity in the two accounts, Tarski was unaware of Bolzano's work until several years after the initial publication of his article. The key difference between the two accounts is simply that Bolzano employs substitution where Tarski uses the more technical, and for the purposes more adequate, notion of *satisfaction*." (p. 27).

Comments on W.V.O. Quine, *Grammar, Truth, and Logic*, same volume, pp. 17-28.

"I shall now comment on some points in the paper which, it seems to me, would be well worth discussing by our group. I will concentrate on the following three points:

1. Logical particles.
2. Syntactic ambiguities.
3. Demonstratives." (p. 29)

(...)

"One hundred and fifty years ago, Bolzano² was the first to have the idea of demarcating logic the way Quine does with the help of a set of logical particles which are held constant, while the other non-logical expressions are freely substituted for one another. However, Bolzano's idea received little attention until it was rediscovered afresh in the mid-thirties by Quine and Ajdukiewicz⁽³⁾ independently of one another. All the basic ingredients are there in Bolzano: the steps that Bolzano goes through are the same as Quine's and in the same order:

1. Specify a vocabulary of logical particles.
2. Define what it means for two expressions to have the same logical form:

Two expressions have the same logical form if they can be obtained from one another by the substitution of non-logical expressions for non-logical expressions.

3. Define logical truth:

A sentence is logically true if and only if all sentences with the same logical form are true." (pp. 29-30, a note omitted)

Original German published as: *Bolzanos bleibende Leistungen* in: Arkadiusz Chrudzimski and Wolfgang Huemer (eds.), *Phenomenology and Analysis. Essays on Central European Philosophy*, Frankfurt: Ontos Verlag, 2004, pp. 57-68.

Abstract: "Bernard Bolzano (1781-1848) was an original and independent thinker, who left a lasting legacy in several areas of philosophy. Four such areas are singled for special attention: political philosophy, ethics and theology, logics and semantics, and mathematics. In all these areas he was far ahead of his time. He had pioneering ideas in political philosophy and in ethics and philosophy of religion, and he argued for them in a brilliantly clear way. In logic and semantics he anticipated Frege, Carnap and Quine on important points, and he had intriguing, yet to be explored, ideas on intuition and other fundamental philosophical notions. In the foundations of mathematical analysis and the theory of infinite sets he anticipated Weierstrass and Cantor."

33. ——. 2001. "Bolzano, Frege and Husserl on Reference and Object." In *Future Pasts: The Analytic Tradition in Twentieth*

Century Philosophy, edited by Floyd, Juliet and Shieh, Sanford, 67-80. Oxford: Oxford University Press.

"Bolzano was a main influence on the development of Husserl's phenomenology.

Husserl gives generous credit to Bolzano in several of his works and refers to him frequently. Husserl first came across Bolzano when, barely twenty, he read *Paradoxien des Unendlichen*(2) during his studies with Weierstrass in Berlin. And he renewed this acquaintance with *Paradoxien des Unendlichen* in 1884-1885 when he followed Brentano's lectures in Vienna on "Die elementare Logik und die in ihr notigen Reformen."

But it was only later, in the mid-1890s, that Husserl started serious study of Bolzano's *Theory of Science*,(3) which he earlier had regarded as "strange" ("fremdartig"). Husserl had then decided to give up work on the second volume of the psychologistic *Philosophy of Arithmetic* (1891) and had started working on what was to become his first phenomenological work, the *Logical Investigations* (1900-1901). Husserl states that he came to appreciate Bolzano, and in particular his theory of propositions (*Sätze an sich*) and representations (*Vorstellungen an sich*), through studying Lotze's interpretation of Plato's theory of ideas. Husserl interpreted Bolzano in a platonistic manner, which Husserl claimed—I think unjustly—was foreign to Bolzano ([*Husserliana*] XXII, *Aufsätze und Rezensionen* (1890-1910)] p. 130)." "The second Book of the *Wissenschaftslehre*, the *Elementarlehre* (Theory of Elements) is divided into four Parts; the first one is dedicated to the ideas in themselves (it is in the first volume of *Wissenschaftslehre*, the second volume take into account propositions in themselves, true propositions and inferences). This first Part, which includes §§ 46-120, is divided into four Chapters and introduces the notion of objective representation (often indicated as "idea"), its internal attributes and the distinction between the representations on the basis of their interrelation and of their relation to other objects (WL I: 214--571).

Each paragraph is followed by some notes where Bolzano appeals to ancients and moderns to point out his own theses. At the end of the Chapter on ideas in themselves he adds a further Appendix (§§ 115-120) entitled "Previous Treatments of the Subject Matter of this Part," which helps better point out the big picture.

In particular, two paragraphs are devoted to categories-§ 118 to the categories of the "ancients" and § 119 of the "moderns." He thus underlines his willingness to investigate any aspect and to involve all different kinds of interlocutors, but first and foremost his constant necessity to confront Aristotle and Kant." (pp. 77-78, notes omitted)

35. Frairopi, Fausto. 2014. "The Quasi-Ontology of "An-Sich". Bernard Bolzano's *Theory of Science* between Leibnizian *Ars Combinatoria* and the Husserlian Idea of *mathesis universalis*." *Avello Publishing Journal* no. 4:1-25.

Abstract: "Starting from the critical position that Husserl assumes against Bolzano and his idea of *mathesis universalis*, this paper focuses and emphasizes Bolzano's project for a *mathesis* and the differences between this project and Leibniz's. Putting into an historical perspective these three forms of *mathesis*, by Leibniz, Bolzano, and Husserl, we / I open in so doing a theoretical perspective concerning the nonontological dimension of idealities they form and articulate *mathesis* as such. The an-ontological Combinatorics of propositions and of ideas in themselves, suggests, Bolzano

maintains, the possibility of a treatment of Combinatorics independently from these ontological and metaphysical presuppositions that formed and structured the Leibnitian *ars combinatoria*. In this sense, the philosophical position of a “semantic Platonism,” assumed by Bolzano, opens the perspective of a non-metaphysical but modular *mathesis* that we can articulate and widen beyond an ontological commitment.”

§ 2: *Bolzano's question*, pp. 81-92.

"Bernard Bolzano engaged in the profound study of two distinct notions of logical consequence over several decades in the early nineteenth century.

The work most remembered and highly regarded by modern logicians, because of its striking resemblance to twentieth century set-theoretical definitions of consequence, concerns the *Ableitbarkeit* (“derivability”) relation.

In his 1837 masterpiece, *Wissenschaftslehre*, Bolzano in fact defines a network of concepts – validity, compatibility, equivalence, and derivability – in terms of one another in a way very similar to contemporary presentations. Here is his definition of the last of these: [*Wissenschaftslehre*, § 155, text omitted].” (p. 81)

"Bolzano’s two theories of logical consequence are themselves not precise enough for their correspondence with one another to be subject to proof. All the same, the question is at the center of Bolzano’s thought.

The procedural *Ableitbarkeit* relation provides a calculus of inference.

The ontological *Abfolge* relation is a feature of the world absolutely independent of our ability to reason about it. By establishing that these notions correspond, we would ensure

that the logical structure of the world is accessible, that some line of thought could trace the dependencies of truths, that the reasons behind the complex facts of reality are discoverable and comprehensible." (p. 92)

37. George, Rolf. 1961. *The Problems of the Infinite and the Continuum in Some Major Philosophical Systems of the Enlightenment*, Michigan State University.

Contents: Introduction 1; Chapter I: Leibniz 19; Chapter II: Berkeley 63; Chapter III: Bayle 111; Chapter IV: Kant 133; Chapter V: Bolzano 192; Conclusion 215; Bibliography I-V.

"The philosophers discussed in this dissertation are Leibniz, Berkeley, Bayle, Kant, and Bolzano. Its aim is to show that certain difficulties connected with infinite and continuous sets were recognized by these philosophers, and that their systems were, at least in part, designed in such a way that these difficulties did not arise in them.

(...)

Bolzano was the first to realize that the so-called Paradox of Galileo is no paradox at all, but simply describes a common property of all infinite sets.

As concerns the constitution of continua the problem was that neither the assumption that a continuum ultimately consists of unextended parts, nor that it consists of extended parts seemed defensible. Against the former case it was argued that unextended parts, no matter how many, cannot make a finite extension, against the latter that extended parts are not ultimate, but are further divisible. Bayle held that none of the logical alternatives are defensible, so that no one need bother to change whatever opinion he happens to have on the subject.

(...)

Bolzano declared that in a continuum every point has a neighbor within any distance, no matter how small. This definition, although ultimately unsatisfactory, proved to be of

great help in discovering various important properties of continuous sets." (From the Abstract)

38. ———. 1972. "Enthymematic Consequence." *American Philosophical Quarterly* no. 9:113-116.

"Enthymemes were traditionally defined as incomplete or incompletely stated syllogisms.

Arguments of this sort, though formally invalid, must be allowed to have some merit, and although the restriction to syllogisms is undesirable, the definition at least has the advantage of precision.

(...)

I shall argue in this paper that, while it is true that enthymematic arguments can be augmented so that valid arguments result, it is not wise to define enthymemes in these terms. I shall instead give a definition of enthymematic consequence which is similar to Tarski's definition of logical consequence; one can even arrange matters so that the latter becomes a limiting case of the former.

The definition can then be used to generate additional premisses which will convert enthymematic arguments into logically valid ones. It will thus automatically provide the desired restriction upon missing premisses.

I shall then show that the definition gives the same results as the traditional account within the domain of syllogisms, and that outside this domain it singles out a class of invalid but plausible arguments which seem to answer to many logicians' intuition of what an enthymeme is, if we can take the examples in their textbooks as a clue." (p. 113)

(...)

"It remains to give a logician his due who more than a hundred years ago propounded a theory of logical consequence which in one definition accounted for both logical and enthymematic validity: Bernard Balzano. He defined consequence thus: "I say that propositions $M, N, O \dots$ follow from Propositions A, B, C, D, \dots with respect to the variable parts i, j, \dots if every class of

representations whose substitution for i, j, \dots makes all of A, B, C, D, \dots true also makes all of M, N, O, \dots true." (6) It has been pointed out that Bolzano anticipated Tarski by almost exactly a hundred years in his definition of logical consequence. (7) Indeed,

if the variable parts i, j, \dots are taken to consist of all and only the extralogical terms of $A, B, C, D, \dots, M, N, O, \dots$ the definition is close to that of Tarski (though Bolzano demands that the premisses be consistent). Cases where i, j, \dots include more or fewer than the extralogical terms were generally regarded as somewhat quaint. In particular, it has not been seen that cases of Bolzano-entailment where the class of "variable" terms is smaller than the class of extralogical terms are just those argument forms which we are wont to call enthymemes." (p. 116)

39. ———. 1983. "Bolzano's Consequence, Relevance and Enthymeme." *Journal of Philosophical Logic* no. 12:299-318.

"Historians of logic tend to view their task as the application of modern insights and symbolic techniques to old texts. Perhaps they do this on the assumption that what is good in these works must be an adumbration of what was recently done and is now well known. This holds, at any rate, for most discussions of Bolzano's theory of logical consequence.

In the present paper I shall reverse this procedure and comment on some problems and beliefs of contemporary logic from what I take to be Bolzano's point of view. This will have the advantage of bringing out more forcefully than a straight exegesis what his view was and will also, I hope, put in doubt certain contemporary dogmas.

I begin by applying his definition of consequence to propositional logic. Bolzano did not entertain this branch of logic, and to this extent my account is ahistorical. That it is, nonetheless, a straight extension of his theory is shown by the

fact that all 23 theorems about consequence which he proves in his *Theory of Science* hold in this application I then consider how C. I. Lewis's so-called "independent proof" for $A \& \neg A \models B$ fares in this system (it fails). After some comments on the proof, I show that in Bolzano-consequence premisses and conclusion share a subsentence (a necessary condition of relevance). There follows a discussion of enthymemes and a general procedure for generating the so-called "nutting premiss". At the end I sketch a taxonomy of consequence relations and briefly remark on earlier interpretations of Bolzano's work. In using the first person plural (from now on) I mean to speak for those who think Bolzano's approach sound, a group that includes at least Bolzano and myself." (p. 299, notes omitted)

40. ———. 1983. "A Postscript on Fallacies." *Journal of Philosophical Logic* no. 12:319-325.

"Bolzano is justly esteemed for his opposition to psychologism in logic. It is most fitting, therefore, that his definition of consequence has enabled us to strike a blow at the residual psychologism that is found in the customary treatment on enthymemes.(1) We shall now do the same for the so-called formal fallacies." (p. 319)

41. ———. 1986. "Bolzano's Concept of Consequence." *Journal of Philosophy* no. 83:558-564.

Reprinted in: Dale Jacquette (ed.), *Philosophy of Logic: An Anthology*, Malden: Blackwell, 2002, pp. 205-209.

"Plainly, to identify a speech as an argument and to understand its premises and conclusion is not the same as knowing what argument is intended. What is missing? Bernard Bolzano defines the concept of consequence thus:

Propositions M, N, O, \dots follow from propositions A, B, C, D, \dots with respect to variable parts i, j, \dots if every class of ideas whose substitution for i, j, \dots makes each of A, B, C, D, \dots true also makes all of M, N, O, \dots true.(1)

The $i, j \dots$ are constants tagged for substitution; I shall call them *variands*." (p. 558)

(...)

"The conception of consequence here adumbrated has two features that should recommend it to logicians who are concerned not with the development of formal systems, but with the analysis of informally stated arguments and the identification of fallacies. The first of these is that arguments of invalid form are invalid. In the classical view, this is not the case, as Gerald Massey has pointed out with clarity and vigor.

(3)

(...)

In Bolzano's view, the evaluation of any argument must begin with the identification of variands. If their variation generates an invalid form, the argument is invalid; if not, not. It is of course possible to make mistakes in this, just as sentences can be misunderstood. It is a cultural, and perhaps even a human, failing that we do not usually indicate the variands explicitly. But these are problems of communication. Plainly, it is often possible, and sometimes important, to identify formal fallacies. It therefore seems that in this respect Bolzano's account of consequence is superior to the classical. A second positive feature of Bolzano's conception is that it gives a promising account of enthymemes. Although he concentrates on arguments in which all indexical elements are variands (this being the proper province of logic, cf. WL § 223), his definition does not exclude cases in which only some of them are. We readily identify 'Socrates' as the variand in 'Socrates was a man, therefore Socrates was mortal'. That is, we understand this argument as implicitly claiming that every substitution on 'Socrates' that makes the premise true also makes the conclusion true. If we had to construct a device for computing the "missing premise" (which we intuitively take to be 'All men are mortal'), we would have it state that fact. It would, that is, form the universal closure on the variand, over the conditional consisting of premise and conclusion, and voila, the missing premise results. This procedure works for all syllogistic

enthymemes, and is only slightly more complex when no singular terms are involved. No principle of charity or other proviso is needed. I venture the guess that some such computation is going on even in our own minds when, with a speed that must compel wonder, we determine what all the world takes to be the missing premise in such a case."

42. ———. 1987. "Bolzano on Time." *Philosophia Naturalis* no. 24:452-468.

"In the first volume of the *Wissenschaftslehre* Bolzano claims that "by the word 'time' we mean nothing but that particular determination in a real thing which is the condition for correctly attributing to it a given property."(1) He says that from this *all* properties of time can be deduced. This is supported by just one example, namely, that several contrary properties can be attributed to the same substance only on condition that times differ. This follows directly, since sentences with contrary predicates can be true only if their subjects differ. Hence one and the same substance can have contrary attributes only on the assumption that its time determinations are not the same.

In Chapter 412 he maintains that a theory can have the status of a science even if its extent is very small. Consequently, he says, "the theory of time (the properties of time, not of the art of measuring it) deserves to be treated as a special science (i.e. the pure theory of time) although this science can consist of only a very few propositions."(2) Kant, he objects, should not have denied it the name of science for no other reason than its small extent.

In the following chapter Bolzano adds that a theory need not be denied the status of a science even if everyone already knows its propositions. Again the theory of time serves as an example. He maintains that all theorems of the pure theory of time are obvious to everyone (*sind jedem von selbst schon bekannt*) (3), but that it should be considered to be a science nonetheless.

These are sweeping claims. Given the voluminous publications, the many controversies and the continuing interest in the subject of time they seem strange, even absurd. I begin by discussing these assertions, then add some reflexions on Bolzano on *time perception*, and end with a brief account of his criticism of Kant's views." (p. 452)

43. ——. 1992. "Concepts of Consequence." In *Bolzano's Wissenschaftslehre 1837-1987. International Workshop*, 3-26. Firenze: Leo S. Olschki.

"It has been held since antiquity that in all deductive argumentation there is a formal element or aspect. I wish to distinguish, and contrast, two ways of characterizing this. One of them I call «logic of schemata», or the «Received View», and the other, which was first articulated by Bolzano, «logic of variation». I shall investigate how these concepts of consequence succeed in addressing five concerns, not all of them logical issues, as we now understand logic, but connected with argumentative practice and certain epistemic matters.

(1) For the sake of completeness I mention first that a definition of consequence should fix a relation that satisfies certain formal requirements, i.e. a cut rule, thinning, and the like. There is a conventionally accepted set of these, described, e.g. by Gentzen. If a consequence relation shows deviations from this, it must be a reasoned difference that should be argued for. Also, a consequence relation (specifically logical, rather than enthymematic consequence) should be defined in such a way that first order predicate logic is strongly complete, that is, that

if A is a consequence of a set of sentences X, then A should be deducible from X in a finite sequence of steps.

(2) A defensible definition of consequence should have the form, broadly, «If an argument satisfies this definition, it is valid, otherwise not». Contemporary definitions fail, as a rule, to satisfy the «otherwise not» clause. It is, however, argumentative practice to convict arguments of being formally fallacious. This can only be based on the assumption that if we have *fully understood* an argument, we can judge it to be valid or invalid - setting aside such esoterica as undecidable cases. I think it desirable that a definition of consequence allow an account of invalidity as well as validity.

(3) I shall consider a definition of logical consequence to be superior if it is broad enough to explain why we concede merit to some formally invalid arguments (enthymemes), but withhold approbation from others (gross non-sequiturs), that is, if it treats *logical consequence* as a special, though perhaps the most important and interesting, case.

(4) Arguments as presented in both informal and formal contexts can be ambiguous, even if they are constructed of unambiguous sentences, and even if they are couched in a language that stipulates a rigid distinction between logical and extralogical constants. I call an argument *naked* if all that is presented are premisses, conclusion, and an inference indicator, like «therefore». I shall maintain that when we understand an argument, we understand more than the sentences of which it is composed, and more than the unspecified claim that the conclusion *somehow* follows from the premisses. That is, we grasp more than the naked argument. If we fail in this, we may misconstrue arguments, which amounts to saying that naked arguments can be ambiguous. I suggest that an acceptable theory of consequence should allow us to bring into focus the problem of argument ambiguity.

(5) It is desirable that a concept of consequence, if it does not itself define a «relevant» relation, can at least be augmented so that it does. (A consequence relation is here called relevant if it

stipulates or implies that premisses and conclusion share some element)." (pp. 3-4)

44. ———. 1997. "Psychologism in Logic: Bacon to Bolzano." *Philosophy and Rethoric* no. 30 (3):213-242.

Reprinted in: Dale Jacquette (ed.), *Philosophy, Psychology, and Psychologism. Critical and Historical Readings on the Psychological Turn in Philosophy*, Dordrecht: Kluwer, 2003, pp. 21-49.

"The first logician to conceive of logic as a matter wholly apart from psychology was Bolzano. He did, however not neglect the old concerns. Of the four volumes of his *Wissenschaftslehre* only the first two (and not all of them) deal with the objective world of propositions in themselves. The third is epistemology, dealing with the manifestation of propositions in the mind: a judgment, in contrast to a proposition, which is abstract and mind independent, now is a mental episode whose "matter" is a proposition in itself. In this part of the work he discusses all those issues that tended to be mixed into the discussion of logic itself: clarity and obscurity of representations, knowledge and error, as well as the "art of discovery" which now has its proper place as a part of epistemology. The last volume, finally, is given over to the presentation of a science in the form of a treatise of the subject.

This is the old "methodology", the theory of combining discovered truths into the system of a science." (p. 39 of the reprint)

(...)

"I hope to have clarified in this paper at least some of the strands of psychologism that ran through the history of logic between Bacon and Bolzano. Much had to be left out. My thesis — if I may be said to have argued one — has been that there were different kinds of intrusion of psychology into logic, some due to a conception of logic that included much of what is now assigned to other fields, others due to cultural and ideological persuasions, and still others to the obsession that logic is the science of thinking." (p. 44 of the reprint)

45. ———. 1997. "Bolzano's Programme and Abstract Objects." *Grazer Philosophische Studien* no. 53:167-180.

Abstract: "Most of the Bolzano literature is exegetical, neglecting, unfortunately, the great potential of his logic as the beginning of a *Programme*. Specifically, his unorthodox construal of the consequence relation as triadic, and his account of logical form are promising beginnings which even as they stand shed light on question of relevance, the ancient problems of enthymemes and others. Instead of developing these suggestions, Bolzano scholars have been occupied with elucidating the ontology of sentences in themselves, and related topics. I argue, and believe to be in agreement with Bolzano, that the nature of sentences is fully explained by the relations that hold between them, just as money has no nature or essence beyond the transactions it makes possible. It follows that the development of his logic would contribute at least as much to the understanding of sentences than any exegesis."

46. ———. 2003. "Bolzano and the Problem of Psychologism." In *Husserl's Logical Investigations Reconsidered*, edited by Fissette, Denis, 95-108. Dordrecht: Kluwer.

"As we saw, the view that subjective ideas are parts of judgments was not new, but Bolzano's theory of objective contents allowed him to avoid a certain confusion. It was generally acknowledged that ideas pass through the mind when one thinks, i.e. judges. At the same time they were thought to be sensations, or the copies of sensations, that is, visual or auditory sense data.

They were often described in terms not consistent with their roles as terms of judgments, i.e. as extended, round, moving, receding, as semblances of their objects, etc. (cf. Exner, *supra*) [*]. But mental occurrences of this sort cannot be terms of judgments. Hume, for example, claimed reasoning to be the operation of our thoughts and ideas, but it is not very plausible to think of it as an operation on something that can be blue, round, divided, or point-like.

Bolzano was not a victim of that confusion. For him a subjective idea is part of a mental proposition or at least could be such a part, and must have the character that goes with this role. He concentrates on the logical functions of ideas, thus avoiding certain classical mistakes. In particular the view that knowledge consists in the similarity or resemblance between our ideas and their objects is exposed as fallacious. Terms of propositions refer to their objects, they need not resemble them. The truth of a proposition, and hence our knowledge of an object, does not depend upon the similarity between idea and object. Rather, "a proposition is true if we connect with the idea of an object the idea of an attribute which this object actually has" (WL §42). This rejection of the resemblance theory is not based on the classical argument that we can never know whether our ideas resemble their objects since we can never compare the two, the object being altogether inaccessible. Rather, the critical point is that it is of no consequence whether an idea resembles its object." (pp. 105-106)

(...)

"Bolzano had a very generous conception of the scope of logic, which for him included a logic of discovery, epistemology and a lot of communication theory. He insisted that logic in this broad sense needed to make use of psychological theory. However, the Theory of Elements in the first two volumes of WL on which "logic as a science must be built" (Husserl) is a historical first in avoiding all connection with psychological doctrine." (p. 108)

[*] Bernard Bolzano, *Letter to Franz Exner*, 18th December 1834, in: *On the Mathematical Method and Correspondence with Exner*, Amsterdam: Rodopi 2004, pp.157-174.

47. ———. 2004. "Intuitions—the Theories of Kant and Bolzano." In *Semantik und Ontologie. Beiträge zur philosophischen Forschung*, edited by Siebel, Mark and Textor, Mark, 319-354. Frankfurt: Ontos Verlag.

"Bolzano credits Kant with impressing on the philosophical public the distinction between intuition (*Anschauung*) and concept (*Begriff*). But making the distinction is one thing,

explaining it is another. Bolzano is not happy with Kant's account (*WL* I, § 77),(1) but his critique does not connect well with Kant's theory. The gulf between them, in both substance and terminology, is too deep. Despite the divergence between the two philosophers on almost any topic, Bolzano paid more attention by far to Kant and Kantian logicians than any other tradition or school, for good reasons."

(...)

"Mathematical propositions are purely conceptual, and so intuitions will play no role in their proof or analysis. They can be established a priori because they are purely conceptual. Bolzano's theory of intuition supports this profoundly important tenet of his thought. His redefinition of "Anschauung" was thus not merely an exercise in persuasive definition, and the appropriation of a popular and important expression for different purposes.

According to Bolzano (and in truth, I might add) there are no such things as Kantian intuitions. Bolzano's construal of the word, whatever its shortcomings, certainly removes the temptation to seek geometrical and arithmetic truth in intuitions, yet preserves the root connotation that *Anschauungen* are those thought episodes that represent our direct empirical awareness." (p. 35)

Selected Bibliography on Bernard Bolzano's Contributions to Logic and Ontology. Third Part: Gie - L

Studies on Bolzano's Logic and Ontology

1. Gieske, Carsten Uwe. 1997. "Bolzano's Notion of Testifying." *Grazer Philosophische Studien* no. 53:249-266

Abstract: "The notion of testifying (or testimony) is the central notion of Bolzano's theory of communication. In his *Wissenschaftslehre* (Theory of Science) Bolzano gives an analysis of this notion. It shows surprising parallels to Paul Grice's attempt to define "A meant something by x". I will begin with an explanation of some parts of the analysis and continue with an investigation of the relationship between Bolzano's analysis and that of Grice. In conclusion I would like to present some evidence supporting the hypothesis that several of the virtues of Grice's theory had already been developed by Bolzano, whose approach even has the advantage of a better definition than Grice's, as Bolzano's analysis provides a better basis for defining a notion of successful communication of information."

2. Grossmann, Reinhardt. 1961. "Frege's Ontology." *Philosophical Review* no. 70:23-40

Reprinted in: E. D. Klemke, *Essays on Frege*, Urbana: University of Illinois Press 1968, pp. 79-98.

On Bolzano see pp. 23-27.

"I begin by describing some features of Bolzano's *Wissenschaftslehre*, for much of what I shall have to say about

Frege can best be understood against the background of Bolzano's view.(4) According to Bolzano, all things are of one of three kinds:

First, there are different kinds of mental states (*subjective Vorstellungen*), namely, (a) individual ideas (*subjective Einzelvorstellungen*), (b) general ideas (*subjective Allgemeinvorstellungen*), and (c) thoughts (*gedachte Saetze*). Things of these three kinds are supposed to exist in individual minds; in this respect they are "subjective" rather than "objective."(5) Second, there are so-called objects₁ (*Gegenstaende*), namely, (a) individual things and (b) properties (*Beschaffenheiten and Relationen*). These things are not in any individual mind, but exist independently of minds and are therefore "objective" rather than "subjective."(6)

Third, there are senses (*objective Vorstellungen*), namely, (a) individual concepts (*objective Einzelvorstellungen*), (b) general concepts (*objective Allgemeinvorstellungen*), and (c) propositions (*Saetze an sich*). These things differ from mental states in that they are as "objective" as objects₁. But they also differ from the latter. One important difference is that they are more closely connected with mental states than are objects₁. (7)" (pp. 23-24)

(7) *Ibid.*, pp. 216-218.

3. Hafner, Johannes. 2000. "Bolzano's Criticism of Indirect Proofs." *Revue d'Histoire des Sciences* no. 52:385-399

Abstract: "The bearing of *Ableitbarkeit* and the compatibility requirement on the possibility of indirect proofs in Bolzano's logic has frequently been misconstrued. Without additional

assumptions concerning the logical structure of indirect proofs and the relationship between proofs and *Ableitbarkeit* the compatibility requirement does not in general preclude indirect proofs. Bolzano's own objections to them are raised in the context of *Abfolge*, not *Ableitbarkeit*. Closer inspection shows that there are in fact two distinct criticisms in play. Identifying and analyzing them clarifies what exactly Bolzano views as the problem of indirect proofs."

4. Hale, Bob, and Wright, Crispin. 2015. "Bolzano's Definition of Analytic Propositions." *Grazer Philosophische Studien*:325-364

Abstract: "We begin by drawing attention to some drawbacks of what we shall call the Frege-Quine definition of analytic truth. With this we contrast the definition of analytic propositions given by Bolzano in his *Wissenschaftslehre*.

If Bolzano's definition is viewed, as Bolzano himself almost certainly did not view it, as attempting to capture the notion of analyticity as truth-in-virtue-of-meaning which occupied centre stage during the first half of the last century and which, Quine's influential assault on it notwithstanding, continues to attract philosophical attention, it runs into some very serious problems. We argue that Bolzano's central idea can, nevertheless, be used as the basis of a new definition which avoids these problems and possesses definite advantages over the Frege-Quine approach. Our title notwithstanding, we make no claim to contribute to the exegesis of Bolzano's thought and works, which we must leave to those more expert in these matters than we are. Naturally, we have done our best not to misrepresent Bolzano's views, and believe we have avoided doing so. But it bears emphasis that it is no part of our intention to suggest that the modifications to his definition which we propose would have had any appeal for him, or that he had, or would have had, any sympathy with the project which motivates them."

5. Haller, Rudolf. 1992. "Bolzano and Austrian Philosophy." In *Bolzano's Wissenschaftslehre 1837-1987. International Workshop*, 191-206. Firenze: Leo S. Olschki

"It would be fruitful to compare in detail some of the formulations in Twardowski, Husserl, Meinong, Mier, and Kerry, with the original work of Bolzano, a task which cannot be done here. That we cannot rely in all cases on a clear-cut causal relation from reading Bolzano to the adoption of his arguments may not wonder us. To speak about an entire tradition is always a tricky thing, since traditions are not easily to be identified. But if we may use the expression 'tradition' then part of a philosophical tradition is that its main tenets recur in different writings and the same or at least similar methods are applied. The fact, however, that even the philosophers of the Vienna Circle claimed to be part of this tradition has been overlooked for a long time. After all, *logical empiricism* was only one of the labels they accepted. Neurath's preferred name «rational empiricism» is somewhat nearer to what was the significant principle of Austrian philosophy. It was the attempt to base the system of science on an ontology of objects. For both fields the tradition starting with Bolzano provided a good basis to build up a philosophical program.

To investigate how many of the philosophers of this tradition came to similar conceptions under an influence of Bolzanoan ideas *without a wider knowledge of his work* and to *explain*, how at the same time we find a strong impact of this conception in different philosophers will remain a task for further research." (pp. 205-206).

6. Jaray, Kimberly. 2006. "Reinach and Bolzano: Towards A Theory of Pure Logic." *Symposium. Journal of the Canadian Society for Continental Philosophy* no. 10:473-502

"The work of Adolf Reinach (1883-1917) on states of affairs, judgment, and speech acts bears striking similarities to Bernard Bolzano's work in the area of general logic. It is my belief that these similarities suggest that Reinach used Bolzano's logical work to assist with his own. Three considerations support this view. First, Bolzano's work in *Die Wissenschaftslehre* (Theory of Science) was considered by Husserl to be the necessary foundation for any work in logic. Second, Bolzano's logic was a suitable alternative to Immanuel Kant's in that he formulated his essential relations as inexistent yet real, not Platonic or

belonging to a transcendental realm. Third, Reinach did not openly criticize Bolzano in the manner he did the Austrians of the Brentano school, suggesting that Bolzano's logic was more complementary with his own. Due to his untimely death in 1917, Reinach's work on states of affairs and logic remains incomplete, some of it even lost or destroyed. I shall here offer a few brief remarks about Husserl as he was Reinach's mentor and friend, but an in depth discussion of the differences between Reinach and Husserl will not be offered in this paper. Secondary literature tells us that Reinach admired Husserl's *Logical Investigations*, in which phenomenology was said to concern itself with "primarily the discovery of the terra firma of pure logic, of the *Sachen* (things) in the sense of objective entities in general and of general essences in particular," and further "this phenomenology must bring to pure expression, must describe in terms of their essential concepts and their governing formulae of essence, the essences which directly make themselves known in intuition, and the connections which have their roots purely in such essences." These acts of discovering and describing essences or things themselves became the foundation of Reinach's realist ontology: things themselves surround us in the world and our access to them does not require a transcendental turn. It was precisely this realist foundation that allowed Reinach to develop and extend his phenomenological work to logic, legal philosophy, and speech acts as well. This conception of the nature and goal of phenomenology allowed Reinach and other phenomenologists a manner in which to analyze experience with its essential connections without either falling prey to psychologism or resorting to Platonism: phenomenology for them was truly a realist alternative." (p. 473)

7. Kasabova, Anita. 2002. "Is Logic a Theoretical or Practical Discipline? Kant and / or Bolzano." *Archiv für Geschichte der Philosophie* no. 84:319-333

"Does logic describe something or not? If not, is it a normative or practical discipline? Is there a radical division between the practical or normative level and the theoretical or descriptive level? A discipline is theoretical, we may say, if its main

propositions contain descriptive expressions, such as "is" or "have", but no normative expressions, such as "ought", "ought not" or "may". A discipline is normative if its main propositions are of the form "it ought to be". Theoretical propositions express what is, whereas practical propositions express what should be. So a theoretical discipline is descriptive and a normative discipline is prescriptive, but what does a theoretical discipline describe?

According to one view, logic is only theoretical and only describes how things are. Logic as a purely theoretical discipline can then be said to be about mental or linguistic activities, or about non-temporal entities and their non-natural connections, such as entailment or derivability. The practical alternative of this purely theoretical view is that logic is only a practical discipline. Its propositions tell us how we may, should or should not judge and reason. Logic as a normative discipline states norms for human activities. According to another view, logic is primarily a theoretical discipline and its counterpart says that logic is primarily a practical discipline. Yet another view of logic says that it can be conceived as both theoretical and practical." (p. 319).

"Which view of logic does Bolzano take? Whereas Husserl insists on delineating a separate pure logic, Bolzano's Theory of Science combines theoretical and practical logic. Unlike Husserl and contrary to Kant, Bolzano claims that logic as a theory of science, must have both a theoretical and a practical character. Bolzano's wide understanding of logic as a Wissenschaftslehre or doctrine of how to present sciences (WL I, § 1) extends to epistemology and methodology, including didactic and methodological rules for classifying and teaching the sciences. These latter are collections of truths (WL I, § 1) and it is the practical task of a theory of science or logic to direct our acquaintance with these collections of true propositions. Bolzano even claims that logic in this wide sense is essentially a normative discipline, which depends on psychology (WL I, § 11) (21) and that logic proper (22) is a methodology containing laws that regulate our acquisition of knowledge (WL I, § 15.2) (23)." (p. 326).

8. ——. 2004. "Colour Sensations and Colour Qualities: Bolzano Between Modern and Contemporary Views." *British Journal for the History of Philosophy* no. 12:247-276

"What are colour sensations? Sensations are the basic constituents of our perceptual states. They are primitive mental events and are usually distinguished from the conceptual component of more complex mental states, such as beliefs or judgements. For instance, we may see a certain colour or hear a sound without understanding what it is, but we do not remember a colour or sound, nor believe that there is a colour such as tawny, or want to hear a certain sound, without having some idea of what it is." (p. 247)

(...)

"How does Bolzano distinguish between colour sensations and colour qualities? He explains the fact that we have colour sensations by assuming that these latter are caused by real properties of objects and, in the *Wissenschaftslehre* and the *Athanasia*, he claims that colours are dispositional properties or secondary qualities. His causal thesis on colour perception is that colours are properties or attributes of things and we assume that these properties are the cause of our colour sensations and the reason for our judgements that we are seeing coloured things.(12)

His claim that colours are dispositional qualities underlies his examination of physical experiments on colours, which I reconstruct in the next but one section. I then bring the implications of his view into the contemporary discussion of whether colours are dispositional or physical qualities of objects." (p 249)

9. ———. 2006. "Bolzano's Semiotic Method of Explication." *History of Philosophy Quarterly* no. 23:21-39

"This paper is programmatic: it presents a so-far undiscussed part of Bolzano's *Theory of Science*, namely the *Semiotics*.(1) Bolzano's account of explication is reconstructed to show his contribution to the contemporary discussion." (p. 21)

(...)

"In the second section of the semiotics dealing with the use of signs in treatises and manuals, Bolzano introduces the notion of *Verständigung*.

In German, a *Verständigung* means to inform someone of something, to communicate with someone and to make oneself (or something) understood.(7) Bolzano's English and French translators use the word *explication* for translating *Verständigung*, for this notion concerns the interpretative relation between linguistic and mental events: the relation between signs and intentions and the way in which we understand words. A *Verständigung* is more than the mere grasping or understanding of a word, however, for this word designates the linguistic act of making something explicit in such a way that it is understood by others and thus this concept plays an important role in communication." (p. 21-22)

(1) Bolzano, Bernard (1837), *Wissenschaftslehre (Theory of Science)*, Sulzbach, Seidel, [WL] IV, §§ 637-677; (1833-1841) *Von der mathematischen Lehrart (On the mathematical method)*, in Bernard Bolzano *Gesamtausgabe*, Stuttgart: Frommann-Holzboog, 1969-, Nachlass II, A, 7, [ML] § 9.

(7) The noun *Verständigung* is the nominalization of the verb *verständigen*, which means "to inform" ("den Leser zu verständigen") or "to communicate."

The second use occurs especially with constructions using the genitive, e.g., "den Gastfreund der Ursache ihres Kummers zu verständigen" or "der jungen Fürstin meine Liebe zu

verständigen." Sich verstandigen means "to make oneself understood" and, more specifically, "to correct mistakes or misunderstandings" (Missverständnisse). See H. Paul, *Deutsches Wörterbuch* (Halle: Niemeyer, 1896, 1935), pp. 608-609, as well as contemporary dictionaries of the German language, such as the *Wahrig* (1966), Bertelsmann, (2002).

10. Kasabova, Anna. 2012. "Bolzano's Semantic Relation of Grounding: A Case Study." In *Inference, Consequence, and Meaning: Perspectives on Inferentialism*, edited by Gurova, Lilia, 85-103. Newcastle upon Tyne: Cambridge Scholars Publishing

Abstract: "I reconstruct Bolzano's account of the grounding relation (*Abfolge*) which, I argue, is a precursor of inferentialism as a basis for semantics and I apply the grounding relation to a particular case: episodic memory. I argue that the basis of episodic memory is not the empirical relation of causality but the semantic relation of grounding which explains why we remember some things rather than others."

11. Kasabova, Anita. 2013. "Dubislav and Bolzano." In *The Berlin Group and the Philosophy of Logical Empiricism*, edited by Milkov, Nikolay and Peckhaus, Volker, 205-228. Dordrecht: Springer

"Brief Introduction

Walter Dubislav (1895–1937) was an active member of the Berlin Group of logical empiricism in the early 1930s. A philosopher, mathematician and logician, he shared the thematic focus of the Berlin Group on the natural sciences, mathematics and logic. He shared the methodological demand of the Berlin Group that philosophical method of inquiry should follow the rigor and precision of formal sciences in exposition and logical reasoning (Rescher 2006, 283). A rigorous methodology for philosophy was also required by Bernard Bolzano (1781–1848), the Prague mathematician, logician and philosopher. Was it Bolzano's efforts to separate logic from psychology in the *Theory of Science* (Bolzano 1837) or his reconstruction of mathematics in the *Contributions to a*

Better Founded Exposition of Mathematics (1810) which attracted Walter Dubislav's attention?

Dubislav was not interested in Bolzano's early attempts to develop a mathematical method for expounding objective dependence relations which hold between judgments as grounds and consequences (Bolzano 1810, II, § 2). His research is focused on the later Bolzano (1837). In a series of papers published between 1929 and 1931, he deals with Bolzano's Kant-criticism and Bolzano's contribution to modern logic. More specifically, he examines what he calls Bolzano's propositional functions (*Aussage- oder Satzfunktion*), his notion of analyticity and analytic statements, as well as his notions of probability (*Wahrscheinlichkeit*) and derivability (*Ableitbarkeit*)." (p. 205)

12. ———. 2013. "Bolzano on Kant's Definition of Analyticity – Does it Fall Short of Logical Precision?" *Philosophical Alternatives* no. 6:13-34

Abstract: "My commentary is Kant-friendly and I begin by re-situating the Siebel-Bolzano-Kant discussion on analytic judgments in regard to their history, namely, to Aristotle's predication. I focus on Siebel-Bolzano's objections that Kant's analytic judgments (i) have a definiens permitting too broad an interpretation, and (ii) that the definiens is too narrow. I re-examine Kant's use of 'covertly' and 'identity of concepts' and argue pace Mark Siebel that Kant's analytic judgments make explicit the shared content of subject and predicate. I then re-examine Kant and Bolzano's notion of (essential) distinctive feature (*Merkmal*) discussed by Siebel in the context of the 'contained in'/'contained under' issue, and show that Kant's analytic judgments are nominal definitions."

13. Kluge, Eike Henner. 1980. "Bolzano and Frege: Some Conceptual Parallels." *Grazer Philosophische Studien* no. 10:21-41

"Recent Frege scholarship has evidenced a growing interest in the historical basis of Frege's thought. By and large, that interest has focussed on the figure of Leibniz, and although there is still some disagreement over the precise nature and

extent of the latter's influence, the fact that it exists is apparently beyond dispute. However, there is another historical figure, of some importance in his own right, whose influence on Frege - or, to be more precise, the possibility of whose influence on Frege - has largely been ignored. I am referring to Bernard Bolzano (1781-1848). The purpose of this paper is to expose some interesting not to say profound similarities between certain fundamental doctrines of the two thinkers, and to suggest on that basis the likelihood of an influence of the former on the latter should be seriously considered." (p. 21)

14. Kneale, William, and neale, Martha. 1962. *The Development of Logic*. Oxford Clarendon Press

Chapter V. *Logic after the Renaissance*. § 5. *Bolzano and Mill*, pp. 358-371.

"According to Bolzano a science in the objective sense of that word is a sum of objective truths. If it is set forth in a treatise, the truths of which it consists must, of course, be known to some man, but truths are not in general to be identified with truths known to men. On the contrary it is reasonable to suppose that the great majority of them are known only to God. For an objective truth is a true proposition-in-itself (*Satz-an-sich*), that is to say, a true propositional content, something thinkable or expressible but not necessarily thought or expressed.(6) Often the word 'judgement' is used in this sense, but it is not suitable as a technical term because it is sometimes used also for the act as opposed to the content of judging; and apart from that it would be misleading if applied to a content which was not believed but merely considered as an hypothesis. 'Judgement' is in fact just one of many words that we can use to refer to propositional contents in special contexts. Others are 'premiss' and 'conclusion', which logicians introduced as descriptions for sentences occurring in certain positions in arguments but used later as though they were designations for propositional contents." (p. 360)
