The first of Reinach's systematic-phenomenological Essays, "Towards the Philosophy of the Negative Judgment" (in the *Festschrift* for his earlier teacher in philosophy, "*Munchener philosophische Abhandlungen. Th. Lipps zu seinem 60. Geburtstage gewidmet von fruheren Schulern*," Leipzig, 1911) deals in an extraordinarily penetrating way with difficult questions belonging to the general theory of the judgment. It is original in attempting to develop a phenomenological difference between "conviction" and "assertion" and in this way to enrich the theory of the negative judgment by making various phenomenological distinctions. Very important but apparently neglected is Reinach's study, "Deliberation in Its Ethical and Legal Significance" (*Zeitschrift für Philosophie und philosophische Kritik* 148 and 149; 1912, 13). The pure phenomenological analysis of the essence of theoretical ("intellectual") and practical ("voluntary") deliberation leads Reinach to fine and significant distinctions in the area of intellectual and practical-emotional acts and states of mind; he then applies his results to questions of ethics and penal law. The most significant and the longest work of Reinach's is also a mature and thoroughly finished work, "On the Apriori Foundations of Civil Law," which appeared in the first volume (1913) of my *Jahrbuch für Philosophie und phänomenologische Forschung*, of which Reinach was a co-editor. This work attempts something completely new with respect to all present and past philosophies of law: on the basis of pure phenomenology it attempts to develop the idea, long held in suspicion, of an apriori theory of right. With inimitable analytic power Reinach brings to light a whole array of "apriori" truths which underlies any real or possible legal code; and these truths, as he shows, are apriori in exactly the sense of the basic axioms of arithmetic and logic, that is, they are truths which are grasped in intellectual insight as being valid without any possible exception, and they are prior to all experience. These apriori truths in the sphere of right, such as that a claim is dissolved by its being fulfilled, or that property, through the act of transfer, passes from one person to another, have nothing to do with the "enactments" (arbitrary determinations that something ought to be) of the positive law. For all positive enactments presuppose concepts such as claim, obligation, property, transfer, etc.; these concepts are thus apriori with respect to positive law. Reinach's apriori principles are simply

expressions of absolutely valid truths which are grounded in the essential meaning of these concepts. What is utterly original in this essay of Reinach's, which is in every respect masterful, is the idea that we have to distinguish this apriori, which belongs to the proper nature of any legal order, from the other apriori which is related to positive law as something normative and as a principle of evaluation: for all law can and must be subjected to the idea of "right law"-- "right" from the point of view of morality or of some objective purpose. The development of this idea would lead to a completely different apriori discipline, which however does not, just as Reinach's apriori theory of right does not, go in the direction of realizing the fundamentally mistaken idea of a "natural law." For this apriori discipline (of "right law") can only bring out formal norms of right, and from these one can no more extract a positive law than one can get definite truths in the natural sciences out of formal logic. No one who is interested in a strictly scientific philosophy of right, in a definitive clarification of the basic concepts which are constitutive for the idea of any possible positive law (a clarification which, it is clear, can be achieved only by phenomenologically penetrating into the pure essence of our consciousness of right) can afford to overlook this work of Reinach's which breaks so much new ground. It is for me beyond any doubt that it will secure for its author a permanent place in the history of the philosophy of right."

From: Edmund Husserl, "Obituary notice", *Kant-Studien*, 13 1919, pp. 147-149, translated by John F. Crosby, *Aletheia. An International Journal of Philosophy*, 3, 1983, pp. XI-XIII.

"It is characteristic for Reinach that in each of these studies, even if they treat of rather particular problems, Reinach achieves and formulates, often for the first time, general foundational insights. And these insights are at the same time in most instances so precisely formulated that nothing more is needed for us to build on them. Thus the short study entitled, "The Most General Principles of the Inference according to Kant," which is on one level only a critical study of Kant, clarifies one of the basic problems of logic, the problem of the so-called general object, by distinguishing between essence and the indeterminate individual object which participates in the essence. In the same way his paper, "Kant's Understanding of

Hume's Problem," in its aim apparently so very specialized, clarifies the nature of authentic causality by distinguishing between modal and material necessity. And in the same way his paper, "Towards the Theory of the Negative Judgment," clarifies the nature of presentation (*Vorstellung*) and intuition (*Anschauung*), and makes the foundational distinction within the sphere of theoretical acts between acts in which a position or stance is taken, and acts in which something is grasped or apprehended. This distinction, made in connection with the distinction between presentation and judgment (both in the sense of conviction as well as of assertion), has a fundamental importance which not only far surpasses the sphere of the negative judgment, the subject of this paper, but also surpasses the sphere of the judgment in general and is fundamental for every ontology of acts of the person. This characteristic of Reinach's mind comes out most clearly in his most perfect work, "The Apriori Foundations of the Civil Law." His theme here is one belonging to the philosophy of law, but what he deals with is not just anyone but rather the problem of legal philosophy. The so ambiguous concept of the apriori finds here its definite and classical formulation. The idea of the social acts, with their characteristic need of being heard by the addressee, or of the constitutive importance of certain acts through the performance of which are constituted real, objectively valid relations, withdrawn from our arbitrariness, all this and other ideas as well have an importance which goes far beyond the scope of Reinach's legal theme. We have here insights which are fundamental for the whole ontology of the sphere of personal acts as well as of the sphere of those objectively valid structures which are constituted by the performance of certain acts."

Annotated Bibliography on Adolf Reinach

Works in German

Abbreviations: (GS = Gesammelte Schriften; SW = Sämtliche Werke)

1. Reinach, Adolf. 1905. *Über den Ursachenbegriff im geltenden Strafrecht*. Leipzig: J. A. Barth.

(SW pp. 1-43).

"Psychology, Reinach argues, is capable of assisting in the clarification of the legal meaning of the concept of cause via appeal to the notion of a *psychic regularity*. This same notion can help also in the clarification of the probable intent of specific laws. From the point of view of Reinach's later philosophy, the work may be seen as a study of the legal determinations [*Bestimmungen*] of positive law and of the development of aids for their practical interpretation. There is as yet however no suggestion of his doctrine of the *a priori* structures underlying legal formations." (Barry Smith, *An Annotated Bibliography*, p. 300)

2. ———. 1910. "William James und der Pragmatismus." *Welt und Wissen. Hannoversche Blätter für Kunst, Literatur und Leben*.

(SW pp. 45-50)

(GS pp. 36-55; SW pp. 51-65)

4. ———. 1911. "Kants Auffassung des Humeschen Problems." *Zeitschrift für Philosophie und philosophische Kritik* no.

141:176-209.

(GS pp. 1-35; SW pp. 67-93)

5. ———. 1911. "Zur Theorie des negativen Urteils." In *Münchener Philosophische Abhandlungen. Festschrift für Theodor Lipps*, edited by Pfänder, Alexander, 196-254. Leipzig: J. A. Barth.

(GS pp. 56-116; SW pp. 95-140).

Revised edition in: *Metaphysica. International Journal for Ontology and Metaphysics*, Vol. 0, April 1999, pp. 37-103.

6. ———. 1913. "Die apriorischen Grundlagen des bürgerlichen Rechtes." *Jahrbuch für Philosophie und phänomenologische Forschung* no. 1:685-847.

New edition with the title "*Zur Phänomenologie des Rechts. Die apriorischen Grundlagen des bürgerlichen Rechts*" and a preface by Anna Reinach, München, Kösel, 1953.

(GS pp. 166-350; SW pp. 141-278)

7. ———. 1913. "Die Überlegung: ihre ethische und rechtliche Bedeutung." *Zeitschrift für Philosophie und philosophische Kritik*.

First part Vol. 148 (1912) pp. 181-196; second part Vol. 149 (1913) pp. 30-58.

(GS pp. 121-165; SW pp. 279-311)

8. ———. 1914. "Paul Natorps 'Allgemeine Psychologie nach kritischer Methode'." *Göttingische gelehrte Anzeigen* no. 4:193-214.

(GS pp. 351-376; SW pp. 313-331).

"Natorp had claimed that the I can never be an object of consciousness and thus it cannot form part of the subject-matter of psychology. The latter is restricted to the contents of consciousness, i.e. to all of that of which one is conscious. Reinach argues that it is grounded in the essence of *cogitationes* that they can exist only as experiences of an I. Thus he defends the Cartesian view according to which the *cogito* is the starting point of our knowing, and he insists that

the I is present in each and every experience. However, the pure I - as distinct from the empirical person - is not a thing with characteristics; Natorp may therefore be correct in his view that it 'does not admit of any explanation'. But this does not rule out the clarification of the ways in which it interrelates with other elements in essential structures.

In grasping itself the I is both bearer and end-point of a grasping act. Unlike Natorp, who insisted that each relation must have two terms, Reinach sees no difficulty here, since intentionality is not a relation in the usual sense."

Barry Smith, (*An Annotated Bibliography*, p. 300-301)

9. ———. 1921. *Gesammelte Schriften*. Halle: Max Niemeyer.

Edited from his students. With a preface by Hedwig Conrad-Martius (XXVI+461 ppages).

(This edition is now superseded by *Sämtliche Werke*).

10. ———. 1921. "Über das Wesen der Bewegung." In *Gesammelte Schriften*, 406-461. Halle: Max Niemeyer.

Prepared by Edith Stein from seminar notes in Reinach's *Nachlass*.

(SW pp. 551-588).

"Contains an analysis of continuity and of the essence of traversing of space, the results of which are then applied to Zeno's paradoxes. A motion is a continuous process, it should not be thought of as a series of single part-processes somehow combined together.

Reinach asserts that it is self-evident that all real motion requires a bearer, but denies that this implies that all perception of motion involves the perception of a bearer. I can speak of motion and intend motion without at the same intending something that moves."

Barry Smith, (*An Annotated Bibliography*, p. 301)

11. ———. 1951. *Was ist Phänomenologie?* München: Kösel.

With a preface by Hedwig Conrad-Martius Lesson held at Marburg in 1914 with the title *Über Phänomenologie* and first published in GS pp. 379-405 (SW pp. 531-550).

12. ———. 1989. *Sämtliche Werke. Textkritische Ausgabe in 2 Bänden*. München: Philosophia Verlag.

Critical edition by Karl Schuhmann and Barry Smith in two volumes.

English translations

1. Reinach, Adolf. 1968. "What is Phenomenology." *The Philosophical Forum* no. 1:234-256.

Translation and introduction (pp. 231-233) by Derek Kelly.

"Reinach's essay is a brief introduction to applied phenomenology. The first part of the essay is exegetical: Reinach explains the philosophic limitations and problems of the sciences of psychology and of mathematics, and discusses in particular the work of Hilbert and Kronecker. In the second part of the paper, Reinach develops the concept of the 'a priori.' He rejects both the positivist conception of solely analytic 'a priori,' and also the Kantian notion of necessary conditions for thought. Reinach argues that the 'a priori' is legitimately seen not as subjective or as necessary for thought, but as a necessity of being."

2. ———. 1969. "Concerning Phenomenology." *The Personalist* no. 50:194-221.

Translation by Dallas Willard.

"This paper attempts to illustrate how phenomenological research is done. For Reinach, phenomenology is an attitude or way of seeing, not a set of truths. It is the examination of essences, or universals, and their interconnections. Reinach discusses and illustrates how such examination is required in descriptive psychology, and how it is essentially dispensed with in mathematics, as understood by Hilbert. There follows a critique of Frege's view of number, and a phenomenological elucidation of the distinction between cardinal and ordinal numbers. Reinach's final remarks are devoted to misinterpretations of the "a priori" and to its correct analysis."

7. Brown, James. 1987. "Reinach on representative acts." In *Speech Act and Sachverhalt: Reinach and the foundations of realist phenomenology*, edited by Mulligan, Kevin, 119-131. Dordrecht: Martinus Nijhoff Publishers.

"Austin is certainly the founding father of speech act theory as we have known it in recent decades, and one reason why Reinach's views on social acts are worthy of attention is the

extent of their anticipation of Austin's work and their contribution to the understanding of human communicative action. Mother is their bearing on the thesis that fundamental concepts of civil law are found, and not introduced, by positive law. A further reason is that, apart from anticipating the work of others, Reinach explores a kind of social act which appears to have been neglected by subsequent speech act theorists. I refer to representative acts, where one person acts for or on behalf of or in the name of another! I shall first try to set out Reinach's views (sections 1 and 2), and then discuss some issues which they raise, in particular that of sincerity (sections 3 and 4) then that of prior empowerment for representative acts (section 5)." 12. Cantegreil, Julien. 2005. "D'une voie phénoménologique en théorie du droit. Remarques sur le réalisme d'Adolf Reinach." *Les Études Philosophiques*:99-112.

"Écartant les questions traditionnelles de savoir comment il s'est singularisé dans l'histoire de la doctrine allemande du

droit et les raisons qui font de lui l'un des précurseurs de la théorie des actes de langages, la présente étude évalue l'intérêt juridique de l'approche « intuitionniste » de Reinach.

L'utilisation conjointe de sa définition de la promesse et des travaux de Jean-Louis Gardies devraient montrer l'impasse théorique et le faible intérêt pratique de son intuitionnisme, et ce faisant contribuer à diriger les recherches phénoménologiques en théorie du droit vers les travaux du Husserl des Idées directrices."

13. ———. 2006. "Adolf Reinach théoricien du droit: sur la causalité." *Archives de Philosophie du Droit* no. 49:401-416.

"Bien qu'il ait été commenté par les plus illustres (Husserl, Kantorowicz, Radbruch, Villey...) et que l'on ait récemment pris la mesure de son importance en philosophie, Reinach n'a toujours pas su trouver sa place en théorie du droit.

Comprendre l'impasse théorique et le faible intérêt pratique de son approche intuitionniste avait seulement suggéré de rediriger les recherches phénoménologiques en droit vers les oeuvres tardives de Husserl. La présente analyse propose de relire Reinach à partir d'un texte de jeunesse quasi inconnu, sa Dissertation de 1905 *Sur le Concept de cause en droit pénal*. Reinach y apparaît alors non seulement un représentant exemplaire des contradictions du positivisme de la fin du XIXe siècle, mais aussi une aide précieuse pour conceptualiser la cause en droit. Précurseur en ce qui concerne les actes de langages, Reinach l'est aussi en ce qui concerne le concept de causalité. Reinach théoricien du droit gagne ainsi pertinence, profondeur et actualité."

14. Chrudzimski, Arkadiusz. 2012. "Negative States of Affairs: Reinach versus Ingarden." *Symposium. The Canadian Journal of Continental Philosophy* no. 15:106-127.

Abstract: "In Reinach's works one finds a very rich ontology of states of affairs.

Some of them are positive, some negative. Some of them obtain, some do not. But even the negative and non-obtaining states of affairs are absolutely independent of any mental activity. Despite this claim of the "ontological equality" of

positive and negative states of affairs, there are, according to Reinach, massive epistemological differences in our cognitive access to them. Positive states of affairs can be directly "extracted" from our experience, while to acquire a negative belief we must pass through a quite complicated process, starting with certain positive beliefs. A possible and reasonable explanation of this discrepancy would be a theory to the effect that these epistemological differences have their basis in the ontology of the entities in question. Our knowledge of the negative states of affairs is essentially dependent on our knowledge of the positive ones precisely because the negative states of affairs are ontologically dependent on the positive ones. Such a theory has, in fact, been formulated by Roman Ingarden. According to him, negative states of affairs supervene on some positive ones and on certain mental acts of the conscious subjects."

15. Crosby, John. 1983. "Reinach's discovery of the social acts." *Aletheia* no. 3:143-194.

Contents: 1. The significance of Reinach's monograph; 2. Reinach as phenomenologist; 3. Reinach's discovery of the "social acts"; 4. Reinach in dialogue with the speech act philosophers: promising as a social act; 5. Continuation of the dialogue between Reinach and the speech act philosophers: the uninventable essence of promising; 6. Towards developing and deepening Reinach's analysis of the social acts; Reinach and Wojtyla; Reinach and Husserl; 7. Reinach's apriori sphere of right and the natural moral law; 8. Legal obligation and moral duty; 9. Some consequences of Reinach's discovery for political, legal, and moral philosophy; conclusion of the dialogue with the speech act philosophers.

16. Davie, George. 1987. "Husserl and Reinach on Hume's "Treatise"." In *Speech Act and Sachverhalt: Reinach and the foundations of realist phenomenology*, edited by Mulligan, Kevin, 257-274. Dordrecht: Martinus Nijhoff Publishers.

"In 1929 Husserl wrote that Hume's real greatness was still unrecognised in its most important aspect. Now I believe that the contribution to Hume studies by Husserl - as conveyed by

Jean Laporte in France and Kemp Smith in Britain - and by his pupil Reinach, have gone a long way towards changing this state of affairs, because of a new way of reading Hume's *Treatise* that they introduced. I first set out Husserl's early views on Hume and then turn to Reinach's paper on Hume, which builds on this work, but also goes a long way beyond it and isolates the most important aspect of Hume's achievement." (p. 257)

18. DuBois, James. 1994. "An introduction to Adolf Reinach's '*The supreme rules of rational inference according to Kant*'." *Aletheia* no. 6:70-80.

"In 1911, the same year that he published his work *On the theory of the negative judgment*, Adolf Reinach published two articles on Kant's philosophy: *Kant's understanding of the humean problem* and *The supreme rules of rational inference according to Kant*. More than mere historical studies, these articles extend Reinach's contribution to the fields of ontology and what might be broadly construed as the field of logic."

19. ——. 1995. *Judgment and Sachverhalt. An introduction to Adolf Reinach's phenomenological realism*. Dordrecht: Kluwer.

Contents: Acknowledgements VII; Introduction 1; 1. Judgments and states of affairs 7; 2. Negation and correspondence 47; 3. Insight and the *a priori* 77; 4. Logic and arithmetic 115; 5. The discovery of social acts 129; 6. Reinach as phenomenologist 145; Bibliography 159; Index 167-168.

"The outline of our study is as follows.

Chapter One explores Reinach's conception of the judgment in terms of a state of belief, an act of assertion, and an ideal meaning-unit. We examine his understanding of states of affairs, the objectual-correlates to judgments of all kinds. We further investigate how it is that the mind becomes directed towards states of affairs, and this involves us in a study of Reinach's understanding of the relationships between

intentionality, presentation, and intuitive fullness. Particularly here we see Reinach's indebtedness to Husserl. Towards the end of the chapter we consider briefly the concepts of evidence and knowledge -- for a judgment cannot be considered rational unless it is somehow related to objective being through evidence or direct knowledge.

In Chapter Two, we examine Reinach's claim that negative states of affairs subsist or obtain just as do positive states of affairs. Here a confrontation with Ingarden's ontological investigations is particularly helpful, and something of a compromise position is defended. Reinach's discussion of negation provides us with the opportunity to better understand the nature of concepts and properties, and the peculiar sort of existence espoused by these. Chisholm's view of negative properties and states of affairs is compared to Reinach's, and here too we argue for modifications of both views.

In Chapter Three we examine how Reinach's ontology of states of affairs is seen to lie at the basis of most traditional epistemological distinctions. Thus, distinctions between states of affairs give rise to the differences between necessary and contingent, synthetic and analytic, and formal and material judgments. We investigate further why philosophical insight is possible with regard to the states of affairs grounded in some essences, but not others. At this point we turn to the work of Reinach's student, Dietrich von Hildebrand, where he distinguishes between accidental essential unities, morphic essential unities, and necessary essential unities, only the last of which can be known through insight or essential intuition. We close the chapter with a defense of insight, and a discussion of its place in philosophical argumentation.

By the time we reach Chapter Four, we have already investigated the nature of many logically relevant concepts, such as proposition, truth and falsity, implication, ontological modality, analyticity and syntheticity. However, it seems worthwhile to present Reinach's overall conception of logic, a conception which is at the same time classical and original. In connection with his work on logic we discuss briefly Reinach's

conception of numbers. Interestingly, Reinach rejects the existence of ordinal numbers, and he argues that cardinal numbers cannot be predicated. As one might expect, his explanation of the ontological correlates to the truths of arithmetic involves a fascinating application of his philosophy of states of affairs.

In Chapter Five we examine his "Apriori Foundations of the Civil Law". Particularly here we are forced to prescind from many interesting and worthwhile ideas. Our interest in this work is restricted to his discovery of social acts (better known today as speech acts), and in particular the nonasserting or nonjudging character of these acts. These acts are neither correct nor incorrect, for they are not "conforming" acts, or acts of "fit". They are rather "grounded" or "ungrounded" and "effective" or "ineffective". A confrontation of his analysis of promising with that of Searle allows us to test the soundness of Reinach's ontology of essences and his recognition of synthetic *a priori* states of affairs and truths. Finally, we examine Reinach's claim that he has discovered a new sort of object: real, temporal objects, which are neither physical nor mental.

In Chapter Six, our concluding chapter, we look at Reinach as a phenomenologist. By the time we reach this last chapter, many will understand why we call Reinach a realist, but they will wonder what characterizes him as a phenomenologist. We present a few key ideas from his lecture "Concerning Phenomenology" and defend an interpretation of the phenomenological attitude as characterized above all by a rigorous fidelity to what is given. While we refuse to take up a confrontation of Reinach's phenomenological realism with the motives for Husserl's transcendental idealism, we do briefly suggest some philosophical reasons which make intelligible Reinach's unwillingness to espouse the "new developments". We conclude the book by suggesting one sense in which Reinach's analysis of human acts stands in need of a "subjective" grounding, though not of the sort Husserl suggests." (pp. 3-5).

"One of the most interesting contributions to philosophy in Adolf Reinach's work *The A Priori Foundations of Civil Law* is the analysis the author puts forward of what he generally calls social acts. This analysis is extended to deal with such specific types of social acts as promises, orders, prayers, requests, communications (*mitteilen*), questions, the particulars of which are all gone into by Reinach.

When, much later, Anglo-Saxon authors such as Austin and Searle discovered the quite special character of speech-acts it is almost certain that Reinach could have had no influence on them, for they knew nothing of his work. Even if they had had some indirect acquaintance with the work it is by no means certain that they could have profited from its analyses. The intuitionist style that marks the work, which appeared in 1913 as part of the first large wave of the phenomenological movement removes it almost totally from the purview of the analytic approach of the Anglo-Saxon tradition within which the new theory of speech-acts was to find its natural home. Since the two philosophies use quite different languages it would have been difficult to see that there was a shared subject matter and that some at least of the conclusions were the same." (p. 107)

(...)

"Reinach's merit is to have given superb demonstrations of the a priori character of the pure science of law. He has annihilated psychologism, sociologism and historicism in the legal sphere as surely as Frege had annihilated them in the realm of mathematics. It remains to provide each of his remarkable analyses with its theoretical explanation in order to establish that, in the last instance, the *a priori* judgements whose existence at the basis of civil law he *has* revealed, are themselves analytic." "If one is to believe Mephistopheles, even the devil seems to be bound to keep a promise and the explanation of this state of affairs requires more than just a few words.

In the twentieth century various well-known philosophers have gone into great detail in order to clear up the question why promises can give rise to obligations. The works of Adolf Reinach and John Searle are two outstanding examples of attempts to analyse promising. In what follows I shall compare their accounts as precisely as possible in order to provide arguments for and against the view that the famous analysis by John Searle was already anticipated by Adolf Reinach in 1913.

I begin with an examination of the relation between Reinach's (category of) social acts and Searle's (category of) speech acts in which I concentrate on the relations between entities and laws

on the one hand and institutional facts and rules on the other. Finally, I scrutinize the different conception of 'obligation' in the two accounts." (p. 91)

"For Reinach as for Russell, the state of affairs called "the being snub-nosed of Socrates" contains as "objectual elements" (gegenständliche Elemente, gegenständliche Glieder)³⁷ a "real" as well as an "ideal object", "Socrates and the property of being snub-nosed. Reinach clearly recognizes, what some analytical philosophers do not, that "states of affairs cannot be simply stuck together (*zusammengestoppelt*), as it were, out of

arbitrary elements"? Only if somebody (rightly or wrongly) can judge or believe that a is P, is there such a thing as the (obtaining or not obtaining) state of affairs, the being P of a (See § 3 above).

Reflecting on attributes like possibility and necessity, Reinach stresses "that it is ... states of affairs and only states of affairs, which can adopt such modalities". I shall try now to clarify the relevance of this Reinachian observation in the final section of this paper." (p. 185, notes omitted).

"Phenomenology as practised by Adolf Reinach (1883-1917) in his all too brief philosophical career exemplifies all the virtues of Husserl's *Logical Investigations*. It is sober, concerned to be clear and deals with specific problems. It is therefore understandable that, in a philosophical climate in which Husserl's masterpiece has come to be regarded as a mere stepping stone on the way to his later Phenomenology, or even to the writings of a Heidegger, Reinach's contributions to exact philosophy have been all but totally forgotten. The topics on which Reinach wrote most illuminatingly, speech acts (which he called 'social acts') and states of affairs (*Sachverhalte*), as well as his realism about the external world, have come to be regarded as the preserve of other traditions of exact philosophy. Like my fellow-contributors, I hope that the present volume will go some way towards correcting this unfortunate historical accident.

Reinach's account of judgements and states of affairs, an account that precedes those of Russell and Wittgenstein, his 1913 treatment of speech acts, his reinterpretation of Hume and aspects of his legal philosophy are the main philosophical topics dealt with in what follows. But his analysis of deliberation as well as his work on movement and Zeno's paradoxes get only a passing mention." (from the Preface)

36. ———. 1987. "Promising and other social acts: their constituents and structure." In *Speech Act and Sachverhalt: Reinach and the foundations of realist phenomenology*, edited by Mulligan, Kevin, 29-90. Dordrecht: Martinus Nijhoff Publishers.

"The discovery of what Reinach called *social acts* (in 1913) and Austin *speech acts* (in 1962) was first and foremost the discovery of a type of linguistic action which, Reinach and Austin are convinced, had simply not been noticed hitherto. It is true that both authors present their discovery within a theoretical framework and that they hoped that their accounts

of the phenomenon discovered would be taken as representative of new ways of doing philosophy. It is also true that there are great differences between the frameworks and the hopes of the two philosophers. But both are emphatic that their primary objective is to bring into focus, and fully *describe*, a phenomenon of which promising is their favourite example. Other social acts dealt with in some detail by Reinach are requesting, questioning, ordering, imparting information, accepting a promise and legal enactment, which - except for the last two - are all at least touched on by Austin. (*)" (p. 29)

(*) Reinach's theory is set out in his monograph *The Apriori Foundations of the Civil Law*, in particular in § 2 *Claim and Obligation*, § 3 *The Social Acts*, § 4 *The Act of Promising as the Origin of Claim and Obligation*, § 7 *Representation*, § 8 *Enactments and the Propositions which Express Enactments*.

"The judgment constitutes a fundamental notion for several disciplines such as descriptive psychology, ontology and logic, and hence its investigation represents a pivotal area of research within theoretical philosophy. Inside the Brentano-School, Alexius Meinong (1853-1920) and Adolf Reinach (1883-1917) made significant contributions to this topic, separating and exploring both the subjective side of judgment (the intentional experience of judging) as well as its objective side (the "state of affairs" or the "objective"). In this publication Meinong's and Reinach's lore regarding the psychological and object-theoretical aspects of judgment are explicated, compared and evaluated."

- "The paper investigates the role played by ethical deliberation and ethical judgment in Wittgenstein's early thought in the light of twentieth-century German legal philosophy. In particular the theories of the phenomenologists Adolf Reinach, Wilhelm Schapp, and Gerhart Husserl are singled out, as resting on ontologies which are structurally similar to that of the *Tractatus*: in each case it is actual and possible *Sachverhalte* which constitute the prime ontological category. The study of the relationship between the States of Affairs depicted, e.g., in the sentences of a legal trial and prior fact-complexes to which these may correspond suggests one possible connecting link between the logical and ontological sections of the *Tractatus* and the ethical reflections appearing at the end. It is argued that the latter can best be understood in terms of the idea of a "Last judgment" (with its associated ethical rewards and punishments) which would relate to the world as a whole as a penal trial relates to individual complexes of facts."

Dordrecht: Martinus Nijhoff Publishers.

"When the present volume was first conceived, it was confidently believed that a survey of the literature on Reinach's thought could be kept within comfortable limits. It rapidly became clear, however, that this was not the case. Reinach's discoveries in the sphere of speech act theory have, it is true, gone almost unnoticed. Reinach has nevertheless enjoyed an enduring notoriety among those working in the philosophy of law, and ever since its appearance in 1913, Reinach's work on "Die apriorischen Grundlagen des bürgerlichen Rechtes" has served as the principal representative of phenomenological, aprioristic and ontological/realist approaches in this discipline. His name accordingly appears in the majority of the more substantial general treatises in the discipline (or at least in those treatises and reference works published in countries whose law and philosophy have been influenced by the Germanic tradition: Edwards' great *Encyclopedia of Philosophy* does not contain even a mention of Reinach).

The goal of completeness has therefore been abandoned in what follows, and items containing merely passing references to Reinach's work have been listed only where they are of particular historical importance or bear evidence of some more substantial influence. The list has been compiled with the assistance of N. Bokhove, A.G. Conte and M.-E. Conte, J. Crosby, N. Duxbury, J. Joerden, S. Paulson, H. Spiegelberg and the indefatigable librarians of the University of Erlangen."

53. ———. 1989. "Logic and the Sachverhalt." *The Monist* no. 72:52-69.

"Logic is often conceived as a science of propositions, or of relations between propositions. There is an alternative view, however, defended by Meinong, Pfänder, Reinach and others, which sees logic as a science of *Sachverhalte* or States of Affairs. A consideration of this view, which was defended especially by thinkers within the tradition of Brentano, throws new light on the problems of intentionality and of mental content. It throws light also on the development of logic in Poland. Here the influence of Brentano's student Kasimir Twardowski is especially important, and the paper concludes with a new interpretation of Tarski's work on truth against the background of Twardowski's thinking."

Stanislaw Leśniewski's Logical Systems: Protothetic, Ontology, Mereology

Introduction

"Leśniewski defined ontology, one of his three foundational systems, as 'a certain kind of modernized 'traditional logic' [On the Foundations of Mathematics (FM), p. 176]. In this respect it is worth bearing in mind that in the 1937-38 academic year Leśniewski taught a course called "Traditional 'formal logic' and traditional 'set theory' on the ground of ontology"; cf. Szrednicki and Stachniak, *Leśniewski's Systems: Protothetic*, 1988, p. 180. On this see Kotarbinski *Gnosiology. The Scientific Approach to the Theory of Knowledge*, 1966, pp. 253-54 [the Polish original was published in 1929], which Leśniewski praised in [FM]: see in particular pp. 373 ff. Kotarbinski noted that Leśniewski "calls his system 'ontology' in harmony with certain terms used earlier (as in the 'ontological principle of contradiction')", and in strict relation to the Greek root of 'ontology' as the participle of the verb 'to be'. Leśniewski's 'ontology' is therefore "closely connected with traditional Aristotelian formal logic, of which it is an extension and an improvement, while on the other hand it is a terminal point in the attempt to construct a calculus of names in the area of logistic ... If in spite of these reasons we do not use the word 'ontology' here as a name for the calculus of names, this is only because of the fear of a misunderstanding. Misunderstanding could arise from the fact that this name has its roots already in another role, i.e., it has been long agreed to call 'ontology' the enquiry 'on the general principles of existence' conducted in the spirit of certain parts of Aristotelian 'metaphysical' books. It has to be admitted however, that if the Aristotelian

definition of the main theory (*prote filosofia*) discussed in those books is interpreted in the spirit of a 'general theory of objects', then both the word and its meaning, can be applied to the calculus of names of Leśniewski", Kotarbinski 1966, pp. 373-374. Leśniewski commented on Kotarbinski's remarks thus: "I used the name 'Ontology' to characterize the theory I was developing, without offence to my 'linguistic instincts' because I was formulating in that theory a certain kind of 'general principles of existence'" [FM, 374].

Given these premises, we gain clearer understanding of his interest in the principles of non-contradiction [PC] and excluded middle [EM], as well as his references to the theory of conversion (p. 68 ff), of the *suppositio* (p. 18) and of the validity of the syllogism (p. 71 ff). This inquiry was encouraged by his interest in the history of logic and in the formal treatment of the problems of classical philosophy by the Lvov-Warsaw school. Jan Łukasiewicz's (1886-1939) research into the history of propositional calculus, the Aristotelian syllogistic and the principle of non-contradiction are well known. (...)

Twardowski, the founder of the school, was also interested in traditional logic. As a lecturer at the University of Lvov, for many years he taught a course on Attempts to reform traditional logic, in which he outlined the theories of Bolzano, Brentano, Boole and Schröder; cf. Damska *François Brentano et la pensée philosophique en Pologne: Casimir Twardowski et son École*, Grazer philosophischen Studien, 5, 1978, p. 123." (pp. 187-188)

From: Roberto Poli and Massimo Libardi, "Logic, Theory of Science, and Metaphysics According to Stanislaw Leśniewski", *Grazer Philosophische Studien*, 57, 1999, pp. 183-219.

"In the period between the two world wars, Stanislaw Leśniewski (1886-1939), one of the founders and a prominent member of the Warsaw School of Logic, created a system of the foundations of mathematics comprising three deductive theories: Protothetic, Ontology, and Mereology. The point of departure for the construction of this system was his study of logical paradoxes and, in this context, a distinction between the distributive and collective interpretations of a class. This distinction between the two interpretations was reflected in the development of two deductive theories, the theory of collective classes, which he eventually called

Mereology, and the theory of distributive classes, called Ontology. Finally, in order to combine Mereology and Ontology into a logically rigorous system, he constructed Protothetic -- the system of "First principles." Leśniewski's ambition was "not to add one more calculus to the variety already invented, nor even to prove general metatheorems about alternative formal calculi, in the interests of "comparative logic"; it was instead to perfect a universally valid classical system of logic and foundations of mathematics, in which he could rigorously formulate generalizations expressible only in the metalanguages of systems poorer in means of expression, [...] and on which he could rely as a true instrument of deduction and scientific investigation (Luschei, *The logical systems of Leśniewski*, 1962, p. 24)." This program was initiated by Leśniewski in 1914 with his studies on a general theory of sets (later to be named 'Mereology'). The first version of Mereology appeared in print in 1916 under the title *Foundations of a General Theory of Sets. I* (in Polish).

In 1919, Leśniewski joined the University of Warsaw as a professor of the philosophy of mathematics. He met a group of gifted mathematicians, Zygmunt Janiszewski, Stefan Mazurkiewicz, Waclaw Sierpidski, whose research interests, like those of Leśniewski, were focused on the foundations of mathematics. In 1920 this group, joined by Jan Łukasiewicz, founded the mathematical journal *Fundamenta Mathematicae* with Mazurkiewicz and Sierpiriski as editors, and Leśniewski and Łukasiewicz as members of the editorial board. The name, scope, and membership of the editorial board of the journal adequately reflected the research activities of the Warsaw schools of mathematics and logic during the first decade of the journal's existence.

The construction of Ontology in the period between 1919-1921, marked the next step in the formation of Leśniewski's system of the foundations of mathematics, although it was not until 1930 that Ontology appeared in print (cf. Leśniewski, 1930).

The construction of Protothetic began in 1922 and went quickly through numerous improvements and modifications, to be concluded in 1923. By then, Leśniewski's system of the foundations of mathematics was formally ready and, to quote Jordan, it was "the most thorough, original, and philosophically significant attempt to

provide a logically secure foundation for the whole of mathematics" (cf. Jordan, 1945).

Even such a critic of the importance of Leśniewski's contribution to modern logic as Grzegorzczyk admitted that "Leśniewski's treatment of logic was in his times the most exact; it was simpler than *Principia* [*Mathematica*] and had it been published simultaneously with the second edition of the *Principia*, it would have played a considerable part in the development of logic" (Grzegorzczyk, 1955, p. 78)."

The roots of Protothetic can already be found in Leśniewski's early writings between 1912 and 1914. The "deductions" in his 1916 work on the general theory of sets are based on his logical intuitions which eventually were captured in the axioms and directives of Protothetic and Ontology." (pp. VII-VIII)

From: "Editor's Foreword" to Jan Szrednicki, and Zbigniew Stachniak (eds.), *Leśniewski's Systems: Protothetic*, Dordrecht: Kluwer 1998.

Applications of Leśniewski's Ontology

Tadeusz Kotarbinski (1) made the following comment on Leśniewski's ontology: " It must be however admitted if the Aristotelian definition of the supreme theory... be interpreted in the spirit of a "general theory of objects", then both the word ["Ontology" -- C. W.] and its meaning are applicable to the calculus of terms as expounded by Leśniewski".

Leśniewski (2) himself fully shared this opinion: "I used the name "ontology" to characterize the theory which I was developing without offence to my "linguistic instincts" because I was formulating in that theory a certain kind of "general principles of existence" (3).

Both quotations suggest looking at Leśniewski's ontology (hereafter LO) for insights for philosophical ontology. This is precisely what I would like to do in this paper (4).

That Leśniewski's logical systems have interesting applications in philosophy has already been pointed out by several authors. For example:

-- Lejewski's (5) works about multicategorical and unicategorical languages and ontologies. In particular, Lejewski shows how Leśniewski's ideas help in speaking on non-existents without falling into Platonism or Meinongianism;

-- Simon's (6) study on parts and wholes ;

-- Lejewski's and Wolenski's (7) attempts to interpret Kotarbinski's reism by means of LO (8) ;

-- Waragai's (9) formalization of fundamental ontological principles in the framework of LO ;

-- Henry's (10) uses of LO in his reconstructions of medieval logic and semantics.

My concern here is more general. I will try to show how to attack the concept of being by means of Leśniewski's logic. Before going on to do this, however, I would like to make some comments on the relation of Leśniewski's logic to nominalism. The first impression is that mereology is particularly important in this respect. Certainly, this is correct, because mereology formalizes the part/whole relation which is crucial for nominalism. The usual interpretation of mereology provides a formalization of the theory of physical parts in Brentano's sense. Simons (11) shows that one can also obtain a nice mereological interpretation of "being a part in the metaphysical sense". Now there remains the problem of mereology which would be suitable for a theory of logical parts. This is probably equivalent to finding a mereology similar in its expressive power to set theory.

At first glance, both first-order logic and Lo seem to be equally good as logical bases for nominalism. However, this is not the case because, although first-order quantifiers range over individuals, the standard semantics for elementary quantification theory must appeal to sets and relations Leśniewski's Logic and the Concept of Being as referents of predicates. On the other hand, if we take Lejewski's (12) ontological tables as semantic models of nominal phrases in LO, we easily see that all nominal expressions exclusively refer to individual things. Moreover, the identity predicate is definable in elementary ontology, though it must be added as a new primitive to elementary logic or defined by second-order means. Finally, looking at nominalism through "Leśniewskian glasses" we can see that the

metaphysical nature of individuals is not especially important for nominalism. Now it is not especially surprising that Quine's ontology is sometimes qualified as nominalistic Platonism. It is only strange for anybody who thinks about nominalism as a kind of materialism. What Lo shows is that nominalism consists in abandoning general objects, essences common to many individuals and the like. I am not claiming that the marriage of nominalism and Lo secures victory for the former. My intention rather, is to show that Lo helps nominalists much more than does first-order logic." (pp. 94-96)

Stanisław Leśniewski: bibliography in English (A - Ind)

Studies on Leśniewski in English

1. Ajdukiewicz, Kazimierz. 1978. "Syntactic Connexion (1936)." In *The Scientific World Perspective and Other Essays, 1931-1963*, 118-139. Dordrecht: Reidel.

First published in German as: Die syntaktische Konnexität, *Studia Philosophica*, 1, 1935, pp. 1-27.

"The discovery of the antinomies, and the method of their resolution, have made problems of linguistic syntax the most important problems of logic (provided this word is understood in a sense that also includes metatheoretical considerations). Among these problems that of syntactic connexion is of the greatest importance for logic. It is concerned with the specification of the conditions under which a word pattern, constituted of meaningful words, forms an expression which itself has a unified meaning (constituted, to be sure, by the meaning of the single words belonging to it). A word pattern of this kind is syntactically connected.

The word pattern 'John loves Ann', for instance, is composed of words of the English language in syntactic connexion, and is a significant expression in English. However, the expression 'perhaps horse if will however shine' is constructed of meaningful English words, but lacks syntactic connexion, and does not belong to the meaningful expressions of the English language.

There are several solutions to this problem of syntactic connexion. Russell's theory of types, for example, offers a

solution. But a particularly elegant and simple way of grasping the concept of syntactic connexion is offered by the theory of semantic categories developed by Professor Stanisław Leśniewski.

We shall base our work here on the relevant results of Leśniewski,(1) adding on our part a symbolism, in principle applicable to almost all languages, which makes it possible to formally define and examine the syntactic connexion of a word pattern.

Both the concept and the term 'semantic category' (*Bedeutungskategorie*) were first introduced by Husserl.(2)" (p. 118)

(...)

(1) Stanisław Leśniewski, *Grundziige eines neuen Systems der Grundlagen der Mathematik*. (Reprinted from *Fundamenta Mathematicae* 14 (Warsaw, 1929), pp. 13 ff., 67 ff.) We borrow from Leśniewski only the basic idea of semantic categories and their type.

Leśniewski cannot be held responsible for the wording of the definitions and explanations we offer, nor for the details of the content we assign to this term, since his definitions are not general, but apply only to his special symbolism, in a quite distinct, highly precise, and purely structural sense.

(2) 2 Edmund Husserl, *Logische Untersuchungen*, vol. ii, part I (2nd. rev. ed. Halle/S., 1913), pp. 294, 295, 305-12, 316-21, 326-42.

2. ——. 1978. "On the Notion of Existence. Some Remarks Connected with the Problem of Idealism (1949)." In *The Scientific World Perspective and Other Essays, 1931-1963*, 209-221. Dordrecht: Reidel.

First published in *Studia Philosophica* IV (1949/50).

"I wish to discuss in the present article two notions of existence, namely, the notion of real existence and that of intentional existence. The results obtained I propose to apply to the interpretation of the idealistic thesis which denies real

existence to things we encounter in nature according them only an intentional existence, and to base on this interpretation a criticism of this thesis.

The term 'exists' occurs in logical systems in which it is precisely defined.

Such a definition has been given by Russell and Whitehead and also by Leśniewski. Russell's definition is formulated in a manner which allows to apply the term 'exists' only to symbols of classes, relations and descriptions, but its application to proper names is not admissible. This means that an expression consisting of the term 'exists' and a proper name has, in Russell's system, no meaning at all. Leśniewski in whose calculus of names, called Ontology(1) , proper names belong to the same syntactical category as common names, defines the term 'exists' in such a way that every sentence in which the term 'exists' is conjoined with an arbitrary name, irrespective of whether this is a proper name, a class name, or a description, has a definite meaning.

For this reason, as well as because Leśniewski's definition seems closer to everyday language and is better known in Poland, we shall base our considerations on his definition of 'existence'. (p. 209)

(1) Stanisław Leśniewski, *Über die Grundlagen der Ontologie*, Comptes rendus des séances de la Soc. Sci. Lett. Varsovie, Classe III, 23, 111 ~ 132.

3. Apostel, Leo. 1960. "Logic and Ontology." *Logique et Analyse* no. 3:202-225.

"Let us finally examine the fact that for certain logicians, logic was ontology. This was the case for Leśniewski and for Heinrich Scholz (deeply influenced by Leśniewski in this respect). Here the science of logic has quite explicitly as its object the study of certain very general laws of being. In the not well known work of Heinrich Scholz *Die Metaphysik als Strenge Wissenschaft* and in a famous paper by Leśniewski *Über die Grundlagen der Ontologie* (Comptes rendus des Séances de la Société des Sciences et des Lettres de Varsovie, classe III, 1930), these

opinions have been expressed. Recently they have been clearly explained and analysed by Czesław Lejewski in *Logic and Existence* (*British Journal for the Philosophy of Science*, 1954-1955, p. 104-119) and in *On Leśniewski's ontology* (December 1958, *Ratio*). It will perhaps astonish the reader that we examine such a very divergent view in this context. The reason however is that the definition of existence we meet in Leśniewski's *Ontology* (we regret not to have been able to consult Prof. Scholz'book) is extremely close to the definitions we have been studying." (pp. 213-214)

4. Asenjo, F. G. 1977. "Leśniewski's Work and Nonclassical Set Theories." *Studia Logica* no. 36:249-255.

"I. The heuristic value of Leśniewski's mereology

This is the thesis to be upheld. Leśniewski's conception of collective class and of the relationships between parts and wholes is not an idiosyncratic aberration that leads away from sound classical ideas but is, rather, an open door to a world of fresh, alternative ways of looking at the notion of aggregate. Since axiomatic set theory is by no means a closed book and is still today under intensive examination particularly stimulated by Cohen's results on the continuum problem every approach to the idea of aggregate that helps free the mind from traveling well-worn grooves should be welcome indeed. From this point of view, it is a disservice to Leśniewski's originality of outlook to interpret mereology as a Boolean algebra without a zero. Although legitimate from other viewpoints, here such an interpretation would hide more than it reveals. Further, in attempting to pursue the ramifications of Leśniewski's mereology it does not help to add individual atoms to his theory in order to force it into line with current set-theoretic conceptions. The fact that Leśniewski was not trapped by prevailing atomistic prejudices is very much to his credit; this was definitely an intended position on his part at the time of mereology's inception, not an omission, even if later on his feelings about the proper role of individuals may have been less assertive if that is really so." (p. 249)

5. Badejo, O. O. 2011. "Bivalence, Classical Logic and the Problem of Contingent Statements." *Lagos Notes and Records* no. 17:27-46.

Abstract: "The main objective of this paper is to argue that the principle of bivalence is right, contrary to the view of some philosophers. To fulfil this objective, the paper examined some arguments raised in Philosophy of Logic about the principle of bivalence starting from Aristotle's challenge to the principle of bivalence based on the idea that the principle cannot accommodate contingent statements. The paper examined Lukasiewicz's challenge of the principle of bivalence and Leśniewski's response to him. The paper evaluated these debates, in Philosophy of Logic, to determine if the principle of bivalence should be rejected. The paper employed the methods of logic. The study showed that the principle of bivalence had been misunderstood by some of the most influential proponents of many-valued logic, for example, Łukasiewicz. It was established that the terms true (or false), in the arguments against bivalence, was used in an epistemic sense and not a logical sense. It was established that contrary to Aristotle's and Lukasiewicz's assumption, contingent statements were necessarily either true or false; hence, the principle of bivalence could accommodate contingent statements. The paper concluded that the principle of bivalence is not in any way limited; it is the core of logic; Furthermore, there may be no conflict between the principle of bivalence and other systems of logic that are not strictly bivalent, if their justification does not rely on a rejection of the principle of bivalence."

6. Bar-Hillel, Yehoshua. 1960. "On categorical and phase structure grammars." *The Bulletin of the Research Council of Israel* no. 9F:1-16.

Reprinted as Chapter 8 in Y. Bar-Hillel, *Language and Information: Selected Essays on their Theory and Application*, Chichester: Addison-Wesley 1964, pp. 99-115.

"The present chapter is dedicated to a study of certain more complex types of grammars discussed by Chomsky, which we call *simple phrase structure grammars* (SPGs), and their

relation to what we propose to call *categorial grammars* (CGs), certain types of which were discussed by Leśniewski [88], Ajdukiewicz [1] and in Chapters 5 and 6.

The plan of this chapter is as follows. In Section 1, the historical background of these grammar types is sketched. In Section 2, the basic concepts to be discussed in this chapter are introduced. Section 3 contains the proof of the main result of the chapter, viz. the equivalence between SPGs and various kinds of CGs. As a corollary, these kinds of CGs are shown to be equivalent to each other. Section 4 contains a short remark on the adequacy of SPGs for representations of natural languages.

In the next chapter, we shall study the behavior of SPGs under Boolean operations and the relation between SPGs and finite automata; there we shall also deal with various decision problems connected with SPGs.

1. Historical survey

The Polish logician St. Leśniewski [88] introduced his theory of semantical categories for certain logico-philosophical reasons, under the impact of Husserl's *Bedeutungskategorien* on the one hand and Bertrand Russell's logical types on the other. However, this theory remained almost unnoticed outside of Poland until, in 1935, K. Ajdukiewicz [1] presented a more generally accessible version of it. In its full rigor, it was meant to apply not so much to natural languages as to artificial language systems and among these more specifically to those written in the so-called Polish (parenthesis-free) notation, i.e., the notation in which the operators (or functors) are always written to the immediate left of their arguments.

This notation allows us, for instance, to distinguish without the use of parentheses between arithmetical expressions which in the ordinary notation are distinguishable only by the use of parentheses. Instead of $(a + b) - c$ and $a + (b - c)$, for instance, the Polish notation has $- + abc$ and $+ a:be$, respectively." (pp. 99-100)

7. Belnap, Nuel. 1993. "On Rigorous Definitions." *Philosophical Studies: An International Journal for Philosophy in the Analytic Tradition* no. 72:115-146.

"Definitions are crucial for every serious discipline.(1) Here I consider them only in the sense of explanations of the meanings of words or other bits of language. (I use "explanation" as a word from common speech, with no philosophical encumbrances.) As a further limitation I consider definitions only in terms of well-understood forms of rigor. Prominent on the agenda will be the two standard "criteria" - eliminability and conservativeness - and the standard "rules". There is, alas, hardly any literature on this topic. The discussion will therefore be preliminary, all too elementary, and imperfectly plain." (p. 115)

(...)

"*History*. The standard theory of definitions seems to be due to Leśniewski, who modeled his "directives" on the work of Frege, but I cannot tell you where to find a history of its development. The standard citation seems to be Leśniewski 1931; see also Leśniewski 1981 (*Collected works*). I learned most of the theory first from Suppes 1957, who credits Leśniewski (p. 153, note). There should have been mini-histories in either Church 1956 or Curry 1963, but I couldn't find what I was looking for. The matter was well understood by Frege (e.g. in Frege 1964), Couturat (see Couturat 1905), Carnap (e.g. in Carnap 1937) and Tarski (see e.g. Tarski 1941 for some well-chosen elementary words). Tarski himself contributed heavily to the theory, as evidenced in the material translated and reprinted in Tarski 1956. There Tarski gives the dates and circumstances of his own early contributions in the 20s and 30s. But no one of these lays out an account of the history of the matter in its beginnings. The standard histories of logic (Bochenski 1956, Kneale and

Kneale 1962) do not discuss modern theories of definition. Neither does Kneebone 1963. Neither does Church's article on "definition" in Runes 1962. The 207-page book Robinson 1950 neither discusses the technical theory nor refers to its history (though there is some reference to the history of nontechnical discussions). The definition article in *The Encyclopedia of Philosophy* (1967) [*] does not even mention Leśniewski. The only useful general references I happen to know are the definition article in the *Dictionary of Logic*, Marciszewski 1981, and some penetrating paragraphs and authoritative citations in Luschei 1962 (see especially pp. 36-37 and nn. 34 and 78)." (pp. 117-118)

(1 Thank to A. Gupta and J. Tappenden for many-sided help.

8. Betti, Arianna. 1998. "De veritate: Another Chapter. The Bolzano-Leśniewski Connection." In *The Lvov-Warsaw School and Contemporary Philosophy*, edited by Kijania-Placek, Katarzyna and Wolenski, Jan, 115-137. Dordrecht: Kluwer.

"In 'De Veritate: Austro-Polish contributions to the theory of truth from Brentano to Tarski' Jan Wolenski and Peter M. Simons related an intriguing story of the "Austro-Polish obsession with truth".(1) Woleński and Simons mention the Bohemian philosopher Bernard Bolzano several times, with particular reference to absoluteness and sempiternity of truth in Twardowski and Leśniewski.

(...)

In the following I wish to point out three issues. First, in the so-called prelogistic writings the early Leśniewski defines truth of sentences in such a way that truth conditions are the same - *mutatis mutandis* - as Bolzano's.

Secondly, from this point of view the links between the early and the late Leśniewski, in this case between some parts of his early writings and some aspects of Ontology, are closer than they are commonly believed to be. Thirdly, in this perspective it can be shown that some of Bolzano's views come near to Leśniewski's Ontology. In discussing Bolzano's views I shall mostly follow Casari's reading of Bolzano's *Wissenschaftslehre*. The works of Leśniewski with which I am concerned are essentially 'An Attempt at a Proof of the Ontological Principle of Contradiction' (1912) and its Russian version published in *Logical Studies* (1913), the translation-revision by Leśniewski himself of the 'Attempt' and of his first article, 'A Contribution to the Analysis of Existential Propositions' (1911).(4)" (p. 115)

9. ———. 2004. "Leśniewski's Early Liar, Tarski and Natural Language." *Annals of Pure and Applied Logic* no. 127:267-287.

Abstract: "This paper is a contribution to the reconstruction of Tarski's semantic background in the light of the ideas of his master, Stanisław Leśniewski. Although in his 1933 monograph Tarski credits Leśniewski with crucial negative results on the semantics of natural language, the conceptual relationship between the two logicians has never been investigated in a thorough manner. This paper shows that it was not Tarski, but Leśniewski who first avowed the impossibility of giving a satisfactory theory of truth for ordinary language, and the necessity of sanitation of the latter for scientific purposes. In an early article (1913) Leśniewski gave an interesting solution to the Liar Paradox, which, although different from Tarski's in detail, is nevertheless important to Tarski's semantic background. To illustrate this I give an analysis of Leśniewski's solution and of some related aspects of Leśniewski's later thought."

10. ———. 2004. "Łukasiewicz and Leśniewski on Contradiction." *Reports on Philosophy* no. 22:247-271.

"It was in 1911 that Łukasiewicz and Leśniewski met. Leśniewski himself reported that at that time he had read Łukasiewicz's masterpiece *On the Principle of Contradiction in Aristotle* (1910),(1) and, as Lejewski knew from Łukasiewicz, he said he had come to criticize the author.(2) In the same year Leśniewski wrote "An Attempt at a Proof of the Principle of Contradiction", which was published in 1912 on *Przegląd Filozoficzny* and was addressed on the whole against Łukasiewicz's book.(3)

Whereas the role played by the principle of contradiction in the development of Łukasiewicz's ideas is generally speaking correctly underlined, it is not so in Leśniewski's case. Surely the oblivion which covered Leśniewski's early writings prevented the scholars from regarding the issue worthy of inquiry in his philosophy.

Yet the controversy between Leśniewski and Łukasiewicz on the principle of contradiction may be considered quite rightly a touchstone between their very distant philosophical attitudes, which remained that way also later.

It is hard to exaggerate the great weight Łukasiewicz's monograph had in the Polish logico-philosophical scene. Although polemically inspired, Leśniewski did acknowledge the importance of Łukasiewicz's work:

<My> results [...] on the whole oppose the theoretical theses supported by Łukasiewicz [...] But the polemical character <of some passages> should not arouse in the reader the erroneous conviction that I turn

a blind eye to the theoretical value of Łukasiewicz's work, which I regard as one of the most interesting and original of the entire 'philosophical' literature known to me." (p. 247)

• Added in proof. This paper was written in 1996. Until the publication in this issue it has circulated in various versions and forms. Although the bibliography has been updated for the occasion, the paper has not been revised as regards content.

11. ———. 2006. "Sempiternal Truth: The Bolzano-Twardowski-Leśniewski Axis." In *The Lvov-Warsaw School: The New Generation*, edited by Jadacki, Jacek Jusliuz and Pasniczek, Jacek, 371-399. Amsterdam: Rodopi.

In 1913 Stanisław Leśniewski published his article on the sempiternity of truth, "Is Truth Only Eternal or Is It both Eternal and Sempiternal?" (Leśniewski 1913a).¹ The paper, directed against Kotarbinski's "The

Problem of the Existence of the Future" (Kotarbiński 1913), made an important contribution to the debate on the excluded middle current in the Lvov circle in those years.⁽²⁾ The discussion involved at the same time absoluteness, eternity and sempiternity of truth, i.e. truth for ever and truth since ever, and had as ideal reference point Twardowski's "On the So-Called Relative Truths" (1900),⁽³⁾ where the founder of the Lvov-Warsaw School had attacked the relativity of truth. Contrasting Kotarbinski's positions, Leśniewski defended "absolutism," consequently taking sides with Twardowski.⁽⁴⁾ Twardowski had revived Bernard

Bolzano's ideas on the subject, and, mainly thanks to him, these became known in the Lvov-Warsaw School (see, for instance, Jadacki 1993, p. 191). " (p. 371)

(2) To the discussion belonged also Leśniewski (1913b).

(3) See Twardowski (1900), labeled henceforth in the text *Relative Truths*. I should warn the reader that the German translation of the latter omits some parts of the text. See *infra*,

nn. 39, 45. This paper and Twardowski (1911) have finally a good translation by Arthur Szylewicz in Kazimierz Twardowski – On Actions, Products and other Topics in Philosophy, J. Brandl and J. Wolenski (eds.), Rodopi, Atlanta/Amsterdam, 1999, resp. pp. 147-168 and 103-132.

"I have previously discussed in several papers specific Bolzanian elements present in the Polish tradition. This paper will not, for the most part, add anything in particular to that. The new - and rather blunt hypothesis to be put forward here is that, despite appearances, Twardowski also contributed *de facto* to slowing down the reception of Bolzano's most modern logical discoveries. For in Poland Bolzano was to remain one logician among many for rather long. It was chiefly thanks to two factors that Bolzano's star could, slowly, begin to rise in Poland, or, at least, that the fundamental achievements of his logic could be known. One factor is antipsychologistic (more precisely Platonistic) influence coming from Husserl and from Twardowski's student Łukasiewicz. The other factor is the change in the conception of logic which took Polish logic from, say, Sigwart, to Tarski through Leśniewski and Łukasiewicz," (p. 55)

13. ———. 2008. "Polish Axiomatics and its Truth: On Tarski's Lesniewskian Background and the Ajdukiewicz Connection." In *New Essays on Tarski and Philosophy*, edited by Patterson, Douglas, 44-71. New York: Oxford University Press.

"In the first chapter of his monograph Tarski credits Leśniewski with crucial results on the semantics of natural language. As I showed in a previous chapter (Betti 2004), Lesniewski's early

solution to the Liar reveals that it was indeed he who first avowed the impossibility of giving a satisfactory theory of truth for ordinary language, as well as the necessity of sanitation of the latter for scientific purposes. Of Lesniewskian origin were also Tarski's analysis of quotation marks, the idea that truth is language-relative, the notion of a closed language, and the finding that natural language is such a language.

But these are all negative results concerning the semantics of natural language, a diagnosis, if you will. How about the positive results, the medicine? Tarski's own solution to the Liar and the cure he proposes for the illnesses of natural language apparently did not coincide with his master's ultimate remedy—at least, nothing similar to the very idea of Tarski's enterprise can be found in Leśniewski. As Tarski wrote in 1944,

Leśniewski did not anticipate the possibility of a rigorous development of the theory of truth, and still less of a definition of this notion. (1944, 695 note 7)

The reason for this is probably that a Tarski-like theory of truth must have appeared to Leśniewski to offer an insufficiently intuitive solution to the malady of semantic antinomy. But in what sense exactly? A proper answer is still missing. Lack of textual evidence is one reason, but another, equally important reason is that, from a broader point of view, we also do not yet know enough about the specific cultural context in

which the answer must be sought. It is the aim of this chapter to address some aspects of this context." (pp. 44-45)

14. ———. 2009. "Leśniewski's Systems and the Aristotelian Model of Science." In *The Golden Age of Polish Philosophy: Kazimierz Twardowski's Philosophical Legacy*, 93-111. Dordrecht: Springer.

"The systems of Lessniewski, like Frege's, have an unmistakably old-fashioned flavour.

They stand to, say, post-Tarskian, post-Gödelian, post-Hilbertian logic like traditional peasant Tuscan bread soup stands to molecular fusion kitchen. Why is that?

According to suggestions recently put forward, which rely on van Heijenoort's opposition "Logic as Language vs. Logic as Calculus", or similar dichotomies, Lesniewski's attitude to logic was similar to Frege's insofar as it matched Frege's "Logic as Language" rather than Boole's and Schröder's "Logic as Calculus".(1) What grounds the old-fashioned aura of Lesniewski's systems, so goes the suggestion, is Lesniewski's adherence to the "Logic as Language" paradigm.

Is this correct? In introducing his opposition, van Heijenoort builds on a remark by Frege on the *Begriffsschrift* as a system embodying two Leibnizian ideals that are in fact not opposed: *lingua characteristic*a and *calculus ratiocinator* (van Heijenoort 1967: 233). But van Heijenoort's dichotomy remains very sketchy, so sketchy that one does not seem to get very far by applying it. Two things can be done to save its gist. One is beefin it up. This was done by Jaakko Hintikka in his refurbished *Language as Universal Medium vs. Language as Calculus*. The other option is tracing the source of van Heijenoort's opposition in the history of

philosophy, and go back, if at all possible, where it all started. In this paper I shall go for the latter. I shall leave for another occasion an account of why I think this is a much more fruitful option than Hintikka's. For my purposes here it will suffice to show that there is another way to account for Lesniewski's conservatism, a way that makes appeal to a millennia-old

recipe for building proper deductive systems: a venerable model of scientific rationality to which I will refer in what follows as *The Aristotelian Model of Science*. The main purpose of this paper is to illustrate, then, that Lesniewski's systems follow this model closely." (p. 93)

Abstract: "Leśniewski's systems deviate greatly from standard logic in some basic features. The deviant aspects are rather well known, and often cited among the reasons why Leśniewski's work enjoys little recognition. This paper is an attempt to explain why those aspects should be there at all. Leśniewski built his systems inspired by a dream close to Leibniz's *characteristica universalis*: a perfect system of deductive theories encoding our knowledge of the world, based on a perfect language. My main claim is that Leśniewski built his *characteristica universalis* following the conditions of de Jong and Betti's Classical Model of Science (2008) to an astounding degree.

While showing this I give an overview of the architecture of Leśniewski's systems and of their fundamental characteristics. I

suggest among others that the aesthetic constraints Leśniewski put on axioms and primitive terms have epistemological relevance."

16. ———. 2014. "Leśniewski, Tarski and the Axioms of Mereology." In *The History and Philosophy of Polish Logic: Essays in Honour of Jan Woleński*, edited by Mulligan, Kevin, Kijania-Placek, Katarzyna and Placek, Tomasz, 242-258. New York: Palgrave Macmillan.

"Alongside a respect for philosophically informed formal work and an interest in all things Polish, Jan Woleński and I share a profound admiration for Leśniewski's oeuvre. As Jan once told me, you can work on Leśniewski for your whole life. Indeed so. Eighteen years after I first met him, on a morning in late March at a bus stop in Sucha Bezkidzka, Southern Poland, here's a story about the axioms of Leśniewski's mereology, and Tarski's complicated role in it.

This story is for Jan." (p. 242)

17. Blass, Andreas. 1994. "A faithful modal interpretation of propositional ontology." *Mathematica Japonica* no. 40:217-223.

"Inoué [2] gave an interpretation of Ishimoto' propositional ontology [3] in the modal logic \mathbf{K} . (The terminology used here will be defined below). He showed that his interpretation is not faithful in general although it is for a restricted class of formulas. In this note we present another interpretation of propositional ontology in \mathbf{K} and we show that it is faithful.

In Section 1, we provide some known background information about Leśniewski's ontology and certain fragments of it. We include more in this section than is strictly needed in what follows in order to place propositional ontology in its proper

context. Section 2 contains the definitions of propositional ontology and **K**, and a discussion of their models. In Section 3, we describe our interpretation, compare it with Inoué's and prove its correctness.

Finally, Section 4 contains the proof that this interpretation is faithful." (p. 217)

Reprinted in Albert Menne (ed.), *Logic-Philosophical Studies*, Dordrecht: Reidel 1962, pp. 67-87.

"The theory of the syntactical categories (abridged here as 'SCs') has, since the twelfth century, been a traditional part of Scholastic logic. As a matter of fact we owe the idea to Aristotle. (1) After the barbarous period which for logic constitutes the modern centuries (sixteenth century-1847), the first new logicians showed hardly any interest in it. Husserl was the first to outline at the beginning of our century a sketch of a theory of SCS.(2)

Nearly thirty years later, St. Leśniewski elaborated a rigorous system of it(3) - but the present author knows only of one general study on that subject in existence, a paper by Professor K. Ajdukiewicz.(4) It would

seem that in spite of the brilliant development of other parts pertaining to the logical syntax, recent logicians are apt to neglect somewhat the problems of the SC.(5)" (p. 67)

(1) *On Interpretation* 1-5. 16a1-17a24. This is the first known attempt to classify the SCs; some remarks contained in that part of the works of Aristotle are still unsurpassed, e.g., the definition of a symbol, involved in 16a 2aif., the definition of a sentence, 17a 3ff. etc. There is no doubt that the Scholastics

have greatly developed the Aristotelian syntax. But - as is generally the case in the entire domain of Scholastic logic - we have no information about it, since there does not exist a single satisfactory study on it.

(2) *Logische Untersuchungen* (Halle an der Salle, 1913) II, 294, pp. 305f; pp. 316f. pp. 326f. Husserl calls them 'Bedeutungskategorien' i.e., categories of meaning.

(3) Grundzüge eines neuen Systems der Grundlagen der Mathematik, *Fundamenta Mathematicae*, 11 (1929), 13f., 67f. It is unfortunate that St. Leśniewski (1885-1939) who was considered the most eminent Polish logician, died without having published more than a small part of the results of his research. Moreover, even those papers which have been published are seldom read or used.

(4) Die syntaktische Konnexität, *Studia Philosophica, Commentarii Societatis Philosophicae Polonorum* 1 (1935), pp. 1-28.

(5) The matter has been, of course, often mentioned and several definitions concerning it have been stated. Cf. e.g. A. Tarski, Der Wahrheitsbegriff in den formalisierten Sprachen, *Studia Philosophica*, 1, 261-406; R. Carnap, *Introduction to Semantics* (3rd ed., Cambridge, Mass., 1948), p. 43. Also the Grammarians have studied the subject, e.g. o. Petersen, *The Philosophy of Grammar* (London, 1924), pp. 96lf.

(...)

"The object of the present paper is to develop further the main ideas proposed by Professor Ajdukiewicz(2) by drawing a sketch of such a theory and applying it to some logical and ontological problems. The

method will be a rather informal one; the reader is presumed to know the symbolism and the technique of elementary mathematical logic(3); more complex notions will be shortly explained." (p. 68)

(2) The main ideas explained in I, 1-3 and I, 1 are derived from this important paper, (quoted in footnote 4 on page 67). However, Professor Ajdukiewicz also speaks of semantical, not of syntactical categories; and for the formulation of the definitions and laws the author of the present paper is alone responsible.

19. Bochman, Alexander. 1990. "Mereology as a theory of part-whole." *Logique et Analyse* no. 129-130:76-101.

"Mereology is now a widely known general name for various theories concerning part-whole relationships (see Simons [13]). The notions of part and whole are highly placed among philosophical concepts and they have been regarded as an important area of philosophical investigation from the time of Aristotle, who gave us the first systematic attempt to explore and employ these notions. Despite much attention given to this area since then, the first formal theory of the part-whole relation, called mereology, was developed only at the beginning of our century by the Polish logician and philosopher Stanisław Leśniewski.." (p. 75)

(...)

"Contemporaneously with Leśniewski, Alfred North Whitehead was developing a philosophical theory, which used some means similar to that of mereology (see Whitehead [15,16,17]). One of his aims was to build a

theory of space and time which would not be based on the notion of point (resp., instant) as a primitive. In order to define points in terms of extended regions, Whitehead proposed his 'method of extensive abstraction', according to which points are defined roughly as chains of infinitely converging regions, ordered by the relation of being part." (p. 76)

(...)

"As will be clear, the theory proposed below has much in common with Aristotle's views described above and hence could be regarded in some respects as their restoration(1). However, the proposed theory is intended to cover not only continuous structures, but discrete 'wholes' as well." (p. 78)

"In the abstract of his recent article (4) Rafa l Urbaniak announces:

We present an algorithm which allows to define any possible sentence-formative functor of Lesniewski's Elementary Ontology (LEO), arguments of which belong to the category of names.

Other results are: a recursive method of listing possible functors, a method of indicating the number of possible n-place ontological functors, and a sketch of a proof that Lesniewski's Elementary Ontology is functionally complete with respect to $\{\wedge, \neg, \vee, \text{"}\}$.

Our claim is the author presented neither a correct algorithm, nor a correct method for intended tasks the sketch being just sketchy and therefore hard to judge. Still, if we were to base the proof on the faulty results

we could obtain wrong conclusions." (p 249)

22. ———. 1969. "Leśniewski's terminological explanations as recursive concepts." *Notre Dame Journal of Formal Logic* no. 10:337-369.

"In 1929 Leśniewski published terminological explanations for his system of logic [5] where he used certain concepts from his system of mereology along with others such as equiformity. In [1] Peano's axioms

for arithmetic are shown to be derivable in Leśniewski's system of ontology extended by an axiom of infinity. In that exposition use is made of a numerical epsilon, first defined in [2], in order to provide a characteristically ontological model for the natural numbers. It is shown there that analogues for the axiom, rule of extensionality, and rule of definition for the primitive epsilon (ϵ) of ontology are derivable for the numerical epsilon (ϵ_∞).

Thus, one has available for the numerical epsilon analogues of every thesis of ontology involving the primitive epsilon.

The numerical epsilon serves in this paper to reduce Leśniewski's terminological explanations to numerical concepts. That is, each terminological concept is shown to be definable as a numerical concept within

ontology extended by an axiom of infinity. Since the definitions to be given are recursive, the incompleteness of this extension of ontology is readily established." (p. 337)

23. ———. 1969. "Ontology: Leśniewski's Logical Language." *Foundations of Language* no. 5:455-469.

Reprinted in Jan T. J. Srzednicki, V, F, Rickey (eds.), *Leśniewski's Systems: Ontology and Mereology*, The Hague: Martinus Nijhoff 1984, pp. 158-163.

"Leśniewski's system of ontology developed out of his investigations of the logical paradoxes which were of concern to logicians at the beginning of this century. In discussing Russell's paradox, he distinguished collective and distributive uses of nouns in a manner not unlike that of the medieval theory of supposition. Roughly speaking, he attributed the existence of the syntactic paradoxes, at least in part, to the failure to treat separately the uses he distinguished. His objection can be paraphrased by maintaining that the existence of paradoxes in Frege, for instance, can be traced to his axioms about classes which assert some of the properties of classes where 'class' is taken by Frege in a distributive sense and some of the properties of classes where 'class' is taken in a collective sense.(1) After his investigation of the paradoxes, Leśniewski developed a theory of collective classes which he eventually called mereology. In his expositions of this system, certain nouns and nominal phrases were clearly indicated as collective, but their logic was couched in a language which employed nouns in a distributive sense. That is, in formally presenting the logic of collective classes, Leśniewski relied on a theory of distributive predication which for a time lacked any formal exposition of its own. In the interest of making his investigations precise, Leśniewski then developed his theory of distributive predication which he called ontology. If, following Leśniewski's analysis of propositions about individuals, one maintains that such propositions are composed of a subject, copula and predicate, then his theory is captured by asserting that any proposition about an individual subject is true only if the subject of the proposition is unique and unempty, while the copula of the proposition is transitive." (p. 158 of the reprint)

(1) Sobocinski [1949-1950].

(...)

"Leśniewski's ontology remains an early source of a language whose terminology is thoroughly explained; whose coherence is

contextually determinate and unambiguous; whose type theory adheres closely to categories which must be recognized in ordinary language; and whose directives for development mirror the contextually determinate development that is to be expected of a vehicle for communication." (p. 163 of the reprint)

24. ———. 1969. "The numerical epsilon." *Notre Dame Journal of Formal Logic* no. 10:47-63.

"In this paper* Leśniewski's system of ontology extended by an axiom of infinity is used to derive Peano's arithmetic. Section 1 gives the main theses of this derivation which parallels the work of [6]. Using the

numerical epsilon, defined in section 2, Peano's arithmetic is given a characteristically ontological model in section 3. Thus, the paper provides, for Peano's arithmetic, the two ways of treating logical concepts in

ontology, the one, protothetical (section 1), the other, ontological (section 3)." (p. 47, a note omitted)

(...)

"Finally, having supplied an ontological model for Peano's arithmetic in ontology (extended by an axiom of infinity), the incompleteness of this system will follow, if its directives are recursive. In this respect, the

numerical epsilon proves very useful. The directives for ontology were given by Leśniewski [3] in a list of terminological explanations which are developed by employing his mereological concepts. Now, the numerical epsilon provides an efficient means of modeling Leśniewski's original terminological explanations in Peano's arithmetic as given in section 3, thus showing the applicability of Gödel's incompleteness result to ontology.

The details of this work are left for another paper." (p. 62)

"It was one of Brentano's central ideas that all judgements are at bottom existential. In his *Psychology from an Empirical Standpoint* he tried to show how all traditionally acknowledged judgement forms could be reinterpreted as existential statements. Existential propositions, therefore, were a central concern for the whole Brentano School. Kazimierz Twardowski, who also accepted this program (Twardowski 1894, 15f., 25), introduced the problem of the existential reduction to his Polish students, but not all of them found this idea plausible. In 1911 Stanisław Leśniewski published a paper under the title "A Contribution to the Analysis of Existential Propositions" where he criticised Brentano's translation. According to Leśniewski the consequences of Brentano's program would be absurd because according to Leśniewski all positive existential propositions are analytically true and all negative ones are contradictory. In his later works Leśniewski repudiated all his early writings (1911–1914) as philosophically immature and formally imprecise. "[...] I regret that they have appeared in print," he writes, "and formally 'repudiate' them herewith [...]" (Leśniewski 1927–31, 198) But in spite of this severe assessment, these early papers are worth considering not only from a historical standpoint. As we will see, Leśniewski's critique of Brentano is unsound, but it casts an interesting light

on his understanding of certain basic metaphysical concepts."

"Although Aristotle (*Metaphysics*, Book IV, Chapter 2) was perhaps the first person to consider the part-whole relationship to be a proper subject matter for philosophic inquiry, the Polish logician Stanisław Leśniewski [15] is generally given credit for the first formal treatment of the subject matter in his Mereology.(1) Woodger [30] and Tarski [24] made use of a specific adaptation of Leśniewski's work as a basis for a formal theory of physical things and their parts. The term 'calculus of individuals' was introduced by

Leonard and Goodman [14] in their presentation of a system very similar to Tarski's adaptation of Leśniewski's Mereology. Contemporaneously with Leśniewski's development of his Mereology, Whitehead [27] and [28] was developing a theory of extensive abstraction based on the two-place predicate, 'x extends over y' which is the converse of 'x is a part of y'. This system, according to Russell [22], was to have been the fourth volume of their *Principia Mathematica*, the never-published volume on geometry. Both Leśniewski [15] and Tarski [25] have recognized the similarities between Whitehead's early work and Leśniewski's Mereology. Between the publication of Whitehead's early work and the publication of *Process and Reality* [29], Theodore de Laguna [7] published a suggestive

alternative basis for Whitehead's theory. This led Whitehead, in *Process and Reality*, to publish a revised form of his theory based on the two-place predicate, 'x is extensionally connected with y'. It is the purpose of this paper to present a calculus of individuals based on this new Whiteheadian primitive predicate." (p. 204)

29. Clay, Robert F. 1965. "The relation of weakly discrete to set and equinumerosity in mereology." *Notre Dame Journal of Formal Logic* no. 5:325-340.

"This paper deals with a formal system introduced by Leśniewski called mereology, in which, as the name implies, the concept of "party of the whole" is primitive. This system studies the properties of the collective class. Mereology is based on ontology, a formal system in which "is" is the primitive term. Ontology in turn is based on protothetic or on propositional calculus and quantification theory.

The collective class differs greatly from the distributive class. However, under the condition, "the *a*'s are weakly discrete", which we introduce, the collective class of the *a*'s and the distributive class of the *a*'s become alike with respect to equinumerosity. We are thus able to prove the analogs of three important set-theoretic theorems under this condition.

Two of these were previously known for the condition, "the *a*'s are discrete", but the third is an entirely new theorem.

We then prove that for a certain class of statements dealing primarily with equinumerosity, discrete and weakly discrete are inferentially equivalent." (p. 325)

"It is known that Leśniewski constructed an interpretation of mereology in the real number system using binary expansions. (2) Unfortunately, this construction is no longer extant. The following paper, except for a slight variation, is an attempt to reconstruct this interpretation. Leśniewski probably considered sequences of 0's and 1's (except for the sequence of all 0's) and defined a first sequence as an element of the second if every place in which the first has a 1, so also does the second. Since some real numbers have two binary expansions, one must then construct a one-to-one function from the sequence of 0's and 1's onto the real numbers. Then the definition of element must be carried over to the real numbers by means of the function constructed. We shall eliminate the necessity for the function by considering decimal expansions of 0's and 1's (except for the expansion consisting only of 0's). We thus rule out expansions with all but a finite number of 9's and so no two expansions of the type we use give rise to the same real number. Our interpretation is thus constructed from a proper subset of the real numbers as opposed to Leśniewski's which used the whole set. This distinction is irrelevant to the matter of consistency. We shall consider the real number system as introduced by an axiom system within the framework of ontology. The real numbers are thus objects in ontology. Now if this system composed of the axioms and rules of ontology together with the axioms for the real numbers is consistent, then mereology is consistent. Note that this model does not restrict the rules of procedure to the basic semantical category so that the interpretation we are about to construct is an interpretation in the full sense of the word." 33. ———. 1971. "A model for Leśniewski's mereology in functions." *Notre Dame Journal of Formal Logic* no. 12:467-478.

"Introduction.

Mereology, it may be recalled, is Leśniewski's system consisting of:

- (1) A system of propositional logic, upon which is based
- (2) A system for characterizing the meaning of 'is', upon which is based
- (3) A system for characterizing the relation of 'part' to the 'whole'.

The partial system of mereology consisting of just (1) is called protothetic. The partial system consisting of (1) and (2) is called ontology.

Up to now, the models of mereology that have been constructed have given an interpretation for the terms 'part' and 'whole' of (3) but have left the term 'is' of (2) uninterpreted (see [3]). In this paper we give the first model for mereology in which 'is*' is interpreted as well. In other words, based on ontology, we have a model of mereology that includes a model of ontology." (p. 467)

Reprinted in Jan T. J. Srzednicki, V, F, Rickey (eds.), *Leśniewski's Systems: Ontology and Mereology*, The Hague: Martinus Nijhoff 1984, pp. 241-252.

"It has been stated in Tarski [1956] and 'proved' in Grzegorzcyk [1955] that:

(A) The models of mereology and the models of complete Boolean algebra with zero deleted(1) are identical.

Proved has been put in quotes, not because Grzegorzcyk's proof is faulty but because the system he describes as mereology is in fact not Leśniewski's mereology." (p. 241 of the reprint)

(...)

"Since cardinality is primarily a distributive notion, one's intuition should not be violated if the collective class cannot describe it.

Since Leśniewski's mereology includes protothetic and ontology and Boolean algebra is usually given some other logical base, statement (A) needs to be put into a precise context. There is also need for a formal

definition of complete Boolean algebra with zero deleted. Since statement (A) is in some sense not completely true, we break it up into the following two statements:

- (1) Mereology is a complete Boolean algebra with zero deleted.
- (2) Complete Boolean algebra with zero deleted is a mereology.

'We shall present two alternative ways of introducing partial ordering into Leśniewski's logic and show that in order for (2) to hold we must be unreasonably restrictive in our definition of complete Boolean algebra with zero deleted.' (p. 242 of the reprint)

(1) Deleting zero from a Boolean algebra results in a system without a zero except in the case when the Boolean algebra has exactly two elements.

Open Access Master's Theses Paper 1547.

"Stanisław Leśniewski (1886-1939) is called a nominalist, even though his published works contain no developed philosophical doctrine. Yet, in order to understand and interpret his logical systems, we must understand his nominalism. This thesis will investigate, in detail, the philosophical origins of the "nominalistic" elements of Leśniewski's logical systems and will offer a characterization of his nominalism.

This thesis will provide a brief historical sketch of Leśniewski's career as a logician and of the times in which his logical systems were developed. A definition of nominalism will be developed within the context of the realist/nominalist debate over the existence of universals and a realists notion of universals will be given as a background against which Leśniewski's philosophical beliefs can be measured. The philosophical origins of Leśniewski's nominalism will be explored and will provide the basis for an

examination of the nominalistic elements of his logical systems and the basis for a characterization of his nominalism.

Leśniewski's nominalism avoids traditional classification and can only be examined indirectly through an analysis of his

logical systems and through his attitude towards Russellian classes. In the final analysis, it is best to say that Leśniewski was a philosopher who created consistent logical systems in which to "talk" about objects."

43. Gessler, Nadine. 2007. "Abstraction and Nominalization in Leśniewski's Ontology." In *Contemporary Perspectives on Logicism and the Foundation of Mathematics*, edited by Joray, Pierre, 63-82. Neuchâtel: Centre de Recherches Semiologiques.

"In this paper I intend to examine certain features that characterize the logicist construction that can be performed within the categorial and expansive framework provided by Leśniewski's Ontology, by putting these features in relation with the question of procedures of abstraction and nominalization. The latter will be placed in the problematic framework of classical logicism, relative to which the treatment of this question acquires all its relevance, given the fully effective resolution that Ontology makes possible." (p. 63)

44. Grzegorzczak, Andrzej. 1955. "The Systems of Leśniewski in Relation to Contemporary Logical Research." *Studia Logica* no. 3:77-95.

"The logical symbolism used by Stanisław Leśniewski (1886-1939), his specific metalogical terminology and the philosophical introductions. to his formal works evoke in his readers the feeling of the peculiarity of the problems with which he deals. The question thus arises : in what relation are Leśniewski's investigations to the whole trend of logical research in the first half of the 20th century ? In the present paper I wish to give a brief answer to this question. Although I do not feel competent to give a proper historical account of Leśniewski's role in the development of logic, I believe that it might be useful to precede a formal logical discussion of his systems by some general historical remarks." (p. 77)

(...)

"To sum up, Leśniewski's investigations in the years 1917 -1927 dealt with problems which interested all logicians; they were of the nature of discoveries and they were not published. In later

years they gradually lost their actuality. Leśniewski's main conceptions, as to which his priority is unquestionable, date back to the first period. These are: the construction of a system of the simple theory of types (called by Leśniewski the system of semantic categories) simultaneously with Chwistek(6) and a philosophical explanation of that system on the basis of an analogy with everyday language; the establishing of the theory of classes (ontology) on the basis of a semantic analysis of the word "is" and thus giving a specific philosophical interpretation to the theory of classes; the construction of a theory grasping the intuitions connected with the word. "part" (mereology); the development of numerous syn.tactical concepts and the construction of many rules of inference which have henceforth become a part of the logical achievements of 20th century, above all the formulation of a rule of definition, the only one that was sufficiently exact; a contribution to the elucidation of several problems which were obscure at the time, such as the differentiation between. language and metalanguage, with Leśniewski's own solutions of all known logical antinomies;(7) and finally numerous critical remarks with regard to contemporary systems of logic. It is a well know fact that Leśniewski obtained all his results starting from his own specific philosophical intuitions. Hence the philosophical foundations of his systems and their philosophical interpretations seem particularly interesting.

We shall not deal here with this aspect of his work and we shall concentrate on comparing Leśniewski's systems with other known systems. As we shall see his systems greatly resemble other systems created independently about the same time or somewhat later." (pp. 79-80)

Leśniewski's Ontology." *Studies in logic, grammar and rhetoric* no. 42:67-78.

Abstract: "This article is an attempt to recreate the intuitions which accompanied Leśniewski when he was creating his calculus of names called Ontology. Although every reconstruction is to some extent an interpretation, and as such may be defective, still, there are reasons justifying such reconstruction. The most important justification is the fact that both Leśniewski and his commentators stressed that ontology originated from reflections about ordinary language, in which sentences such as A is B appear in one of the meanings associated with them in Ontology, and that the users of the Polish language use such sentences accordingly and properly identify them. Assumed it is so, let us try, based on Leśniewski's guidelines as well as comments and elaborations on Ontology (Leśniewski 1992: 364-382, 608-609; Kotarbiński 1929: 227-229; Rickey 1977: 414-229; Simons 1992: 244; Lejewski 1960: 14-29), to evaluate the accuracy of this approach, referring also to certain knowledge of the Polish language. To make it clear, this article is not about Ontology as a formal theory of language. It is solely an attempt to assess whether some syntactical constructs of the Polish language and this language's properties are significant conditions of a proper understanding of Ontology, and whether Ontology is, in fact, in a relationship with the ethnic language of its author."

46. Henry, Desmond Paul. 1964. "Ockham, *suppositio*, and modern logic." *Notre Dame Journal of Formal Logic* no. 5:290-292.

In a discussion (*Philosophical Review*, Jan. 1964) of the alleged difficulties of rendering the *descensus* of Ockham's *suppositio*-doctrine in terms of modern logic, G. B. Matthews is concerned with the inferences corresponding to the following theses:

. 1 If some man is animal, then this man is animal or that man is animal or ...

.2 If all men are animal then each man is either this animal or that animal or ...

.3 If some man is animal then some man is this animal or some man is that animal or ...

A If all men are animal then this man is animal and that man is animal and ...

$$5 (3x)(F_x \cdot G_x) \supset (F_{x_1} \cdot G_{x_1} \cdot \vee F_{x_2} \cdot G_{x_2} \cdot \vee \dots)$$

"The complaint that modern logic cannot analyse certain theses or forms of expression which occur in medieval logic has become a constantly recurring commonplace in the recent histories of logic; the offending items are dismissed as idiosyncratic (e.g. "homo est species"), or even as "nonsense" (as in the case of "All men exist"). The discussion just summarised attempts to diagnose exactly what the reason for this kind of failure amounts to in the cases described. I want to suggest that such complaints and diagnoses are based on an excessively narrow view of what "modern logic" is. After all, if it fails to accommodate itself to innocent little truths like "All men exist", small wonder that the slightly more complex truths of medieval logic should elude it. I shall now demonstrate the narrowness

of the view presupposed by showing the perfectly straightforward analyses of .1, .2, .3, and .4 which are furnished by the Ontology of S. Leśniewski, and which do full justice to Ockham's position. My account is, for the most part, based on C. Lejewski's "On Leśniewski's Ontology" (*Ratio*, Vol. I, No. 2 [1958]), and on conversation with him. This system of course by no means abrogates the perfectly reputable predicate calculus in terms of which the discussion was originally based."

47. ———. 1969. "Leśniewski's Ontology and some medieval logicians." *Notre Dame Journal of Formal Logic* no. 10:324-326.

"In the issue of this journal dated October 1966 (Vol. VII, No. 4, pp. 361-364) Professor John Trentman suggested limitations on my claim that Leśniewski's Ontology is of use in furnishing formal analyses of medieval logical theories, his grounds being that certain medieval theories deny what is called the "two-name theory of predication" allegedly common to Ockham and Ontology. Hence while the work of Ockhamists would be analysable with reference to Ontology, that of those "Thomists" who deny the two-name theory would not. Professor Trentman then goes on to suggest that for such "Thomist" analyses to take place, "something like Frege's functional analysis of predication", is needed to show the "disparity of semantic category that holds between the subject and the predicate", thereby implying that no such form is available in Ontology, and that the allegations about the inadequacy of the two-name theory could have escaped my notice.

Neither of these implications is tenable. Ignoring the second of them, I can deal with the first by exemplifying the manner in which the Ontology in question deals with the relations between names and verbs (i.e. functors which when completed with nominal arguments form propositions)." (p. 324)

48. ———. 1972. *Medieval Logic and Metaphysics: A Modern Introduction*. London: Hutchinson.

"Fortunately it happens that there exists a system of modern formal logic, unfamiliar to many logicians and philosophers, and sometimes misunderstood by others, which allows the investigator to overcome

all of the difficulties stated above, and from the standpoint of which many of the further difficulties which may still be raised can be satisfactorily resolved. This logic is that of the Polish logician S. Leśniewski (1886-1939), a partial account of which may be found in Part II below. This logic is anti-formalist, in that its theorems are interpreted truths, and not mere syntactically-permissible combinations of uninterpreted marks (cf. II §0.00). It has the capacity for the introduction of indefinitely many new parts of speech (semantical categories) and hence can adapt itself to the required degree of exactitude

for the purpose of analysing medieval logic, as Part III will demonstrate. It employs an interpretation of the quantifiers which allows dissociation of the latter from its usually necessary entanglement with the notion of existence (II §2.23, II §2.25), and so is in a position to come to more exact terms with medieval discourse on this topic.

It follows that the purpose of the present work is three-fold. After the preliminary consideration of the field which is contained in this introduction, a practical account of one of the central theories of Leśniewski, namely his Ontology, will be presented in Part II. Thus armed, we will be in a position to expose in detail in Part III some examples of the way in which Ontology may be used in the analysis of medieval themes." (pp. 3-4)

49. Hintze, Henning. 1995. "Merits of Leśniewski type nominalism." *Logic and Logical Philosophy*:101-114.

"For the sake of explaining the merits of a Leśniewski type nominalism, it should be made clear what is meant by „nominalism” and what the characteristics of this special type of nominalism are. To the first question we can find quite a lot of mutually inconsistent answers. Therefore I will just explain the distinction between two different nominalistic traditions which I hold to be fundamental. I think we should not just focus on the question which so-called abstract entities are rejected but as well look for basic entities nominalists rely on." (p. 102)

50. Hiž, Henry. 1984. "Frege, Leśniewski, and Information Semantics on the Resolution of Antinomies." In *Foundations: Logic, Language, and Mathematics*, edited by Leblanc, Hugues, Elliott, Mendelson. and Orenstein, Alex, 51-72. Dordrecht: Reidel.

"Frege sharply distinguished functions from objects. The interplay between the two domains led to serious complications to which many logicians of our century have addressed themselves. Perhaps the time has come to bridge this gap and to this end information semantics is a contribution.

Frege supposed that every function uniquely determines an object which is the value range of the function. He assumed also that functions with the same value range apply to the same objects. As is well known, Frege's postulates led to a contradiction. In order to analyze the problems involved in the antinomial character of Frege's theory, it is advisable to abstract from the intuitive sense of such wordings as 'is the value range of' (or 'is a class of'), and to note the relation by using the arbitrary letter 'a' and to see in it only what is stated in the postulates." (p. 51)

(...)

"In Section 3 and 4, I will report the details of Leśniewski's work. I will abstract from the less popular features of Leśniewski's theories. I will place these formulations entirely in the second-order predicate logic.

Leśniewski wrote a book about antinomies. It was never published and, so far as I know, the only handwritten copy of it vanished in Warsaw in 1944. Sobocinski published an extensive paper reconstructing in detail some of the main ideas and proofs.(5) Sobocinski's paper is my main source." (pp. 51-52)

(5) Bolesław Sobocinski. 'L'analyse de l'antinomie Russellienne par Leśniewski'. *Methodos*, vol. I (1949), pp. 94-107; pp. 220-28; pp. 308-16; vol. II (1950), pp. 237-57.

Sections 2, 3, and 4 of the present paper constitute a restatement of what is in Sobocinski's paper. (Errata to Sobocinski's paper: p. 226, line 2 from the bottom, put a left-hand parenthesis before 'D'; p. 238, line 18, instead of '=' put '='; p. 238, line 24, instead of 'et' put 'est'.)

51. Hodges, Wilfrid. 2008. "Tarski's Theory of Definition." In *New Essays on Tarski and Philosophy*, edited by Patterson, Douglas, 94-132. New York: Oxford University Press.

"This chapter reviews what Alfred Tarski said about the theory of definitions during the years 1926–38. It is not the chapter I was expecting to write. I had believed that Tarski had his own well-formed views on definitions, and that I would be able to collect them together from his papers. Not so: his statements

about central questions in the theory of definitions are often indirect and sometimes frankly careless. By

contrast he was extremely careful about any questions to do with the relationship between object theory and metatheory. So his true interests reveal themselves.

For the theory of definitions, the effect is a little like playing the violin with gloves on—if you can really play well with them on, you must be terrific with them off.

And so the work of Tarski that revolves around definitions, whatever its motives, did have a fundamental effect on our understanding of definitions. One measure of this is that these papers of Tarski are prominent in Robert Vaught's masterly summary [73] of Tarski's contributions to model theory—a part of mathematical logic with definitions close to its heart. Another discipline linked with the theory of definitions is formal semantics; when eventually the history of this discipline is written, Tarski should be named as one of its founders." (p. 94)

In *Automated Reasoning: 11th International Joint Conference, IJCAR 2022 Haifa, Israel, August 8–10, 2022 Proceedings*, edited by Blanchette, Jasmin, Kovács, Laura and Pattinson, Dirk, 541-558. Cham, Switzerland: Springer.

Abstract: "The ontology of Leśniewski is commonly regarded as the most comprehensive calculus of names and the theoretical basis of mereology.

However, ontology was not examined by means of proof-theoretic methods so far. In the paper we provide a characterization of elementary ontology as a sequent calculus satisfying desiderata usually formulated for rules in well-behaved systems in modern structural proof theory. In

particular, the cut elimination theorem is proved and the version of subformula property holds for the cut-free version."

53. ———. 2024. When Epsilon meets Lambda: Extended Leśniewski's Ontology. In *Applications of Logic in Philosophy and the Foundations of Mathematics XXVII*, Szklarska Poręba, Poland.

Abstract: "Leśniewski's ontology LO is an expressive calculus of names. It provides a basis for mereology but allows also for direct formalisation of reasoning in natural languages. Recently its elementary part was characterised by means of the cut-free sequent calculus GO. In this paper we investigate its extended version ELO which introduces lambda terms to represent complex descriptive names. The hierarchy of three systems is formalised in terms of sequent calculi which satisfy cut elimination and the subformula property."

3. ———. 2021. "A Sound Interpretation of Leśniewski's Epsilon in Modal Logic KTB." *Bulletin of the Section of Logic* no. 56:455-463.

"One motive from which I wrote [9] and [10] is that I wished to understand Leśniewski's epsilon ε on the basis of my recognition that Leśniewski's epsilon would be a variant of truth-functional equivalence \equiv . Namely, my original approach to the interpretation of ε was to express the deflection of ε from $=$ in terms of Kripke models. Another (hidden) motive of mine for I^M is to interpret L_1 in intuitionistic logic and bi-modal logic. It is well-known that Leśniewski's epsilon can be interpreted by the Russellian-type

definite description in classical first-order predicate logic with equality (see [12]). Takano [18] proposed a natural set-theoretic interpretation for the epsilon. To repeat, I do not deny the interpretation using the Russellian type definite description and a set-theoretic one. I wish to obtain another interpretation of Leśniewski's epsilon having a more propositional character." (p. 460)

4. ——. 2022. "On Blass Translation for Lesniewski's Propositional Ontology and Modal Logics." *Studia Logica* no. 110:265-289.

Abstract: "In this paper, we shall give another proof of the faithfulness of Blass translation (for short, B-translation) of the propositional fragment L_1 of Lesniewski's ontology in the modal logic \mathbf{K} by means of Hintikka formula. And we extend the result to von Wright type deontic logics, i.e., ten Smiley-Hanson systems of monadic deontic logic. As a result of observing the proofs we shall give general theorems on the faithfulness of B-translation with respect to normal modal logics complete to certain sets of well-known accessibility relations with a restriction that transitivity and symmetry are not set at the same time.

As an application of the theorems, for example, B-translation is faithful for the provability logic \mathbf{PrL} (= \mathbf{GL}), that is, $\mathbf{K} + \Box(\Box\phi \supset \phi) \supset \Box\phi$. The faithfulness also holds for normal modal logics, e.g., \mathbf{KD} , $\mathbf{K4}$, $\mathbf{KD4}$, \mathbf{KB} . We shall conclude this paper with the section of some open problems and conjectures."

5. ——. 2024. Nontrivial single axiom-schemata and their quasi-nontriviality of Leśniewski-Ishimoto's propositional ontology L_1 .

Preprint September 15, 2024 (The 4th version).

Abstract: "On March 8, 1995, was found the following nontrivial single axiom-schemata characteristic of Leśniewski-Ishimoto's propositional ontology L_1 (Inoué [4]).

$(A_{M8}) \in ab \wedge \in cd. \supset .\in aa \wedge \Box cc \wedge (\in bc \supset .\in ad \wedge \in ba).$

In this paper, we shall present the progress about the above axiom-schema from 1995 and conjectures about it. Here we shall give two criteria nontiriviality and quasi-nontriviality in order to distinguish two axiom-schemata. As main results, among others, in §6 - §8, we shall give the simplified axiom-schemata (A_{S_1}), (A_{S_2}) and (A_{S_3N}) based on (A_{M8}), their nontriviality and quasi-nontriviality."

6. Ishimoto, Arata. 1977. "A Propositional Fragment of Leśniewski's Ontology." *Studia Logica* no. 36:285-299.

Abstract: "In spite of a number of expository works Leśniewski's ontology seems to remain unfamiliar in the contemporary logico-philosophical scene.

Among munerous attempts made so far with a view to making this unfamiliar system more familiar and less puzzling there is Prior's [5], in which the author proposes to interpret Leśniewski's ontology as a broadly Russellian theory of classes deprived of the entities of the lowest type, namely, of individuals.

The purpose of the present paper is to pursue the attempt thus initiated by Prior in the above cited paper. More specifically, it will be proved among others that a propositional fragment of Leśniewski's (elementary) ontology represents the broadly Russellian theory of classes with no bound class variables and without any occurrences of free individual variables. This will be established through an embedding of the said fragment into first-order predicate logic with equality by way of a translation suggested by Prior. (For Prior's suggestion refer also to Sagal [6], which offers a criticism of such an attempt.)"

Abstract: "We shall be concerned in this paper with the logical analysis of natural language on the basis of Leśniewski's ontology, which is a logical system without type-distinction between individuals and monadic predicates. This, it is believed, is also one of the features of natural language, and use will be made of this feature for developing a fragment of natural language."

8. ———. 1997. "Logicism revisited in the propositional fragment of Leśniewski's ontology." In *Philosophy of Mathematics Today*, edited by Agazzi, Evandro and Darvas, György, 219-232. Dordrecht: Kluwer.

"Introduction

Although not so popular in the contemporary philosophical and logical scene, logicism dating from Frege and Russell was the first attempt to declare arithmetic as invariantly valid for any model involving an infinite number of individuals.

Now, the purpose of this paper is to locate such an invariance in a more elementary part of logic, namely, a tiny fragment of Leśniewski's ontology, and it will be shown that the fragment to be called L1 is invariant with respect to any model including or not including individual-like names. (The said propositional fragment L1 was introduced by Ishimoto [1977] and has subsequently been elaborated by Kobayashi-Ishimoto [1982], Inoue-Kobayashi-Ishimoto [forthcoming] and others.)" (p. 219)

9. Iwanuś, Bogusław. 1969. "An extension of the traditional logic containing the elementary ontology and the algebra of classes." *Studia Logica* no. 25:97-135.

"In this paper the term "traditional logic" denotes the system of Aristotelian syllogistic - in the axiomatic approach presented by J. Łukasiewicz in the paper [4] - enriched by the nominal negation. Besides the laws of the square of opposition, the law of conversion and the categorical syllogisms there are the laws of obversion, contraposition and inversion of propositions in this system(1).

The paper deals with some axiomatic extension of traditional logic. Its main aim is arriving at a calculus of names in which all of the known laws of the categorical propositions are preserved and which would admit the introduction of notions corresponding semantically to the relation ε (... is ...) of St. Leśniewski's ontology, empty and universal sets and such operations of the algebra of classes as addition, multiplication and subtraction of sets." (p. 97)

10. ———. 1969. "Remarks about syllogistic with negative terms." *Studia Logica* no. 24:131-137.

"The present paper deals with the axiomatic systems of the traditional logic (syllogistic) of I. Thomas, A. Wedberg and C. A. Meredith (see [7]). Besides, a new axiomatic system of the traditional calculus of names is presented here. This system differs - as I know - from all hitherto constructed axiomatic systems of syllogistic. The systems of Thomas, Wedberg and Meredith are based on the two-valued propositional calculus. The Aristotelian "a" (all... are...) and the sign of nominal negation (i.e. negation of nominal arguments) " ' " are primitive terms of the first and second system. The sign of nominal negation and the functor "e", forming universal negative

propositions, are primitive terms of Meredith's system. Each of these three systems has different set of axioms and primitive rules of inference but they are equivalent (see [7], p. 310)." (p. 131)

(...)

"As it has been remarked Wedberg's system contains all laws of the traditional calculus of names. However, Wedberg's set of axioms does not characterize sufficiently the constants of the Aristotelian syllogistic and the sign of nominal negation. In particular - as it has been shown by the example above presented - Wedberg's system does not exclude the interpretation of some categorical propositions which is

not in accordance with the sense of current language or with some known interpretation of these propositions. It seems that Wedberg's system and the equivalent systems of Thomas and Meredith should be strengthened especially by the axioms which exclude the above presented interpretation.

In this paper I attempt to formulate such axioms. The system presented here differs from Wedberg's system among others by the fact that it is based on the first order functional calculus without identity. The number of the axiomatic systems of syllogistic (with nominal negation and without such a negation) is considerable and therefore the construction of new axiomatic system of this kind should be justified." (p. 132)

(...)

"It can be also shown that the whole elementary ontology of S. Leśniewski is a fragment of the system S_2 enriched by the axiom stating that each non-empty set includes a unit subset.
(5)

The detailed discussion of these questions, which lies beyond the limits of this paper, will be presented in my paper "Traditional logic, elementary ontology and the algebra of classes". (p. 136)

(5) This axiom has nearly the same content as the expression α in the paper [10] of A. Tarski (p. 53).

Reprinted in Jan T. J. Szrednicki, V, F, Rickey (eds.), *Leśniewski's Systems: Ontology and Mereology*, The Hague: Martinus Nijhoff 1984, pp. 165-215.

"S. Lesniewtiki's calculus of names, often referred to as ontology, originated in 1920. This system like his other systems, mcreology and protothetics, was constructed with the aim on the one hand of bringing logic closer to the intuitions of natural language and on the other of searching for foundations for mathematics. Leśniewski's ontology, in spite of numerous intuitive and formal advantages and in spite of its considerable expressive potential, has bcen underrated and little known for a long time; although half a century has passed since the construction of the system no precise elaboration of it has yet appeared which takes account of its methodological aspect. This situation seems fundamentally to be due to the fact that Leśniewski published no paper presenting his system in more or less final form. The manuscripts that Lesniewtiki left and which covered the remIts of the years of his investigations into ontology were destroyed during world war II. Nor should one ignore the fact that most of the published papers, in which Leśniewski presented his system at the stage of formalisation, were written in a difficult and not easily intelligible style.

Leśniewski's complicated symbols, although abounding in interesting ideas, differ from the familiar logical and set-theoretic symbols and thus create an obstacle to the appreciation of his ideas. This explains the scarcity of extensive discussions of the ontology." (p. 165 of the reprint)

12. Jacquette, Dale. 2006. "Bochenski on Property Identity and the Refutation of Universals." *History and Philosophy of Logic* no. 35:293-316.

Abstract: "An argument against multiply instantiable universals is considered in neglected essays by Stanisław Leśniewski and I.M. Bochenski. Bochenski further applies Lesniewski's refutation of universals by maintaining that identity principles for individuals must be different than property identity principles. Lesniewski's argument is formalized for purposes of exact criticism, and shown to involve both a hidden vicious circularity in the form of impredicative definitions and explicit self-defeating consequences. Syntactical restrictions on Leibnizian indiscernibility of identicals are recommended to forestall Lesniewski's paradox."

13. Jadacki, Jacek Jusliuz. 2020. *Stanisław Leśniewski: Genius of Logic*. Bydgoszcz (Poland): Oficyna Wydawnicza Epigram.

Translated from the Polish (2016) by Katarzyna Cullen.

"The book consists of five chapters. The focal point of the first chapter, "Life story — personality — milieu", is the calendarium. Preceded by Leśniewski's short (and probably only surviving) autobiography, it constitutes the most comprehensive chronological compilation of the events of his life thus far; it is mostly based on reliable sources — and sometimes directly on the relevant documents. A short description of Leśniewski's personality has been made on the basis of remarks scattered in texts by various authors. The list of students is far from complete.

(...)

Chapter two, “Official assessments”, consists of requests and justifications attached to them, which concern the creation of the extraordinary chair for Leśniewski at the University of Warsaw and admitting him the title of ordinary professor. One of the opinions was probably expressed by Waclaw Sierpiński (or possibly Stefan Mazurkiewicz?), the other — definitely by Łukasiewicz. Apart from historical value, they also have factual value, as they provide a substantial and competent description of Leśniewski’s work, presented by the greatest contemporary experts, who N.B. have not ceased to be experts up today.

4

In chapter three, “In the eyes of the environment”, there are texts in chronological order by the people who were in direct contact with Leśniewski at various points of his life.

(...)

5

A separate matter is the presence of texts by Leśniewski’s three students from a later period in his life: Jerzy Słupecki, Czesław Lejewski and Henryk Hiż, included in chapter three.

They all wrote about their master on more than one occasion.

Słupecki (1904–1987) published two biographical notes about Leśniewski. Although they contain partially similar information, I decided to include both, since some details are depicted in a different light in them. Also, Lejewski (1913–2001) published two, much more extensive, biographical notes about Leśniewski, but they overlap to a large extent. Therefore, I am including one of them and have added a fragment which is significantly different in both versions. The first of Hiż’s (1917–2006) texts was in a way commissioned by me (I write about it in more detail in the introduction to this text).

The second, although it partly overlaps with the first when it comes to information, is more extensive and contains many significant addenda to the first. This is why I decided to reprint both texts, as in the case of the biographical notes written by Słupecki. At the end of the chapter, I include short statements

about Leśniewski found in the preserved legacy of one of his (quasi)mentors (Mścisław Wartenberg), colleagues (Kazimierz Ajdukiewicz, Leon Chwistek, Kazimierz Kuratowski, Czesław Znamierowski, and Roman Ingarden) or students (Bolesław Sobociński, Kazimierz Pasenkiewicz, nd Józef M. Bocheński).

6

In the fourth chapter, “From the correspondence”, I primarily reprint twenty letters written by Leśniewski to Twardowski, as well as a few letters from Twardowski to Leśniewski: all that has survived from the ravages of history and which is kept in the Archive of the Polish Philosophical Society in Warsaw.

7

Chapter five, “Work — the most important achievements”, is a discussion of the two main aspects of Leśniewski’s genius, written by myself." (pp. 10-15)

14. Joray, Pierre. 2004. "Logicism in Leśniewski's Ontology." *Logica Trianguli* no. 6:3-20.

Abstract: "The paper presents a logicist construction of Peano’s arithmetic based on the framework of S. Lesniewski’s extensional calculus of names (Ontology). The construction is shown to have three main advantages compared to *Principia Mathematica*’s classical solution. First, cardinality is defined without the use of classes or sets (even as convenient symbols). Secondly, the dependence of Peano’s axioms vis-à-vis the only non logical assumption (axiom of infinity) is clarified. At last, the use of Lesniewski’s definition rules shows that there is no need of an ad hoc reduction process of unpredicative functions to predicative ones (axiom of reducibility)."

15. ———. 2015. Teaching Leśniewski’s Protothetic with a Natural Deduction System. *arXiv.org (Cornell University Library)*: 1-8.

Abstract: "Protothetic is one of the most stimulating systems for propositional logic. Including quantifiers and an inference rule for definitions, it is a very interesting mean for the study of many questions of metalogic. Unfortunately, it only exists in an

axiomatic version, far too complicated and unusual to be easily understood by nowadays students in logic. In this paper, we present a system which is a natural deduction (in Fitch-Jaśkowski's style) version of protothetic. According to us, this system is adequate for teaching Leśniewski's logic to students accustomed to natural deduction."

16. ———. 2022. "Definition and Inference in Leśniewski's Logic." In *Logic in Question: Talks from the Annual Sorbonne Logic Workshop (2011–2019)*, edited by Béziau, Jean-Yves, Desclés, Jean-Pierre, Moktefi, Amirouche and Pascu, Anca Christine, 245-258. Cham (Switzerland): Birkhäuser.

Abstract: "Since Whitehead and Russell's *Principia Mathematica*, explicit definitions are usually considered to be logically neutral. In this paper, we explore those explicit definitions which were called *creative* by the members of the Warsaw School. We explain why a definition can be necessary for the proofs of certain results in a formal system and why the eliminability of a definition does not imply its logical neutrality. For this purpose, we explore certain important but often neglected results about definitions established by Leśniewski, Łukasiewicz, and Tarski in the 1920s."

17. Kearns, John. 1967. "The Contribution of Leśniewski." *Notre Dame Journal of Formal Logic* no. 8:61-93.

"The present paper aims at giving an account of the logical work of Stanisław Leśniewski. Many other papers, as well as a book, are available, which treat Leśniewski and his work. However, I feel that another paper is called for. None of the articles presently available gives a satisfactory account of what Leśniewski did and why he did it. And the book, *The Logical Systems of Leśniewski*, by E. C. Luschei, which is a complete account of certain aspects of Leśniewski's work, does not make it easy for a person who knows little or nothing about Leśniewski to appreciate Leśniewski's work. The present paper attempts to give a brief, sympathetic, and relatively complete account of Leśniewski's work. What Leśniewski did and his reasons for doing it are both interesting and important—

important enough to justify still another paper these many years after his death." (p. 61)

18. ———. 1969. "Two views of variables." *Notre Dame Journal of Formal Logic* no. 10:163-180.

"This paper has been prompted by the article "Logic and Existence," by Czesław Lejewski, which appeared in the *British Journal for the Philosophy of Science* 5 (1954). In his article, Dr. Lejewski has considered how

to give a logical analysis of statements where we say that something does or does not exist." (p. 163)

(...)

"I feel that one can distinguish two fundamentally different ways of regarding variables—I will call these two views of variables. The first view I call the Russell-Quine view; the second is the Frege-Leśniewski view

(these will be abbreviated as R-Q and F-L, respectively).⁴ These two are not the only possible views, but I feel that they are the two basic views; other views will be variants of one or the other, or perhaps combinations of the two." (p. 165)

(4) I will not try to make any historical points about either Russell or Frege. In discussing formal systems and formalized languages, each of these men have made statements which suggest the views to which I have attached their names. It may well be that on other occasions they have made statements inconsistent with these views. With respect to Frege, for example, if one takes the account given by Professor Church in the introduction to *Introduction to Mathematical Logic* as a natural development of Frege's own view, then the considered Fregean view of variables is distinct from both the Russell-Quine and the Frege-Leśniewski

views.

19. ———. 2006. "An elementary system of Ontology." In *The Lvov-Warsaw School - The New Generation*, edited by Jadacki, Jacek and Paśniczek, Jacek, 87-112. Amsterdam: Rodopi.

"According to Sobocinski (1949), the Polish logician Stanisław Leśniewski devised his logical system Ontology in order to capture or express the notion of a distributive class. However, it isn't clear to me that Ontology involves any sort of classes. I think Lesniewski's system is best understood as a theory concerned with some features of common nouns – in contrast to first-order theories, which focus on referring expressions and predicates of individuals. In this paper I will explain my understanding by developing elementary systems of Ontology in which the semantic account makes no provision for distributive classes. After developing these systems of Ontology, I will discuss collections, which I think are close to what Leśniewski understood distributive classes to be.

As it turns out, the elementary systems of Ontology are not suited for making statements about collections. I will finish by sketching changes in one system of elementary Ontology which allow it to incorporate statements about collections." (p. 87)

20. Kielkopf, Charles S. 1977. "Quantifiers in Ontology." *Studia Logica* no. 36:301-307.

Abstract: "This paper is a reaction to G. Küng's and J. T. Canty's 'Substitutional Quantification and Lesniewskian quantifiers' *Theoria* 36 (1970), 165-182. I reject their arguments that quantifiers in Ontology cannot be referentially interpreted but I grant that there is what can be called objectual - referential interpretation of quantifiers and that because of the unrestricted quantification in Ontology the quantifiers in Ontology should not be given a so-called objectual-referential interpretation. I explain why I am in agreement with Küng and Canty's recommendation that Ontology's quantifiers not be substitutionally interpreted even if Leśniewski intended them to be so interpreted. A notion of an interpretation which is referential but yet which does not interpret \exists as an assertor of existence of objects in a domain is developed. It is then shown

that a first order version of Ontology is satisfied by those special kind of referential interpretations which read \exists as 'Something' as opposed to 'Something existing'."

"Introduction This dissertation deals with the Axiom of Choice in the field of Leśniewski's Ontology. Ontology, a theory of pure logic structured along the lines of a logical type theory, was developed by Stanisław Leśniewski (1886-1939) as a result of his own intensive analysis of the logical paradoxes and his dissatisfaction with the work of Russell and White head in *Principia Mathematica* [34] and was intended to provide a secure and intuitively acceptable logical foundation for the formal development

of mathematics."

(...)

"In this dissertation we will show, first, that certain principles known to be equivalent to the Axiom of Choice in the field of Set Theory are also equivalent in Ontology. In particular we show the equivalence of the Axiom of Choice, the Kuratowski-Zorn Lemma, and the Well Ordering Principle though it will be noted that the sense of this equivalence in Ontology is analogous to, but not identical with, the sense of their equivalence in Set Theory. Second, since Ontology's type theoretical structure prevents the addition of the Axiom of Choice as a single formula, but requires the addition of a spectrum of formulas, we give a precise syntactical description of the conditions these formulas must meet. More specifically we provide a modification to the Rule of Ontology which will insure that the Axiom of Choice is available for each semantic category (logical type) expressible in Ontology." (p. 2)

"Editorial Note: This is an abstract of Kruszewski's lecture delivered at the meeting of the Warsaw Institute of Philosophy on December 20, 1924. The report was published by B. Gawecki in "Przegląd Filozoficzny", Vol. XXVIII (1925) in Polish. Translated by Ewa Jansen."

"The speaker defines all fundamental concepts of ontology and proves as theorems the axiom and all equivalences formulated as definitions in Leśniewski's ontology. With respect to ontological definitions, i.e., definitions formulated by the use of the word "is" (e.g.: x is even = x is a natural number and x is divisible by 2), it is possible to give a general method by means of which equivalences of that sort are obtained straightforwardly given an appropriate logical definition." (p. 10)

25. Kulicki, Piotr. 2012. "An axiomatisation of a pure calculus of names." *Studia Logica* no. 100:921-946.

Abstract: "A calculus of names is a logical theory describing relations between names.

By a pure calculus of names we mean a quantifier-free formulation of such a theory, based on classical propositional calculus. An axiomatisation of a pure calculus of names is presented and its completeness is discussed. It is shown that the axiomatisation is complete in three different ways: with respect to a set theoretical model, with respect to Leśniewski's Ontology and in a sense defined with the use of axiomatic rejection. The independence of axioms is proved. A decision procedure based on syntactic transformations and models defined in the domain of only two members is defined."

26. Küng, Guido. 1977. "The meaning of quantifiers in the logic of Leśniewski." *Studia Logica* no. 26:309-322.

"Quine has claimed that Lesniewskian quantification is substitutional.

But this interpretation is incorrect (cf. Küng and Canty [16]). Actually Lesniewskian quantification constitutes a third possibility that lies between objectual (referential) quantification and substitutional quantification, and it overcomes the drawbacks of each of its better known alternatives: while objectual quantification is restricted because some names do not have objects and substitutional quantification is restricted because some objects do not have names, Lesniewskian quantification works both for empty names and for nameless objects. This is so because, as we shall see, the range of quantification is neither the set of objects nor the set of names but the set of extensions (i.e. of extensional meanings). And even empty names have an extension, and even nameless objects belong to extensions.

The formulas of substitutional and of Lesniewskian quantification belong to the object language, but their readings are in a certain sense metalinguistic. For instance, according to Ruth Barcan Marcus '($\exists x$)Fx' is to be read "Some substitution instance of 'Fx' is true" and correspondingly '($\forall x$)Fx' is to be read "Every substitution instance of 'Fx' is true" (cf [32] p. 252-253). How is that to be understood? We shall see that in an adequate reading of those formulas names of expressions occur only in an "implicit" and not in an "explicit" way.

In my opinion the question of how to read quantified statements is of some consequence. The habit of giving merely model-theoretic interpretations and no intuitive paraphrases has tended to obscure some

subtle, but very important aspects of oblique speech. This can best be made clear by taking as a starting point some recent discussions concerning "saying that". (p. 315, two notes omitted)

27. ———. 1981. "Leśniewski's systems." In *Dictionary of Logic as applied in the Study of Language: Concepts, Methods and Theories*, edited by Marciszewski, Witold, 168-177. The Hague: Martinus Nijhoff.

"Leśniewski's logic is composed of the three systems:
protothetics, ontology

and mereology, which correspond, very roughly speaking, to
propositional logic ;

predicate logic (with identity) and set theory; and the calculus
of individuals." (p. 168)

(...)

"Protothetics

This most general of Leśniewski's three systems is the science
of the proto-theses (the most primitive theses). It is a
propositional logic that has equivalence as its only primitive
term, but allows (unlike most of the usual propositional calculi)
quantification with respect to sentences and even with respect
to functors of any category.£ (p. 169)

(...)

"Ontology

Leśniewski's ontology, the science of the copula "is" (and in this
sense, of being), must not be confused with ontology in the
usual philosophical senses of the word. It is a system of the
logic of names, built upon protothetics, with a new primitive
term, the copula 'ε', and a new basic category, the category of
names." (p. 170)

(...)

"Mereology

Mereology, the science of parts and wholes (from the Greek
meros: part), presupposes both protothetic and ontology, but
historically it was the first system developed by Leśniewski, for

his main aim had been to overcome Russell's antinomy of clarifying the notion of class (cf. Sobocinski 49-50). The notion of a mereological "class", i.e. of a collective whole (a concrete "heap" composed of parts), is of all the explicata of the notion of class the one which is the most easy to understand. The notion of a distributive class is much more controversial. As we have seen, Leśniewski refused to accept such classes as objects and instead

developed ontology, i.e. the logic of distributively referring names." (p. 174)

Abstract: "When Russell argued for his ontological convictions, for instance that there are negative facts or that there are universals, he expressed himself in English. But Wittgenstein must have noticed that from the point of view of Russell's ideal language these ontological statements appear to be pseudo-propositions. He believed therefore that what these statements pretend to say, could not really be said but only shown. Carnap discovered a way out of this mutism: what in the material mode of speech of the object language looks like a pseudo-proposition can be translated into a perfectly meaningful proposition in the formal mode of speech (in the metalinguistic mode of speech of the logical syntax of language). But is this ascent into the metalanguage necessary? Taking advantage of Leśniewski's logical system there exists another way out- we can expand the number of categories of our ideal language. But Leśniewski's formulas raise another profound problem, the problem of "semantical muteness" (cf. W. G. Lycan 'Semantic Competence and Funny Functors' *Monist* 64 (1979), 209-222)."

33. ———. 1991. *Leśniewski's Computative Protothetic*, University of Manchester.

Abstract: "The logician Stanisław Leśniewski devoted most of his academic life to the development of a system of foundations of mathematics, which consists of three deductive theories:

protothetic, ontology, and mereology. Protothetic is the most general of these theories, logically prior to the others; it has been described by its creator as a unique extension of the classical 'theory of deduction' or 'propositional calculus', though this theory differs from more usual versions in many respects. The 'standard' system of protothetic is developed by a rule of procedure corresponding to the traditional style of development incorporating substitution and detachment, but including directives for definition and extensionality.

Leśniewski also developed systems of protothetic whose rule of procedure does not contain directives for substitution or detachment, and whose style of development has been described as 'computative' or as involving 'automatic verification'. The directives may be said to resemble Peirce's zero/one verification method, though they are extended to allow verification and rejection of expressions containing variables in all semantic categories, and having various numbers of possible 'values'. Only an informal summary of Lesniewski's work on these systems survives.

This thesis examines computative protothetic historically, informally, and formally.

It contains a set of directives for a system of computative protothetic which is as close as possible to the lost directives of Lesniewski's own systems."

"The meaning of 'exist(s)' can best be determined on the basis of the logic of noun-expressions constructed as a deductive system by Leśniewski in Warsaw in 1920 and called by him 'Ontology'.⁽¹²⁾ The original system of Leśniewski's Ontology is based on singular inclusion (a is b or in symbols $a \varepsilon b$) as the only primitive function. For various reasons, however, I prefer to continue my analysis of 'exist(s)' with reference to a system of Ontology based on ordinary inclusion, with I shall write in the following manner: I shall read it 'all a is b ' or 'all a 's are b 's'. I prefer doing this because ordinary inclusion seems to be more intuitive to an English speaking reader than Leśniewski's singular inclusion. Thus for instance ordinary inclusion has recently been used by Woodger in his 'Science without Properties'⁽¹³⁾ for the purpose of constructing a language whose general tendency approximates the tendencies embodied in Ontology." (pp. 57-58 of the reprint)

(12) See Leśniewski [1930].

(13) See Woodger [1952].

"I wish to conclude with a brief summary of the results. The aim of the paper was to analyse rather than criticize. I started by examining two inferences which appeared to disprove the validity of the rules of universal instantiation and existential generalization in application to reasoning with empty noun-expressions. Then I distinguished two different interpretations of the quantifiers and argued that under what I called the unrestricted interpretation the two inferences were correct. Further arguments in favour of the unrestricted interpretation of the quantifiers were brought in, and in particular it was found that by adopting the unrestricted interpretation it was possible to separate the notion of existence from the idea of quantification. With the aid of the functor of inclusion two functors were defined of which one expressed the notion of existence as underlying the theory of restricted quantification while the other approximated the term exist(s) as used in ordinary language.

It may be useful to supplement this summary by indicating some aspects of the problem of existence which have not been

included in the discussion. I analyzed the theory of quantification so far as it was applied in connection with variables for which noun-expressions could be substituted and my enquiry into the meaning of exist (s) ' was limited to cases where this functor was used with noun-expressions designating concrete objects or with noun-expressions that were empty. It remains to explore, among other things, in what sense the quantifiers can be used to bind predicate variables and what we mean when we say that colours exist or that numbers exist. These are far more difficult problems, which may call for a separate paper or rather for a number of separate papers." (p. 58 of the reprint)

[The first part was by Peter Frederick Strawson, pp. 191-228]

"In my contribution to the symposium I propose to follow Mr. Strawson's lead as regards the selecting of the main topics for the discussion but I shall try to approach the various problems with which he is concerned from a somewhat different angle. The principal aim of Mr. Strawson's paper is, as he puts it

himself, to find the rationale of the doctrine that particulars cannot be predicated and to arrive at an understanding of the distinction between reference and predication. I shall also deal with the doctrine but the questions connected with the semantical status of predicate-expressions will be discussed with greater accuracy than other problems." (p. 228)

(...)

"Not unlike Mr. Strawson's paper, the present discussion was primarily devoted to the problem of the distinction between subject-expressions (or arguments) and predicate expressions (or functors). In the Method of Individual Names I tried to show how a syntactical and semantical theory could be built up, starting with the concepts of truth and falsehood and the semantical relation of designating.

In the Generalized Method [of Leśniewski] I made use of a more comprehensive relation of naming. With the aid of this semantical equipment other concepts required for the semantical analysis of the constituent parts of simple propositions were introduced. In particular it was shown that within the framework of both methods functors which correspond to predicate-expressions could be classified into unshared, shared, and fictitious in analogy to a similar classification of names. The characteristic feature of this classification of functors consisted in complete avoidance of any reference to entities other than individuals. On an example of a certain type of problem propositions, I tried to point out that in ordinary usage ' pseudo-names ' are used to stand for functors. It is the wide use of 'pseudo-names', just in this sense, that accounts for the generally accepted semantical theories which presuppose the existence of entities other than individuals. In the final sections of the paper I suggested a tentative definition of ' proper names ' and then I discussed some of the expressions of ordinary language which seem to satisfy the requirements of the definition." (p. 255)

38. ———. 1958. "On implicational definitions." *Studia Logica* no. 8:189-206.

1. *Fragmentary and full systems of the Calculus of Propositions.* The Implicational Calculus of Propositions, i. e. the Propositional Calculus based on implication as a sole primitive function is a fragmentary calculus because it contains implicational theses only. In other words it contains those and only those theses of the Full Propositional Calculus in which the functor of implication occurs as the only constant term."

(...)

"It is with the aid of a rule of definition together with the other two rules of inference that we derive theses with occurrences of other proposition-forming functors for propositional arguments. Only a calculus which in virtue of its rules of inference contains all such theses, truly deserves the name of Full Propositional Calculus."

"In this paper I propose to formulate a quite general rule which extends a system of the ordinary Implicational Calculus into a system of the Full Propositional Calculus in the sense just explained. This new rule I shall call the rule of 'implicational definitions'.

2. *Leśniewski's views concerning definitions.* As regards definitions in general, the majority of contemporary logicians seem to share the views of A. N. Whitehead and B. Russell expressed on the subject in the *Principia Mathematica*(2)

These views may be summarized as follows:

(a) Definitions are not propositions. They are neither true nor false.

(b) Definitions do not belong to the system and theoretically are superfluous.

(c) Definitions are concerned with the symbols, not with what they symbolize.

(d) Definitions are mere typographical conveniences.

(e) The sign '= ... Df', which is used to express a definition, is not equivalent to any of the functors of the Full Propositional Calculus.

(f) The definiendum has the same meaning as the definiens.

A different view on the nature of definitions was held by S. Lwaniewski of the Warsaw School. Leniewski regards'definitions as theses of the system.

In this respect they do not differ either from the axioms or from theorems, i. e. from the theses added to the system on the basis of the rule of substitution or the rule of detachment. Once definitions have been accepted as theses of the system, it becomes necessary to consider them as true propositions in the same sense in which axioms are true.(3)" (pp. 189-190)

Reprinted in Jan T. J. Szrednicki, V, F, Rickey (eds.), *Leśniewski's Systems: Ontology and Mereology*, The Hague: Martinus Nijhoff 1984, pp. 123-148.

"Leśniewski's criticism of 'pure' formalism shows that he had never ceased to be a philosopher. There are many 'pure' formalists among logicians and mathematicians but there are few 'pure' formalists among philosophers. For philosophers are, for the most part, preoccupied with the problem of meaning. Whether they deal with expressions of ordinary language or with logical formillae, they are concerned with interpretation rather than with formal elegance alone. The doctrine of 'pure' formalists could erhaps be condensed into the following motto: formalization before interpretation. Leśniewski's principle would read in the reverse.

For the most part Leśniewski's published papers present his theories at the stage of formalization with the problems of interpretation either left out or touched upon in an incidental manner. This makes the reading of these papers extremely difficult. It is the aim of the present contribution to bring the problems of interpretation to the foreground and by so doing serve as an informal introduction to one of the principal theories conceived by Leśniewski." (p. 124 of the reprint)

(...)

"Although Ontology was the subject of several university courses given by Leśniewski during the twenty years of his academic career in Warsaw until his death in 1939, there have been few papers published on it. The fundamental and most authoritative source is Leśniewski [1930]. It is an extremely condensed and difficult paper as it was meant to be a sort of 'identity card' of Ontology and not its 'lengthy biography'.

It gives an axiom of Ontology and, with reference to Leśniewski [1929a, pp. 59-67], it also gives the rules of inference for Ontology stated here with a precision which has not since been improved upon. In addition, the paper contains a brief account of the researches of Leśniewski and his collaborators into the axiomatic foundations of Ontology.(7)

There are two more papers by Leśniewski on special problems theoretically belonging to Ontology. They are Leśniewski [1929a] and Leśniewski [1929b]. These papers are also worth mentioning for the fact that they contain some of the neatest examples of Leśniewski's method of setting out his deductions.

Finally, there is Leśniewski [1927-1931, Ch. XI], where he gives his analysis of the meaning of the primitive constant of Ontology as used in Leśniewski [1930]. Naturally enough this analysis is made from the point of view of the Polish language.

This is all that Leśniewski himself ever published on his Ontology.

His copious notes and manuscripts, which contained a wealth of new results and which were to have been prepared for

publication by Sobocinski, were destroyed in 1944 during the war." (pp. 125-126 of the reprint)

"The theory of descriptions occupies a very prominent place in Russell's system of logic and indeed in his system of

philosophy. Since the publication of the now classical paper "On Denoting" in *Mind* for 1905 the theory had been incorporated into *Principia Mathematica*, the first volume of which appeared in 1910. In 1918 Russell discussed descriptions in his lectures on the *Philosophy of Logical Atomism*, which subsequently were published in *The Monist* for 1919. A very lucid exposition of the main tenets of the doctrine is to be found in the *Introduction to Mathematical Philosophy* dating from the same year. Epistemological aspects of the theory of descriptions are examined in "Knowledge by Acquaintance and Knowledge by Description", in the *Proceedings of the Aristotelian Society* for 1910-11, and also in Chapter V of *The Problems of Philosophy*, first published in 1912.(1) It is not an exaggeration to say that the theory of descriptions has become part and parcel of modern logic. Naturally, it has been criticized on different accounts, but the various arguments of the critics seem to have failed to move Russell from the position he took over fifty years ago. I propose to re-examine Russell's theory of descriptions because it seems to me that it raises a few interesting problems which appear to have escaped the notice of its originator, let alone his critics." (p. 14)

42. ———. 1963. "Aristotle's syllogistics and its extensions." *Synthese* no. 15:125-154.

"The task I have set myself in this paper can be described as bridging the gap between Aristotle's syllogistic and Leśniewski's ontology. I propose to suggest a number of successive extensions of syllogistic culminating in a system of what may be regarded as basic ontology. In this way I hope to throw new light on the significance of the Aristotelian logic. At the same time I hope to add a little to the understanding of Leśniewski's ontology, which interestingly enough was conceived by its originator as a modernised continuation of the ancient and medieval tradition.(1)" (p. 125)

(1) For a modern treatment of Aristotle's syllogistic see Łukasiewicz [8]; a condensed but authoritative presentation of ontology is to be found in Leśniewski [6]; an elementary discussion of ontology and some of its problems is contained in Kotarbiński [2], Sobocinski [12], Sobocinski (13), Slupccki (11), and Lejewski [4].

Reprinted in Jan T. J. Srzednicki, V, F, Rickey (eds.), *Leśniewski's Systems: Ontology and Mereology*, The Hague: Martinus Nijhoff 1984, pp. 232-238.

"According to Sobocinski's recollection, the consistency of Mereology was proved by Leśniewski by means of an appropriate interpretation within the framework of the theory of real numbers. His proof was never published, but in a recent paper R. E. Clay has succeeded in reconstructing a version of it. (1) Clay's result amounts to showing that if Leśniewski's Ontology expanded by the addition of the axioms for the real numbers is consistent then Mereology is consistent. Without casting any doubts on the validity of the proof one can hardly fail to note that here we have a case where the consistency of a conceptually simple theory is made to depend on the

consistency of a theory which from the point of view of intuition is far from being obvious. What we would like to be in a position to do is to prove the consistency of Mereology relative to a theory which is more obvious than Mereology, or, preferably, relative to a theory which is, in fact, a much weaker subsystem of Mereology. It is with this methodological principle in mind that I propose to outline, in what follows, a new proof of the consistency of the theory under consideration." (p. 232 of the reprint)

45. ———. 1970. "Quantification and ontological commitment." In *Physics, Logic, and History: Based on the First International Colloquium held at the University of Denver, May 16-20, 1966*, edited by Yourgrau, Wolfgang and D., Breck. Allen, 173-181. New York: Plenum Press.

Discussion between Quine, Lejewski, Yourgrau, Kaplan, Mercier, Hintikka, Popper, pp. 181-190.

"In his review of a paper by Ajdukiewicz [1], Quine makes the following comments on Leśniewski's version of the membership connective 'ε':

(...)

If quantification as Leśniewski used it did not commit him squarely to a theory of classes as abstract entities, then the present reviewer is at a loss to imagine wherein such commitment even on the part of a professing Platonist can consist [2].

I quote this passage because the last sentence in it poses two problems which I want to make central to the present enquiry. First, is quantification as Leśniewski used it, and as his followers continue to use it, incompatible with the renunciation of abstract entities? Second, in what way can a professing Platonist give expression to his ontological commitment?

The language of Łdźniewski's logic differs from the language of the traditional theory of quantification (with identity) in several respects.

But as it happens, we need not go into details because we can solve our problem by first solving it within a more familiar context." (pp. 173-174)

(...)

"To sum up. In the traditional theory of quantification the variables of the first order are correlated with a realm of entities thought of as their values; the variables of a higher order, whether quantified or not, presuppose no additional realm of entities, and quantifying propositional variables within the logic of propositions does not commit us to entertaining the existence of any entities at all." (p. 177)

"Here I propose to bring to an end my examination of the two problems arising from Quine's remarks on Łdźniewski's logic of 'ε'. In conclusion I wish to mention a third problem, which is closely connected with the topic under discussion but exceeds the boundaries of the present paper. The problem is this: how can we give expression to what might be called a negative ontological commitment? How can we say, without contradicting ourselves, that there are no abstract entities? How can we renounce, without contradicting ourselves, the universe of classes or the universe of numbers, or the universe of any other sort of abstract entities?" (p. 181)

47. ———. 1974. "A system of logic for bicategorical ontology." *Journal of Philosophical Logic* no. 3:265-283.

"However, it would seem to be appropriate to make it clear at this stage that the problem to be dealt with in the present paper is not in fact ontological. I shall not be concerned with propounding arguments either for or against a unicategorical ontology, according to which there is only one kind of things, or a bicategorical ontology, which holds that there are two kinds of things, either kind enjoying a different mode of existence, or any other multicategorical ontology. And although in the end my own ontological preferences will probably fail to remain unnoticed, my primary task is that of a logician. On the assumption that there are ontologists who advocate a bicategorical ontology and also those who are anxious to refute

it, I propose to suggest a system of logic acceptable to both sides of the dispute. I have chosen bicategorical ontology as the theme of my study because of all multicategorical ontologies it is the simplest. If we can solve, to our satisfaction, some of the logical problems connected with bicategorical ontology then we may hope to be able to use our results as a guide-line for approaching, if need be, the logical problems that any other multicategorical ontology may raise. And, speaking generally, I find this sort of enquiry of some significance for two reasons. First, philosophers have been talking about various categories of being ever since Aristotle. Indeed, the idea that there are various modes of existence should, perhaps, be traced back to Plato or even back to the Pythagoreans. When we turn to more recent developments, Russell's theory of logical types in its ontological version is the case in point.

Secondly, the views put forward by some logicians as to how one gives expression to one's commitment to a multicategorical ontology appear to me to be totally unacceptable.(2)" (pp. 265-266)

48. ———. 1977. "Systems of Leśniewski's Ontology with the Functor of Weak inclusion as the Only Primitive Term." *Studia Logica* no. 36:323-349.

"The original system of Ontology, constructed by Leśniewski in 1920, is based on the functor of singular inclusion as the only primitive ontological term. As regards its meaning, the functor of singular inclusion approximates the meaning of the copula 'is'. In natural languages without indefinite articles, in Latin or in Polish for instance, the approximation appears to be closer than is the case in the languages in which the indefinite articles have a role to play. It is, therefore, not surprising that English or German speaking logicians find Leśniewski's logical

language offending their linguistic intuitions, and treat his Ontology, and the theories which presuppose it, with a certain amount of suspicion. They might have been less mistrustful of Ontology, had Leśniewski based it on a different primitive term. It is quite likely that the functor of weak inclusion would prove to be more acceptable at least to those logicians who had been acquainted with the researches of Boole and Schröder" (p. 323)

In Part I, I propose to discuss, in very general and informal terms, the nature of logic and ontology, and the relationship that seems to connect these two disciplines. In Part II, I intend to examine, in some detail, a certain specific problem, which concerns logicians as well as ontologists, a problem which has been with us for about forty years, and which lacks a generally acceptable solution." (p. 379)

(...)

"In line with the traditional theory of quantification we are entitled to infer the proposition $(\exists.F) \cdot F(\text{Socrates})$ ' from the premiss 'Socrates is wise'. Now, if, as Quine tells us, the premiss does not commit us to the existence of properties but the conclusion does then the inference cannot be valid. I agree that the premiss carries with it no commitment to the existence of properties but I prefer to regard the inference as valid and reject the view that quantifying predicate variables commits us, within the framework of the traditional theory of quantification, to an ontology with properties or any other abstract entities.

If that is the case, how can the multicategorical ontologist present his doctrine in a standardised language? In my view he can still use any of the three languages we have distinguished, each time specifying informally the universe of discourse (the possible world) he is describing. Every statement of his theory will be about entities belonging to one universe of discourse or

possible world. No proposition referring to more than one possible world will be expressible in any of the three languages at his disposal. Moreover, the language of the traditional theory of quantification will not enable him to deny the existence of any possible world as a whole. If he wanted to do that, he would have to turn to the language of free logic or to L4 both appropriately re-interpreted. For the existence of a possible world can only be denied in an ontologically neutral language.

However, logic can offer a better way of helping the multicategorical ontologist in his predicament, a way which is also acceptable to his opponents. It consists in constructing an ontologically neutral multicategorical language. As far as I know, Kazimierz Ajdukiewicz, the Polish logician, was the first to see the possibility of such a language. Independently, some work in this field has been done by propounders of many-sorted theories (A. Schmidt, Hao Wang). For a concrete example of a standardised language for bicategorical ontology may I refer those who are interested to a paper of mine which I read at another Salzburg Colloquium, held in 1973 ('A System of Logic for Bicategorical Ontology', *Journal of Philosophical Logic* 3 (1974), 265-283)." 53. ———. 1983. "A note on Leśniewski's axiom system for the mereological notion of ingredient or element." *Topoi* no. 3:63-72.

"A system of mereology in which the notion of ingredient or element plays the role of the only primitive, i.e., undefined mereological notion, was constructed by Leśniewski in 1920 and published in Chapter VII of his 'O podstawach matematyki' [On the Foundations of Mathematics], *Przegląd Filozoficzny* 33 (1930), 82ff. The axiomatic foundations of the system consist of the following four theses:

(a) if P is an ingredient of Q and it is not the case that Q is P then Q is not an ingredient of P;

(b) if P is an ingredient of Q and Q is an ingredient of R then P is an ingredient of R;

(c) if (every a is an ingredient of P and an ingredient of Q and for all R , if R is an ingredient of P or R is an ingredient of Q then a certain ingredient of R is an ingredient of an a) then P is Q ;

(d) if a certain object is an a then for some P ((for all Q , if Q is an a then Q is an ingredient of P) and for all Q , if Q is an ingredient of P then a certain ingredient of Q is an ingredient of a certain a).

On adjoining to the axioms the definition of the notion of part

(e) P is a part of Q if and only if (P is an ingredient of Q and it is not the case that P is the same object as Q);

and the definition of the notion of mereological class

(f) P is the class of a s if and only if (P is an object, (for all Q , if Q is an a then Q is an ingredient of P) and for all Q , if Q is an ingredient of P then a certain ingredient of Q is an ingredient of a certain a).

Leśniewski went on to prove that his new system of mereology was inferentially equivalent to the original system as outlined in [2] and reproduced, in an improved version, in [3].

54. ———. 1985. "Accommodating the informal notion of class within the framework of Leśniewski's Ontology." *Dialectica* no. 39:217-241.

Summary: "Interpreted *distributively* the sentence 'Indiana is a member of the class of American federal states' means the same as 'Indiana is an American federal state'. In accordance with the *collective* sense of class expressions the sentence can be understood as implying that Indiana is a part of the country

whose capital city is Washington. Neither interpretation appears to accommodate all the intuitions connected with the informal notion of class. A closer accommodation can be achieved, it seems, if class expressions are interpreted as verb-like expressions of a certain kind as available within the framework of Leśniewski's Ontology."

55. ———. 1986. "Logic and Non-Existence." *Grazer Philosophische Studien* no. 25/26:209-234.

"1. Whatever exists, exists, and whatever does not exist, does not exist. And that's that. To put it in a different but equally tautological way

(1) a exists or it is not the case that a exists, whatever a may be or not be

It appears to follow from (1) that between existence and nonexistence there is no half-way house to accommodate subsistent entities or possible entities or fictitious entities. However, having said that, one must admit that a great deal of explaining has to be done before the notions of existence and non-existence lose their powers of confusing and mystifying. They enjoy these powers largely within the precincts of ordinary language and manifest them through inducing philosophers to make statements that are puzzling in the extreme or give rise to never ending controversies.

I propose to begin my inquiry into what there is or is not, by outlining a logic which, in my view, provides a promising basis for the starting of an attack on the problems of non-existence.

2. The logic to which I wish to relate the subject matter of my essay, is Leśniewski's Ontology.(1)"

1962.

56. ———. 1986. "Logic, Ontology and Metaphysics." In *Philosophy in Britain Today*, edited by Shanker, S. G., 171-197. London:

Croom Helm.

"The principal characteristic of ontology is, in accordance with Aristotle's conception of the science of being, its universality. The interest of a special science, Aristotle tells us, is limited to certain objects whereas the science of being studies all objects that there are, and does so generally, concerning itself with particular objects only in special cases. Extending Aristotle's idea a little further one can stipulate that if there are kinds of entity other than objects then the science of being should study these kinds of entity as well.

Another characteristic feature of the science of being, according to Aristotle, is this: the science of being lends itself to a very precise treatment and can be presented with the degree of exactitude unattainable in other disciplines. Does this mean that ontology, as conceived by Aristotle but elaborated up to the standards of exactitude established long after his time, can eventually be given the form of a deductive system or that of a body of deductive systems? I shall return to this problem at a later stage of my investigations." (p. 172)

(...)

"Can ontology, as conceived by Aristotle, be given the form of a deductive system or that of a body of deductive systems?

Any general description of reality is likely to consist of several theories, and the description just outlined above is no exception.

The interesting point is that the theories which are constituent parts of the reistic description of reality, are not unrelated. Some of them are presupposed by others. A theory **A** is said to be presupposed

by a theory **B** just in case the vocabulary exhibited in the theses of **A** has to be used in the theses of **B** together with the vocabulary characteristic of **B** whereas the latter vocabulary is not exhibited in the theses of **A** at all." (p. 187)

(...)

"This sort of vocabulary will be readily recognised as the vocabulary of the logic of propositions, and it is the logic of propositions that is presupposed by Ontology. It constitutes as it were the first chapter of a systematic presentation of the science of being. It presupposes no other theory, and on this account can be described as the most general theory of all. Every theory of lesser generality presupposes the logic of propositions and uses its vocabulary however limited this use may turn out to be.

Now, what kind of logic of propositions — and there are several kinds of logic of propositions — is the most appropriate theory, from the reistic point of view, to serve as the fundamental presupposition

of any description of reality? As 'a philosopher interested in ontology I have no hesitation in suggesting that Lesniewski's *Protothetic* is such a theory." (p. 188, a note omitted)

57. ———. 1989. "Formalization of functionally complete propositional calculus with the functor of implication as the only primitive term." *Studia Logica* no. 48:479-494.

Abstract: "The most difficult problem that Leśniewski came across in constructing his system of the foundations of mathematics was the problem of 'defining definitions', as he used to put it. He solved it to his satisfaction only when he had completed the formalization of his protothetic and ontology. By formalization of a deductive system one ought to understand in this context the statement, as precise and unambiguous as possible, of the conditions an expression has to satisfy if it is added to the system as a new thesis. Now, some protothetical theses, and some ontological ones, included in the respective systems, happen to be definitions. In the present essay I employ Leśniewski's method of terminological explanations for the purpose of formalizing Lukasiewicz's system of implicational calculus of propositions, which system, without having recourse to quantification, I first extended some time ago into a functionally complete system. This I achieved by allowing for a rule of 'implicational definition', which enabled me to define

any proposition forming functor for any finite number of propositional arguments."

58. ———. 1995. "Remembering Stanisław Leśniewski." In *Stanisław Leśniewski aujourd'hui*, edited by Miéville, Denis and Vernant, Denis, 25-66. Grenoble: Recherches sur la Philosophie et le Langage.

"Kotarbiński was probably the first philosopher to realize that Lesniewski's *ontology* had much in common with Aristotle's « science of being as being » presented in the books of *Metaphysics*. Aristotle referred to it, occasionally, as *first philosophy*, and emphasized its generality. Whereas special sciences were, in his view, concerned with certain objects only to the exclusion of others, the science of being as being searched for principles which were true of everything that existed. Many centuries after Aristotle the science of being as being was given the name of *ontology*. In the first decade of the 20th century it was revitalized by Meinong as the theory of objects [*Gegenstandstheorie*] only to return to its earlier name in Lesniewski's system of the foundations of mathematics. In a sense, this system has achieved completion. Arithmetic can be reconstructed within the framework of a part of it, namely within the framework of *ontology*, and *mereology* provides an important presupposition on which to base certain theories that belong to geometry(71). Ontology in the traditional sense of the term will never achieve completion. For we shall never be able to give a complete description of reality. Lesniewski's ontology offers a very general, and - for this reason - a least controversial description of objects. Now *ontology* can be extended, step by step, into theories which provide more specific descriptions of what there is. The description obtainable within the framework of *mereology* is still very general but in part controversial, as some ontologist will maintain. In accordance with one of the *mereological* theses if in this world there are more objects than one then some objects are parts of other objects, and if this is so then some objects must be extended in time or in space, which suggests that mereology ought to be followed by a theory that concerns itself with objects as extended and ordered in time, or by a theory that deals with the extension and distribution of

objects in space. Only the former theory, named *chronology*, is beginning to take form of a deductive theory, which as regards explicitness and precision may one day achieve the standard of Lesniewski's *mereology*.⁽⁷²⁾ The latter theory, which could perhaps be called *stereology*, is still on the drawing board so to say. It is likely to prove to be more difficult than *chronology*, but, when successfully axiomatized, it may in conjunction with *chronology* provide a right framework within which one could try to describe objects in move. Thus, what may come after *stereology*, is a sort of general *kinematics*. To develop the above suggested extensions of the theory of objects to the point where they can be seen to have become deductive theories of the standard comparable with that of Lesniewski's *mereology*, will probably take several years of concentrated research by philosophers who, in addition to having a keen interest in symbolic logic, would have to be concerned in preserving and advancing the Lesniewskian way of doing philosophy." Stanisław Leśniewski: bibliography in English (Lep - Sim)

Studies on Leśniewski in English

1. Lepage, François. 2000. "Partial monotonic Protothetics." *Studia Logica* no. 66:147-163.

Abstract: "This paper has four parts. In the first part, I present Leśniewski's protothetics and the complete system provided for that logic by Henkin. The second part presents a generalized notion of partial functions in propositional type theory. In the third part, these partial functions are used to define partial interpretations for protothetics. Finally, I present in the fourth part a complete system for partial protothetics. Completeness is proved by Henkin's method using saturated sets instead of maximally saturated sets. This technique provides a canonical representation of a partial semantic space and it is suggested that this space can be interpreted as an epistemic state of a non-omniscient agent."

2. ———. 2009. "Definitions and Contradictions. Russell, Poincaré, and Leśniewski." *Baltic International Yearbook of Cognition, Logic and Communication*: no. 4:1-28.

"Introduction

This paper is composed of two independent parts. The first is concerned with Russell's early philosophy of mathematics and his quarrel with Poincaré about the nature of their opposition. I argue that the main divergence between the two philosophers was about the nature of definitions.

In the second part, I briefly present Leśniewski's Ontology and suggest that Leśniewski's original treatment of definitions in the foundations of mathematics is the natural solution to the problem that divided Russell and Poincaré." (p. 1)

3. López-Escobar, E. G. K. , and Miraglia, Francesco. 2002. *Definitions: the primitive concept of logics or The Leśniewski-Tarski legacy*. Warsaw: Polska Akademia Nauk, Instytut Matematyczny.

"In the 75 years since the publication of Tarski's result [the reduction of all the classical logical atoms to the *equivalence propositional connective* (and the *universal quantifier*)]. there has been an increasing trend for Mathematics to be more constructive. Thus we decided that an appropriate way to acknowledge the work of Lessniewski and Tarski was to develop, *ab ovo*, a Constructive Protothetic, which we call the New Protothetic; furthermore not only the formalization should reflect constructive intuition, but the metatheory should also be constructively acceptable.

In Part Two of the monograph we set up the New Protothetic, simultaneously explaining why we chose that particular formalization. Then we prove some general results about it, results which further legitimize the system; for example, the completeness with respect to Beth models and proven in an intuitionistic metatheory (which is the version of constructive Mathematics that we are adopting) and the *normalization property*(12).

To complete Part Two we show that Tarski's reduction, that conjunction is definable in terms of equivalence and the universal quantifier, is also applicable in the New Protothetic. Thus Part Two may be considered as an extension of the Leśniewski/Tarski project to constructive logics." (p. 11)

(12) Actually the proof of normalization is in Appendix A.

4. Luschei, Eugene. 1962. *The Logical Ssystems of Leśniewski*. Amsterdam: North-Holland.

"Prescribing rules of definition as comprehensive and rigorous as his other directives, Leśniewski formalized his system completely, combinatorially on a finite basis, and in extensional terms. It is further distinguished by its “constructively nominalist” and “contextualist” character; its basic grammar of semantic categories; its rigor, generality, and power of expression; its demonstrable relative consistency; its universal validity; and its logical purity, economy, and elegance. It consists of three axiomatic deductive systems in hierarchic order: *protothetic*, *ontology*, and *mereology* etymologically, proto-theses, theory of being, and theory of parts, respectively. Protothetic and ontology together form a unified system of logic comparable in scope and power to *Principia Mathematica* as a foundation for classical mathematics and for any further axiomatic theory, such as mereology, in a deductive hierarchy.

I rely on context to distinguish Lesniewski's ontology from the homonymous branch of metaphysics. The names stem from the same root, the genitive case of the participle of the Greek copula, whose initial letter provides the epsilon of singular predication in Lesniewski's ontology." (p.28)

5. Lyczak, Marcin, and Andrzej, Pietruszczak. 2018. "On the definability of Leśniewski's copula 'is' in some ontology-like theories." *Bulletin of the Section of Logic* no. 47:233-263.

Abstract: "We formulate a certain subtheory of Ishimoto's [1] quantifier-free fragment of Lesniewski's ontology, and show that Ishimoto's theory can be reconstructed in it. Using an epimorphism theorem we prove that our theory is complete with respect to a suitable set-theoretic interpretation.

Furthermore, we introduce the name constant 1 (which corresponds to the universal name 'object') and we prove its adequacy with respect to the set-theoretic interpretation (again using an epimorphism theorem). Ishimoto's theory enriched by the constant 1 is also reconstructed in our formalism with into which 1 has been introduced. Finally we examine for both our theories their quantifier extensions and their connections with Lesniewski's classical quantified ontology."

Abstract: "Stanisław Lesniewski's mereology was originally conceived as a theory of foundations of mathematics and it is also for this reason that it has philosophical connotations. The 'philosophical significance' of mereology was upheld by Bolesław Sobocinski who expressed the view in his correspondence with J.M. Bochenski. As he wrote to Bochenski in 1948: "[...] it is interesting that, being such a simple deductive theory, mereology may prove a number of very general theses reminiscent of metaphysical ontology". The theses which Sobocinski had in mind were related to the mereological notion of "the Universe". Sobocinski listed them in the letter adding his philosophical commentary but he did not give proofs for them and did not specify precisely the theory lying behind them. This is what we want to supply in the first part of our paper. We indicate some connections between the notion of the universe and other specific mereological notions. Motivated by Sobocinski's informal suggestions showing his preference for mereology over the axiomatic set theory in application to philosophy we propose to consider Sobocinski's formalism in a new frame which is the ZFM theory—an extension of Zermelo-Fraenkel set theory by mereological axioms, developed by

A. Pietruszczak. In this systematic part we investigate reasons of 'philosophical hopes' mentioned by Sobocinski, pinned on the mereological concept of "the Universe".

7. M., Machover. 1966. "Contextual Determinacy in Leśniewski's Grammar." *Studia Logica* no. 19:47-57.

"There are several reasons why much of Leśniewski's work has fallen into oblivion. For one thing, a considerable part of it was destroyed during World War II, which started shortly after Leśniewski's death. And what he did publish¹ is written in a highly condensed and difficult style. Moreover, as Grzegorzczuk [2] has pointed out, the general trend of logical research had meanwhile drifted away from "system building" to metalogical investigations, for which Leśniewski's system (although very admirable as such) is not too convenient. More important still, Leśniewski wished to base mathematics not upon set-theoretical ideas and relations but rather upon a certain kind of Boolean algebra⁽²⁾. This approach - which is quite out of line with the thinking habits of most mathematicians - is not only built into his formal system, but also determines his mode of expression when speaking about it, in his syntactical explanations, etc. This makes Leśniewski's system uninviting, and his explanations of it intelligible only with great difficulty, to people who do not share his philosophical beliefs and habits of thought. (To this should be added his insistence that the conditions in each metalogical definition be mutually independent - an insistence which is perhaps very laudable in theory, but certainly most cumbersome in practice). All that is quite unfortunate, for many features incorporated in Leśniewski's system of logic have a definite merit by themselves, quite apart from the philosophical doctrine with which they are associated. These features are certainly worth investigating even by mathematical "technicians" and may

eventually be employed for various theoretical and practical purposes." (p. 47)

(1) For a bibliography of works by Leśniewski and his disciples see Luschei [3]. This book is an orthodox account of Leśniewski's ideas, together with an ardent (to say the least) defence thereof.

(2) At least, this is one way of looking at what he did - a way to which he himself would presumably not have agreed.

8. Miéville, Denis. 2009. "Leśniewski, Negation, and the Art of Logical Subtlety." In *The Golden Age of Polish Philosophy: Kazimierz Twardowski's Philosophical Legacy*, 113-120. Dordrecht: Springer.

"Leśniewski essentially developed three theories: Protothetic, Ontology, and Mereology. Since his death in 1939, none of the efforts to reawaken interest in Leśniewski have had much success. In spite of his successive burials, I am among those who persevere in thinking that Lesniewski's systems present more than a merely historical interest. The richness of Lesniewski's alternative lies in his approach to truth and falsity, the idea of predicative levels and his conception of logic as something which, so to say, freely "expands". Lesniewski's systems can be called to task when it comes to the study of formal languages, the development of higher order logics, definitiona procedures, the search for extreme metalinguistic rigor and the quest for an ontologically neutral language. In this paper, I focus on the following three issues. First, I consider the question of the number of operators a formal system must or can possess. Secondly, I argue that those unsatisfied by the conceptual paucity of classical logics – that is to say, systems that were initially developed specifically as tools for the foundations of arithmetic – should envision a new way of developing formal systems, and that Lesniewski's work has, in this respect, valuable heuristic potential. Finally, after presenting the main lines of Lesniewski's project, I will illustrate the value of his approach. Although Leśniewski was a marginal figure as far as both his work and his character are concerned, he occupies a central position in the history of

Polish philosophical thought. The fact that he studied and collaborated, namely with Twardowski, Ajdukiewicz, Łukasiewicz, and Tarski is not insignificant in this respect (see for instance the papers by Łukasiewicz, Patterson, Wolenski, this volume)." (pp. 113-114)

Abstract: "The aim of the paper is to consider ontological views connected with mathematics and logic of main representatives of Lvov-Warsaw School of Philosophy.

In particular views of the following scholars will be presented and discussed: Jan Łukasiewicz, Stanisław Leśniewski, Alfred Tarski, Tadeusz Kotarbiński and Kazimierz Ajdukiewicz. We shall consider also views of Andrzej Mostowski who belonged to the second generation of the school as well as of Leon Chwistek who was not directly the member of this group but whose conceptions are of interest."

11. Obojska, Lidia. 2015. "Some Remarks of Jan Slezynski regarding Foundations of mathematics of Stanisław

Leśniewski." *Technical Transactions / Czasopismo Techniczne* no. 2:235-245.

Abstract: "Jan Śleszyński [1854-1931], a great mathematician, is considered a pioneer of Polish logic; however, he was not connected with the famous Warsaw School of Logic (WSL). He believed that his mission was a critical evaluation of work of other logicians in the field of foundations of mathematics and proof theory. Among his writings we find several notes regarding the work of Stanisław Leśniewski (the co-founder of the WSL) and his collective set theory. These remarks are the subject of investigation of the presented paper."

"Conclusion

Summarizing, in general, the criticism of Śleszyński can be considered very positive. It emphasizes Leśniewski's accuracy and precision, and the work itself contains neither logical nor formal errors. As for the lack of understanding of certain terms, one can always have doubts, but it is not a formal shortcoming of this work.

It is a pity that Śleszyński's notes were not published during his life. Perhaps the reception of Leśniewski's ideas could have been easier. Leśniewski's systems are not currently used as foundations of mathematics; maybe the reason lies in the language applied by the author. However, his work can be considered a masterpiece of mathematical precision and accuracy." (p. 244)

12. Ozawa, Masanao, and Waragai, Toshiharu. 1985. "Set theory and Leśniewski's Ontology." *Annals of the Japan Association for Philosophy of Science* no. 6:261-272.

The aim of this paper is to investigate a general logical relation holding between Leśniewski's Ontology and axiomatic set theory. Though a natural and intuitive comparison of these two systems well suggests a close logical relation between them, no direct comparison between them seems to have not undertaken yet, probably because of Leśniewski's extreme nominalistic standpoint.

We begin this paper with some remarks which are of historical interest.

Fraenkel-Bar-Hillel-Levy [1973] makes mention of the relation between Ontology and axiomatic set theories, stating: "Since Leśniewski's ' \in ' is not meant to be a symbol for class-membership, it is preferable to regard his ontology not as a variant of set theory but rather as a rival of set theory for the foundation of mathematics. How important a rival of set theory ontology is, or could be made to be, is a question which it is still very difficult to decide" [p. 203]. We see two points in this passage, namely 1) the foundational status of Ontology is acknowledged in connection to set theory, while 2) the logical relation which should hold between them is referred to as one left unestablished. Thus the foundational character of Ontology has been realized, whereas it has been left as an open problem.

To this problem, the following remark seems also worth mentioning : "This view does not exclude that counterparts of many set-theoretical axioms turn out under a certain notational transformation - to be ontological theorems or that the ontological axiom should be transformed into a type-theoretical axioms. The latter possibility is easily materialized by interpreting ' $x \in w$ ' as ' x is a unit-class of individuals, w is a class of individuals and $x \subset w$ ' [loc. cit. p. 203]. Thus the crux of the problem is to define set-theoretical concepts inside of Ontology and to determine the deductive power of the set theory within Ontology.

We aim to give an answer to this open problem. The main result of this paper is the following : By adding to Ontology one function symbol for class formation, we can define the set, the class and the membership relation within Ontology. The deductive power of the resulting class theory can be also well characterized by an extensionality axiom and an impredicative comprehension axiom. Eventually, this class theory is ultimately innocent of existence of sets. Thus we can conclude that any axiomatic set theory can be developed equivalently in Ontology by adding to it one function symbol for class

formation and appropriate axioms for existence of sets." (pp. 261-262)

13. Paśniczek, Jacek. 2023. "Leśniewskian Ontology with Many-argument Predication." *History and Philosophy of Logic* no. 44:327-336.

Abstract: "Leśniewskian Ontology (LO) is a system in which the basic subjectpredicate formula takes the form of $a\epsilon b$ and express one-argument predication, e.g. John is a student. In LO's language, there is no many-argument form of predication given that would allow for the structural expression of, for example, the sentence John is Anne's son. In this article, a simple and natural extension of LO is suggested to encompass many-argument predication. The system thus obtained corresponds to polyadic second-order logic."

"The article presents the views of Leśniewski both from the first and the second period of his work. Although his articles from the period of 1911–1915 do not usually get much attention, they should not be completely forgotten as the opinions expressed therein are reflected in his later output. Above all, the method of practicing philosophy changed radically. The purpose of deliberations presented below is a synthetic discussion of the views of Leśniewski, but also presentation of certain connections between his opinions from the grammatical and formal periods." 16. ———. 2024. "From the History of Lesniewski's Mereology." *Studia Humana* no. 13:5-16.

Abstract: "In this paper, we want to present the genesis of Stanisław Lesniewski's mereology. Although 'mereology' comes from the word 'part', mereology arose as a theory of collective classes. That is why we present the differences between the concepts of being a distributive class and being a collective class. Next, we present Lesniewski's original mereology from 1927, but with a modern approach. Leśniewski was inspired to create his concept of classes and their elements by Russell's antinomy. To face it, Leśniewski had to define the concept of being an element based on the concept of being part of. Leśniewski showed that in his theory, there is no equivalent to Russell's antinomy. We will show that his solution has nothing to do with the original approach because, in both cases, we are talking about objects of a different kind. Russell's original antinomy concerned distributive classes, and Lesniewski's considerations concerned collective classes."

17. Poli, Roberto, and Libardi, Massimo. 1998. "Leśniewski's conception of logic." In *The Lvov-Warsaw School and Contemporary Philosophy*, edited by Kijania-Placek, Katarzyna and Wolenski, Jan, 139-152. Dordrecht: Kluwer.

"The current availability in English of almost all of Leśniewski's works allows even those scholars unfortunate enough not to read Polish to gain a clearer picture of his ideas. 1 Even a brief reading of Leśniewski's works reveals that his main references are J.S. Mill, Austrian philosophy (Brentano, Marty, Husserl), J. Łukasiewicz and L. Petrażycki.

The first three (Mill, Austrian philosophy and Łukasiewicz) are well-known; what is new is the Russian-Polish thinker Leon Petrażycki.² His 1905 book, *Introduction to the study of law and morality: the bases of emotional psychology*, was quoted by Leśniewski in some central passages. Unfortunately the 1955 translation of Petrażycki's book into English does not include the logical part of his work.⁽³⁾

In the course of this paper, we propose to present a reconstruction of Leśniewski's position, gathering together and analyzing his general theories and as far as possible - his explicit references to other authors." (p. 139)

(1) S.l Surma, IT. Srzednicki, D.1. Barnett, Y.F. Rickey (eds.): *Stanisław Leśniewski. Collected works*, 2 vol., Dordrecht, Kluwer Academic Publishers, 1992. The publication has been an arduous editorial undertaking that has occupied Jan Srzednicki for more than eighteen years.

To him we owe our gratitude for the tenacity and the strength of will that enabled him to surmount the many and difficult obstacles that stood in his way. Unfortunately, the English translation is not always crystal clear and certain papers contain some irritating mistakes. For some general assessments, see the critical notice by M. Libardi, *Axiomathes*, 1993, pp. 105-129, and the review by P. Simons, 'Discovering Leśniewski', *History and Philosophy of Logic*, 1994, pp. 227-235.(,,)

"We can therefore now attempt to draw some conclusions.

First, the influential role of Lukasiewicz's monograph on the Aristotelian principle of non-contradiction emerges with unexpected salience, but also and especially that of Petrażycki's monograph on the psychological foundation of law.

Lukasiewicz's monograph had important repercussions on Leśniewski's concepts of ontology and of synonymy. From

Petrażycki he derived his theories of science, logic and (again) metaphysics/ontology.

An extreme hypothesis, one which is not supported by Leśniewski's writings but which emerges with a certain force from examination of his intellectual career, is the following: it seems that the fundamental purpose of his entire inquiry was to progress towards a formalization and a 'modernization' of Aristotle's *Metaphysics*.

Indeed, Leśniewski's early works are perfectly in keeping with the Aristotelian revival of the period. One need only consider his papers on the ontological principle of contradiction [PC] and on the principle of the excluded middle [EM], as well as those on the existential propositions [EP] and on truth [EB]. But the most telling evidence is provided by a possible and, in the end quite reasonable, interpretation of the structure of his system of the foundations of mathematics." (p. 216)

19. Praker, Judith. 1983. "A Lesniewskian re-examination of Goodman's nominalistic rejection of classes." *Topoi* no. 2:87-98.

"In 'A World of Individuals (1)~ Goodman clarifies his earlier rejection of classes. To him, "as a nominalist", he says, "the world is a world of individuals". What is involved in being an individual is made clear by the calculi of individuals. To be an entity is to be an individual: no other sorts of entities are

admissible. What makes them inadmissible is their behaving in an unintelligible way, contrary to the principles set forth in the calculi of individuals, because, in effect, the calculi of individuals lay down general principles of intelligibility for being an entity at all.(2) What is unacceptable about class theories, then, is that classes are purported to have properties that individuals cannot have. The problem is not that classes are 'abstract' or 'non-concrete' or "universal', but that they are not individuals. A nominalist, to use class terminology in an intelligible way at all, must be able to reconstrue all claims about classes as claims about individuals." (p. 87)

(...)

"As long then as 'class construction' is to be limited to those 'classes' produced by generating relations, it is going to be very difficult to produce some distinct 'classes' that will go proxy for those distinguished by set theoreticians.

For the same reason that K and L are difficult to distinguish, so are: \emptyset , the empty set, and $\{\emptyset\}$ (not to mention the problem of understanding how \emptyset can be 'generated' in the first place!); a and $\{a\}$ (where 'a' is taken to name some individual); (a,b) and (b,a). (the usual ordered pairs of the individuals a and b).

But without these distinctions much of set theory is lost and along with it, many would argue, the possibility of providing logical foundations for much of classical mathematics(3).

What I want to suggest is that there is a way to provide a logical reconstrual of these distinctions which makes them intelligible (and acceptable) while at the same time we are not required to abandon the Principle of Nominalism that there can be no distinction of entities without a distinction of content, nor are we required to accept any non-individuals as entities. The logical reconstrual will be within Lesiewski's systems. I also want to claim that the reconstrual can help us to evaluate, rather more clearly than has previously been possible, the philosophical position of present-day nominalists on the matter of the existence of mathematical entities." (p. 87)

(1) Goodman (1956).

(2) Incidentally, these clarifications of Goodman's ought to suggest that, contra Martin (Martin, 1963), the Principle of Nominalism is to be regarded as a principle of logic, even if as a principle of transcendental logic.

(3) For Martin (Martin, 1963, p. 34) is surely correct that it is not enough to be able to construe the syntax of mathematics nominalistically.

We also need a suitable *interpretation*.

22. Richard, Sebastien. 2018. "Leśniewski on metalogic and definitions." *Synthese* no. 195:2649–2676.

Abstract: "Lesniewski's metalogic is often considered to be difficult to understand because it differs greatly from its standard formulation. In this paper I try to explain the reasons of these idiosyncrasies. I claim that they have mainly two sources. First of all there is Lesniewski's conviction that a formal system should be conceived as a set of concrete marks that can always physically and syntactically be expanded by the

addition of new theses. Secondly there is Lesniewski's conviction that definitions should neither be formulas belonging to the metalanguage, nor deduction rules, but formulas belonging to the object-language and expressed with the help of the biconditional functor. The realisation of the first point is linked to the second one in so far as the metalinguistic rule for the writing out of definitions has to be formulated in a way that makes it possible to build the formal system in agreement with Lesniewski's conception. While explaining these points I give an overview of the main peculiarities of Lesniewski's metalogic."

23. ———. 2020. "Leśniewski's Intuitive Formalism." In *Formal and Informal Methods in Philosophy*, edited by Będkowski, Marcin, Brożek, Anna, Chybińska, Alicja, Ivanyk, Stepan and Traczykowski, Dominik, 206-228. Leiden: Brill Rodopi.

Abstract: "When Stanisław Leśniewski read in 1911 Jan Łukasiewicz's book *The Principle of Contradiction in Aristotle* he discovered modern symbolic logic and the Russellian antinomy of the classes, that do not contain themselves. He started then to look for a solution to this antinomy and elaborated his formal theory of wholes and parts. However, if he adopted the new formal tools of logistics, he refused to proceed in his building of formal systems as a "pure formalist". In particular, for Leśniewski, a formal system must not be interpreted after having been built. An intuitive interpretation must be given from the beginning, the formal system being only a means to communicate the "logical intuitions" of the author. That is the reason why Leśniewski's unconventional position has been called an "intuitive formalism" by Kearns or an "intuitionistic formalism" by Tarski. In this paper, I try to make these expressions more precise and explain how exactly the relation between intuition and formal systems must be understood according to Leśniewski."

24. Rickey, Frederick V. 1973. "Axiomatic inscriptional syntax. Part I: General syntax." *Notre Dame Journal of Formal Logic* no. 13:1-33.

"Inscriptional syntax is that study of syntax wherein the linguistic entities are studied as inscriptions, i.e., as physical objects and not as abstract entities. In this paper we shall axiomatize the syntax which is common to all languages, i.e., General Syntax. In *Chapter I* of this paper we elucidate the notion of an inscription, expose some pre-logical assumptions, describe the three primitive terms of inscriptional syntax, and discuss our logical basis (viz., Leśniewski's Ontology). In *Chapter II* we present the axioms for the syntactical system M, define the usual notions of general syntax, and prove some typical theorems of general syntax. Our aim is not to obtain new syntactical results, but rather to put the theory of syntax on a secure foundation. Accordingly, we shall only develop system M to the point where most syntactical investigations begin. In particular, concatenation is defined in our system, whereas it is usually taken as primitive.

The initial task of syntax is to formulate precise statements of the formative and deductive rules of a particular formal language. After these rules have been stated it is of interest to develop their consequences by proving derived rules and to investigate the interconnections between primitive and derived rules. All of these tasks can be accomplished using system M. To support this claim we shall formulate the rule of Protothetic in the second part of this paper." (p. 1, a note omitted)

25. ———. 1973. "Axiomatic inscriptional syntax. Part II: The syntax of protothetic." *Notre Dame Journal of Formal Logic* no. 14:1-52.

Reprinted in Jan Srzednicki, Zbigniew Stachniak (eds.), *S. Leśniewski's Systems: Protothetic*, Dordrecht: Kluwer 1998, pp. 217-288.

"Part 1** of this paper presented an axiomatized theory of general syntax, defined the usual notions of general syntax, and proved some typical theorems of general syntax. We claimed that this system is strong enough to precisely state the formative and deductive rules of formal languages. In Part II we support this claim by formulating, in a very precise way, the rule of procedure of Leśniewski's Protothetic. Section 1 is an

informal introduction to Protothetic and its rule of procedure. Our metalogical system is extended there to a theory MP which is concerned explicitly with the syntax of Protothetic. This section is intended to motivate the Terminological Explanations of Section 2 which culminate in the statement of the rule of Protothetic. In Section 3 we sketch a proof that our formulation of the rule is equivalent to that given by Leśniewski (1929). This proof shows that our system is strong enough to conduct certain metalogical investigations." (p 217 of the reprint)

** Part I of this paper appeared in the *Notre Dame Journal of Formal Logic* XIII (1972), pp. 1-33. The author would like to thank Professor Boleslaw Sobocmski for considerable advice.

26. ———. 1975. "Creative definitions in propositional calculi." *Notre Dame Journal of Formal Logic* no. 16:273-294.

"Leśniewski felt that definitions were most naturally stated as equivalences in the object language and as such a rule of procedure governing their introduction is necessary. This view will be accepted here in our investigation of the role played by definitions in propositional calculi. In this paper we construct propositional calculi wherein some of the definitions play a creative role; i.e., they do not function as mere abbreviations and are not, even theoretically, superfluous.

A definition will be said to be creative for a thesis T in a given presentation of a deductive theory iff T does not contain the defined term (nor any defined via it) and is provable using the definition, but not without it.

The usual approach to definitions is to attempt to prescribe conditions which prevent the creativity of definitions. In trying to understand the role that definitions play in deductive theories we approach the subject from the opposite direction and attempt to construct systems which contain creative

definitions. In 3 we give axiomatizations of propositional calculi which contain a single creative definition, a finite number of creative definitions, and also examples which contain an unlimited number of creative definitions.

In 1 the history of the problem is presented as best it is known, including a review of the literature. The rules of procedure for propositional calculi and especially the rule of definition are presented informally

in 2 and precisely in the appendix. Several metalogical remarks are presented in 4 including our proof of a hitherto unpublished theorem of A. Lindenbaum which shows that if Cpp is a thesis of a propositional calculus, then that calculus contains no creative definitions." (p. 273)

Reprinted in Jan Srzednicki, Zbigniew Stachniak (eds.), *S. Leśniewski's Systems: Protothetic*, Dordrecht: Kluwer 1998, pp. 23-41.

"In the period between the two world wars the eminent Polish logician Stanisław Leśniewski (1886--1939) created a hierarchy of logical systems which are unparalleled for their generality, precision, and intuitive foundations. By way of a careful and insightful analysis of the Russell Antinomy he came to distinguish between two notions of class, the distributive class and the collective class. Investigation of these concepts led to the creation of his systems of Ontology and Mereology, respectively. Then, in order to secure the foundations of these systems, he created the most fundamental system, Protothetic.

We intend to survey the most important technical contributions to these three disciplines. The restriction to technical results is necessary to restrict this paper to manageable proportions. Moreover, the non-technical aspects of Leśniewski's systems are more accessible. There is no doubt that the philosophical aspect of Leśniewski's work is extremely important and interesting.

This, together with historical matters, is enthusiastically discussed in Luschei's book (1962) on *The Logical Systems of Leśniewski*. Applications to philosophy and linguistics are also omitted. Hopefully, all of these matters will receive full consideration at this conference.(*)" (p. 23 of the reprint)

28. ———. 1985. "Interpretations of Leśniewski's Ontology." *Dialectica* no. 39:181-192.

Summary: "This article proposes to clarify the problem of interpreting Leśniewski's ontology. A distinction is made between two kinds of interpretation: substitutional and "natural". Substitutional interpretation is shown to involve difficulties and limitations. A "natural" ontology, the major principles of which are presented here, is shown to be of considerable interest."

29. Rybaříková, Zuzana. 2016. "Prior's Definition of Creative Definitions (Sobociński-Prior-Lejewski's Discussion on the Leśniewskian Definitions)." *Organon F* no. 23:405-416.

Abstract: "The article introduces Prior's paper *Definitions, Rules and Axioms* which deals with Leśniewski's creative definitions. It presents the origins of Prior's paper and the discussion which is linked with its final form. Prior's aim in this paper was to present the Leśniewskian definitions in comparison with Russell's concept of definitions, demonstrating their advantages and disadvantages. The main source of Prior's knowledge about the Leśniewskian definitions were Sobociński's papers and letters, which are stored in the Bodleian library. Although the paper *Definitions, Rules and Axioms* is a unique attempt at approximating creative definitions, it contains several mistakes. Lejewski identified them in his letter to Prior and also described how they arose. Lejewski's critique was not severe, however, and Prior coped with it in the introductory page of his paper."

30. ———. 2016. "The Reception of Stanisław Leśniewski's Ontology in Arthur Prior's Logic." *Organon F* no. 2:243-262.

Abstract: "Arthur Prior's logic was influenced, among others, by logicians from the Lvov-Warsaw school. This paper introduces the impact Leśniewski's Ontology had on Prior's logical system. The paper describes the main characteristics of Leśniewski's Ontology,

Prior's logical system and the manner in which Prior became acquainted with Leśniewski's logical system. Since Leśniewski was no longer alive when Prior began to develop his logical system and Leśniewski's papers were not easily available to Prior, this paper also includes Prior's interpretation of Leśniewski's logical system which did not always correspond to Leśniewski's original ideas."

Abstract: "Since Kazimierz Twardowski introduced the notions of "symbolomania" and "pragmatophobia," the relationship between logic and reality was the focus of the philosophers from the Lvov-Warsaw School — inter alia two prominent logicians of the group, Stanisław Leśniewski and Jan Łukasiewicz. Bolesław Sobociński has pointed out, however, that there was a contrast between their approach to logic and reality. Despite being members of the same philosophical group and even colleagues from the same department, their philosophical views on the position of logic in reality differed considerably. Yet they both agreed that reality has a certain importance for logic and that logic could be valuable for reality. The aim of this paper is to introduce their divergent positions and describe in more detail how Leśniewski and Łukasiewicz understood the relationship between logic and the real world."

32. ———. 2023. "Arthur N. Prior and Leśniewski's Concept of Names: Why Prior Adopted It and Why He Left It in His Temporal Ontology." *Logic and Philosophy of Time* no. 5:1-20.

Abstract: "For a certain period, the concept of names that Stanisław Leśniewski and his followers developed had a certain impact on the concept that appeared in Arthur Prior's temporal ontology. However, this impact seemed to vanish in time. The aim of this paper is to present why Prior was interested in Leśniewski's concept of names and quantification and to discuss why in Prior's later works Leśniewski's influence is not as apparent as it was in the first works on temporal logic. Namely, the paper suggests three possible solutions; the differences that were between Prior and Leśniewski's views on time and determinism, new concepts of names that occurred at that time, and Leśniewski's extensionalism that opposed Prior's preference for intensional logic."

33. Sagal, Paul T. 1973. "On how best to make sense of Leśniewski's ontology." *Notre Dame Journal of Formal Logic* no. 14:259-262.

"Familiarity breeds contempt; on the other hand it can be very comforting. Philosophers find familiar logical systems very comforting.

On the whole they prefer the logic they learned on their mother's knee or in graduate school. When confronted with an unfamiliar system they either resist it or twist and turn to put the unfamiliar in a familiar frame.

A. N. Prior, in his essay *Existence in Lesniewski and in Russell*(1) does a lot of twisting and turning. Prior centers his discussion upon Theorem 24.52 of Russell and Whiteheads's *Principia Mathematica*. This theorem asserts that there exists at least one individual. But where does a logical system come off telling us that something exists ? Leśniewski's ontology contains no such thesis. Prior's essay investigates how *ontology* could get away with this when Russell considered 24.52 a necessary evil. This investigation leads Prior to make some general claims about Leśniewski's *ontology*, and to present its

basic ideas in what Prior considers a less puzzling way than is customary. Prior's thesis is "that ontology is just a broadly Russellian theory of classes deprived of any variables of Russell's lowest logical type." (150) If we consider lowest type variables to range over individuals then we are left with a no *individual* theory. The only logical truths which remain would be those not involving individuals. According to Prior, the above characterization captures the essence of *ontology*. To give the reader who is completely unfamiliar with *ontology* enough information to appreciate the following discussion, I will make a few observations about *ontology*." (p. 259)

"In conclusion, it is to be emphasized again that Lesniewski's motive in building his systems was to formalize intuition. Kearns remarks that in attempting to formalize intuition rather than to devise just any sort of system which "works," Leśniewski is choosing to understand rather than simply to invent.(25)

That is, the construction of the Lesniewskian systems is an examination and elaboration of basic intuitions about the world and about language.

It is difficult, however, to pin down just what it was that Leśniewski was trying to understand - whether it was language or the world. For although intuitions are surely about the world, they are themselves linguistic in character: Kearns may be correct in suggesting that Lesniewski's intuition is best described as knowledge of how language must be if it is to adequately and efficiently represent the world.(26)

This emphasizes the linguistic element of Leiniewski's work. But might not his intuition be described equally fairly as knowledge of what the world must be like, given the distinctive linguistic character of intuitions? In such a formulation, the

ontological element of the systems may be seen, along with the justification for Kotarbinski's remark that Lesniewski's Ontology is in fact a "theory of what there is, or general principles of being".(27) Perhaps the best formulation would be that Leśniewski's Ontology is a theory of what restrictions pure logic places on what can be. This avoids Kearns's objection that the Kotarbitiski remark ignores Lesniewski's nominalistic philosophical view, while preserving a kind of ontological characterization of the system. For Leśniewski's nominalism enters the scene only in Mereology: Protothetic and Ontology are independent of it.(28)" (p. 413)

Abstract: "Following an idea first proposed by Jerzy Wróblewski, this paper examines the usefulness of formal logic for comparative legal analysis. Subject of the comparison are the doctrines of mistake and attempt in German and English criminal law. These doctrines are distinguished by the interaction of deontic, epistemic and alethic modalities. I propose a purely extensional logic which is based on Leśniewski's substitutional interpretation of quantification to

analyse differences in the logical structure of the various criminal law doctrines."

36. Scharle, Thomas W. 1962. "A diagram of the functors of the two-valued propositional calculus." *Notre Dame Journal of Formal Logic* no. 3:243-255.

"By means of arranging the functors of the two-valued propositional calculus in a certain array (to be described below), we find that several properties of the functors are related. Such properties are connected to the possibilities of defining some functors by others, and thus in the diagram we have displayed definitional connections between certain sets of functors.

In this paper we first present the method of diagramming, and certain helpful connections within the diagram, then several theorems on definitions within the propositional calculus. We are then able to show that there are three exhaustive classes for single functors in terms of definitions, of such a nature that we are able to give axioms for a large number of functors.

The paper is concluded with some further consideration on definability in special cases." (p. 243)

38. Schumann, Andrew. 2013. "On Two Squares of Opposition: the Leśniewski's Style Formalization of Synthetic Propositions." *Acta Analytica* no. 28:71-93.

Abstract: "In the paper we build up the ontology of Leśniewski's type for formalizing synthetic propositions. We claim that for these propositions an unconventional square of opposition holds, where a, i are contrary, a, o (resp. e, i) are contradictory, e, o are subcontrary, a, e (resp. i, o) are said to stand in the subalternation. Further, we construct a non-Archimedean extension of Boolean algebra and show that in this algebra just two squares of opposition are formalized: conventional and the square that we invented. As a result, we can claim that there are only two basic squares of opposition. All basic constructions of

the paper (the new square of opposition, the formalization of synthetic propositions within ontology of Leśniewski's type, the non-Archimedean explanation of square of opposition) are introduced for the first time."

"This paper assesses those features of Leśniewski's ontology which make it difficult to understand for logicians accustomed to more orthodox systems of logic. It is seen that certain general features of presentation and content can, by selective acceptance or modification, be accommodated with a fairly orthodox viewpoint. The chief difficulty lies in the interpretation of Leśniewski's names, and the constant "'?". Four interpretations are suggested in turn: Leśniewski's names as monadic predicates; as class terms; as common nouns; and as empty singular or plural terms. This last and least orthodox interpretation is argued to be the most suitable, but it is shown how it can be made to live in harmony with either the common noun or the class interpretation."

41. ——. 1983. "A Lesniewskian Language for the Nominalistic Theory of Substance and Accident." *Topoi* no. 2:99-110.

"The power of Leśniewski's language and his understanding of the quantifiers as being without existential import enabled him to express without heavy ontological commitment to abstract entities what other philosophers could only say provided they accepted such entities. So it is not surprising that Leśniewski and his followers have tended to be nominalists, both in the traditional sense which involves denying the existence of universals, and in the sense coined by Goodman (4) which involves denying the existence of sets. The possession of a Lesniewskian language leaves room for nominalism in a way which most other languages do not. Some exponents of Leśniewski have followed Kotarbiński in adhering to an extremely sparse form of reism, according to which the only things that exist are spatio-temporally extended bodies.(5) But while the adoption of a Lesniewskian language opens the way for such an ontology, it does not entail its acceptance. Lejewski has shown how a Lesniewskian type of language may be developed to allow the adumbration of a multicategorical ontology, say one involving both concrete individuals and abstract sets,(6) and I have sketched elsewhere how this idea may be naturally extended to form a basis for a simple theory of types.(7) But even within Leśniewski's language as it stands, a Platonist may quite happily claim the right to talk about the abstract entities which he recognises.(8) The point is that Lesniewskian languages free the metaphysician from having to accept the existence of certain entities simply in order to get a language of sufficient expressive power for his purposes. However they do not bind the metaphysician to reism." (p. 99)

(4) * I present a theory of classes as many in my 'Plural Reference and Set Theory', in B. Smith (ed.), *Parts and Moments*, Philosophia, Munich, 1981.

(5) See N. Goodman, 'A World of Individuals', in *Problems and Projects*, Bobbs-Merrill, Indianapolis, 1972, pp. 155-172.

T. Kotarbiński, *Gnosiology*, Pergamon, Oxford, 1966, p. 55f.

Kotarbiński was not the first reist. Brentano's reism predates Kotarbiniski's, and Leibniz flirts with the position: cf. his *New Essays on Human Understanding*, C.U.P., Cambridge, 1981, p.

217, a passage quoted by both Brentano and Kotarbiński. Since Leibniz's flirtation consists in suggesting that perhaps accidents (and they alone) are not real, his official position is the same as that adopted in this paper. Brentano's reism, unlike Kotarbinski's accepts souls as well as bodies.

(6) C. Lejewski, 'A System of Logic for Bicategorical Ontology', *Journal of Philosophical Logic* 3 (1974), 265-283.

(7) Cf. § 9 of my 'On Understanding Leśniewski', [1982].

(8) This would apply to what Lejewski calls a 'unicategorical Platonist': cf. his 'Ontology and Logic', in S. Körner (ed.), *Philosophy of Logic*, Blackwell, Oxford, pp. 1-27, esp. p. 6. The bicategorical Platonist (ibid.) needs a bicategorical language. But because of the nature of Lesniewskian languages, the opponent of Platonism can still meaningfully discourse with the Platonist without accepting his ontological commitments, thus solving Quine's problem of 'Plato's beard': 'On What There Is', in *From a Logical Point of View*, Harper & Row, New York, 1953, p. 1f.

46. ———. 1987. *Parts: A Study in Ontology*. Oxford: Clarendon Press.

"That most modern ontology passes mereology by is due to the inadequacy of CEM [Classical extensional mereology] as a conceptual instrument capable of use in the variety of issues found in ontology, coupled with a historically misinformed supposition that mereology is something for nominalists only. If I am right about the formal nature of mereology, it should be neutral on the issue of nominalism/realism. If mereology can be applied universally (and that has not been shown here, because we have not discussed abstract objects), then it should regain a central position in ontology; along with existence and identity, it should take us to the heart of many ontological issues. The topics covered in Parts II and III are meant to show this: Part II for existence in and through time, for identity, matter, and form, and Part III for essence, dependence, substance, unity, integrity, and form. It is notable how many of the issues in Part III are under-represented in the contemporary literature, although they loom large in traditional ontology, where it was felt to pay to be discriminating about different kinds of parts, as the quotation from Aquinas at the beginning of this section shows.

The contemporary field ontologist is better equipped than his predecessors because he is familiar with formal systems, a device we owe to Leibniz. The acquisition of this tool does not render the old resources—experience, wit, authority, the lore of

language—obsolete, but it shifts the ontologist's role. He now has a theoretically endless supply of formal templates to hold up to the untamed phenomena, and his job now consists in fair part in constructing such formal systems and testing them for their applicability. It is tempting to be led by the attraction of internal properties of the formalism either into taking the world to be tamer than it is, or into a relativistic, pragmatic attitude to ontology which can be seen at its most significant in Quine. Such attraction, for which again Leibniz is responsible, lies behind CEM's two errors of omission and two of commission. For different regions, we need different templates, and it is mainly the templates which must be bent to fit, not the world. In the case of mereology, this fails to descend to utter relativism because the theory has a formal skeleton and a range of analogous fleshings out which provides unity in the diversity." (pp. 363-364)

47. ———. 1992. "Lesniewskian Term Logic." *Lingua e Stile* no. 27:25-45.

"Students of traditional logic, by which I mean the central core of categorical syllogistic with whatever further forms were studied at the time, were drilled in putting the sentences occurring in arguments into «correct logical form», and present-day students do no different when replacing their natural language sentences by the formulas or semiformulas of predicate logic. Both procedures involve doing some violence to natural modes of expression. A sentence like *Whoever flies saves time* must be replaced by something like *Every flier is a time-saver* by traditional logicians and by *For all x: if x flies then x saves time* by modern logicians. As this makes clear, different logical systems may compete in offering prepared forms proximate to a natural specimen, so there may be a real choice as to which system is preferable for a given purpose. This is familiar to observers of modern logic since there are competing logics of definite descriptions, modality, and so on. Of course, if we confine attention just to the opposition between categorical syllogistic and predicate logic, there seems to be no contest. Predicate logic is expressively much the more powerful system, and as these two are the only two logical systems to

have enjoyed widespread acceptance as tools for analysing validity of natural arguments, it might seem that only predicate logic remains as a general vehicle for workaday argument assessment. But the large number of introductory logic textbooks which still contain material on categorical syllogistic bears witness to the fact that, within its more limited sphere, the traditional logic of terms is widely felt to be a more natural and useful alternative to monadic predicate logic. Historical interest alone could not compensate for the inconveniences of introducing two quite different systems, with their different sentential analyses, laws, and terminology, to cover the same ground.

It is apparent that one disadvantage of predicate logic for these purposes is its use of bound individual variables, which natural languages do not have, and which they can simulate and match only by rather tortuous use of pronouns and pronominal phrases. Of course this helps to account for the greater perspicuity of predicate logic once we leave the simplest sentences behind, but at the most elementary level it is a hindrance. The singular term/predicate analysis of simple predications compels common noun phrases and adjectives used attributively to appear as syntactically inseparable parts of predicates, which correspond most closely to verb phrases in natural language. Again, this is not a huge sacrifice, but it is pervasive, is felt to be unnatural, and contributes to beginners' difficulties in learning logic.

So it is worth considering from a practical and pedagogical point of view whether, in order to gain the considerable benefits conferred by predicate logic - quantification, multiple generality, relational predicates - it is necessary to put up with the disagreeable features of standard predicate logic. I shall argue that it is not, and that a more natural and flexible medium for which to prepare natural language sentences and arguments is provided by the term logic invented around 1920 by Stanisław Leśniewski (1886-1939) and usually known as Ontology. (*)" (pp. 25-26)

(*) The possible confusion of the system of logic with the branch of metaphysics of the same name is not a danger in this context, and in any case I will write the name of the system with a capital letter. Sometimes Ontology is called the Calculus of Names, but this is misleading, since much more than names are involved. It would be nice to have a better name for Ontology.

48. ———. 1992. "Existential propositions." *Grazer Philosophische Studien* no. 42:229-259.

Summary: "By considering a wide and expressly classified range of examples from natural and logical languages, I attempt to isolate from other concomitants the features of existential sentences which make them existential. One such concomitant is the imputation of singularity. There are many ways to say something exists, and their relationships are charted. I deny that there is anything in reality called existence, or any special existential facts."

"So far we have considered how the expression of existence can be divorced from devices expressing singular or plural, and so these features are inessential to the expression of existence as such, but reflect, as it turns out, either the grammatical number of an open nominal or the meaning of a numerical quantifier, or both.

Examination of classical logic alone, with its embedded prejudice in favour of the singular, does not prepare us for this discovery: we need to consider a wider range of languages such as natural languages or Leśniewskian. By the same score, there is

another dimension of variation covered by neither classical nor Lesniewskian logic, namely the distinction between count and mass nominals." (p. 240)

49. ———. 1993. "Nominalism in Poland." In *Polish Scientific Philosophy: The Lvov-Warsaw School*, edited by Coniglione, Francesco, Poli, Roberto and Wolenski, Jan. Amsterdam: Rodopi.

Reprinted in Jan Srzednicki, Zbigniew Stachniak (eds.), *S. Leśniewski's Systems: Protothetic*, Dordrecht: Kluwer 1998,

pp. 1-22.

"Several prominent Polish philosophers were nominalists. This paper concentrates mainly on the views of Leśniewski and Kotarbiński, in the belief that their views are the most interesting in themselves, the most historically important, and present most clearly the difficulties and challenges that nominalism has to face." (p. 1 of the reprint)

(...)

"Conclusion

The influence of Leśniewski and Kotarbiński goes beyond Tarski of course. Another of their students, Czeslaw Lejewski, is a staunch defender of a reism which is committed to unverifiable theses which even Kotarbiński was reluctant to accept.(51) Lejewski has also, more than any other follower of Leśniewski, gone out of his way to show how to accommodate within Ontology talk which is ostensibly about abstract entities like classes,(52) and to furnish language within which a Lesniewskian nominalist can carry on a dialogue with his Platonist opponent.(53) No doubt there are other Polish nominalists whose thinking was influenced by Leśniewski and Kotarbiński. A more exhaustive cataloguing of the extent of Polish nominalism is something I shall not undertake here, because what is important is not a head-count but the issue of principle: does Polish nominalism contribute essentially to answering the question whether nominalism is correct? My answer is plainly that it does, and the main problem which needs to be overcome is the one at

the heart of the discussions between Quine and Leśniewski: can a powerful higher-order logical language avoid commitment to abstract entities? Thanks to the work of Leśniewski, Kotarbiński, their associates and students, we are closer to an answer than before." (p. 18 of the reprint)

"This discussion review examines the English edition of Leśniewski's *Collected Works*. Points emphasized include: the early (pre-symbolic) period, the quality of translation and typesettings, and the scandalously outdated bibliography."

51. ———. 1994. "Leśniewski and Generalized Quantifiers." *European Journal of Philosophy* no. 2:65-84.

"Generalized quantifier theory is usually dated to the 1957 paper 'On a generalization of quantifiers' by Andrzej Mostowski. After some use by mathematical logicians, including Lindstrom's 1966 paper 'Predicate logic with generalized quantifiers' it became widely known as a topic of investigation on the borderlines between logic and linguistics with the publication in 1981 of the paper 'Generalized quantifiers and natural language' by Jon Barwise and Robin Cooper. The subject has since expanded rapidly: it has an appealing simplicity and the essentials can be mastered quite quickly.

In this paper I put forward two theses. The first is historical and is the claim that there is a significant anticipation of certain key aspects of generalized quantifier theory in the logic of Stanisław Leśniewski (1886-1939), one of the founders and prime movers of the Warsaw group of logicians in the inter-war years. The

second thesis builds on this anticipation and is the claim that Leśniewski's logic provides a framework for working on generalized quantifiers which has definite logical and ontological advantages over the rather eclectic mixture of ordinary language, standard predicate logic, and set theory in terms of which generalized quantifier theory is generally pursued." (p. 65)

Abstract: "In the dispute between Quine and Leśniewski as to whether quantification of higher-order variables views Platonistic ontological commitments, it was Leśniewski (who answered negatively) who was right. I analyse here the notion of ontological commitment and show that the axioms and rules of Lesniewski's logic remain valid even if there are no objects. The fact that there is nevertheless a plurality of different propositive logical constant in this case is to be explained by the « primeval fact » of logic, that truth is not falsity, that to be true is not to be false."

53. ———. 2002. "Reasoning on a Tight Budget: Leśniewski's Nominalistic Metalogic." *Erkenntnis* no. 56:99-122.

"How can one be a logician and yet believe that there are no abstract entities such as properties, sets, or expression types? Stanisław Leśniewski showed how. Leśniewski was one of the original practitioners of metalogic, and through the influence of his ideas and example on the Polish school many of his incidental ideas entered the mainstream, but his own nominalistic approach to metalogic did not. One of his major achievements was to formulate scrupulous metalogical descriptions of and directives for certain formal systems. The key idea is that directives are not descriptions of actually existing (abstract) expression types but detailed instructions on what expression tokens, if produced, are to count as axioms, definitions, and the acceptable products of inference rules, in a logical system which may grow in time by the addition of new

token expressions. The directives are appended to a series of some fifty prescriptive metalogical definitions called 'terminological explanations'. One of these, a definition of 'definition' in protothetic, comprises over two sides of dense symbols in eighteen independent clauses. The terminological explanations are justly notorious for their density and impenetrability, and Leśniewski himself typically took three semesters to work through them with graduate students.

This paper aims to smooth the way for a better understanding of Lesniewski's distinctive approach to metalogic. After outlining Lesniewski's philosophical background and illustrating his dissatisfaction with the inexactness of the metalogical practice of his time, I briefly explain the nature of his own system of the foundations of mathematics, before elucidating the idiosyncrasies of his concretist inscriptional approach and his reasons for adopting it. The approach is then illustrated with simple examples from propositional logic." (p. 99)

54. ———. 2006. "Things and Truths: Brentano and Leśniewski, Ontology and Logic." In *Actions, Products, and Things: Brentano and Polish Philosophy*, edited by Chrudzimski, Arkadiusz and Łukasiewicz, Dariusz, 83-106. Frankfurt: Ontos Verlag.

"When Stanisław Leśniewski went to Lwów in 1910 to study with Kazimierz Twardowski, he was already acquainted with the philosophy of what he later called "the Austrian School", by which he meant Franz Brentano and his students, especially Anton Marty and Edmund Husserl, whose works initially captivated Leśniewski. This knowledge had been acquired during Leśniewski's philosophical education in Germany, Russia and Switzerland, but it is very likely that his doctoral supervisor Twardowski would have made further aspects of Brentano's work known to him. Despite this, and despite the often remarkable convergences between the philosophical views of Brentano and Leśniewski, there is little evidence of direct influence of the former on the latter. We have the testimony of Leśniewski's friend and colleague Tadeusz

Kotarbiński that the latter's even closer philosophical parallels to Brentano's work were acquired independently.(1)

Leśniewski did interact with Brentano's views, but only at the very beginning of his career, and unsuccessfully. Later parallels are just that: parallels, and we are unlikely to come upon significant new evidence

as to whether there was or was not any direct influence, positive or negative.

Brentano and his philosophy were part of the philosophical wallpaper in Twardowski's Lwów, but Leśniewski's interests soon came to settle on logic and the foundations of mathematics, and such figures as Russell,

Frege, Cantor and Zermelo quickly outranked Brentano in their importance for his views. Nevertheless, the parallels are real, interesting, and revealing." (p. 83)

(1) Cf. Kotarbiński 1976, 195, where he points out that his reism, elaborated by him in 1929, owed nothing to Brentano despite Twardowski having been Brentano's student and Kotarbiński being Twardowski's student. The explanation was the late change of mind of Brentano, which took him out of the orbit Twardowski knew into a reism which was not widely read or appreciated when it first appeared around 1914.

"Leśniewski had definite ideas about the intellectual economy of logic. A system ought to have as few primitive notions, axioms, and directives as possible; the axioms ought to be as short as possible, logically independent, and organic—that is, not contain provable theses as subformulas. The search for ever shorter axioms was a general feature of the Warsaw School,

which Leśniewski and his followers sometimes pursued at the expense of defending controversial aspects of the systems, such as their interpretation of quantification, their radical nominalism, and their thoroughgoing extensionalism." (p. 293)

"Although the concept of a part is one of the oldest and most ubiquitous of formal concepts, formal theories of part and whole, or mereologies, emerged only around 1914-1916, independently, in the works of two philosopher-logicians: A.N. Whitehead and Stanisław Leśniewski. Whitehead developed his account of part and whole to serve the abortive fourth volume of *Principia Mathematica*. Mereology was the basis of his theory of extensive abstraction, which he employed in "La theorie relationniste de l'espace." (1) Whitehead went on to employ mereology and extensive abstraction to define geometric elements such as points and lines in his *Principles of* 1919.(2)

(...)

"In 1916 Leśniewski put forward the first axiomatization of this theory of part and sum, under the title "Foundations of the General Theory of Sets," but he later changed the name to "mereology" to avoid confusion with what he called "official" set theory.(5) A definitive account of mereology was published in a series of articles from 1927-31 with the title "On the Foundations of Mathematics". (pp. 598-599)

(...)

"Conclusion

Mereology is an essential part of ontology, but it can easily be overused. For instance, several important computer ontologies use only two formal relations among entities: *is_a* and *part_of*. (39) Even if these are interpreted sensibly,(40) this places far too much burden on mereology, not to mention inclusion, exemplification, or whatever *is_a* is supposed to represent. Even formal ontology is a good deal richer than this. But in particular it cannot be assumed that because the part-relation

behaves in one way in one domain -- in the ontology of spatiotemporal regions, say -- that it must behave similarly elsewhere. All that can be guaranteed a priori is that the part-concept has the formal characteristics which are analytic of it.

(41) When it comes to the honest toil of investigating the principles governing what objects are parts of others, and what collections of objects compose others, it appears that most ontologists have been following the paradigm of abstract algebra when it would have been better to take a lead from sciences such as geology, botany, anatomy, physiology, engineering, which deal with the real.(42)

"In the course of the 1920s Leśniewski submitted his rigorous but unformalized reasonings regarding propositions, objects, collections and parts to a process of progressive formalization. The axioms of his 1916 mereology were rendered into a formalized axiomatic mereology, where undefined expressions meaning 'part of' and 'collection of' were taken as primitive. This rendering of mereology and its immediate consequences suffered two drawbacks: the expression for 'collection of' needed to be defined in terms of 'part of' before being inserted into the axioms; and the logical principles governing names and name-forming functors were not made explicit. The former was easily remedied by a new axiomatization; the latter required another logical system, one dealing with names, predicates, and other functors. This system, which picked up where the early papers left off, but now ditched the notions of connotation and property, Leśniewski came to call 'ontology', because he saw it as a general theory of objects in the sense of Aristotle.

But ontology had its own logical presuppositions, a logic of propositions or "theory of deduction" as Whitehead and Russell had called it. This most basic theory of logical first principles Leśniewski called 'protothetic'. For him it included not just the standard truth-functional connectives, but also higher functors and the basic principles governing the logic of quantifiers." (p. 307)

58. ———. 2014. "Arithmetic in Leśniewski's Ontology." In *The History and Philosophy of Polish Logic: Essays in Honour of Jan Wolenski*, edited by Mulligan, Kevin, Kijania-Placek, Katarzyna and Placek, Tomasz, 227-241. New York: Palgrave Macmillan.

"Jan Wolenski and I shared more than a merely antiquarian interest in Leśniewski however. Like myself, Jan also considered that Leśniewski had been somewhat poorly portrayed in subsequent literature, both by Leśniewski's often ignorant detractors and by his often equally uncritical admirers. We both take a somewhat more detached view than the latter, enabling us, as we think, to give a fair assessment of his important contributions.

I am concerned to exhibit some of the striking advantages of doing more things Lesniewski's way even today, and this paper falls into that category." (p. 228)

(...)

"Lesniewski's ontology (the logical system) goes beyond standard Frege-Russell style predicate logic because it is more liberal with its names. Whereas standard predicate logic has only singular names, to which free logic adds empty names, ontology in addition allows plural names: names of several individuals. But it stops there. In a sense it doesn't take multitudes or groups (the objective counterparts of plurals) fully seriously, since a plural term is just one term for many individuals.

We can have predicates true of multitudes, and with our numerical predicates we have seen how this allows us to bring arithmetic down a level by comparison with its standard (non-set-theoretic) treatment, where numerical terms are quantifiers, or predicates of predicates. And in Lesniewski's logic we have to use analogous numerical constants from ever higher types to continue the story. However, the illustration from kindergarten arithmetic shows that we naturally use the very same numerical terms for groups as for individuals, and indeed for groups of any desired level or order." (p. 239)

(...)

"While the final form of such a theory is not yet certain, it holds out a number of promises. The first is that it will allow a type-free account of arithmetic that is still beyond Leśniewski. The second is that the principles of Peano arithmetic in this system will have a much weaker existential requirement for their truth: by dint of the ability to ramify multitudes up to any finite order, no more than two individuals are required to kick-start an infinite hierarchy and so ensure that every finite cardinality predicate is satisfied. This is not to give up on Lesniewskian ontological neutrality, since it remains a non-logical fact that even one individual exists, but we can be assured that in any

universe we care about, in particular our own, Peano arithmetic will be true.

And finally, the endless resources of such a system of multitudes holds out the promise of doing something that, following Quine, has been universally assumed to be impossible, namely to provide a nominalistically acceptable formal semantics for predicate logic, of first or higher order. These are heady prospects, and tasks for another time. But it all starts from the first step of Leśniewski having the courage and foresight to retain plurally referring names when all around him the logical world was rejecting them." (p. 240)

59. ———. 2018. "Stanisław Leśniewski: Original and Uncompromising Logical Genius." In *The Lvov-Warsaw School. Past and Present*, edited by Garrido, Ángel and Wybraniec-Skardowska, Urszula, 209-221. Cham (Switzerland): Birkhäuser.

Abstract: "Stanisław Leśniewski was one of the two originators and drivers of the Warsaw School of logic. This article describes his work chronologically, from his early philosophical work in Lvov to his highly original logical systems of protothetic, ontology and mereology. His struggles to overcome logical antinomies, his absolute commitment to logical clarity and precision, and his antipathy towards set theory made his nominalistic approach to logic among the most original of the twentieth century, while his early death and the loss of his papers meant his work was only gradually discovered and appreciated outside Poland."

60. ———. 2018. "Leśniewski and Mereology." In *The Lvov-Warsaw School. Past and Present*, edited by Garrido, Ángel and Wybraniec-Skardowska, Urszula, 337-359. Cham (Switzerland): Birkhäuser.

Abstract: "This paper surveys mereology, the theory of parts and wholes, focussing on its origins in Leśniewski, and noting its intended employment as a surrogate for set theory.

We examine parallel and independent work by Whitehead, Leonard and Goodman, and outline the subsequent adventures

of mereology, both in its formal guises and in its now intensive application within philosophical ontology."

Stanisław Leśniewski: bibliography in English (Sin - Z)

Studies on Leśniewski in English

1. Sinisi, Vito. 1961. "Nominalism and common names." *The Philosophical Review* no. 71:230-235.

"Edwin Allaire, Gustav Bergmann and Reinhardt Grossmann have objected to the nominalistic analysis of "this is red and that is red" which treats "red" as a common name. Such an analysis, they argued, must assimilate the copula in this sentence to the "is" of identity. sinisi claims that this objection is mistaken. Using a logical system developed by Stanisław Leśniewski, he shows that it is possible to construe "red" as a common name without taking the copula as the "is" of identity."

2. ———. 1965. "Discussion: ` ` ∈ " and Common Names." *Philosophy of Science* no. 32:281-286.

"In [6] I tried to show how an objection to "the nominalist's" analysis of (a) "This is red" and (b) "That is red" on the basis of "the doctrine of common names" might be overcome.(1) The objection is that "the nominalist," attempting to analyze (a) and (b) by construing the pronouns in these sentences as two different proper names and "red" as a common name, is forced thereby to construe the copula in both sentences as the "is" of identity, and hence (it is claimed) this and that are identical, i.e., that there is only one red spot and not two. I attempted to show that by using Leśniewski's original axiom of ontology "the nominalist" could construe the pronouns in (a) and (b) as proper names, and "red" as a common name without taking the copula to express identity; he would not be forced to identify this with that.(2) The cogency of my explanation has been recently challenged by Mr. Grossmann [1]. In the first part of this note I shall answer some of his criticisms of my paper, and in the second I shall answer two questions he asks." (p. 281)

(1) The objectors are Edwin B. Allaire, Gustav Bergmann, and Reinhardt Grossmann. references see [6].

(2) Familiarity with [6] is assumed.

3. ———. 1966. "Leśniewski's analysis of Whitehead's theory of events." *Notre Dame Journal of Formal Logic* no. 7:323-327.

"Stanisław Leśniewski (1886-1939) was a leading member of the famous Warsaw school of logicians which flourished between the two Wars. The works of Lejewski and Sobocinski have made many readers of this journal familiar with Leśniewski's three systems of logic: protothetic, ontology, and mereology. What does not seem to be generally known is that in the course of setting forth mereology [1]: Leśniewski proved that A. N. Whitehead's axiomatic basis for the concept of event is an inadequate foundation for Whitehead's theory of events.

The purpose of this note is to recapitulate Leśniewski's analysis (available only in Polish) of Whitehead's theory of events. Perhaps a knowledge of this analysis will be of value not only to those interested in Leśniewski's work but to that growing number of philosophers concerned with Whitehead's metaphysics and philosophy of science." (p. 323)

[1] Leśniewski, Stanisław, "O podstawach matematyki," (On the Foundations of Mathematics), section 4, *Przegląd Filozoficzny* (Philosophical Review), XXXI (1923), 261-291.

4. ———. 1969. "Leśniewski and Frege on collective classes." *Notre Dame Journal of Formal Logic* no. 10:239-246.

"Between 1927 and 1931 Leśniewski published a series of articles on the foundations of mathematics in the Polish journal *Przegląd Filozoficzny*. 65% of the work is devoted to various

axiomatizations of Leśniewski's mereology (a theory of collective classes) while the remainder takes up various related issues. In the third part of this series Leśniewski informally sets forth his notion of a collective class, criticizes certain descriptions of distributive classes, and argues that there is no justification in Frege's statement that the conception of a class as consisting of individuals, so that the individual thing coincides with the unit class, cannot in any case be supported.

Leśniewski's refutation of Frege's statement appears to be unknown to western logicians and philosophers. None of the recent books on Frege (e.g., Angelelli, Egidi, Sternfeld, Thiel, Walker) mentions it. Luschei, in his *The Logical Systems of Leśniewski*, mentions it but does not present it.

My purpose here is to state and explain Leśniewski's refutation in the hope that it will help stimulate interest in his work." (p. 239)

5. ———. 1976. "Leśniewski's Analysis of Russell's Antinomy." *Notre Dame Journal of Formal Logic* no. 17:19-34.

"As mentioned above, Leśniewski's third analysis of Russell's antinomy has been published by Sobocinski in [49-50]. Luschei in [62] summarized Leśniewski's second analysis, which was published in [27]. However, the historically important first analysis of 1914, the analysis which determined the character of Leśniewski's later logical theories, is not accessible to those who do not read Polish.(5) This analysis should be of interest not only to those concerned with Leśniewski's Ontology and Mereology but also to those concerned with the antinomy. My purpose here is to state and explain the main points of Leśniewski's 1914 paper "Czy klasa klas, niepodporzadkowanych sobie, jest podporzadkowana sobie?" in order to reveal some of the factors which determined the form of Mereology, and to

help stimulate interest in his work." (pp. 19-20)

(5) Luschei [62], p. 20, asserts that Leśniewski repudiated his paper "Czy klasa klas . . . , " and in his bibliography of Leśniewski's works, p. 321, he lists this paper under the

heading "Early writings, later repudiated." Luschei also lists Leśniewski's [16] under this heading. Unfortunately, I have not found any textual evidence to support the claim that Leśniewski repudiated these two works. In [27], pp. 182-183, Leśniewski listed four articles, two published in 1911, and two published in 1913, which he solemnly repudiated, but his list does not contain either the paper "Czy klasa klas . . ." or his [16]. Leśniewski said that he mentioned these four works " . . . because I wish to indicate that I am very distressed that they were published at all, and I herewith solemnly 'repudiate' these works, which I have already done from a university lectern, and assert the bankruptcy of the 'philosophico'-grammatical enterprises of the first period of my research." Furthermore, Luschei [62], p. 67, summarizes Leśniewski's second analysis of the antinomy, which appeared for the first time in Leśniewski's [27], pp. 182-189, but incorrectly he attributes the analysis to Leśniewski's "Czy klasa klas . . ." of 1914. The analyses of [27] and of "Czy klasa klas . . ." are distinct. "Czy klasa klas . . ." is not, as Luschei says, recapitulated in [27].

[The paper of 1914 "Czy klasa klas . . . , " is translated as "Is the Class of Classes not Subordinated to Themselves, Subordinated to Itself?" in the first volume of Lesniwski, *Collected Works*, pp. 115-128]

6. ———. 1983. "The Development of Ontology." *Topoi* no. 2:53-62.

"Leśniewski published only two works devoted exclusively to Ontology: an article, 'Über die Grundlagen der Ontologie', in 1930, and, a year later, Chapter XI, 'O zdaniach "jednostkowych" typu "A e b" ' ['Singular' sentences of the type 'A e b'], in his series of articles on the foundations of mathematics(1) The first is essentially a highly formalized presentation of the terminological explanations for Ontology, breathtaking in its brevity and rigor; it concludes with a laconic summary of some results obtained by Leśniewski, Sobocifnski, and Tarski during 1921-1929. The second differs radically in style and content; written in colloquial Polish, almost a memoir, it narrates the development of Ontology. My purpose here is to give an analytical review of this narrative which includes many informative and illuminating discussions of the conceptual basis of Leśniewski's Ontology (or 'calculus of names', as it is sometimes called), and which may be helpful to those who are interested in Leśniewski's work but who do not read Polish." (p. 53)

[Chapter XI. "On 'singular' propositions of the type $A\epsilon b$ " is translated in *Collected Works*, pp. 364-382]

7. ———. 1983. "Leśniewski's Foundations of Mathematics." *Topoi* no. 3:3-52.

"During 1927-1931 Leśniewski published a series of articles (169 pages) entitled 'O podstawach matematyki' [On the Foundations of Mathematics] in the journal *Przegląd Filozoficzny* [Philosophical Review], and an abridged English translation of this series is presented here. With the exception of this work, all of Leśniewski's publications appearing after the first World War were written in German, and hence accessible to scholars and logicians in the West.

This work, however, since written in Polish, has heretofore not been accessible to most Western readers, and it is hoped that this translation will encourage both the study of Leśniewski's works as well as the further development of his theories.

Leśniewski's foundations of mathematics consists of three theories: Protothetic, which, according to Leśniewski, roughly corresponds "to what is known in the discipline as the 'calculus of equivalent statements', 'Aussagenkalkul', 'theory of deduction' joined with the 'theory of apparent variables' "; Ontology, "which is a kind of modernized 'traditional logic', and with respect to its content and 'strength' most closely approaches Schröder's 'Klassenkalkul' considered as including a theory of 'individuals' "; and Mereology, an axiomatization of the part-whole relation, which Leśniewski initially called "general set theory".

Mereology presupposed Ontology, which in turn is grounded in Protothetic. When Leśniewski began the publication of his 'O podstawach matematyki' he intended to present all three theories, but was able to present only Mereology.

There is an informal discussion of Ontology in Chapter XI of this series; and the terminological explanations, as his rules were called, for Ontology were published in another journal in 1930. Protothetic was first presented in 1929 in *Fundamenta Mathematicae*, and in 1938 his last work on Protothetic appeared. A year later, he died at the age of 53. During the Warsaw Insurrection of August, 1944 all of his unpublished manuscripts and lecture notes were destroyed." (p. 3, notes omitted)

"The essay "On the Foundations of Mathematics" is translated in *Collected Works*, vol. 1, pp. 174-382]

8. Slupecki, Jerzy. 1953. "St Leśniewski's Protothetics." *Studia Logica* no. 1:44-111.

Reprinted in Jan Srzednicki, Zbigniew Stachniak (eds.), *S. Leśniewski's Systems: Protothetic*, Dordrecht: Kluwer 1998, pp. 85-152.

"This paper does not bear the character of a historical study on Professor Leśniewski's system as the notes on which it is based were not written by himself. Moreover, the exposition of protothetics given here deviates in many points from that contained in those notes. This seemed to be indicated, in the

first place, for didactic reasons, my aim being to make this paper comprehensible also to non-specialists,(2) although it has, of course, been taken for granted that the reader is familiar with the fundamental branches of mathematical logic.

I have taken account of all the results contained in the notes with the exception of a few which I consider either unessential or indeed obsolete.

In order to make the exposition of protothetics both concise and complete I was bound to amplify considerably the material found in the notes. However, all the results given here and not contained in the notes were undoubtedly known to Professor Leśniewski. The paper includes no results of my own but a considerable part of the proofs has been entirely worked out by myself. I mention this so that I alone should be held responsible for any inaccuracies and errors which may have occurred.

This paper is not written with that exactitude which Professor Leśniewski always observed in his lectures and publications. This reservation, however, refers only to the meta-logical considerations whereas in the proofs of theorems of the system I have strictly followed the proofs found in the notes.

The lectures "On Certain Problems of Protothetics", the notes of which form the basis of this paper, were delivered by Professor Leśniewski at the Warsaw University during the academic year 1932-1933. The subject-matter of this paper is discussed in a more detailed way in Section 2." (p. 86 of the reprint)

(2) With the exception of Section 13 (proof of completeness of protothetics).

9. ———. 1955. "S. Leśniewski's Calculus of Names." *Studia Logica* no. 3:7-70.

Reprinted in Jan T. J. Srzednicki, V, F, Rickey (eds.), *Leśniewski's Systems: Ontology and Mereology*, The Hague: Martinus Nijhoff 1984, pp. 59-122.

"The only primitive term in Leśniewski's system of the Calculus of Names is the verb 'is' for which the participle 'being'

corresponds to the Greek 'ον' (gen. 'ὄντως'). This was by no means the only reason for Leśniewski's use for his system a name indicating one of the main branches of philosophy. Thus in Leśniewski's article "On the Foundations of Mathematics"(2) we read:

... I used the term 'ontology' for the theory I developed, as this was not opposed to my 'linguistic intuition', just in view of the fact that I formulated in that theory a sort of 'general principles of being'.

In the title of this paper I nevertheless thought it better to use "Calculus of Names", as 'ontology' might cause some misunderstanding, but I shall be using throughout the text 'ontology' for Leśniewski's system." (p. 59 of the reprint)

(...)

"I have subdivided this paper into four sections. Section I discusses the intuitive and formal foundations of ontology. Section II deals with theorems of that part of Leśniewski's system to which I shall refer as elementary ontology(7) and which contains the simplest theorems of the whole system and those nearest to intuition. It is in this section too that I discuss the relation between ontology and traditional logic as well as the algebra of sets. Section III deals with the remaining part of the system, i.e. the non-elementary ontology. However, I shall not give a systematic presentation of non-elementary ontology, as this could only be done in a separate and large treatise. I shall only adduce the theorems and definitions I consider most characteristic of non-elementary ontology. Further, I shall present all those theorems and definitions contained in the notes from Leśniewski's lectures which, though exceeding the limits of elementary ontology, are nevertheless closely related to its theorems and notions. Section IV contains brief methodological considerations on the system."

"The antinomies of the set theory have made it imperative for logicians and mathematicians to investigate its basic assumptions. As a result, consistent systems were formulated, but at the same time the intuitive interpretations of the "naive" set theory were lost. In all those systems, except the mereology of S. Leśniewski, the set is interpreted so that even sets of perceivable objects are not perceivable objects; thus, e. g., libraries are not sets of books, and constellations are not sets of stars. Mereology, however, is essentially "poorer" than other systems of the set theory. It is, for instance, impossible to build in mereology the arithmetic of natural numbers. In this paper Leśniewski's system is enriched so as to be suitable for laying the foundations of mathematics in the same degree as is the case of other systems of the set theory. This is achieved by including in mereology certain new definitions and by using much stronger logical means than it was done by Leśniewski. The extended system of mereology, however, retains the basic intuitive assumptions of the original system." (p. 131)

"Protothetic is a deductive theory constructed by the late Stanisław Leśniewski. As we know, he based the whole system of contemporary mathematics on three deductive theories, protothetic, ontology, and mereology, which he conceived and constructed. [...]

I will neither describe the characteristic features of these theories nor comment on the theoretical basis of St. Leśniewski's system. I will only state that:

1. The precision and the conciseness of the formalization, symbolism, and the formulation of the rules of procedure for

the above theories are unparalleled among the known deductive systems.

2. The principles on which these theories are based differ in many respects from those that were usually accepted before the discovery of the Russell Antinomy. They allow, nevertheless, to formulate and prove all the theorems of classical logic.

3. There are straightforward proofs that these theories and the entire system are consistent, and, consequently, that no known logical antinomy can be reconstructed in them." (p. 72)

(...)

"While investigating various problems of protothetic, I observed that a number of theorems which, as far as I could ascertain, remained unknown at that time (December 1935), were theses of protothetic. 26 As this finding is closely associated with the theorem of Dr. Alfred Tarski concerning the definability, in protothetic, of conjunction in terms of equivalence, I have decided to publish the theses discovered by myself." "In this paper I should like to present the results of my unpublished investigations concerning axiom-systems of protothetic. Strictly speaking, only the system of protothetic called S [Gothic] 5 will be considered here. It seems to me that this investigation may interest students of propositional calculus and the related subjects, since the deductions which will be used, sometimes unexpected and rather difficult, not

only explain to some degree the structure of protothetic, but can also throw light upon several problems concerning various systems of propositional calculus. Because, generally, protothetic is still a little known theory, at the beginning I have to give several, possibly short, explanations concerning it. Without them the subject of this paper and the proofs presented below would hardly be understandable for the reader.

Thus, in the first section a short description of protothetic and the necessary information about the rules of procedure of the system S [Gothic] 5 will be given.

There will also be added some history of the researches concerning the single axioms of protothetic and related problems. Especially, I shall discuss briefly the metatheorems L (of Leśniewski) and the stronger S (mine). In the second section I shall present a combined proof: (1) that my axiom A_n can serve as a single (and probably the shortest) axiom of the system S [Gothic] 5 of protothetic, and (2) that the above mentioned metatheorem S is sufficient to check the completeness of any axiom system of protothetic. In the third and the last section it will be shown, in the shortest possible way, how the classical propositional calculus and the quantification theory for protothetical formulas can be obtained in the field of the system S [Gothic] 5 **.

Instead of the authentic symbolism of Lesniewski² introduced by him mostly in order to formulate the rules of procedure in the most precise way, I shall use here a more convenient Peano-Russelian symbolism modified in a manner which will satisfy the requirements of protothetic. Anyone who is familiar with [elementary] logic will understand these modifications without difficulty." (p. 153 of the reprint, a note omitted)

** [Ed. Note: The third section was never published by Sobocinski; its intended contents is discussed by Rickey in paper II of this volume.]

19. ———. 1984. "Leśniewski's Analysis of Russell's Paradox (1949) (*)." In *S. Leśniewski's Systems: Ontology and Mereology*, edited by Srzednicki, Jan, Rickey, Frederick V. and Czelakowski, Janusz, 11-44. The Hague: Martinus Nijhoff.

Published in French in four parts: *Methodos*, I - II - III: vol. 1. (1949) pp. 94-107; 220-228; 308-316; IV: vol. 2 (1950) pp. 237-257.

"The purpose of this article is to give, with a minimum of symbolism, a simple, accessible, unpolemical exposition of Leśniewski's analysis of Russell's Paradox.(1)

This analysis merits attention for several reasons. Mainly, because it was the point of departure for the construction of Leśniewski's system for the foundation of mathematics. His method of overcoming the paradox in question is very different from those employed by others. From the start it forced Leśniewski to take a path on which he had to overcome great difficulties related to the problem of the paradoxes; it determined the character of the theories which constitute his system. This system, which differs in many ways from contemporary systems, is non-contradictory (which is easy to prove), and is an adequate base for the construction of contemporary mathematics. However, it is not very easy to get the feel of the system, nor is it easy to penetrate the psychology from which it arose-what precisely were Leśniewski's thoughts about Russell's Paradox.(2)" (p. 11)

"Conclusion

Around 1930 Alfred Tarski, a mathematician by inclination, training, and ability, very much like other contemporary researchers, attempted to apply the techniques of mathematics to problems in logic. Out of necessity this demanded that the formal languages of logic had to be converted into objects of study, from having been major tools for research. For him personally this entailed a conflict between the foundational stance that he had taken over from his teacher Leśniewski and the metamathematical *laissez faire* towards which he, as a mathematician, was inclined. He resolved this dilemma between 1933 and 1935 and his unequivocal choice was in favour of metamathematics. I have suggested that contributing factors in this decision were, possibly among others, (1) the impact of the achievements of metamathematics; (2) Tarski's own experience of metamathematical work; (3) the availability of an attractive alternative foundation, namely, Zermelo's axiomatic set theory in relation to the cumulative hierarchy; and (4) unfortunate personal conflicts among his teachers and collaborators." (p. 123)

"Concluding remarks

Stanisław Leśniewski's efforts to solve the problem of antinomies resulted in the construction of what he called the New System of the foundations of mathematics, distinguished by originality, comprehensiveness and elegance, a pioneering achievement of the 20-ties.

Leśniewski played a considerable role during the period of elaborating modern tendencies of mathematical logic and the foundations of mathematics. He was the forerunner and originator of many ideas now incorporated into logical and foundational text-books.

But Leśniewski's writings are done in a highly condensed and difficult style, most cumbersome in practice, his famous terminological explanations are hardly intelligible. He invented a special symbolism, the so called wheel and spoke notation the use of which was an additional factor determining his isolation on the international scene.

This is why Leśniewski's systems have not been so popular as they deserved. Another reason is that general trends of logical research had meanwhile drifted away from "system building" to metalogical investigations mostly of first order languages. All this is quite unfortunate but the fact remains that Leśniewski-systems are not generally accepted as a tool in the foundational practice, and they" are not the systems a mathematician in the street makes use of. But on the other hand, Leśniewski's work has greatly influenced the very philosophy of logic and of the foundational studies. In this field Leśniewski had worked out an original point of view he had called the "intuitionistic formalism" which he characterized by these sentences:

"I might take this opportunity to point out that. for many months I have devoted a considerable expenditure of systematic work towards the formalization of these systems /
••• / through a clear formulation of their directives using a

number of the auxiliary terms whose meaning I fixed in the terminological explanations / •. /. Having no predilection for various "mathematical games" that consist in writing out according to one or another conventional rule various more or less picturesque formulae which need not be meaningful, or even - as some of the "mathematical gamers" might prefer - which should necessarily be meaningless, I would not have taken the trouble to systematize and to often check quite scrupulously the directives of my system, had I not imputed to its theorems a certain specific and completely determined sense, in virtue of which its axioms, definitions, and final directives / .•. / have for me an irresistably intuitive validity" and further "I know no method more effective for acquainting the reader with my logical intuitions than the method of formalizing any deductive theory to be set forth./Compare for this Leśniewski /1929/, p.78/." (pp. 212-213)

Abstract: "The present paper proposes a comparative analysis of two standpoints on the existence and nature of universals hold by Stanisław Leśniewski and Bolesław Sobocinski. We consider first the nominalistic argumentation of Leśniewski formalized by Sobocinski and described in the correspondence with J. M. Bochenski in 1956. Sobocinski's formalization revealed a fundamental pragmatic weakness of the reconstructed argumentation which was also mentioned by Sobocinski. He himself was aware of the difficulties connected with an adequate interpretation of the crucial axiom, whose

acceptance Leśniewski imputed to supporters of all theories of universals. Finally, the problem of the existence and nature of universals was elaborated by Sobocinski also in a separate typescript "Uwagi w sprawie powszechników" (Remarks on universals).

The view formulated by Sobocinski comes from a combination of the methodology of deductive systems and the conceptualist standpoint. From the philosophical perspective Sobocinski's idea is both interesting and original, but it remained unknown to philosophers and logicians in general. For these reason we describe it and compare it with Lesniewski's approach. We use in this description epistemological notions of R. Suszko. Our analysis enables to speak about universals in sense of Leśniewski, which are described by some universal in sense of Sobocinski."

26. Tajtelbaum-Tarski, Alfred. 1998. "On the primitive term of logistic. *Doctoral Dissertation* [1923]." In *S. Leśniewski's Systems: Protothetic*, edited by Srzednicki, Jan and Stachniak, Zbigniew. Dordrecht: Kluwer.

"This paper appeared in print in Polish under the title 'O wyrazie pierwotnym logistyki', *Przegląd Filozoficzny* XXVI (1923), 68-89, by permission of Jan Tarski. Translated by Z. Stachniak." (p. 43)

"The considerations carried out in the present work belong to the area of logistic; the sentences on which I based these considerations are generally accepted among researchers working in this field of knowledge. I do not, however, carry out my considerations on the basis of any specific system of logistic; in particular, I do not make my reasonings dependent on the best known theory of logical types by Russell. Although it is not possible, as I see it, to develop a consistent system of logistic without this or that theory of types, among all the theories of types which could be constructed(2) there unquestionably exist those according to which my arguments, in their present general form, are faultless. One such theory was developed by S. Leśniewski during his lectures on the

foundations of arithmetic at the University of Warsaw (in 1920-1921).(3)

The main objective of the present work is to settle the following problem: is it possible to construct a system of logistic with the sign of equivalence as the sole primitive term (in addition, of course, to the quantifiers(4))?" (p. 43)

(2) The possibility of constructing different theories of logical types was already anticipated by the inventor of the first of them - Russell. Cf. A.N. Whitehead and B. Russell, *Principia Mathematica*, Cambridge 1910, Vol. I, p. vii.

(3) One way in which Leśniewski's theory of types affected the layout of this work is that for functions, whose arguments are not sentences, I am using distinct parentheses. Cf. Def. 4 in Section 2 and Def. 6 in Section 3.

(4) I am using the term 'quantifier' in the sense of Peirce ([cf.] 'On the Algebra of Logic', *American Journal of Mathematics* VII, 1885, p. 197), who denotes with this term the symbols ' Π ' (universal quantifier) and ' Σ ' (particular quantifier), representing abbreviations of the expressions: 'for every signification of terms ... ' and 'for some signification of terms ... '.

Abstract: "Parmenides formulated a formal ontology, to which various additions and alternatives were proposed by Melissus, Gorgias, Leucippus and Democritus. These systems are here interpreted as modifications of a minimal Lesniewskian Ontology."

"There is a tradition of ontological theorising which commences with Parmenides and whose central arguments can be given a purely formal interpretation. This, of course, is not their only possible interpretation. It is, nonetheless, worthy of consideration, as a means of articulating the continuities and discontinuities within that tradition, and of investigating the prehistory of logic.

The main thesis of this paper is that such a purely formal interpretation of Parmenides, his followers and critics, is best expressed in the language (or, if you wish, in some of the languages) of Leśniewski's Ontology." (p. 155)

33. Trentman, John. 1966. "Leśniewski's Ontology and Some Medieval Logicians." *Notre Dame Journal of Formal Logic* no. 7:361-364.

"In a recent issue of this journal (Oct., 1964) Professor Desmond Paul Henry [*] has shown that, although it may be the case that Ockham's descensus in his supposition theory cannot be adequately rendered in the lower functional calculus (Cf. [7]), it can be adequately rendered in the Ontology of S. Leśniewski. Professor Henry, furthermore, suggests that Ontology would be an appropriate tool for analyzing other medieval logical theories, claiming, "It is not difficult to multiply examples of the facility and directness with which Ontology can furnish formal analyses of medieval logical theories, including those cases which are despaired of in the histories." (P. 292)

In this note I wish to suggest an important limitation upon this claim.

For a very fundamental reason Ontology is not an appropriate tool for analyzing a certain class of fourteenth-century logical theories. One can best make this point, however, by emphasizing its usefulness for explicating Ockham's doctrines. Not only will it allow one to express the descensus; it also provides a very close and illuminating explication of Ockham's doctrine of predication, and this is the matter that most concerns me in this note." (p. 361)

[*] Ockham, *suppositio*, and modern logic, pp. 290-292.

34. ———. 1976. "On Interpretation, Leśniewski's Ontology, and the Study of Medieval Logic." *Journal of the History of Philosophy* no. 14:217-222.

"The most characteristic thing about D. P. Henry's interesting studies of medieval logic is his persistent use of and appeal to

the logical system called Leśniewski's Ontology.

Whether this characteristic of his books and essays is useful or repellent to the reader is a matter of controversy, and the use of this particular interpretative tool has, in fact, been challenged on the ground that if Leśniewski's Ontology is taken as an interpreted system in the sense in which medieval logics must be seen to be interpreted, it must be regarded as committed to a two-name doctrine of predication and, hence, is good Ockhamism but a dubious device for the expression of anti-Ockhamist logics.(1)

Henry has responded that this objection is mistaken.(2) There is no reason to believe that Ontology is thus limited. Nevertheless, Ontology is an interpreted system in the strong sense intended in the criticism. Indeed, he says about my characterization of the difference between logic and an uninterpreted calculus, "In fact the view of logic propounded is exactly the one adopted by Leśniewski."(3)

The aim of this note is to attempt some clarification of this controversy about the use of Leśniewski's Ontology as an analytical and historiographic tool. Henry's understanding of what the medieval logicians were trying to do is totally unexceptionable, but I shall suggest it is far from easy to get, either from him or from Leśniewski's other interpreters, a coherent and consistent understanding of the philosophical point of view of Ontology, upon which one might base a judgement about its historiographic usefulness.

The key to the problem is to be found in understanding what it means or can mean to talk about the interpretation of logic; it is here that an attempt at clarifying these issues must begin." (p. 217)

35. Urbaniak, Rafal. 2006. "On Ontological functors of Leśniewski's Ontology." *Reports on Mathematical Logic* no. 40:15-43.

Abstract: "We present an algorithm which allows to define any possible sentence-formative functor of Leśniewski's Elementary Ontology (LEO), arguments of which belong to the category of names. Other results are: a recursive method of listing possible functors, a method of indicating the number of possible n-place

ontological functors, and a sketch of a proof that LEO is functionally complete with respect to $\{ \wedge, \neg, \forall, \in \}$."

36. ———. 2006. "On Representing Sentential Connectives of Leśniewski's Elementary Protothetic." *Journal of Logic and Computation* no. 16:451-460.

Abstract: "After a brief presentation of Leśniewski's notation for 1- and 2-place sentential connectives of protothetic, the article discusses a method of extending this method to $n \geq 3$ -place sentential connectives. Such a method has been hinted at by Luschei, but in fact, no general effective method of defining such functors has been clearly and explicitly given. The purpose of this article is to provide such a method."

37. ———. 2006. "Some non-standard interpretations of the axiomatic basis of Lesniewski's Ontology." *Australasian Journal of Logic* no. 3:13-46.

"Intuitively, in a slogan, when we give axioms for a given axiomatic system one of our purposes is to characterize constants occurring in these axioms. Following this idea, axioms of Lesniewski's Ontology aim to characterize 'univocally' the primitive constants of this system. Usually, there is only one such a constant specific to Ontology; it is " (sometimes, there are other constants: see

Lejewski [9]). Hence, Lejewski writes:

In the original system of Ontology . . . the meaning of the copula 'is' (' ε ' axiomatizations. In order to proceed, we shall (i) introduce the language we will be talking about (ii) say what axioms and rules of inference were accepted in Ontology in some axiomatizations, (iii) present some possible interpretations of quantifiers in Ontology, (iv) explain what is meant by 'semantic interpretation of a given functor', and, when it will be done, (v) obtain the answer for the main problem.' in symbols) is determined axiomatically . . . [10, p. 323]

Our purpose will be to investigate, whether in fact axiomatizations of Ontology determine a unique semantic interpretation of the primitive constant(s) of this axiomatizations. In order to proceed, we shall (i) introduce the language we will be talking about (ii) say what axioms and rules of inference were accepted in Ontology in some axiomatizations, (iii) present some possible interpretations of quantifiers in Ontology, (iv) explain what is meant by 'semantic interpretation of a given functor', and, when it will be done, (v) obtain the answer for the main problem." (pp. 13-14)

38. ——. 2008. "Leśniewski and Russell's Paradox: Some Problems." *History and Philosophy of Logic* no. 29:115-146.

Abstract: "Sobocinski in his paper on Leśniewski's solution to Russell's paradox (*L'analyse de l'antinomie russellienne par Leśniewski*, 1949) argued that Leśniewski has succeeded in

explaining it away. The general strategy of this alleged explanation is presented. The key element of this attempt is the distinction between the collective (mereological) and the distributive (set-theoretic) understanding of the set. The mereological part of the solution, although correct, is likely to fall short of providing foundations of mathematics. I argue that the remaining part of the solution which suggests a specific reading of the distributive interpretation is unacceptable. It follows from it that every individual is an element of every individual. Finally, another Lesniewskian-style approach which uses so-called higher-order epsilon connectives is used and its weakness is indicated."

Reply to Leslaw Borowski (2010).

"I would like to thank Mr Borowski for his comments, I appreciate his time and effort. It is always uplifting to learn that a topic which one has considered quite hermetic can stir up such emotions. I'll just briefly respond in a rather relaxed manner to what I think the main points raised by Mr Borowski are." (p. 255)

(..)

"Once again, I would like to thank to Mr Borowski for his criticism – he pointed out a mistake in one of the definitions, and the review brought up to my attention the need for extreme clarity which I, over-relying on the reader's common-sense, might have neglected." (p. 259)

40. ———. 2013. *Leśniewski's Systems of Logic and Foundations of Mathematics*. Dordrecht: Springer.

"Leśniewski's work is interesting for a few reasons.

- If one is interested in history of logic in general, it is hard to deny that Leśniewski was one of the key figures in one of the most important schools of logic in twentieth century. He devoted his research to developing an alternative to the system

of *Principia Mathematica* and this attempt is worth studying in his own right.

- If one is interested in the development of Tarski's thought it might be useful to learn what his Ph.D. supervisor's views were and how Leśniewski's work and Tarski's ideas are (or are not) related.
- Philosophical discussions in which Leśniewski participated pertained to issues which are discussed quite lively even today. His approach to semantical and set-theoretic paradoxes and his views on the validity of the principle of excluded middle and of the principle of contradiction are philosophically interesting.
- Leśniewski was a nominalist and his systems were a nominalistic attempt to provide a system of foundations of mathematics. It is a major attempt of this sort and as such it is worth an examination.
- His metalogic is quite specific. Nominalist as he was, he wanted to develop a purely inscriptional syntactic description of his systems in a way that did not make any reference to expression types. It is interesting to see how he proceeded.
- His systems have some interesting properties. For instance, in all of them definitions can be creative (and this is not considered to be a problem). The generality of Prothetic admits interesting extensions (intuitionistic (see López-Escobar and Miraglia 2002) or modal (see the works of Suszko and in general, see Sect. 3.7 for references). The language of Ontology (which, in a way, can be viewed as one of the first free formal logics) is, arguably, more suitable for capturing certain aspects of predication and abstract noun phrases as they work in natural language.

This book is devoted to a presentation of Leśniewski's achievements and their critical evaluation. I discuss his philosophical views, describe his systems, and evaluate the role they can play in the foundations of mathematics. It was my purpose to focus on primary sources and present Leśniewski's own views and results rather than those present in secondary literature. For this reason, later developments are not treated in

detail but rather either mentioned in passing, or described in sections devoted to secondary literature included in some chapters." (Preface, pp. VII-VIII)

41. ———. 2015. "Stanisław Leśniewski: Rethinking the Philosophy of Mathematics." *European Review* no. 23:125-138.

Abstract: "Near the end of the XIXth century part of mathematical research was focused on unification: the goal was to find "one sort of thing" that mathematics is (or could be taken to be) about. Quite quickly sets became the main candidate for this position. While the enterprise hit a rough patch with Frege's failure and set-theoretic paradoxes, by the 1920s mathematicians (roughly speaking) settled on a promising axiomatization of set theory and considered it foundational. Quite parallel to this development was the work of Stanisław Leśniewski (1886-1939), a Polish logician who did not accept the existence of abstract (aspatial, atemporal and acausal) objects such as sets. Leśniewski attempted to find a nominalistically acceptable replacement for set theory in the foundations of mathematics. His candidate was Mereology — a theory which instead of sets and elements spoke of wholes and parts. The goal of my talk will be to present Mereology in this context, to evaluate the feasibility of Lesniewski's project and to briefly comment on its contemporary relevance."

42. ———. 2016. "Potential Infinity, Abstraction Principles and Arithmetic (Leśniewski Style)." *Axioms* no. 5:1-20.

Abstract: "The paper starts with an explanation of how the logistic project can be approached within the framework of Lesniewski's systems. One nice feature of the system is that Hume's Principle is derivable in it from an explicit definition of natural numbers. I generalize this result to show that all predicative abstraction principles corresponding to any second-

level relation which is provably an equivalence relation are provable. However, the system fails, despite being much neater than the construction of *Principia Mathematica*. One of the key reasons is that just as in the case of the system of PM, without the assumption that infinitely many objects exist, (renderings of) most of 8 the standard axioms of Peano Arithmetic are not derivable in the system. I prove that introducing modal quantifiers meant to capture the intuitions behind potential infinity results in the (renderings of) axioms of PA being valid in all relational models of the extended language. The second, historical part of the paper contains a user-friendly description of Lesniewski's own arithmetic and a brief investigation into its properties."

43. Urbaniak, Rafal, and Severi Hämäri, K. 2012. "Busting a Myth about Leśniewski and Definitions." *History and Philosophy of Logic* no. 33:159-189.

Abstract: "A theory of definitions which places the eliminability and conservativeness requirements on definitions is usually called the standard theory. We examine a persistent myth which credits this theory to Leśniewski, a Polish logician. After a brief survey of its origins, we show that the myth is highly dubious. First, no place in Leśniewski's published or unpublished work is known where the standard conditions are discussed. Second, Leśniewski's own logical theories allow for creative definitions. Third, Leśniewski's celebrated 'rules of definition' lay merely syntactical restrictions on the form of definitions: they do not provide definitions with such meta-theoretical requirements as eliminability or conservativeness. On the positive side, we point out that among the Polish logicians, in the 1920s and 1930s, a study of these meta-theoretical conditions is more readily found in the works of Łukasiewicz and Ajdukiewicz."

44. Vanderveken, Daniel R. 1976. "The Leśniewski-Curry Theory of Syntactical Categories and the Categorially Open Functors." *Studia Logica* no. 32:191-201.

"The present paper is concerned with the problems which are posed for the Leśniewski-Curry theory of syntactical categories

by the categorially open functors.

A categorially open functor of a language L is any functor of L whose syntactical category in L ranges at each occurrence over a set of several different syntactical categories admitted in L , and is determined in each case effectively in function of the categories of one or several of the expressions which it then takes as arguments.

For example, the quantifiers and the identity sign of a logical language with several types of objects are categorially open functors in this language.

The deficiencies of the Leśniewski-Curry theory of categories with respect to the categorially open functors have often been mentioned in the literature, for example, in A. Tarski 1936, § 4, 11th note and in A. N. Prior, 1971, ch. 3, § 7.

Our fundamental purpose in this paper is to define a consistent extension of this theory adequate for the characterisation of these functors.

Since the usual categorial base components of transformational grammars are constructed on the model of Leśniewski-Curry's theory, this new theory of syntactical categories will naturally have interesting consequences for those components." (p. 191)

"In spite of the historical proximity of S. Leśniewski to K. Twardowski, an attempt to look at Twardowski's heritage through Leśniewski's eyes leads to striking results. Firstly, it

results in a wider framework than Leśniewski's Elementary Ontology and secondly, it involves a transition from Formal Ontology to Formal Phenomenology. In this paper an extension of Leśniewski's Non-Elementary Ontology is presented which is suitable for investigating Twardowski's Theory of Presentation." (p. 153)

46. Vasyukov, Vladimir. 1993. "A Lesniewskian Guide to Husserl's and Meinong's Jungles." *Axiomathes* no. 4:59-74.

"The borderline between modern and traditional logics can hardly be drawn in the case of the Lvov-Warsaw Philosophical School. If chronologically we regard 1879 (when Frege's *Begriffsschrift* was published) as the beginning of the revolution in logic, then the date of the beginning of the activity of the Lvov-Warsaw school (1895) allows us to consider it prima-facie as wholly belonging to modern logic. And undoubtedly many results and ideas of such members of the school as Łukasiewicz, Tarski, Ajdukiewicz etc. belong to the great development of 'modern' twentieth century logic.

(...)

Taking into account that Leśniewski's Ontology is also the theory of objects, it will not be such a surprising endeavour to analyse Husserl's and Meinong's views from the standpoint of Ontology, in search of the common basic features.

The problem is that perhaps the language of Ontology is too poor to describe some aspects of these other theories. And this is quite natural: Leśniewski's task was an inquiry into the deepest and thus simplest intuitive concepts of objects as such.

Our proposals in this case probably would not meet with the approval of Leśniewski himself, but extending logical theories is common enough, so this is the approach that is undertaken here. We shall consider two ways of extending Leśniewski's Ontology which allow us to interpret some aspects of Husserl's and Meinong's theories of objects. I do not think that this will be precisely the remedy for overcoming the "horrors of Meinong's (Husserl's) jungle" but rather an attempt to yield an ontologically oriented language as background for further

- expeditions and penetrations deep into the heart of these "magical territories." (pp. 59-60)
47. Waragai, Toshiharu. 1979. "Ontological Burden of Grammatical Categories." *Annals of the Japan Association for Philosophy of Science* no. 5:185-205.

"Now the problem about the predicate-quantification disappears, for the category convention of predicates is not that which the category of names has.

They are related to the realm of entities regarding their meanings, or their extensions.

Having an extension is not the same as naming a set. We must introduce some special category, if we want to speak about sets. For some philosophical reason, I shall name the interpretation which I proposed the subjectivistic interpretation of quantification. My philosophical intuition for it is more or less the following.

Our world consists of subjects, which I understand in the sense of traditional ontology; they have their own inner structures within the framework of which they can appear in the world, related to each other again within this framework.

Their classification according as what they are gives us the categories, or predicates³. If we replace a word designating some so-called *substantia prima*, e.g. Socrates, in a sentence containing this word, say 'Socrates is wise', with 'something' (*aliquid*, or better *aliqua res*), then we may be said to be committed to some entity by the use of the sentence 'something is wise', but as to 'wise', the resulting

sentence which we get by replacing this word with 'something' does not make us commit ourselves to any kind of entity. The sentence 'Socrates is something' does not force us to accept any new kind of entity like idea. It only says that Socrates is in some mode of being. Only quantification of the word for the *substantia prima* forces us to commit ourselves to entities. Hence I call my interpretation

subjectivistic." (p. 199, notes omitted)

"Now let me summarize what I have discussed until now in this chapter. The language I considered has as to noun expressions only one category, and they are in two ways related to the reality by the category conventions $C(U)$ and $C(ob)$.

In general, names are related by $C(U)$ to the reality as to their extensions, but those names which can be the subject of the sentence 'x€y' are related to the reality as entity names. Hence, it is clear that the quantification in this language is not merely substitutional, but rather should be regarded as subjectivistic.
(2)

I may stress this fact by saying that *existence is not what quantification expresses but what the grammar of a regimented language does.*" (pp. 201-202)

"§ 7. System Lo and Leśniewski's Ontology

Though the logico-semantical analysis of Aristotle's argument of *descending chain of predicates* [*] which is essentially ontological, and at the same time through the analysis of the everyday usage of names and negations, I made clear the logico-semantical content of the ontological law of identity and that of the ontological law of contradiction by constructing a first-order language Lo which is strong enough to perform the logico-semantical analysis of the two ontological dicta.

Historically speaking, this system is a proper part of a more comprehensive logical system constructed by Stanisław Leśniewski (1886-1939), which he named Ontology.(1)

He stated:

I used the name Ontology for the system I constructed, since, when I consider the circumstances that I formulated in the system a kind of "general principle of being", the name did not hurt my "feeling of language"(2).

But what we regret is that he does not seem to have mentioned any philosophical relation between his system *Ontology* and traditional Ontology.

In this paper, we obtained logical system through a philosophical and logical analysis of Aristotle's argument of descending chain of predicates, and it became clear that the analysis leads us to a logical analysis which is of its essential nature Lesniewskian. This fact helps understand the philosophical relation between Leśniewski's Ontology and traditional Ontology." (p. 58)

51. ——. 1998. "On Some Essential Subsystems of Leśniewski's Ontology and the Equivalence between the Singular Barbara and the Law of Leibniz in Ontology." In *The Lvov-Warsaw School and Contemporary Philosophy*, edited by Kijania-Placek, Katarzyna and Wolenski, Jan, 169-180. Dordrecht: Kluwer.

"The main aim of this paper is to show that in Leśniewski's Ontology, the law of Leibniz and a special case of *Barbara* which we refer to as the singular *Barbara* are equivalent to each other. To show this, we choose a group of theses of Ontology which are sufficient to establish the intended equivalence. From the result it follows that the problematic characters concerning the law of Leibniz reduce either to the

validity of the singular *Barbara* or that of the theses used in establishing the intended equivalence.

We suggest that the most dubious thesis is the one which correctly expresses the operation of comprehension. According to this result, we claim 1) that the dubiousness of the law of Leibniz reduces to that of the notion of comprehension and 2) that not every property is convertible to a name. With respect to these results, the doctrine of limitation of size in set theories will be criticized.

Since I presented and used an extended version of Ontology to show the main results at the conference held in Lvov, I will give a sketch of the system I made use of at the conference. The logical relation between the sole axiom of Leśniewski's Ontology and Russell's theory of description will be made clear, too." (p. 169)

52. Wolenski, Jan. 1986. "Reism and Leśniewski's Ontology." *History and Philosophy of Logic* no. 7:167-176.

Abstract: "This paper examines relations between Reism, the metaphysical theory invented by Tadeusz Kotarbiński, and Leśniewski's calculus of names. It is shown that Kotarbinski's interpretation of common nouns as genuine names, i.e., names of things is essentially based on Leśniewski's logical ideas. It is pointed out that Lesniewskian semantics offers better prospects for Nominalism than does semantics of the standard first-order predicate calculus."

Abstract: "This paper applies Leśniewski's logical ideas to an analysis of the concept of being. The analysis follows the classical ontology which is based on a distinction of two

concepts of being : being in the distributive sense and being in the collective sense. Now it is argued that Leśniewski's ontology (calculus of names) is a much better device for analyzing being in the distributive sense than the standard first-order predicate logic. Moreover, basic intuition connected with the being in the collective sense are nicely captured by mereology."

55. ———. 1995. "Mathematical logic in Poland 1900-1939. People, circles, institutions, ideas." *Modern Logic* no. 5:363-405.

"Assume that someone would try to predict the development of mathematical logic circa 1900. Probably, he would point out Germany, England, and perhaps France as the central countries. Certainly, this person would not mention Poland, and not only because there was no such country at that time. Thirty year later, Heinrich Scholz, the first modern historian of logic, called Warsaw one of the capitals of mathematical logic. How did a country without special traditions in logic so quickly arrive at the top of this field? What happened that permitted Fraenkel and Bar-Hillel to write: "There is probably no country which has contributed, relative to the size of its population, so much to mathematical logic and set theory as Poland"? This paper tries to explain the phenomenon called "Polish logic" by pointing out the wider context in which logic in Poland was done." (p. 363)

56. ———. 2004. "Polish Logic." *Journal of Logic and Computation* no. 12:399-428.

Abstract: "This paper outlines the history of logic in Poland in the years 1918-1939 (which some additions concerning the period before 1918 and after 1945). The disciplinary and social history of logical investigations in Poland is widely described. The author stresses topics characteristic for Polish logic, namely propositional calculus, many-valued logic, Leśniewski's systems, Chwistek's systems and the works in the history of logic."

57. ———. 2012. "Truth is Eternal if and only if it is Sempiternal." In *Studies in the Philosophy of Herbert Hochberg*, edited by

Tegtmeier, Erwin, 223-230. Frankfurt: Ontos Verlag.

"The problem addressed in this paper goes back to Aristotle and his considerations about tomorrow's sea battle. In a famous passage in *De Interpretatione* (19a 25-30; after *The Works of Aristotle*, vol. 1: *Categoriae and De Interpretatione*, tr. by E. M. Edghill, Oxford University Press, Oxford 1928), the Stagirite says:

Everything must be either be or not be, whether in the present or in the future, but it is not always possible to distinguish and state determinately which of these alternatives must necessarily come about.

Let me illustrate. A sea-fight must take place tomorrow or not, but it is not necessary that it either should not take place tomorrow, neither it is necessary that it should not take place, yet it is necessary that it either should or should not take place tomorrow. Since propositions correspond with facts, it is evident that when in future events there is a real alternative, and a potentiality in contrary directions, the corresponding affirmation and denial have the same character.

These words initiated a considerable discussion about the relation between truth and time. Is truth relative and dependent on temporal coordinates or absolute and timeless? The debate concerns several problems, in particular, the validity of some logical principles, fatalism, God's omniscience, free-will and determinism (see Bernstein 1992, Cahn 1967, Gaskin 1995, Hintikka 1977, Lucas 1989, Prior 1953, Vuillemin 1996. This paper concentrates almost entirely on logical issues." (p. 223)

"Final Remarks

There is an explicit continuity of aletheiology in LWS [Lwow-Warsaw School] from Twardowski to Tarski. Most Polish authors followed Aristotle's ideas, eventually in a Brentanist shape, accepted the weak correspondence and considered truth as absolute. (SDT) offers a very sophisticated account of these ideas. Although Łukasiewicz was an exception, he defended the eternality of truth, which can be accepted as a weakened absoluteness. Aletheiology in LWS was developed parallel to the growth of mathematical logic. Twardowski, Kotarbiński, early Leśniewski and early Łukasiewicz explained their ideas informally and with quite old-fashioned formal equipment. On the other hand, later works of Leśniewski, Łukasiewicz and particularly Tarski, involved strong formal logical devices. And this last point is perhaps the most important Polish contribution to contemporary aletheiology." (p. 88)

SDT = A sentence A is true if and only if it is satisfied by every infinite sequence of objects (equivalently; by the empty sequence; by some sequence).

59. Wong, Sen. 2021. "On Reading Leśniewski." *History and Philosophy of Logic* no. 42:160-179.

"It is well-known that Lesniewski's logical works are not reader-friendly, which certainly hinders any attempt to approach and not to mention understand his ideas for first-timers.

Peter M. Simons's *On Understanding Leśniewski* of this journal (Simons 1982) presents a picture of how to interpret names and the constant 'ε' of Leśniewski's second system Ontology. As Ontology assumes Protothetic, it seems a good idea to deal with Protothetic first as it is Lesniewski's first system from the perspective of logical precedence." (p. 160)

(...)

"What follows in this paper is a rough presentation of Protothetic as a template for constructing a nominalist propositional calculus. Some special techniques will be discussed and a method of graphic exposition will be used to describe some of the original TE

[terminological explanations] formulae." (p. 161)

60. Żelaniec, Wojciech. 1998. "Is "Being" Predicated in Only One Sense, after All?" *Logic and Logical Philosophy* no. 6:241-258.

"This piece is going to be on a particular difficulty with translating ordinary language (English, in this case) sentences into logical idiom. Difficulties in this area are quite abundant, as is known to everyone who has ever taught logic, but there is one specific family of problems that appears to be of crucial importance. The chief member of this family is this problem: How is the "is" of ordinary English to be translated into logical idiom?

Traditionally, we distinguish between the "is" of predication — the copula —, the "is" of existence and the "is" of identity. This is not an exclusive classification, however, because the "is" of identity is, syntactically speaking, a special case of the "is" of predication: in sentences of form "A is identical with B" the predicate "... is identical with B" can be discerned, alongside two others. As regards the "is" of existence, a lot of ink has been spilled on "proving" that existence is or is not a "genuine predicate" — which is itself a piece of evidence that things are

not at all clear here. Indeed, apart from quite singular sentences such as “God is” or “He’s the power that was” (said of a politician) we usually make our existence statements in sentences that do not look much different from “ordinary predications”, such as, for instance, “Soldiers are there”, “This technology is available” and the like.

If there is any difference from “ordinary predications” here, it is that of the “is” of localisation (being there, being at some definite place or within some definite domain) and all the other kinds of predication — a difference on which Professor Perzanowski has taught us a lot in a number of articles.

I shall be concerned here with just this: How to distinguish between the “is” of identity and the “is” of other kinds of predication. More precisely, I shall be concerned with the question of which kind of logic allows us to make this distinction with more accuracy. From among all possible kinds of logic as competitors, I shall concentrate on just these two: first-order predicate calculus, as, in the words of Hodges ([8], p. 2), “the simplest, the most powerful and the most applicable branch of modern logic” and Leśniewski’s Ontology, as a modern version of the calculus of names.” (p. 241)

Bibliographie des études en Français sur Stanisław Leśniewski

Études sur Leśniewski en Français

1. Berrendonner, Alain. 1995. "Anaphore associative et méréologie." In *Stanisław Leśniewski aujourd'hui*, edited by Miéville, Denis and Vernant, Denis, 237-255. Grenoble: Recherches sur la Philosophie et le Langage.

Résumé : "La compréhension d'une « anaphore associative » requiert un raisonnement implicite par lequel on infère un objet non-dit à partir de contenus (objet ou procès) nommés antérieurement. On s'efforce de formaliser, et de ramener à un modèle commun, les divers modes sur lesquels s'opèrent ces inférences. L'hypothèse est qu'il s'agit de divers parcours dans une même configuration-substrat composée de deux sortes de relations : la subsomption sous un type et l'ingrédience méréologique."

2. Fredj, Mounia. 1995. "Implémentation des principes méréologiques." In *Stanisław Leśniewski aujourd'hui*, edited by Miéville, Denis and Vernant, Denis, 275-295. Grenoble: Recherches sur la Philosophie et le Langage.

Résumé : "Le travail présenté ici s'inscrit dans le cadre général du traitement automatique des langues naturelles, et s'intéresse notamment au problème de représentation des connaissances et des raisonnements « portés » par la langue naturelle.

Nous avons conçu le système Saphir qui a pour objectif de construire le réseau d'objets issus du discours, en décrivant certains des raisonnements mis en œuvre dans les processus d'acquisition de connaissances, et plus particulièrement ceux

permettant de résoudre les anaphores associatives. Par discours, nous entendons toute séquence en langue naturelle écrite, texte ou dialogue.

Un modèle de représentation des connaissances contenues dans le discours a été défini. Nous présentons dans ce papier le formalisme qui sous-tend le système Saphir. C'est un formalisme orienté objet, dont les fondements théoriques sont les systèmes logiques de Leśniewski : 'l'Ontologie et la Méréologie."

3. Gessler, Nadine. 2005. "Introduction à l'oeuvre de S. Leśniewski. Fascicule III - La Méréologie." *Travaux de Logique (Neuchâtel)*.

"Le premier fascicule d'introduction à l'oeuvre de S. Leśniewski présente à la fois quelques aspects biographiques de Leśniewski et la protothétique. Le deuxième insiste sur le développement de l'ontologie et en explore quelques applications.

Ces deux fascicules ont été conçus de manière à présenter l'esprit, l'écriture contextuelle et les mécanismes inférentiels associés à ces systèmes développementaux si particuliers. Ils ont donc valeur de référence.

Ce présent fascicule, troisième du nom, expose la théorie logique appliquée, la théorie générale des classes développée par Leśniewski et connue sous le nom de méréologie.

L'intention a été de présenter ce système non pas comme un objet théorique en soi et qui contient la protothétique et l'ontologie, mais davantage comme une théorie à même de résoudre un problème: l'argument de De Morgan, «tout homme est un animal, donc toute tête d'homme est une tête d'animal»." (p. XII)

4. ———. 2007. "Introduction à l'oeuvre de S. Leśniewski. Fascicule V. Leśniewski, lecteur de Frege." *Travaux de Logique (Neuchâtel)*.

"Ce fascicule des Travaux de Logique est le cinquième consacré à l'oeuvre de Stanisław Leśniewski et à son histoire scientifique. Il paraît après ceux consacrés à la protothétique (I), à l'ontologie (II), à la méréologie (III) et à l'oeuvre de

jeunesse (IV). Cette série spéciale s'achèvera par le fascicule (VI) qui portera sur la présentation de la métalangue formalisée des systèmes logiques de Leśniewski." (p IX)

5. Grize, Jean-Blaise. 1973. *Logique moderne III. Implications-modalités, logiques polyvalentes, logique combinatoire, ontologie et méréologie de Leśniewski*. Paris/La Haye: Gauthier-Villars et Mouton.

Cinquième partie: *Ontologie et Méréologie de Leśniewski*, pp. 77-100.

"L'ontologie et la méréologie de Leśniewski, sommairement exposées ici, ont répondu d'abord à des problèmes relatifs à la théorie des ensembles. Cependant, la façon dont ces systèmes cherchent à rendre compte du verbe ÊTRE, la formalisation de la relation de partie à tout (distincte naturellement de l'inclusion), la notion de classe collective qui contraste avec celle usuelle de classe distributive, l'attitude épistémologique même de Leśniewski en face des systèmes formels - tout cela nous a paru fondamental pour les sciences humaines.

Nous avons ainsi visé à introduire le lecteur dans quelques domaines que nous espérons utiles à ses propres travaux, mais à l'introduire seulement. Cela signifie que ce Fascicule III ne se présente pas exactement

comme les deux premiers. Nous avons cherché à faire connaître l'existence de certaines logiques, à présenter la façon d'aborder les questions sans prétendre écrire un « manuel » au sens courant du terme." (pp. 2-3)

(...)

"Il est de mise aujourd'hui de traiter les systèmes formels comme si l'on ignorait les interprétations que l'on a en vue. L'attitude de Leśniewski est très différente. Il se propose de formaliser certaines notions,

celles par exemple que recouvre *est* (3e personne du verbe «être»), celle que recouvre l'expression *est élément de*, etc. Ces locutions ont un sens pour celui qui parle français. Leśniewski se donne pour tâche de

fixer ce sens - plus exactement une partie de ce sens - à l'aide d'axiomes et d'en déduire ensuite les conséquences. Il s'en suit donc:

- 1) que Leśniewski estime, comme le faisait Aristote, que les langues naturelles véhiculent aussi des rapports logiques et qu'il est légitime d'y prendre appui;
- 2) que la signification des symboles coexiste avec les règles formelles qui les dirigent.

L'interprétation est donc un guide heuristique permanent et ce ne sont pas les axiomes qui donnent un sens aux signes, mais bien le sens des signes qui justifie et explique les axiomes. Un système formel se présente donc comme le résultat d'une formalisation de nos intuitions." (p. 78)

6. Houdé, Olivier. 1995. "Le "langage méréologique" ajoute-t-il quelque chose aux descriptions psychologiques ?" In *Stanisław Leśniewski aujourd'hui*, edited by Miéville, Denis and Vernant, Denis, 297-320. Grenoble: Recherches sur la Philosophie et le Langage.

Rsumé : "Le « langage méréologique » ajoute-t-il quelque chose aux descriptions psychologiques ? Les réponses des psychologues à cette question sont partagées. Pour certains, la méréologie de Leśniewski « habille sur mesure » les faits de développement. D'autres émettent de nettes réserves. Sans souscrire à l'une ou l'autre de ces positions extrêmes, notre texte vise à coordonner quelques éléments théoriques susceptibles d'affiner les termes du débat. Trois courants de recherche sont examinés : le structuralisme piagétien, le néostructuralisme et le cognitivisme développemental."

7. Joray, Pierre. 2001. *La subordination logique. Une étude du nom complexe dans l'Ontologie de S. Leśniewski*. Bern: Peter Lang.

"Introduction

Sous le titre de «On denoting» paraissait en 1905 un court article de Russell qui allait avoir sur la question du nom logique une influence considérable. S'inscrivant à l'opposé de la logique

traditionnelle, qui avait toujours accordé au nom une place centrale dans le contenu logique des énoncés, Russell affirmait que la plupart des noms du langage ordinaire ne pouvaient pas être considérés sans difficultés comme des constituants logiques.

(...)

Notre examen critique des systèmes classiques porte essentiellement dans ce travail sur trois points. Le premier consiste à mettre en doute la possibilité théorique d'une élimination complète des noms du langage symbolique. Si Russell n'envisage pas lui-même une réduction aussi radicale, il échoue pourtant dans l'élaboration d'un critère proprement logique de démarcation entre noms et descriptions. Par le second, nous rappelons l'incapacité bien connue des théories classiques à rendre compte d'une manière satisfaisante des pratiques raisonnées faisant un usage de noms vides. Enfin, le troisième porte sur les inconvénients

inhérents au caractère implicite des présupposés ontologiques attachés au traitement classique de la quantification, tel qu'on le trouve en particulier dans les *Principia*.

Ce travail a pour but de montrer comment il est possible de concevoir un formalisme qui, ne prenant pas pour base la théorie russellienne des descriptions, réussit à s'affranchir des limitations auxquelles elle conduit. En redonnant au nom logique une définition aussi large que possible, nous nous sommes cependant trouvé d'emblée confronté, dans l'analyse formelle, à la diversité considérable des formes qu'il pouvait revêtir dans l'usage ordinaire.

(...)

Après une analyse détaillée, visant à dégager de leurs réalisations discursives les propriétés structurelles propres aux formes logiques de la subordination, il nous fallait encore disposer d'un formalisme adapté à notre projet. Bien entendu, nous ne sommes pas parti de rien. En faisant appel au calcul extensionnel des noms de Stanisław Leśniewski, nous

dispositions dès le départ d'un outil puissant pour la représentation d'un riche ensemble d'opérateurs nominaux.

La partie originale et constructive de notre travail a alors consisté à développer dans cette logique les instruments indispensables à une formalisation des mécanismes opératoires de la subordination logique.

Face à la théorie russellienne des descriptions, nous montrons enfin qu'un tel calcul constitue une alternative adéquate dans le traitement formel des noms logiques et répond ainsi aux exigences de notre projet." (pp. 3-5)

8. ——. 2005. "La *no-class theory* de Stanisław Leśniewski." *Philosophia Scientiæ* no. 9:189-204.

Résumé : "Insatisfait du calcul des classes et des relations de Whitehead et Russell, Leśniewski élaborera en 1919-20 une théorie extensionnelle des noms qu'il nomma Ontologie. Sans entrer dans une description technique du formalisme de Leśniewski, nous montrons dans cet article que l'Ontologie permet un traitement général du distributif qui ne s'appuie à aucun moment sur une notion de classe. Nous illustrons enfin cette particularité importante du système de Leśniewski en proposant une définition logiciste de la notion de cardinalité qui répond d'une manière radicale aux impératifs d'une *no-class theory*."

Abstract: "Leśniewski was not satisfied by Whitehead and Russell's calculus of classes and relations. In 1919-20, he elaborated an extensional theory of names he called Ontology. Without a description of the full technical apparatus of Leśniewski's formalism, I show here that Ontology gives rise to a general treatment of distributive predication which makes no use of the notion of class.

In order to illustrate the importance of this peculiarity, I will give a logicist definition of cardinality which is radically conform with the requirements of a *no-class theory*."

9. ——. 2020. "Un système de déduction naturelle pour la Protothétique de Leśniewski." *Argumentum. Journal of the*

Seminar of Discursive Logic, Argumentation Theory and Rhetoric no. 18:45-65.

Abstract : "Stanisław Leśniewski's system called Protothetic is one of the most stimulating systems of propositional logic. Including quantification and a special rule for introducing definitions among its theorems, it is a powerful means for the study of many questions of logic and metalogic. In this paper we present how to obtain a version of Protothetic in the style of Jaśkowski-Fitch's natural deduction systems. Unlike Leśniewski's original system, which requires a fairly laborious learning process, the use of this new version, called PND, is accessible to anyone familiar with the well-known methods of natural deduction for propositional logic. We show that PND contains classical propositional logic and opens the possibility of developments of Protothetic in intensional logic."

10. Joray, Pierre, and Godart-Wendling, Béatrice. 2002. "De la théorie des catégories sémantiques de Leśniewski à l'analyse de la quantification dans la syntaxe d'Ajdukiewicz." *Langages* no. 36:28-50.

Abstract: "This paper has a double aim. First, in a historical and theoretical part, it shows how Ajdukiewicz's categorial grammar (1935) is directly related to Lesniewski's theory of semantic categories (1922). Secondly, it emphasizes that Ajdukiewicz's analysis of

quantification constitutes a very anticipation of the contemporary categorial solutions which make use of lambda abstraction in order to deal with quantified expressions. In the absence of any published writing concerning the theory of semantic categories,

the main categorial features of Lesniewski's languages are identified in analysing the two logical systems (Protothetics and Ontology) governed by the theory of semantic categories. This study points out the theoretical ideas which will be retained by later categorial grammars and which strongly contrast with Chomsky's transformational model. Furthermore, this analysis reminds that quantifiers were not categorized in Lesniewski's systems and explains this lack's reasons. After a short

presentation of Ajdukiewicz's seminal categorial grammar, the paper examines Ajdukiewicz's treatment of quantification and shows how it constitutes an extension of Lesniewski's theory which foreshadows current compositional solutions"

11. Kalinowski, Georges. 1995. "Les démonstrations de la non-existence des objets généraux chez Leśniewski." In *Stanisław Leśniewski aujourd'hui*, edited by Miéville, Denis and Vernant, Denis, 121-145. Grenoble: Recherches sur la Philosophie et le Langage.

Résumé : "Leśniewski rejette le réalisme au sens de la querelle des universaux. Il précise même qu'il écarte aussi bien le réalisme médiéval que le réalisme antique. Cependant, il n'est pas explicite au sujet de la distinction entre le réalisme radical et le réalisme modéré, contrairement à son ami Kotarbiński, propagateur pourtant de l'ontologie de Leśniewski, qui de son côté en est philosophiquement très proche. Or la question se pose de savoir si les démonstrations de Leśniewski prouvant l'inexistence des objets généraux du réalisme radical valent aussi contre les concepts du réalisme modéré d'un Aristote et d'un Thomas d'Aquin. Tout semble indiquer que la réponse à cette question est négative. S'il en est ainsi, quoique Leśniewski lui-même pense de la portée de la validité de ses démonstrations en question, un réaliste modéré pourrait utiliser l'ontologie de Leśniewski sans se contredire, comme en témoigne l'argumentation d'Ajdukiewicz contre Kotarbiński."

12. Küng, Guido. 1985. "La logique est-elle une discipline des mathématiques ou fait-elle partie de l'ontologie?" *Dialectica* no. 39:243-258.

Résumé : "Heinrich Scholz et J.M. Bochenski ont affirmé que les lois de la logique formelle étaient en fait les lois les plus générales qui caractérisent les choses, les propriétés, les relations, les états de choses etc. D'autres confondent la logique et la théorie des ensembles. Mais l'interprétation des quantificateurs qu'on trouve chez Leśniewski montre que la logique ne fait partie ni de l'ontologie, ni des mathématiques."

Summary: "Heinrich Scholz and J. M. Bochenski have claimed that the laws of formal logic are the most general laws about

things, properties, relations, states-of-affairs, etc. Others have mixed up logic and set theory. But Leśniewski's interpretation of the quantifiers shows that properly speaking logic belongs neither to ontology nor to mathematics."

"Leśniewski a appelé sa logique des noms 'ontologie'. Ceci prête à confusion, car la logique des noms n'est pas une théorie ontologique dans le sens usuel du terme, mais bien une théorie purement logique. Leśniewski l'a appelée 'ontologie' car comme nous l'avons dit, son foncteur primitif est une version de la copule 'est'. On peut donc dire qu'en un sens la logique des noms est la théorie grammaticale du verbe 'être' (17). Mais que la logique des noms ne soit pas une théorie ontologique n'empêche pas que cette logique soit un instrument très utile pour celui qui veut clarifier des notions de l'ontologie proprement

dite. Car bien qu'il n'y ait pas d'isomorphisme entre catégories grammaticales et catégories ontologiques, il existe des analogies multiples entre certaines thèses ontologiques et certaines thèses de cette logique (18).. " (p. 256)

(17) La logique des noms ne distingue pas entre différentes catégories d'étants. Chiens, chats, nombres, choses, propriétés, états-de-choses, etc., tout ce qui est un étant, peut être dénoté par un nom. La même logique des noms vaut pour tous. On peut donc dire que dans un certain sens la logique des noms est une théorie des étants en tant qu'étants.

13. Lecomte, Alain. 1995. "Une descendance des systèmes de Leśniewski. Le calcul de Lambek (*de la grammaire logique aux grammaires de logiques des types*). " In *Stanisław Leśniewski aujourd'hui*, edited by Miéville, Denis and Vernant, Denis, 207-234. Grenoble: Recherches sur la Philosophie et le Langage.

Résumé : "Un des axes de recherche exploré par Leśniewski concerne la notion de grammaire des catégories sémantiques. Cette notion fut reprise est simplifiée par Ajduckiewicz puis par Bar-Hillel sous la dénomination de grammaire catégorielle.

Prévue initialement à des fins purement logiques, la grammaire catégorielle a intéressé les linguistes surtout à partir des travaux de J. Lambek qui en donnent une formulation complète et intégrable dans le formalisme du calcul des séquents de Gentzen. Si on enrichit l'ensemble des constructeurs de types ($/$ \backslash) avec des modalités structurelles, on obtient un formalisme élégant pour décrire les langues naturelles. De plus, le calcul de Lambek intéresse les informaticiens et logiciens dans la mesure où, après les travaux de Girard, il apparaît comme un sous-système non-commutatif de la logique linéaire. Dès lors, des méthodes propres à cette dernière (comme les réseaux de preuves) peuvent s'y appliquer. Il est alors possible de montrer que ces méthodes, appliquées aux grammaires catégorielles de Lambek, ne sont que des extensions conservatrices de l'algorithme de connexité syntaxique d'Ajduckiewicz et Bar-Hillel."

14. Luporini, Valentina. 2019. "Éternité et développement : la question du temps logique chez Leśniewski." *Philosophia Scientiæ. Travaux d'histoire et de philosophie des sciences* no. 23:173-189.

Résumé : "Le problème du temps tourmente et nourrit la philosophie depuis sa naissance. Dans ce cadre, une lecture métaphysique des textes de S. Leśniewski permet de développer un point de vue original sur certaines propriétés fondamentales du temps logique. En particulier, après une analyse minutieuse des oeuvres philosophiques de jeunesse, et notamment de l'article « La vérité est-elle éternelle ou éternelle et sempiternelle ? » (1913), nous montrons que le temps logique est, chez Leśniewski, inévitablement double : les propositions, dont la vérité doit pouvoir être *éternelle*, sont des entités qui se développent dans un espace et dans un temps déterminés (qui correspondent à l'espace et au temps de leur construction graphique). De même, cette double temporalité apparaît dans l'Ontologie (1919), un calcul logique des noms dont l'axiomatique est établie à partir du foncteur ε , connecteur logique à la fois inscrit dans un espace et dans un temps et néanmoins sans ancrage temporel.

Ainsi, plusieurs interrogations émergent. Comment pouvons-nous justifier le statut ontologique de cet « être » ayant une connotation atemporelle – lieu indiscuté et indiscutable de toute vérité logique – à l'intérieur d'une perspective évolutive dans laquelle il est inévitablement inscrit ? Quelles sont les conditions de possibilité de la coexistence de ces deux dimensions temporelles ? Afin de répondre à ces questionnements, une analyse approfondie qui porte sur la nature de ce temps logique se révèle nécessaire."

15. Miéville, Denis. 1984. *Un développement des systèmes logiques de Stanisław Leśniewski. Protothétique, Ontologie, Méréologie*. Berne: Peter Lang.

"Avant-propos

Voici quelques années, J.-B. Grize, directeur du Centre de Recherches Sémiologiques de l'Université de Neuchâtel, mettait en évidence que les objets de la logique naturelle satisfont les propriétés d'une classe collective. L'approfondissement de cette notion l'a conduit à prendre conscience que ces qualités collectives étaient parentes de celles de la classe méréologique de Stanisław Leśniewski.

Participant aux travaux de Grize, nous nous sommes intéressé à comprendre cette notion de classe méréologique ainsi qu'à cerner les systèmes logiques dans lesquels elle prend vie formelle. Cette démarche nous a conduit à pénétrer peu à peu l'oeuvre de Leśniewski, de la prototéthétique à sa théorie générale des ensembles, en passant par l'ontologie. La lecture des documents dont nous disposons nous a stimulé, parfois provoqué; elle nous a engagé surtout à proposer un développement des théories logiques de ce savant polonais.

L'ouvrage que nous présentons est un témoignage de cette reconstitution ainsi que l'expression de nos réflexions qui l'accompagnent." (p. VII)

16. ——. 1985. "Un aperçu des caractéristiques et de l'esprit des systèmes logiques de Stanisław Leśniewski." *Dialectica* no. 39:166-179.

Résumé . "Cet article offre une introduction aux théories déductives si peu connues de S. Leśniewski. Sont exposées les raisons qui ont conduit ce savant polonais à développer une théorie des classes collectives ainsi que les théories logiques qui la fondent. Les trois systèmes de Leśniewski - méréologie, protothétique et ontologie - sont présentés sous l'aspect de leurs caractéristiques essentielles. Cette étude s'accompagne de quelques réflexions épistémologiques."

17. ——. 1987. "Axiomes et définitions chez Leśniewski: Une manière génétique de développer les systèmes formels." *Theoria* no. 2:285-307.

Abstract: "The logical theories of Stanisław Leśniewski differ profoundly from classical formal systems. Unlike the latter, they do not have an entirely predetermined vocabulary. Nor do they have a determined list of functors of syntactical-semantic categories. Due to formalized directives for definitions, the logics of Leśniewski are constructed progressively, making new theses and consequently functors of new syntactical-semantic categories accessible. In this article we present the genetic aspect associated with these theses-definitions. We also show that the property of creativity makes it possible to bridge some of the fundamental gaps in contemporary classical logics."

18. ——. 1992. "S. Leśniewski ou une manière d'aborder l'ontologie." *Sémiotiques* no. 2:19-35.

"L'ontologie de Leśniewski est une théorie logique, et comme telle, elle contient des directives inférentielles. Elles sont au nombre de sept: une directive de *détachement*, une de *substitution*, une directive opérant sur la *quantification*, deux directives d' *extensionnalité* et deux directives de *définition*. Nous insisterons uniquement sur les directives de définition. C'est à travers elles qu'il est possible d'étendre progressivement le système, d'y introduire de nouvelles significations, et ceci, sur la base des constantes et des catégories syntaxico-sémantiques que contient l'axiome ainsi que celles qui ont été préalablement et progressivement inscrites.

Les directives de définition ont la forme suivante, et répondent aux conditions de toute définition explicite bien formée

[Carnap, 1949]. Il est hors de propos d'expliciter ici toutes les conditions associées à ces directives, nous nous contenterons d'en donner une représentation schématique, et de la commenter."(p. 25)

Carnap, R. 1949, *Introduction to Mathematical Logic*, Princeton University Press.

19. ——. 1995. "Calcul et raisonnement chez Leśniewski." *Travaux du Centre de Recherches Sémiologiques* no. 63:136-147.

"Préambule

Depuis plusieurs années, je conduis des recherches dans deux directions. Je m'intéresse d'une part au développement d'une logique naturelle, et d'autre part, à l'élaboration de structures logiques plus complexes et subtiles que celle sur laquelle s'est fondée l'exposition de la logique mathématique classique. Bien que l'objet d'étude de chacune de ces recherches est différent, elles sont toutes deux motivées par le même intérêt qui consiste à cerner toujours davantage les mécanismes d'une pensée logique mise en oeuvre dans le processus d'une démarche raisonnée.

Par ailleurs, ces deux travaux se nourrissent, d'une certaine manière, l'un de l'autre dans la mesure où ils contribuent à établir entre eux une frontière fluente. Enfin, l'une et l'autre recherches s'appuient sur des travaux de S. Leśniewski [1886-1939].

Ce savant polonais a su à la perfection privilégier l'étude de la logique dans le sens d'une «investigation aussi analytique que possible, brisant les inférences en un plus grand nombre possible d'étapes, et les exhibant sous les catégories les plus générales

possibles» pour reprendre les termes même de Peirce. Cependant, Leśniewski n'a pas négligé ni méprisé la construction d'un calcul lorsque celui-ci permettait d'accéder à

des résultats qui n'étaient pas liés directement à l'analyse et l'exposé des inférences.

Dans la suite de mon propos j'esquisserai les deux dimensions complémentaires «calcul» et «raisonnement» qui sont inscrites dans l'oeuvre logique de Leśniewski, en insistant sur l'originalité de chacune des approches et en mettant en évidence l'actualité

de sa manière d'appréhender la logique." (pp. 135-136)

20. ———. 1995. "Stanisław Leśniewski et l'importance d' une logique développementale." In *Stanisław Leśniewski aujourd'hui*, edited by Miéville, Denis and Vernant, Denis, 67-92. Grenoble: Recherches sur la Philosophie et le Langage.

Résumé : "Il est bien connu que la logique classique ne peut représenter que quelques aspects du raisonnement ordinaire. Il existe d'autres théories qui sont moins limitées dans leur manière de cerner ce qui relève du discours rationnel. Parmi celles-ci, les systèmes de S. Leśniewski offrent une très grande liberté de création. Grâce à des directives inférentielles de définitions, les logiques de S. Leśniewski peuvent être développées de manière progressive, donnant accès à de nouvelles thèses permettant ainsi d'inscrire progressivement des foncteurs nouveaux d'une quelconque catégorie syntaxique conçue sur celles des noms et des propositions. Dans un premier temps, nous mettrons en évidence certaines lacunes de la logique classique. Puis nous insisterons sur l'aspect développemental des systèmes de Leśniewski et illustrerons notre propos de quelques exemples de ce qu'il est possible d'y représenter."

21. ———. 2001. "Introduction à l'oeuvre de S. Leśniewski. Fascicule I. La Protothétique." *Travaux de Logique (Neuchâtel)*.

"Introduction

Stanisław Leśniewski a écrit une oeuvre remarquable. Celle-ci a été élaborée en réaction, ou pour le moins en marge des travaux logiques de Russell. Aussi remarquable qu'elle soit, cette oeuvre est restée quelque peu confidentielle. Et pourtant les systèmes

de Leśniewski, conçus sur les catégories des noms et des propositions, sont, conceptuellement, les plus généreux que l'on connaisse; ils sont des logiques libres, universelles et d'ordre supérieur; ils nous invitent à explorer de nombreuses idées nouvelles tant par rapport à la manière de les développer que par rapport aux subtilités opératoires qu'ils permettent d'exprimer.

Pour offrir une meilleure diffusion de cette oeuvre, nous nous sommes décidés à publier quatre fascicules, chacun d'entre eux présentant une facette particulière de cette oeuvre.

Le premier fascicule exposera d'une part la vie scientifique de Leśniewski et d'autre part la protothétique, théorie des thèses premières. C'est ce que nous offrons dans ce fascicule des Travaux de logique. A travers cette présentation, nous tentons d'explicitier le dynamisme évolutif si caractéristique des systèmes de Leśniewski.

Le deuxième présentera l'ontologie de Leśniewski, un calcul de noms et des relations d'ordre supérieur.

Le troisième explicitera la théorie des relations de parties à tout, théorie connue sous le nom de méréologie.

Enfin, le quatrième fascicule dévoilera les linéaments d'une théorie autorisant: le développement d'une syntaxe constructive.

Par ces travaux, nous espérons contribuer non seulement à la diffusion d'une oeuvre subtile et originale nous souhaitons encore réveiller un débat à propos des théories de Stanisław Leśniewski." (p. 1)

"Préambule

Je me suis souvent interrogé sur la nature de l'engagement ontologique des théories logiques. Cette réflexion n'est pas

aisée, et cela d'autant plus que je suis de ceux qui sont tributaires de l'héritage d'un glorieux passé logique, un passé qui a cristallisé certains slogans et sédimenté moult habitudes ; en effet, nul n'ignore la devise quinienne : «être c'est être la valeur d'une variable liée» (Quine 1953: 17). Chacun ou presque, accepte et sans souffrir la nature objectuelle de la quantification des théories dites classiques. Trop souvent aussi, on constate, chez certains auteurs, une confusion diffuse entre la sémantique formelle en tant que système de représentation de significations et l'ontologie en tant que théorie de ce qui est. Dans ce modeste essai, j'étudierai quelques aspects de la logique classique et mettrai en évidence la nature des liens qu'elle supporte avec l'ontologie. J'esquisserai également les contours d'une logique ontologiquement neutre ; une telle logique est ainsi qualifiée si elle ne statue pas sur la nature des objets dans le monde, ni sur leur nombre. Elle ne saurait cependant être totalement ontologiquement innocente, dans la mesure où elle est marquée par le concept d'entité individuelle qu'elle veut associer à l'idée d'objet et par le traitement extensionnel auquel elle veut soumettre ces objets." (p. 149)

(...)

"Épilogue

Tout au long de mon propos, j'ai tenté de réagir contre la difficulté d'aborder la syntaxe et la sémantique des théories formelles classiques en des termes ontologiques. En effet, tant leur forme que leurs concepts basiques (nom, ensemble, quantification, ...) se prêtent difficilement à cette analyse.

Notre inclination naturelle à penser le monde comme un univers peuplé d'entités individuelles conduit le logicien à façonner des systèmes logiques capables d'explicitier un langage à même d'exprimer un traitement extensionnel de ces entités et de leurs organisations. Ils' ensuit la nécessité de développer, avant toute chose, une théorie des noms exempte de tout engagement ontologique.

J'ai défendu ma préférence pour la conception d'un système logique à même d'offrir la plus grande générosité expressive et

bannissant toute ambiguïté. Le choix de l'ontologie de Leśniewski s'est donc tout naturellement imposé. Je sais que pour convaincre il faut montrer et dire davantage que je ne l'ai fait. C'est la raison pour laquelle j'invite le lecteur critique à se plonger dans les très beaux textes de Leśniewski." (p. 161)

"Présentation

Stanisław Leśniewski tient une place toute particulière dans l'histoire de la logique. Au moment même où la publication des *Principia Mathematica* allait imposer pour de nombreuses décennies les calculs propositionnel et fonctionnels de Russell et Whitehead comme paradigme de la logique symbolique moderne, Leśniewski dénonçait le traitement russellien de l'antinomie des classes, proposait pour l'éviter une définition non plus distributive, mais collective des classes, et élaborait, sans recourir initialement à aucun formalisme tout en introduisant une distinction rigoureuse entre langue et métalangue, les trois systèmes des thèses premières (Protothétique), des classes collectives (Méréologie), des noms (Ontologie) qui, par leur souplesse et richesse, constituent une alternative féconde à la logique russellienne « standard ».

Stanisław Leśniewski professa de 1919 à sa mort à Varsovie où il fonda avec Jan Łukasiewicz la fameuse école de logique dite « École de Varsovie ». La dispersion de cette œuvre après l'invasion de Varsovie et le fait qu'elle ait été écrite en polonais a longtemps empêché sa diffusion, en particulier en France où aujourd'hui Leśniewski reste généralement bien moins connu que Łukasiewicz ou même que son élève Alfred Tarski. Ces deux handicaps sont désormais levés avec la traduction française de l'ouvrage majeur *O podstawach matematyki* [*Sur les fondements de la mathématique*] que M. Georges Kalinowski publia en 1989 et la parution en 1992 de l'édition en anglais des *Collected Papers*. Ainsi nous a-t-il paru opportun de nous interroger sur la fécondité des systèmes logiques de Leśniewski. Nous avons voulu souligner, par-delà son intérêt proprement historique, l'actualité de la pensée lesniewskienne, non seulement en philosophie et logique, mais aussi en philosophie du langage, en linguistique, informatique et psychologie cognitive." 27. Nef, Frédéric. 1995. "Sémantique et ontologie: réflexions sur la théorie des objets et les propriétés." In *Stanisław Leśniewski aujourd'hui*, edited by Miéville, Denis and Vernant, Denis, 147-177. Grenoble: Recherches sur la Philosophie et le Langage.

Résumé : "L'auteur explore les liens entre sémantique et ontologie dans le cadre de la tradition polonaise en logique (Leśniewski, Kotarbiński, Tarski...). Il se réclame de ceux qui ont identifié ontologie et théorie des objets (Meinong, le Husserl des *Recherches Logiques*...). Parmi les points examinés : objets arbitraires et déduction naturelle à propos de la généralisation existentielle ; ontologie de la variable ; statut ontologique des objets mathématiques ; individus vagues et vague modal.

Une attention particulière est apportée à l'argument de Berkeley contre les objets généraux (conjonction de propriétés contradictoires), ainsi qu'au problème de l'admission des propriétés dans une ontologie.

L'auteur soutient qu'il est possible d'affaiblir les conditions d'admission des objets dans une ontologie sans pour autant renoncer au rôle normatif de la logique."

28. Peeters, Marc. 2006. "Introduction à l'oeuvre de S. Leśniewski. Fascicule IV. L'oeuvre de jeunesse." *Travaux de Logique (Neuchâtel)*.

"Stanisław Leśniewski a un parcours scientifique étonnant. En plus de son oeuvre, de son génie et de sa perfection conceptuelle, il se caractérise par le fait qu'il semble posséder deux vies scientifiques : l'une philosophique jusqu'en 1914-1915, vie dont il reniera les travaux pour s'engager ensuite dans une réflexion de pure logique. Les choses ne sont cependant pas aussi simples et tranchées que cela, et il était temps d'explicitier la réflexion philosophique de Leśniewski, une réflexion exigeante, subtile, particulière et fermement argumentée. Cette oeuvre philosophique se devait donc d'être étudiée pour révéler les fondements et l'histoire d'une pensée qui s'engage dans le champ de la logique avec une originalité et une pertinence à ce jour inégalées." "Nous présentons un modèle « centré objet » pour la représentation des connaissances liées à des textes en langue naturelle. Ce modèle a deux buts : être un formalisme bien adapté aux langues et permettre la mise en œuvre de raisonnements particuliers (de type « abductif »).

Le modèle est défini formellement à l'aide de la primitive du Calcul des Noms et de celles de la Méréologie de S. Leśniewski. Ces systèmes logiques permettent de rendre compte de façon relativement simple des modèles centrés objets, de leur utilisation en traitement des langues et des raisonnements mis en œuvre, notamment par le biais des « anaphores associatives »."

31. Vernant, Denis. 1995. "Logique et pragmatique: la genèse du concept d'assertion." In *Stanisław Leśniewski aujourd'hui*, edited by Miéville, Denis and Vernant, Denis, 179-206. Grenoble: Recherches sur la Philosophie et le Langage.

Résumé : "Le concept d'assertion fut initialement introduit par Frege, puis repris par Russell. Dans *Les Fondements de la mathématique*, Stanisław Leśniewski souligne l'ambiguïté de ce concept. Il propose de s'en dispenser. Effectivement, les définitions de la tautologie et de la dérivabilité remplissent les fonctions logiques de l'assertion frégréenne. Mais sa nature

pragmatique d'acte subsiste dans la nécessité d'assumer les thèses du calcul logique.

Révélat ainsi sa fécondité, l'analyse frégéenne permet de penser l'assertion comme un acte de discours régissant, selon des modalités différentes, aussi bien le discours logique que l'usage quotidien du langage."

Tadeusz Kotarbinski from Ontological Reism to Semantical Concretism

Introduction

"I reached the chair of philosophy via logic. Teaching logic became the field of my activity as a university professor of philosophy, a member of other humanistic faculties. Emphasis is here placed on the words 'teaching' and 'humanistic'. For my lectures and classes were conceived as an organon in the classical sense of the term, for philosophers as well as for those who, having completed their course of study, would espouse the cause of disseminating humanistic knowledge and thinking, particularly future secondary school teachers. Somewhat later my activity embraced also law students. My linguistic equipment proved to, be very helpful in this respect. For it seems especially important when the problems of an organon of this kind are conceived historically and is quite crucial when pondering the original Organon of Aristotle (or to be more cautious, of the peripatetic school) and its continuators. Conceived in this manner logic was by no means confined to formal logic, but came to comprise the problems of epistemology, semantics and methodology. It is precisely the latter problems - not those of formal logic - that were of particular interest to my mind. Nevertheless, I felt bound to contribute to the study of formal logic. The feeling was encouraged both by my colleagues at Warsaw University and by my awareness of the precise phase that logic had reached in its historical development. It was precisely the moment when mathematical logic was triumphantly entering the scene. The names of Frege, Bertrand Russell, Peano, Burali-Forti, Couturat and many others were on everybody's minds.

Mathematical logic was closely allied with the rapidly developing set theory. The international periodical devoted to the latter, *Fundamenta Mathematicae* was, and still is, published in Warsaw. The distinguished philosophic-mathematical logicians: Jan Łukasiewicz and his disciple and my colleague, Stanislaw Leśniewski among many others, were active here.

I only mention the names of those persons to whom my studies in mathematically oriented formal logic are particularly indebted. In this respect I owe a lot to my close alliance with Professor Leśniewski. I simply took over his original system of formal logic to suit my own purposes. (1) Relieved thus from the necessity to contribute to formal logic itself, I could concentrate on the problems I faced as a teacher of logic to be used by humanists. These centered around the problem of overcoming the hypostasis of linguistic origin, what Francis Bacon referred to as *idola fori*. Both our everyday language and the language of the sciences as well are teeming with nouns or noun-like forms. Hence the tendency to perceive an object behind them even when the noun is an abstract one, like for example, 'roundness', 'equality', etc. Once the existence of the alleged objects of such names is admitted, once we agree to the existence of such qualities or relations, human thought is made to wade through a mire of apparent ontological problems. They in turn impose a literal interpretation of the expressions like 'a quality inheres' in an object in the same way as a nail is embedded in a wall: whereas, in point of fact, their meaning is only metaphorical. Leibniz himself was of the opinion (which he expressed in *Nouveaux essais* 2, XXII, 1) that problems bristling with difficulties can be dispelled as soon as we stick only to the names of concretes in our discourse. Unaware both of these words and equally ignorant of Franz Brentano's similar ideal I formulated in 1929 the principles of the so called reism 2, XXII, 1) that problems bristling with difficulties can be dispelled as soon as we stick only to the names of concretes in our discourse. Unaware both of these words and equally ignorant of Franz Brentano's similar ideal I formulated in 1929 the principles of the so called reism. In its most mature formula it declares war against the hypostasis of linguistic origin on the following lines: inasmuch as it is possible try to formulate statements in a way that would eliminate all names other than the names of objects, that is, physical bodies or

parts thereof. Persons ought to be regarded as objects, i.e. sentient objects. Sentences may contain words that are not names, e.g. verbs or conjunctions, etc. The point is, however, to eliminate names other than the names of objects. Let me hasten with an example of a reistic interpretation of sentences. 'Prudence inheres in wisdom' simply means: 'Every man who is possessed of wisdom is prudent.' 'Bonds of brotherhood related Orestes to Electra' simply means: 'Orestes was Electra's-brother.' A reist by no means demands that the use of sentences with abstract expressions like the names of qualities or relations be completely abandoned. Quite the contrary, the necessity of applying them is fully recognized just because their presence may often reduce the length of the statement. The only thing he insists upon is to try to be able to do without names which are not the names of things. I may add, by the way, that at present I prefer to use the term 'concretism' instead of the term 'reism' as my readers were prone to identify 'reism' with 'realism' while the meanings of the two are totally different.

Thus, reism, that is concretism (or somatism - as I identify all objects with bodies and in Greek 'soma' means 'body') proves to be a certain innovation of my organon. It is however, highly debatable as a conception since a number of difficulties inhering in an attempt to interpret reistically theorems of set theory have not yet been overcome." (pp. 3-5)

Notes

(1) Those interested in the system are referred to E. C. Luschei, *The Logical Systems of Leśniewski*, Amsterdam: North-Holland Publishing Company 1962.

From: Tadeusz Kotarbinski, "Philosophical Self-Portrait", in: Jan Wolenski (ed.), *Kotarbinski: Logic, Semantics and Ontology*, Dordrecht: Kluwer 1990.

"I feel obliged to begin with an explanation of the term "reism", which I introduced in 1929 into my book on gnosiology, logic, and methodology. Although the book, which had its revised second edition in 1961, also appeared in English in 1966 as *Gnosiology, the Scientific Approach to the Theory of Knowledge*, I have no reasons to believe that the term in question is well known to my colleagues

philosophers outside Poland. As I know that it has already caused misunderstandings, by being identified with the term "realism", which is completely at variance with my intentions, I have been trying for a couple of years to replace it by the term "concretism", to which I impart the same meaning. But what that meaning is? Whom do I intend to call a reist or a concretist? Here is my reply which I make as concise as possible. He, and only he, is a reist, or concretist, who goes to the utmost in putting into effect the following intention: for every declarative sentence (statement) that includes abstract terms he tries to find an equisignificant statement including no such terms. By abstract terms I mean here all those which are not concrete, and by concrete I mean all, and only those, terms which are names of things. Thus, the name of a thing is a proper name of a single individual that is a thing, for instance "Vesuvius", or a description that has only one designatum, e.g., "the volcano near Naples", or a general term that has more than one designatum, but on the condition that each of them is a thing, e.g., "a stone", "an overcoat", or a term that has no designatum but has such a meaning that its analytic definition could be: "N is such and such a thing"; for instance, the term "Pegasus" could be defined as "Pegasus is a winged horse". I do not hesitate to give this example, since by a thing I mean any physical body, living organisms included (which automatically includes human beings), or a totality consisting of physical bodies, or any component part of a physical body, or any micro-physical particle or any totality consisting of such particles. Thus it is obvious that reism, or concretism, is a variation of nominalism. The explanations to follow will show in what it differs from its other better known forms. But even now, on the strength of what has been said so far, it can be seen that we have to do here with an ontological approach, and that this approach is physical in nature or, to use a slightly different terminology, materialistic. And perhaps the most pertinent formulation would be to use the term "somatism" in order to bring out the predilection, inherent in reism, i.e., concretism, to single out and to describe bodies: in Greek "soma" means "a (physical) body". I would not feel surprised if some one expressed his astonishment at the fact that a person has come upon the idea of engaging in analyses concerned with a description of reism. In statements and theorems belonging to the various disciplines reference is made incessantly to abstract ideas by means

of abstract terms, and people are inclined to believe that this belongs to the very essence of scholarship. Those statements and theorems abound in such terms as property, relation, dependence, point, number, function, etc. Can we do without them without at the same time renouncing the pursuit of scientific activity? And if so, what induces reasonable people to reformulate statements including abstract terms as equivalent statements devoid of such abstract terms? Several fairly weighty arguments can be adduced in favour of such a programme. First of all, it seems almost natural to resort to such a reformulation in those simple cases when a statement comprising an abstract term proves to be a metaphorical paraphrase, which can be comprehended only indirectly, of a directly comprehensible statement free from an abstract term. If we say that "the diamond has the property of extraordinary hardness", does it not mean just that "the diamond is extraordinarily hard"? We have here successfully eliminated the terms "property" and "hardness". The former has disappeared completely, and the latter has been replaced by the term "hard". But whereas "hardness" is an abstract term, "hard" is a concrete term since it names things: it is certain things, including the diamonds, that are hard, and not the properties. Likewise, if we have the statement "the goat belongs to the class of horned ruminants", we are right in interpreting it as a learned equivalent of the simpler formulation, devoid of abstract terms, which is "the goat is a horned ruminant". In this way we have smoothly eliminated the abstract term "class". The same term can also be eliminated from the statement "the class of joiners is included in the class of artisans" if we say simply "every joiner is an artisan". But there is one reason more why we accept the reistic programme, namely the very reflection on the essence of cognition as expressed by declarative sentences (statements). What is human knowledge, if not a continuation of animal knowledge, improved by the use of language? And does not animal knowledge reduce to responding perceptively to stimuli in forms of things? We, human beings, also respond perceptively to things, and all our knowledge possibly is nothing else but an intricate structure of fragments of ourselves as beings that respond perceptively to stimuli in the form of things, with the only essential difference in comparison with the animals that in our case the world of the stimuli is accompanied by language signs shaped not only phylogenetically, but mostly

historically, by an imitative transmission of language signs that had developed in human communities. But it seems obvious that when we perceive something we always respond to a stimulus in the form of a thing: a thing struck or moved in some way acts on our ears by air waves which result from the fact that the said thing had been struck or moved, and then we hear somehow. It is likewise in other cases, with the difference that it is a vibrating electromagnetic field, and not vibrating air, that is the intermediary between the stimulus, which is the thing perceived, and the eye. Then we see somehow. This applies to all sensory perceptions (introspective perceptions will be discussed later); the simplest case is that of tactile perception, when a stimulus in the form of a thing directly presses the receptor organs of the perceiving individual. From the empirical standpoint adopted here, a standpoint suggested by man's situation in nature and in history, the tentative reduction of all statements to those which do not include abstract terms become a tentative satisfaction of an urge which reaches very far, but is not devoid of rational justification." (pp. 441-443)

From: Tadeusz Kotarbinski, "Reism: Issues and Prospects", *Logique et Analyse*, 11, 1968, pp. 441-458.

The "Concretism" of Kotarbinski

"In an autobiographical remark, Kotarbinski himself defined 'three ideas which constituted his contribution to philosophy: concretism (both ontological and semantical), praxiology or general theory of efficient action, and the ideal of reliable friend as the guiding rule in ethics. I shall now proceed to discuss them in more detail.

Concretism was first conceived as an ontological doctrine. It was originally meant to be an answer to the problem of reduction of Aristotelian categories. The solution advocated by Kotarbinski is probably the most radical. He maintains that all the categories can be reduced to just one: that of things. The first formulation of this thesis appeared in Kotarbinski's fundamental work, *Gnosiology. The Scientific Approach to the Theory of Knowledge* (1929, English translation: Pergamon Press, 1966). It runs as follows.

That reduction (of Aristotelian categories -- K. S.) completed, it turns out that there remains only that category of objects -- that is, there

are no objects other than things, in other words, every object is a thing, whatever exists is a thing. When metaphorical, abbreviated, picturesque, in a word, substitutive, formulations are eliminated and replaced by the basic formulations, interpreted literally, the latter will include no phrases which would appear to be names of something other than things. They will be statements about things only. But it must be emphasized here that by things we do not mean only inorganic solids. Things are inorganic and organic, inanimate and animate, and "endowed with psychic life" -- that is, they are both things in the narrower sense of the word, and persons, too. So much for the reduction of categories of objects to the category of things. The stand taken here by those in favour of such a reduction might be called *reism*.

The name 'reism' was intended to stress the unique position of the category of things; it was later replaced by 'concretism' or 'pansomatism', the last word indicating that the concrete objects are bodies, i. e. are of a physical, not spiritual, nature.

Even this first formulation reveals two non-equivalent variants of the thesis of concretism. One of them is a statement about the world. The fundamental philosophical question "What exists?" is answered by: "Things and only things". The other deals with language; it says that all statements made in a descriptive language are reducible to such sentences which refer directly to things alone, i.e. that the only names they contain are individual and general names of things.

The evolution of concretism consisted mainly in replacing the ontological thesis by the semantical one and in substantial weakening of the latter: the statement about has been transformed into a prescription for its users; a doctrine became a programme.

The ontological variant has been put in abeyance (which does not mean rejected) mainly because of certain difficulties involved in attempts to find a consistent formulation for it. Briefly speaking, the point was that statements denying existence of properties, relations, etc., and ascribing it to things alone; violated concretistic criteria of meaningfulness. They contain, in the subject-place, some expressions that are not names of things ('property', 'relation', etc.), which is inadmissible in a concretist's language, provided the sentences are to be interpreted literally. The thesis to the effect that

whatever exists, is a thing, remains true; but trivially true, since it results from a decision concerning language. According to this decision, we must construct the language in such a way that literally interpreted sentences should admit, as substitution instances of individual and predicate variables, only names of things.

Two questions immediately arise: Is the programme of semantical concretism workable? If it is, why should we adopt it?

The first question amounts to asking whether it is possible to impose the above mentioned restriction upon the descriptive language, without impairing the sense of what is said: Or to put it another way, are the statements of science reducible, in principle, to concretistic formulations?

There is, so far, no definite answer. Two serious difficulties have, however, been pointed out since the time concretism was born. Kotarbinski admitted their seriousness while expressing the hope that they will in time be overcome.

The first difficulty originates in mathematics. In the language of mathematics, the fundamental role is played by the concept of class or set. Now it seems doubtful that this concept can be given concretistic interpretation.

A set of material objects can, of course, be regarded as a thing, viz. material aggregate of its elements (which, in this case, are more properly called its parts). Stanislaw Leśniewski (1886-1939) was among the first to develop this idea; theory of sets so interpreted was called by him mereology.

Leśniewski's thought had a deep influence on Kotarbinski and there is hardly any doubt that, during the initial phase of concretism, he saw in mereology a support of the idea that abstract entities can be dispensed with.

The difficulty that appeared later on consists in the fact that sets in mereological sense of the word have no fixed cardinality. The number of parts in such a set depends on the way the parts are defined: As W. V. O. Quine pointed out in his well known essay "Logic and the Reification. of Universals", the same heap of stones can be said to consist of, say, a hundred stones and of trillions of

molecules. In mathematics, however, the number of elements in a set must be an absolute property of that set; two sets having different members cannot be identical. It follows that sets, as they are understood in mathematics, are abstract.

Kotarbinski was, of course, well aware of this difficulty. He expressed the hope that sets in the abstract, non-mereological sense of the word could, in principle, be eliminated from mathematics by a suitable translation of sentences which ostensibly refer to them. Since the rules of such a translation have, so far, not been found, Kotarbinski's latest standpoint was to suspend judgment as to the (theoretical) possibility of practicing semantical concretism in an absolutely rigorous way.

An additional reason was provided by modern physical theory which throws some doubts on the concept of thing as "an object located in time and space and having certain physical characteristics". This concept is modelled on our perception of objects from the macroworld. Is it, however, compatible with the conceptual apparatus of contemporary physics? Does it; for instance, apply to electromagnetic field? Or to a wave? Or to a meson?

Kotarbinski himself considered this objection less serious than the previous one, based on the concept of set. His reply was that it was up to the physicist to provide a satisfactory explication of concepts that, so far, remain somewhat enigmatic and susceptible to various interpretations. Until this happens, attempts to translate statements in physics into concretistic language must be postponed.

But why should there be such attempts at all? What is the reason for accepting the postulate of semantical concretism? Obviously, belief in ontological concretism would constitute a sufficient justification. If one believes that there is nothing but concrete things (which, according to somatistic interpretation, are bodies) then to refer to objects of other kinds, in particular to abstracts, in such a way as if they really existed, is to indulge in fiction. What, however, if such belief is suspended?

Kotarbinski's answer is that to accept the programme of semantical concretism would be a sound policy for someone who adopts a less restrictive ontology. The point is that concretistic attitude in

discourse is the most radical weapon against uncritical speculation, against *idola fori* Francis Bacon complained of. It acts like Occam's razor, sharpened to the extreme.

To avoid possible misunderstandings, let me stress that what Kotarbinski had in mind was not the actual elimination of abstract names from the discourse (which would result in long and cumbersome circumlocutions) but eliminability in principle. This, in itself, would be a sufficient condition for genuine understanding in verbal communication. As Kotarbinski himself pointed out, the idea goes as far back as Leibniz's *New Essays on Human Understanding* (Book II, Ch. XXIII, 1). It was Leibniz who said that "most intricate speculations, (of scholastics -- K. S.) fall at one blow if we will banish abstract entities and resolve not to speak ordinarily except by concretes, and not to admit any other terms in the demonstrations but those which represent substantial entities".

This philosophical attitude was in harmony with the spirit of the time. Logical empiricism was then the most influential trend in philosophy, while Polish philosophical thought was dominated by the school founded by Kazimierz Twardowski (1866-1938) whose ideas were very similar. He advocated the necessity of a critical reappraisal of the classical problems of philosophy, with the intention of dismissing those which would not conform to rather rigorous standards. Kotarbinski was one of the most prominent members of this school and semantical concretism is his answer to the question, how to reform the language of philosophy and, more generally, of the humanities.

Viewed in this light, concretism is an attempt to draw a demarcation line between genuine statements and such utterances which only apparently can be qualified in terms of truth and falsehood. It is somewhat paradoxical that the possibility of a consistent realization of concretistic programme has been called in question by results of analysis of the language of mathematics and physics, sciences of the highest rigour. After all, it is not those sciences that are in urgent need of a criterion which would enable them to get rid of some more or less evident nonsense. And yet, owing to a veto put by those sciences (to be, annulated in future?), the original version of concretism, attractive because of its radicalism, has been abandoned.

What remained, was a prescription to use expressions translatable into concretistic language, whenever possible." (pp. 25-28)

From: Klemens Szaniawski, "Philosophical ideas of Tadeusz Kotarbinski", *Reports on Philosophy*, 8, 1984, pp. 25-32.

Preassumed Theories:
 1. Calculus of Propositions;
 2. Lesniewski's Calculus of Names with the only Axiom:

(1) $\forall a, b. (a \varepsilon b) \equiv \exists c (c \varepsilon a) \wedge \forall c, d [(c \varepsilon a) \wedge (d \varepsilon a) \rightarrow (c \varepsilon d)] \wedge \forall c [(c \varepsilon a) \rightarrow (c \varepsilon b)]$

Primitive Terms:
 a) 'spatial' - 'Space(x)';
 b) 'temporal' - 'Time(x)';
 c) 'sensual' - 'Sense(x).

Theses of Reism as Axioms:
 (2) $\forall a, b. (a \varepsilon b)$;
 (3) $\forall a, b. ((a \varepsilon b) \rightarrow \{ \{ [a \varepsilon \text{Space}(x)] \wedge [a \varepsilon \text{Time}(x)] \} \vee [a \varepsilon \text{Sense}(x)] \})$;
 (4) $\forall a. \{ [a \varepsilon \text{Sense}(x)] \rightarrow \{ [a \varepsilon \text{Space}(x)] \wedge [a \varepsilon \text{Time}(x)] \} \}$.

Definitions of Reism:
 (5) $\forall a. [\text{ob}(a) \equiv \exists b (a \varepsilon b)]$;
 (6) $\forall a. [\text{res}_1(a) \equiv \exists b (a \varepsilon b)]$;
 (7) $\forall a. [\text{res}_2(a) \equiv \text{ob}(a) \wedge \{ \{ [a \varepsilon \text{Space}(x)] \wedge [a \varepsilon \text{Time}(x)] \} \vee [a \varepsilon \text{Sense}(x)] \}]$;
 (8) $\forall a. [\text{res}_3(a) \equiv [a \varepsilon \text{Space}(x)] \wedge [a \varepsilon \text{Time}(x)]$

Theses of Reism following from Definitions and Axioms:
 (9) $\forall a. \text{ob}(a)$ (what follows from (2) and (5));
 (10) $\forall a. [\text{ob}(a) \rightarrow \text{res}_1(a)]$ (...from (5) and (6));
 (11) $\forall a. [\text{ob}(a) \rightarrow \text{res}_2(a)]$ (...from (3) and (7));
 (12) $\forall a, b. \{ (a \varepsilon b) \rightarrow [a \varepsilon \text{Space}(x)] \wedge [a \varepsilon \text{Time}(x)] \}$ (...from (3) and (4));
 (13) $\forall a. \{ \text{ob}(a) \rightarrow [a \varepsilon \text{Space}(x)] \wedge [a \varepsilon \text{Time}(x)] \}$ (...from (3), (4) and (5));
 (14) $\forall a. [\text{ob}(a) \rightarrow \text{res}_3(a)]$ (...from (13) and (8));
 (15) $\forall a. \{ \text{ob}(a) \equiv \{ \{ [a \varepsilon \text{Space}(x)] \wedge [a \varepsilon \text{Time}(x)] \} \vee [a \varepsilon \text{Sense}(x)] \} \}$ (...from (3) and (5));
 (16) $\forall a. \{ \text{ob}(a) \equiv \{ [a \varepsilon \text{Space}(x)] \wedge [a \varepsilon \text{Time}(x)] \} \}$ (...from (3), (4) and (5));

Studies about the work of Kotarbinski

1. Coniglione, Francesco. 2000. "Kotarbinski's Reism and the Vienna Circle." *Axiomathes* no. 11:37-69.

2. Gasparski, Wojciech. 1993. "A Philosophy of Practicality: A Treatise on the Philosophy of Tadeusz Kotarbinski." *Acta Philosophica Fennica* no. 53:11-114.

"This monograph answers the question concerning the philosophical outlook and the intellectual heritage of the Polish thinker Tadeusz Kotarbinski. Kotarbinski called his own system praxiology. This book has also a wider aim, namely, to describe the "phenomenon of Tadeusz Kotarbinski in the Polish philosophy of the twentieth century". The reader can see how the whole intellectual period full of new methodological and philosophical ideas emerges and changes due to the influence of Kotarbinski during those eighty years that have passed since the publication of his first, seminal essays. The Polish methodology of science has been wonderfully fruitful and the same can be said of the methodology of practical endeavors, as Professor Gasparski shows in this book."

3. Hiz, Henry. 1954. "Kotarbinski's Praxeology." *Philosophy and Phenomenological Research* no. 15:238-243.

"Kotarbinski developed a general theory of action. It abstracts from moral, esthetic and other qualities of action and studies only the efficacy. He provides an analysis of what it means to do something, to be an agent, a perpetrator. It means that his voluntary act is a necessary condition for something to occur. An analysis of negligence, refraining from doing something, collective action and a variety of the methods of efficacy is given."

4. Lejewski, Czeslaw. 1979. "On the Dramatic Stage in the Development of Kotarbinski's Pansomatism." In *Ontologie Und Logik. Ontology and Logic.*, 197-214. Berlin: Duncker & Humblot.

Proceedings of an International Colloquium (Salzburg, 21-24 September 1976).

Discussion pp. 215-218.

5. Niiniluoto, Ilkka. 2002. "Kotarbinski as a Scientific Realist." *Erkenntnis* no. 56:63-82.

"Tadeusz Kotarbinski is widely recognized as a major philosopher of the Lvov-Warsaw school. His reism, which is a contribution to semantics and ontology, is still discussed and debated, and his most original creation, praxiology, has grown into an entire research field. However, Kotarbinski's philosophy of science has not received much attention by later commentators. This paper attempts to correct this situation by considering the hypothesis that Kotarbinski succeeded already in 1929 in formulating a position that can be regarded as an early version of scientific realism. Unlike most other "scientific philosophers" before the mid-thirties, he was able to combine ontological realism (by defending a form of physicalism and nominalism) and semantical realism (by defending the classical correspondence theory of truth). He was also a critical epistemological realist. Further, in spite of the instrumentalist flavour of his reductionist programme in eliminating terms apparently referring to abstract entities, Kotarbinski accepted theories as statements with truth values and theoretical entities as long as they can be understood as physical bodies."

6. Poli, Roberto. 1993. "The Dispute over Reism: Kotarbinski - Ajdukiewicz - Brentano." In *Polish Scientific Philosophy. The Lvov-Warsaw School*, edited by Coniglione, Francesco, Poli, Roberto and Wolenski, Jan, 339-354. Amsterdam: Rodopi.

"Kotarbinski's ontology (called reism) maintains that there are only things. According to this theory, all genuine names refer to things and all the terms that refer to non-things (properties, qualities, events, etc.) are pseudo-names or onomatoids. After the criticisms of Ajdukiewicz, reism turned into a semantic theory stating that onomatoids should be used only in paraphrasable by other expressions containing only terms. I shall try to restate the ontological reading of reism resorting to the theory of substance and accident advanced by Brentano in his last philosophical analysis."

7. Simons, Peter M. 1993. "Nominalism in Poland." In *Polish Scientific Philosophy*, edited by Coniglione, Francesco, Poli, Roberto and Wolenski, Jan, 207-231. Amsterdam: Rodopi.

"The principal defenders of nominalism in Poland were Lesniewski and Kotarbinski. Several senses of nominalism' are distinguished. Lesniewski attacked Twardowski's theory of general objects, rejected set theory, and proposed an ontologically neutral, nominalistically acceptable logic. I examine how this neutrality is to be attained despite higher-order quantificationKotarbinski denied that there is anything except bodies (reism) and attempted to eliminate statements apparently about other things, but reism is inadequate for explaining true predications. Their student Tarski was also a nominalist, but he did not argue for his views in print."

14. ———. 2006. "On the Phases of Reism." In *Actions, Products, and Things*, edited by Chrudzimski, Arkadiusz and Lukasiewicz, Dariusz, 121-182. Frankfurt: Ontos Verlag.
15. Szaniawski, Klemens. 1977. "Philosophy of the Concrete." *Dialectics and Humanism* no. 4:67-72.

"This is a brief appreciation of the philosophical ideas of Tadeusz Kotarbinski, written on the occasion of his ninetieth birthday. The discussion is limited to his doctrine of Reism, asserting the existence of things only. The evolution of Reism is sketched and some difficulties concerning its tenets are pointed

- out. Finally, the author stresses the role of Kotarbinski's teaching in the development of philosophy in Poland."
16. ———. 1984. "Philosophical Ideas of Tadeusz Kotarbinski." *Reports on Philosophy* no. 8:25-32.
17. Wolenski, Jan. 1986. "Reism and Lesniewski's Ontology." *History and Philosophy of Logic* no. 7:167-176.
- "This paper examines relations between Reism, the metaphysical theory invented by Tadeusz Kotarbinski, and Lesniewski's calculus of names. It is shown that Kotarbinski's interpretation of common nouns as genuine names, i.e., names of things is essentially based on Lesniewski's logical ideas. It is pointed out that Lesniewskian semantics offers better prospects for Nominalism than does semantics of the standard first-order predicate calculus."

The Ontology of Wittgenstein's *Tractatus*

Introduction

This page use the font *Lucida Sans Unicode* for logical symbols.

"The *Tractatus* comprises four parts, which correspond to stages of its rocky development: the theory of logic (1912-14), the picture theory (1914), the discussion of science and mathematics (1915-17), and the discussion of the mystical (1916-17). The structure of the book is as follows:

Ontology (1-2.063): although the *Tractatus* is concerned with symbolic representation (*Preface*), it starts with ontology, since the nature of representation, and of what represents (thought/language), is isomorphic with the nature of what is represented (reality).

Depiction (2.1-3.5): having claimed that the world is the totality of facts, the *Tractatus* proceeds to investigate a subset of that totality, namely pictures, in particular PROPOSITIONS, that is, facts which are capable of representing other facts.

Philosophy (4-4.2): unlike science, philosophy does not consist of propositions, since the logical form shared by language and reality cannot be expressed in meaningful propositions, but shows itself in empirical propositions (see SAYING/SHOWING).

Theory of logic (4.21-5.641, 6.1-6.13): Wittgenstein uses truth-functional operations to explain the construction of molecular propositions out of elementary ones -- thereby providing an account of the GENERAL PROPOSITIONAL FORM -- and to establish that logical propositions are tautologies.

Mathematics (6-6.031, 6.2-6.241): mathematics is also explained as an aspect of the logical operations by which propositions are derived from each other.

Science (6.3-6.372): science is treated along Hertzian lines as containing a priori elements, the network of our description of the world. *Mysticism* (6.373-6.522): ETHICAL and AESTHETICAL value is ineffable. *Kicking away the ladder* (6.53f.): the Tractatus aims to indicate the limits of the sayable, but acknowledges that its own pronouncements are on the far side of the limit. They should be used as a ladder which can be kicked away once climbed. 'Whereof one cannot speak, thereof one must be silent' (7)." (p. 364)

From: Hans-Johann Glock, *A Wittgenstein Dictionary*, Oxford: Blackwell 1996.

Frege and Wittgenstein

"For Frege there is some kind of connection between the categories of ontology and the categories of signs. The two primary ontological categories, namely object and function, (39) are in fact linked to the two principal categories of signs, namely saturated expressions and unsaturated expressions. All the different types of objects are linked to saturated expressions and all the types of functions are linked to unsaturated expressions. In what follows we will consider the two main kind of saturated expressions: names and propositions. As we all know, they have both sense and reference. The sense of the name is its *Sinn*, the mode in which reference is given to us, while reference itself, the *Bedeutung*, is the object denoted by the name. As regards propositions, their sense is the *Gedanke*, while their reference is their logical value. It is immediately apparent, therefore, that both categories of signs are articulated into an object (respectively the *Bedeutung* and the logical value) and into the mode whereby this object is presented to us (respectively the *Sinn* and the *Gedanke*). (40) The most debatable aspect of this position concerns propositions.

To understand Frege's account we have to distinguish between 'true' and 'false' as properties (that is as unsaturated expressions) from 'the True' and 'the False' as objects (that is as saturated expressions). When speaking of a logical value as the object referred to by a

proposition, we are considering the True and the False as objects and not true and false as properties.

Using a suggestion coming from the last works by Suszko we can distinguish two different kinds of valuation: logical valuation and algebraic valuation. Logical valuations involve what are conventionally called the values of truth and falsity (as unsaturated expressions), while those that Suszko termed algebraic valuations assign a referent. (41) By admitting the existence of only two referents, Frege's position collapses logical and algebraic valuations together and thus renders them indistinguishable. (42)

Wittgenstein took up a completely different position, where he rejected –this being the difference whence most of his subsequent distinctions stemmed –what Perzanowski called the principle of semantic homogeneity. According to this principle, the problem of the reference of names and the problem of the reference of propositions are both resolved using similar structures. This is Frege's case, therefore. For Wittgenstein, however, the solution to the nominal reference problem is different from that of the propositional reference problem. For names, the semiotic triangle (name-sense-reference) is reduced by eliminating sense, so that names refer directly to objects and do not require the intermediation of sense. This gives rise to an extremely simple one-to-one correlation. It also means that both names and objects are simple, the one in language the other in reality. By contrast, the simplicity of the name-object semantic relation generates an extremely complex semantic representation for propositions that involves the concepts of 'proposition', 'propositional sign' (perceptible sign of the proposition), 'sense of the proposition' (situation in the logical space connected to the proposition), 'thought' (logical picture of the fact related to the proposition) and 'fact depicted by the proposition'. (43)

It seems, therefore, that there are at least two main different strategies to adopt: if we accept Frege's position that names and propositions are semantically homogeneous entities, we can represent their structures by using the relative semiotic triangles. In this case the procedure is straightforward, and we encounter no major obstacles as long as we accept the idea that Truth and Falsity are in every respect objects of our ontology. If, instead, we follow

Wittgenstein and reject the principle of semantic homogeneity, we are stressing that there is an univocal relationship between name and object. On the basis of this relationship each entity is an atom of its universe (the ontological universe in the case of objects, the universe of signs in the case of names). This absolute simplicity as regards names, however, generates major complexity among propositions.

The problem addressed by Wittgenstein was certainly not a new one. The basic issue was whether it was possible to construct an ontologically neutral language. Before Wittgenstein the problem had exercised several other thinkers: Brentano, for example, particularly during his so-called 'reist phase.' The fundamental theoretical problem was how to use language without being trapped by the symbolic features of language itself." (pp. 19-21)

Notes

(39) Note that function make up a number of other categories (1st level concepts, 2nd level concepts, ..., 1st level dyadic relations, etc.).

(40) I follow Perzanowski's 1993 exposition here. See also Perzanowski 1984 and 1990.

(41) See Suszko 1975.

(42) The principle according to which there are only two referents for propositions I shall call, following Suszko, Frege's axiom. It is interesting to note that the independence of Frege's axiom was demonstrated by Tarski in his doctoral dissertation (1923), where he explicitly compared it with Euclid's Fifth postulate. For a brief treatment see Suszko 1977. If all true propositions denote exactly one and the same entity, this means that the real philosophical position underlying the theory is an absolute monism of facts. Suszko's rejection of Frege's axiom prompted him to elaborate his so-called non-Fregean logic. See Suszko 1975 and the paper by Omyla in this volume. [*Formal ontology of situations*, pp. 173-187]

(43) For details see Perzanowski 1993.

[For the complete Bibliographical references, see the pages about Perzanowski, Suszko and Wolniewicz].

Polish philosophers about the Tractatus: ***Boguslaw Wolniewicz***

"The present set of studies was started long ago in an effort to grasp more clearly the metaphysical system sketched out in Wittgenstein's "Tractatus", and to evaluate its implications. The basic tenets of that system are the theses:

1.1 The world is the totality of facts, not of things.

1.2 The world splits into facts."

Thesis 1.1 propounds an ontology of facts; thesis 1.2 propounds a variant of it, known as Logical Atomism.

The studies are based on two concepts. One is that of an "elementary situation", intended as an intermediary between Wittgenstein's "*Sachverhalt*" and "*Sachlage*". ("*Sachverhalte*" are those elementary situations which are atomic and "*Sachlagen*" are certain sets of the former.) The other is that of a proposition being "verified" by an elementary situation. It has soon turned out that the key to the former concept is lattice theory; and that the latter has to be characterized via the meta-logical concept of a complete set of propositions. The link between them is the concept of a "realization" (or a "possible world"), generalizing Wittgenstein's "*Wahrheitsmöglichkeiten der Elementarsätze*": realizations are maximal sets of elementary situations, and complete sets of propositions are their images.

In all of the following our point of departure is a universe SE of elementary situations. We consider it at three levels of generality, corresponding to the course our investigations have taken in time. At the first level the universe SE is a lattice, conditionally distributive and of finite length. (Conditional distributivity means here that the identity $x \dot{\cup} (y \dot{\cup} z) = (x \dot{\cup} y) \dot{\cup} (x \dot{\cup} z)$ holds only under the proviso that $y \dot{\cup} z \neq 1$.) At the second it appears as an arbitrary join-semilattice with unit. And at the third one it forms merely a quasi-ordering induced by a closure system." (p. 11)

From: Bogusław Wolniewicz, *Logic and Metaphysics. Studies in Wittgenstein's Ontology of Facts*. Warsaw: Polskie Towarzystwo Semiotyczne 1999.

"The *Tractatus* is a masterpiece of rare power and ravishing beauty. Its content is a profound and highly coherent philosophy of language, based upon a radically new kind of metaphysics: the metaphysics of facts and situations. (Meinong, with his notion of the 'objective' of a proposition, apparently was moving in the same direction. But he never came near asking himself any of the two crucial questions: (1) When, if ever, are the objectives of different propositions identical? (2) What, if any, is the relation of the objective of a compound proposition to the objectives of its components?) Moreover, the *Tractatus* anticipated many of the later developments of logical semantics, especially those commencing around 1950 and connected with its algebraization. The kernel of its message may be put down as follows.

The fundamental problem of the *Tractatus*, as of all philosophy, concerns the relationship of thought and reality. This relationship is mediated by language, and so it may be decomposed into the relative product of two relations: one between thought and language, the other between language and reality. Let us mark the latter by ' φ ', the former by ' ψ '.

It has been maintained that according to the *Tractatus* the projective relation φ between language and reality has to be an isomorphism. This, however, is not borne out by the text. To satisfy the conditions laid down by Wittgenstein it is enough for φ to be a *homomorphism*, and this already makes a lot of a difference. In the first place, we are confronted now with two delicate questions: (1) Which is the direction of that homomorphism: from language to reality, or the other way round? (2) Is it a homomorphism *onto*, or merely one *into*? Neither of these questions has a trivial answer in the context of the *Tractatus*.

We assume here that the relation φ is a homomorphism on the language L onto the reality R , i.e., that $\varphi: L \rightarrow R$. Thus reality is a homomorphic image of language. But language is the totality of propositions, and the reference of meaningful propositions are

possible *situations*. Consequently, reality is not the world, but the logical space; i.e., it is not the totality of facts, but the totality of possibilities. Thus language is more capacious than the world, and the number of propositions is greater than even that of situations.

The simplest non-trivial homomorphism of that kind is the well-known Fregean one. Language is mapped under it onto the set of the two classic truth-values, and the corresponding two-element Boolean algebra is then the logical space. Thus for Frege there are just two possible situations: the True and the False. This is so because his only stipulation with regard to the reference of propositions is that *contradictory* propositions cannot have the same reference. In the *Tractatus*, however, it is stipulated further that logically independent propositions cannot have the same reference either. This move is the gist of its logical atomism, transforming the Fregean homomorphism $\varphi : L \rightarrow \{1, 0\}$ into the composition of two other ones: φ' on L onto logical space, and φ'' on logical space onto the set of truth-values. (1)

The aim of the *Tractatus* was to stake out the boundaries of clear thought:

Philosophy (...) should trace the unthinkable from within by means of the thinkable. By presenting clearly what may be expressed it will point to the inexpressible. (2)

The positivistically-minded members of the Vienna Circle deemed to recognize in these words their own 'demarkation problem', together with their own hostility towards 'metaphysics' and their cult of 'science'. It was a monumental misunderstanding. To Wittgenstein the metaphysical is indeed the inexpressible, but this is not to mean that it is regarded as some kind of delusion or hoax. On the contrary, the hoax is the idea of a 'scientific philosophy'.

In the *Tractatus* the tracing of the boundaries of the inexpressible was to be accomplished at one stroke. Logical space R fills the realm of the expressible E completely, i.e., we have $E = R$. Consequently, the homomorphism φ' is onto the expressible, and what is left, evidently, is only the inexpressible. This grandiose project, however, was soon to encounter grave technical difficulties, and then Wittgenstein simply dropped it. This was rash. Not all the difficulties were quite as insuperable as they might have seemed, and the

Tractatus left room for manoeuvre. It might have been helpful, for instance, to weaken the homomorphism φ' to one into the expressible. Then instead of the one language L we could consider a whole series of languages L_0, L_1, \dots , and a corresponding series of logical spaces R_0, R_1, \dots . The realm of the inexpressible would be approximated by the latter 'from within' starting from what is expressible in the language L_0 at hand. Certainly, the series of logical spaces need not be monotonic, and in advance there would be no telling whether what is inexpressible at a given stage L_1 is absolutely or only relatively so. Thus the final tracing of the boundaries of the inexpressible would recede to infinity, but for theory this could hardly count as an objection." (pp. 13-15)

Part I.

More than once Professor Anscombe has expressed doubt concerning the semantic efficacy of the idea of an 'elementary proposition' as conceived in the *Tractatus*. Wittgenstein himself eventually discarded it, together with the whole philosophy of language of which it had been an essential part. None the less the idea is still with us, and it seems to cover theoretical potentialities yet to be explored. This paper is a tentative move in that direction.

According to Professor Anscombe, Wittgenstein's 'elementary propositions' may be characterized by the following five theses:

(1) They are a class of mutually independent propositions.

(2) They are essentially positive.

(3) They are such that for each of them there are no two ways of being true or false, but only one.

(4) They are such that there is in them no distinction between an internal and an external negation.

(5) They are concatenations of names, which are absolutely simple signs.

We shall not investigate whether this is an adequate axiomatic for the notion under consideration. We suppose it is. In any case it is possible to modify it in one way or another, and for the resulting notion still to preserve a family resemblance with the original idea. One such modification is sketched out below.

Part II

Let us assume the reference of contingent propositions to be possible situations. This fundamental notion is really an offshoot of the correspondence theory of truth. For let a be any true proposition, and let the line R represent all *reality* in Wittgenstein's sense (i.e., the totality of facts) as shown in Fig. 1:

Fig. 1

Being true, a corresponds to reality, but not all reality is relevant to that. Consequently, R splits up into the segment A referred to by a , and into the vague remainder indifferent to it. Thus A represents here the smallest fragment of reality warranting the truth of a . This is the reference of a , but obviously its truth is warranted also by any fragment A' greater than A . In that case we shall say: a is verified by A' . And any fragment of reality fit to verify a proposition is to be called a situation.

This much is just common sense. The next step, however, is an extremely controversial one, for we expand now the notion of reference so as to cover false propositions as well. Since there are no

facts (i.e., real situations), to correspond to them, we postulate to that purpose imaginary ones. Both are possible, and so the totality of facts is embedded in the totality of possibilities. This consists of all the situations which can be described in the language considered. In a Pickwickian sense we shall still say that a proposition *a* is verified by a possible situation *A*, but now that only means that if *A* were real, *a* would be true.

An imaginary situation is a non-being. Hence to admit them as the reference of false propositions is to infringe what Plato had called 'the ban of the great Parmenides': 'Keep your mind from this way of enquiry, for never will you show that non-being is'. (2) In this, however, we follow in the steps of the great Frege, whose minimal semantics for propositions still admits of two situations: (3) the one real (*das Wahre*), the other one imaginary (*das Falsche*). The former corresponds to 'the One' of Parmenides and to the totality of facts' of Wittgenstein; the latter obviously has no counterpart in Parmenides, and no clear-cut counterpart in Wittgenstein." (pp. 165-166)

Roman Suszko

"Ludwig Wittgenstein attempted in the Tractatus to build a theory of the epistemological opposition:

Mind (language) - Reality (being)

One may distinguish in the Tractatus the three following components:

1. Ontology, i.e., a theory of being,
2. Syntax, i.e., a theory of the structure of language (mind),
3. Semantics, i.e., a theory of the epistemological relations between linguistic expressions and reality.

I present below the formalized version of Wittgenstein's ontology. The syntax and semantics contained in Tractatus will be not

considered here.

Wittgenstein's ontology is general and a formal theory of being. It may be called here shortly: ontology. It concerns (independently of time and space) (*), situations (facts, negative facts, atomic and compound situations) and objects. Thus, the ontology is composed of two parts:

1. s-ontology, i.e., the ontology of situations (*Sachlagen*),
2. o-ontology, i.e., the ontology of objects (*Gegenstände*).

The link between the two parts of ontology consists in the somewhat mysterious concept of a state of affairs (*Sachverhalt*) and that of a configuration of objects. The s-ontology is an original theory of Ludwig Wittgenstein.

It is related in a sense to certain conceptions of G. Frege and to the formalized system of protothetics of St. Leśniewski. The theories of Frege and Leśniewski make use of sentential variables and of operators (e.g. quantifiers) binding them. The s-ontology is also to be formalized by means of sentential variables and corresponding operators binding them.

This is the cause of a certain strangeness of s-ontology and, consequently, of the whole of Wittgenstein's philosophy. Firstly, most formalized languages of contemporary mathematical logic do not use bound sentential variables. On the other hand, the *Tractatus* essentially uses natural language and the notions and statements of s-ontology formulated in this language may seem to be produced by hypostatizing thinking. Certainly, thinking in natural language is much more appropriate to the o-ontology than to s-ontology. Consequently, mathematical thinking in its historical development up to today is concerned with (abstract) objects and not situations." (p. 8)

Notes

(*) There is an opinion that mereology, a formal theory built by St. Leśniewski, is a suitable basis for the theory of spatiotemporal relations.

From: Roman Suszko, "Ontology in the *Tractatus* of L. Wittgenstein", *Notre Dame Journal of Formal Logic* 9, 1968, pp. 7-33.

[Jerzy Perzanowski](#)

"The main aim of my paper is to supply evidence that ontology and semantics of the *Tractatus* (as well as further philosophical theories which are to be found therein) are much more coherent and interconnected than it is usually believed.

2. One evidence comes from the history of Wittgenstein's working on the *Tractatus* which is now well-known due, mainly, to the efforts of Professors G. E. M. Anscombe and G. H. von Wright.

Wittgenstein started with the basic question of the philosophy of logic: Why does logic (4) work? The study of this problem led him to questions concerning the nature of language and next to ontological considerations. In Wittgenstein's own words ". . . Yes, my work has extended from the foundations of logic to the nature of the world. . . ." (*Tractatus* 2.8; *Notebooks 1914-1916* p. 79). The final text of the *Tractatus* is logically ordered, i.e. from ontology via theory of language to philosophy of logic, which is the reverse of the historical order of Wittgenstein's investigations.

It may be interesting to add that the conversion of the first philosophy of Wittgenstein into the second one may be outlined as passing from basing philosophy of language and philosophy of logic upon ontology to grounding it on pragmatics and/or epistemology.

3. Surely, essential evidence would be more welcome than a historical one. It may come from a careful, point-by-point reading of the *Tractatus*, with emphasis put on, let's say; the "deductive closure" of it: on the logical connections between particular Tractarian theses, on their consequences, on looking for arguments and interpretations which eliminate apparent inconsistencies of the *Tractatus*. For such a method of reading it is really important to solve "puzzles" found in the text. But before discussing several puzzles I wish to present, the most important data concerning the *Tractatus* ontology should be recalled.

4. The ontological part of the Tractatus occupying its first few pages consists of 49 theses:

1-2063 and concerns 65 notions --from "the world" and "what is the case" in 1 to the "independent" in 2.061 -- introduced with the frequency vying from 21 uses of one notion (object -- Gegenstand and state of affairs--Sachverhalt) to notions mentioned only once. From the frequency point of view the ontology of the Tractatus is the ontology of objects and states of affairs, but understanding it as the ontology of objects, states of affairs and facts is more common and reasonable.

A very brief account of the Tractatus ontology is as follows: The world is the totality of facts, facts are constituted by states of affairs consisting of objects standing in relations to each other. Objects are simples, the rest consists of complex items (states of affairs, facts, situations, the world): What is complex has a structure, i.e. the way objects hang together in the item and the stuff (or substance), i.e. a collection of objects included in the item: The object is the item which is constant; fixed and necessary, whereas the configuration of objects (complex item!) is the item which is changeable and contingent. Which configuration is possible is determined by internal (essential) properties of objects entering into a given configuration, by their nature. Let me recall 2.012: In logic nothing is accidental, if a thing can occur in a state of affairs, the possibility of the state of affairs must be written into the thing itself." (p. 224-225)

(...)

"10. Now let me pass to the most discussed question of the Tractatus ontology: What are Tractarian objects? Universals? Particulars? Objects of acquaintance? Colours? Geometrical points? and so on.

Many authors, basing their opinion on very few examples, and rather cryptic Tractarian, comments, try to state a general view on Tractatus objects. This seems to be rather hopeless, mainly because the ontology of the Tractatus is indeed a purely "logical" construction, what, according to Wittgenstein's opinion from the time of Tractatus' writing (12), relieve him from a duty to decide a purely empirical question--whether this thing or that is a simple thing or a complex thing.

Therefore, I do not look for concrete examples of objects and I won't hazard establishing a general view on Tractarian objects. Instead, I should like to write a few words of warning, listed in five points below.

(i) Tractarian objects are simples, items which are opposed to complex ones. These two notions: simple--complex are conjugate. Hence any theory of objects must at the same time be a theory of complexes, and any family of concrete objects generates a family of connected complexes. To say which items are objects means to solve the analogous question for complexes.

(ii) The opposition "simple-complex" is relative to a given analysis (See *Notebooks 1914-1916*), i.e. to a given language of analysis and to some methods of decomposition. Hence, any fruitful discussion of this opposition has to start with description of the language of analysis, particularly with, delimitation and classification of its names, and with indicating the methods of analysis. Let me recall that no language of analysis is described in the *Tractatus* in a satisfactory way!

(iii) By choosing appropriate language and method(s) of analysis we, in fact, determine its results. This two-parameter relativeness is the most important facet we should take into account when discussing the problem of objects. Several options, all of them in accordance with *Tractatus* ontology, are left open therein.

(iv) Particularly, taking appropriate "part-whole" methods of analysis (and, of course, an appropriate language) we obtain a very popular option that objects are individuals (or atoms), whereas complexes are some--combinatorial or mereological, etc.--combinations of atoms.

However, if we use method of logical analysis, i.e. when we ask which names of a given language are undefinable, we conclude that category of simples consists of, on the one hand,

all names ostensibly defined (i.e. by indication of examples. as for instance colours), and, on the other hand, the most general notions of the language (i.e. universals), which --according to the classical theory of definition -- are undefinable. To indicate complexes is much more difficult task in the case considered. For instance, some

of them must be items equivalent to combinations of universals, f.ex. individuals if we accept the "bundle" theory of individuals (an individual is equivalent to the bundle of all its properties!).

Of course, choosing appropriate language and methods we may obtain also the phenomenalist option: objects are Russellian objects of acquaintance (sense data). In this case complexes would be like Machian bundles of sensations.

All these conceptions, if only in accordance with *Tractatus* main claims, are only particularizations of more general *Tractatus* ontology; they are rather metaphysical than ontological theories.

(v) Bearing in mind how heavily Tractarian ontology depends on objects, esp. on their internal properties, we must, in any option, answer carefully not only what complexes are, but also we should decide what their internal properties are. This important question is very frequently overlooked, perhaps because it is not possible to discuss this question in the original language of analysis. For such a discussion we must introduce a stronger (meta-) language!

11. To sum up, according to the outlined interpretation the *Tractatus* ontology is, very modal indeed. Not only because many fundamental notions are modal ones, including the notion of "form" which, as I try to show, is the central notion of the *Tractatus* ontology; but also because the *Tractatus* ontological machinery works according to rules taking into account both what is done and what can be done-- all what is possible (remember--the logical space!). Moreover, it should be pointed out that the crux of the interpretation lies not exactly in emphasizing the role played by "form" in the *Tractatus* (What was observed previously by several observant authors), but in its explication (II) with subsequent comments which makes clear how heavily Tractarian ontology is based on objects, esp. on their internal properties (*) -- much more heavily than it is usually recognized.

Is my interpretation right? I am offering the following four arguments to support it:

FIRST, I was trying to be so close to Wittgenstein's own words as possible;

SECOND, The interpretation solves in the uniform way several notorious puzzles of the *Tractatus*;

THIRD, It gives insights into the coherent construction of the main body of the *Tractatus*, particularly--through the outlined ontological solutions to the semantical puzzles discussed previously--into the way in which Tractarian semantics is based on ontology.

Let me also recall--and this is meant to be an addition to all three first arguments--Wittgenstein's well-known dissatisfaction with early interpretations of the *Tractatus*, which later on have become standard. The *Tractatus* ontology seems to be much more close to continental tradition of objects' ontology than it was recognized i.e. by B. Russell and F. Ramsey.

And--last but not least--

FOURTH, When we compare the text of the *Tractatus* with the text of the *Prototractatus* we note that Wittgenstein's amendments are, in fact, responsible for the second and the third puzzle. Namely, both 2.033 as well as the theses defining (in the spirit of 2.033) the form of objects, and--in the course--the second definition of the form of representation are not to be found in the *Prototractatus*, all of them were introduced into the text in the last period of Wittgenstein's working on the *Tractatus*.

I don't believe that Wittgenstein's intention was to spoil the *Tractatus*, on the contrary--I do believe--that he introduced these amendments to point out the intended meaning of the text." (pp. 229-230)

Notes

(*) Both Wittgenstein's terminology (internal--external) and his claims about the nature of objects, particularly 2.012-2.0141, confronts us with the following questions: Either the structure of a given configuration consists only of one relation or it may be factorized into relations: Such "structure" relation, in turn, is determined by the nature of objects (i.e. internal properties) standing in it. The relations of a given structure, using the terminology of F. H. Bradley as presented in B. Russell *My philosophical development* (1959), are internal relations. Hence any

relation is the internal one (the axiom of internal relations), provided, that to be a relation is to be a relation in some structure. However, in Russell's opinion the axiom of internal relations implies monism, whereas Tractarian ontology is a pluralistic one. Therefore, the problem of connections between monism and the axiom of internal relations should be reexamined." (pp. 229-230)"

From: "Some Ontological and Semantical Puzzles of Wittgenstein's *Tractatus*", in: Rudolf Haller (ed.), *Aesthetics. Proceedings of the 8th International Wittgenstein Symposium, 15th - 21st August 1983, Kirchberg am Wessel (Österreich)*, Wien: Holder-Pichler-Tempsky 1984, pp. 224-230.

"Towards Post-Tractatus Ontology. 1. Surely the above title is rather dark. Therefore, let me start with a few words of clarification. "Post-Tractatus" means either after "Tractatus" or a natural prolongation of the books' sequence: "Proto-Tractatus", "Tractatus",... . Hence the title of this paper means either the task of developing ontology built up after "Tractatus" clues, by taking its claims and lesson seriously, or clarification of the "Tractatus" text, by explaining notions and providing its claims with well-grounded arguments, trying thus to develop, step by step, a more advanced and better argued version of Wittgenstein's treatise. As regards Tractarian ontology realizations of the first task are still rather rare. Instead, most of investigators try to adapt ontology of the "Tractatus" to more common and advanced frameworks, looking for its reconstruction. Quite a lot of people, however, have been involved in realization of the second task (1), producing jointly quite convincing explication of Wittgenstein's text and thus opening a way to the proper post-Tractatus investigations.

(...)

Tractarian Ontology. 3. A brief account of the *Tractatus* ontology is as follows: The world is the totality of facts. Facts are constituted by states of affairs consisting of things (2) connected together, hence standing in relations to each other. Things are simples, the rest consists of complex items (states of affairs, facts, situations, the world). Every complex has a structure, i.e. the way things hang together in the item, and the substance – formed by complex's

things, usually treated as the collection of simples included in the item. It also has a form, intermediary between the substance and the structure, defined as the possibility of the structure. As regards things, they have no structure; they have, however, both the substance and the form. The substance of a thing includes the thing itself, whereas the form of a thing is the possibility of its occurring in appropriate states of affairs (complexes). In addition, things are unalterable, subsistent, necessary and stable; whereas complexes are changeable, accidental and unstable. Things constitute the foundation of the (onto)logical space – the space of all possible states of affairs (more generally – complexes or configurations). Which configuration is possible is determined by internal (essential) properties of things entering into a given configuration. Indeed, by 2.012 the possibility of a thing's occurrence in a state of affairs (configuration) must be written into the thing itself.

This formal substance-determination is basic and necessary. It produces (determines) all basic (or atomic) complexes and, further, the rest of complexes. Synthesis of atomic configurations is thereby no accidental, for things are mutually dependent, but, on the contrary, synthesis of non-atomic complexes is, to some extent, accidental, for states of affairs (complexes) are independent of one another (2.061)." (pp. 185-186)

Notes

(1) Let me mention a few: pioneer works of R. Carnap [1934], A. Maslow [1961], G. E. M. Anscombe [1959] and E. Stenius [1960]; books by J. Griffin [1964], B. Wolniewicz [1968], [1985], M. and J. Hintikka [1968], D. Pears [1987]; and the series of papers representing respectively: Warsaw lattice-theoretical approach – R. Suszko [1968a], [1968b], [1975], B. Wolniewicz [1982], [1983], [1985], M. Omyła [1982], [1986]; its Boolean version – G. J. Lockhorst [1988]; set-theoretical approach – J. Czermak [1978], [1979], K. Mudersbach [1978] and others; its combinatorial version – B. Skyrms [1981] and D. Armstrong [1986]; mereological approach – P. Simons [1986]; geometrical interpretation – L. Goddard and B. Judge [1982], etc. Papers dealing with Tractarian modalities should also be mentioned. Most of them look for appropriate modal logics of the "Tractatus", e. g. R. Carnap's [1946], D. Kaplan's [1964], B.

Wolniewicz's [1969], [1972], G. H. von Wright's [1972], [1982], N. B. Cocchiarella's [1974], [1975], G. J. Lockhorst's [1988], and mine [1985], [1989]. [Complete references are given in the [Selected bibliography](#).]

(2) From two Wittgenstein's names for simples: things or objects I prefer the former, as the latter by its extreme generality is very useful to denote any item under consideration. Therefore, in combination ontology we change terminology a bit: simple item is called "element", complex - "combination" or still "complex", whereas "object" means both.

From: "Towards Post-Tractatus Ontology", in: Rudolf Haller and Johannes Brandl (eds.), *Wittgenstein. Towards a Re-Evaluation: Proceedings of the 14th International Wittgenstein-Symposium, Centenary Celebration, 13th to 20th August 1989cKirchberg am Wechsel (Austria)*, Dordrecht: Kluwer 1990.

23. Both the Tractarian ontology and its semantics are based on two fundamental oppositions: simple - complex, actual - possible.

The first opposition is defined with respect to a given analysis. Notice double relativity of this opposition - with respect to the language of analysis and its methods.

Actual means: real or existing. Remember that Tractarian possibilities are necessary, whereas facts are contingent.

24. As regards principles, let me note first that in the Tractatus Wittgenstein has accepted Frege's function-paradigm principle.

Trying to find solid foundations to logic and language he was using, it seems, at least four additional principles:

The Principle of Grounding, or Actuality: What is possible must be, ontologically, grounded on what is real; the realm of possibilities has to be based on the realm of facts, the world.

This is a very old and fashionable philosophical rule used explicitly, inter alia, by Leibniz.

The Principle of Uniformity: All possibilities (possible worlds) are ontologically equivalent. In other words, the (onto)logical space - the

space of all possibilities - is uniform in the sense in which in physics we speak about uniformity of the physical space. i.e., no possibility (possible world) is ontologically distinguished; spaces generated separately by two possible worlds are the same, they are ontologically indistinguishable.

The principle has several applications in the Tractatus, inter alia, direct - in mysterious theses 2.022, 2.023 and 2.025 claiming jointly that any possible world has the same form (=unum formae), probably substance too, as the real one; and indirect - in claim of simple facts' independence.

While the first principle is very Leibnizian in spirit, the last is strongly anti-Leibnizian.

The Principle of Concreteness: A priori (purely formal) components should be eliminated.

The principle expresses an anti-Russellian move of Wittgenstein against Russell's theory of judgements as claiming that any judgement contains an a priori component, its logical form. This move implies that the notion of form should be defined in a way connecting it with ontological concretes - things. And indeed such a definition was provided by Wittgenstein in 2.033.

Once again the principle is very traditional. It motivates, for instance, Leibniz's nominalism or Bradley's critique of relations.

Chance and Necessity Principle: Everything is a fruit of chance and necessity; to be possible is necessary, to exist - contingent.

The principle is stated explicitly in the Tractatus: in thesis 2.012 - In logic nothing is contingent, and in 1.21 - Each item (in the world - J. P.) can be the case or not the case while everything else remains the same.

It is a very old principle of Democritus, having many occurrences both in philosophy and in science." (pp. 366-367)

Abstract: "Frege's notion of concept – the reference (vs. the sense) of a predicate – is here compared with cognate notions in Husserl's *Logical Investigations* and in Wittgenstein's *Tractatus*. Their common trait is unsaturatedness or existential dependency: the different treatment of this chief notion of formal ontology is in turn examined comparatively, with regard to the conflicts and the alliances taking tacitly place between the three. In Frege's notion of concept, at any rate, an inner tension arises from its twofold nature of property and of truth-function: saturation and function/argument are too heterogeneous models. Hints for a way out suggested."

"Universals such as red are plausible examples of *Tractatus* objects, despite 6.3751. This view is linked to the *Tractatus*' conception of analysis and to its phenomenalism. Facts are composed of universals bound together. The totality of facts forms the solipsistic universe; the universe as it appears. There

is no subject to whom it appears; there are only the constituent atomic facts. Appearances change; what was the case is no longer the case. What does not change are the eternally subsisting universals whose changing combinations constitute reality."

"The problem of the relations between the orders of signification, truth and logical consequence is central to logic. The way in which these relationships are established goes some way towards determining the logical theory to which the writer subscribes. This problem has been a major issue in the history of logic. In this essay, I propose to show that the problem of these relations is present in the course of the historical development of logic, and that there is no one solution to it. My aim is thus not to offer an answer to the question posed, but to highlight the contrast between different solutions, approaching this issue from the standpoint defended by Ludwig Wittgenstein (1889-1951) in his *Tractatus Logico-Philosophicus*.² Nor do I intend to provide a detailed explanation of Wittgenstein's view, but only to outline it and

- bring out the contrasts with other possible solutions, solutions which predate it by some considerable time." (Notes omitted)

"This paper aims to explain how the *Tractatus* attempts to unify logic by deriving the truth-functionality of logical necessity from the thesis that a proposition shows its sense. I first interpret the Tractarian notion of showing as the displaying of what is intrinsic to an expression. Then I argue that, according to the *Tractatus*, the thesis that a proposition shows its sense implies the determinacy of sense, the possibility of the complete elimination of nonprimitive symbols, the analyticity thesis and the strong analyticity thesis. The picture theory emerges as what provides the only acceptable account of an elementary proposition, subject to the constraint that a proposition must show its sense. The picture theory and the analyticity thesis then entail the contingency thesis and the independence thesis which, together with the strong analyticity thesis, imply that all logical propositions are tautologies."

"Wittgenstein's *Tractatus* contains some very striking theses. We read, e.g., that "in a sense" we could not be wrong in logic, and that the whole subject matter of the theory of modalities could be reconstructed on the ground of the insights in the mechanism of the linguistic reference. Yet in the light of the last sentences of *Tractatus* the whole semantics turns out to be principally ineffable. In our paper we will try to clarify these matters. We show how these theses could be made plausible in the context of the *transcendental* method of Wittgenstein's *Tractatus*."

- "Wittgenstein's method is that of showing the categories of being through a perspicuous language that mirrors the world. For Wittgenstein there are two categories of being, the category of objects and the category of facts. These categories are radically disjoint: no object is a fact, no fact an object. In a perspicuous language facts cannot be named and objects cannot be asserted. A perspicuous language has one and only one name for each object and one and only one proposition for each possible (and in addition one not-so-possible) fact. Material properties and generality are shown to be analyzable; formal properties are seen as not expressible. The unity of reality shows in the general form of a proposition that is given in a manner far clearer and much less ambiguous than Wittgenstein's own version. The Tractarian view of logic and

mathematics is developed, and questions are raised concerning it that can be seen to occupy Wittgenstein in his later writings."

39. Dejnožka, Jan. 1996. *The Ontology of the Analytic Tradition and Its Origins. Realism and identity in Frege, Russell, Wittgenstein, and Quine*. Lanham: Littlefield Adams Books.

Paperback edition reprinted with corrections, 2002; reprinted with further corrections, 2003.

"While many books discuss the individual achievements of Frege, Russell, Wittgenstein, and Quine, few books consider how the thought of all four thinkers bears on the fundamental questions of twentieth century philosophy. This book is about existence-identity connections in Frege, Russell, Wittgenstein, and Quine. The thesis of the book is that there is a general form of ontology, modified realism, which these great analysts share not only with each other, but with most great philosophers in the Western tradition. Modified realism is the view that in some sense there are both real identities and conceptual (or linguistic) identities. In more familiar language, it is the view that there are both real distinctions and distinctions in reason (or in language). Thus in modified realism, there are *some* real beings which can serve as a basis for accommodating possibly huge amounts of conceptual or linguistic relativity, or objectual identities' 'shifting' as sortal concepts or sortal terms 'shift.' Therefore, on the fundamental level of ontology, the linguistic turn was not a radical break from traditional substance theory. Dejnožka also holds that the conflict in all four analysts between private language arguments (which imply various kinds of realism) and conceptual "shifting" (which suggests conceptual relativism) is best resolved by, and is in fact implicitly resolved by, their respective kinds of modified realism. Frege and Russell, not Wittgenstein and Quine, emerge as the true analytic progenitors of 'no entity without identity,' offering between them at least twenty-nine private language arguments and fifty-eight 'no entity without identity' theories."

44. Frascolla, Pasquale. 2004. "On the nature of *Tractatus* objects." *Dialectica* no. 58:369-382.

"A conjecture on the metaphysical nature of *Tractatus* objects is put forward and its interpretative adequacy is tested. The clarification of the true import of the metaphor of logical space and the recognition of the theoretical role played by Wittgenstein's explicit claim that the emptiness of logical space is conceivable enable us to account for the thesis that objects are the substance of the world. Once objects are identified with those universal abstract entities which are qualia, and complexes or states of affairs with their concrete instances, some statements of the *Tractatus* become liable to a consistent reading: that objects are colourless (TLP 2.0232); that space, time and colour are forms of objects (TLP 2.0251); that Leibniz's Principle of the Identity of Indiscernibles, though still holding for complexes, does not apply to objects (TLP 2.0233). Lastly, it is shown how the interpretation of objects as qualia sheds a vivid light on the theme of the relation between objects and time."

"The ontology of the *Tractatus*, in terms of which objects are characterized as property-less simples, is coherent provided Wittgenstein is not mistakenly taken to be a constructive atomist building complexes from simples. A geometrical model is given to illustrate this. It is also shown that an ontology like that of the *Tractatus* removes much of the conceptual puzzlement of modern particle physics and has implications for current debates about realism, possible worlds and rigid designators."

"The history of philosophy is full of amazing quirks. One of them is the fact that just two basic ontologies have ruled the roost for the last two thousand years, namely, the Platonic system and the Aristotelian system. But it is even more peculiar that neither system contains the category of state of affairs. The main reason for this neglect seems to be a consideration which has plagued philosophy to this day. There can be no such things as states of affairs, because there simply are no states of affairs for false sentences. Russell, influenced by Wittgenstein's criticism, tried to escape from this conclusion with his so-called multiple relation theory of judgment. But he does not succeed. Wittgenstein claimed to have avoided Russell's mistake and to have presented a correct view about the nature of judgment in the *Tractatus*. But a study of the few references in the *Tractatus* to the ontological status of states of affairs represented by false sentences does not show this."

"Ludwig Wittgenstein's conception of the role of objects in our philosophical understanding of the logic of our language is critical for his early philosophy in the *Tractatus Logico-Philosophicus*. While the important connections between Heinrich Hertz's *Principles of Mechanics* and Wittgenstein's *Tractatus* have long been recognized, recent work by Jed Buchwald has deepened our knowledge of the importance of the object-orientation of Hertz's scientific work in a manner that should also deepen our understanding of the nature of

- objects in the *Tractatus*. I will argue that there are important ontological links, involving "a certain physical scheme, one that had powerful implications for thinking as well as doing," between Hertz's work and Wittgenstein's early philosophy."

70. Jacquette, Dale. 2001. "Analysis of Quantifiers in Wittgenstein's *Tractatus*: A Critical Survey." *Logic Analysis and History of Philosophy* no. 4:191-202.

"In the *Tractatus logico-philosophicus*, Wittgenstein distinguishes between what can and cannot be said in any language by the general form of propositions. I explain Wittgenstein's method and discuss Robert J. Fogelin's criticism of what he takes to be the incompleteness of Wittgenstein's general form of propositions in his exposition of the '*Naive Constructivism of the Tractatus*.' [Chapter 6 of: Robert J. Fogelin - *Wittgenstein* pp. 78-85]. I argue that Fogelin's objection is mistaken, and that, contrary to Fogelin's claim, Wittgenstein's method when properly applied produces all of the well-formed formulas with mixed multiple quantification that Fogelin maintains it cannot provide. I conclude by offering a critical comparison of similar solutions proposed, among others, by P.T. Geach, Scott Soames, and Matthias Varga von Kibéd."

71. ———. 2004. "Wittgenstein's *Tractatus* and the logic of fiction." In *Wittgenstein and philosophy of literature*, edited by Gibson, John and Huemer, Wolfgang, 305-317. London: Routledge.

"Wittgenstein's *Tractatus Logico-Philosophicus* articulates a logic and semantics for all possible languages in which states of affairs (*Sachverhalten, Tatsachen*) as truth-makers are pictured in sentences under analysis. Wittgenstein considers both existent and nonexistent states of affairs as pictured, respectively, by true and false sentences. This raises the question as to whether the *Tractatus* constitutes or provides the formal basis for a logic of fiction. I identify four criteria for

a logic of fiction, and argue that the *Tractatus* satisfies only the first three. The remaining criterion has to do with logical analysis of a fictional character's psychology internal narration. These are excluded by Wittgenstein's application of Occam's razor in defense of the general form of proposition in the case of fiction just as they are in nonfictional discourse."

75. Klement, Kevin C. 2004. "Putting form before function: logical grammar in Frege, Russell, and Wittgenstein." *Philosopher's Imprint* no. 4:1-47.

"The positions of Frege, Russell and Wittgenstein on the priority of complexes over (propositional) functions are sketched, challenging those who take the "judgment centered" aspects of the *Tractatus* to be inherited from Frege not Russell. Frege's views on the priority of judgments are problematic, and unlike Wittgenstein's. Russell's views on these matters, and their development, are discussed in detail, and shown to be more sophisticated than usually supposed.

Certain misreadings of Russell, including those regarding the relationship between propositional functions and universals, are exposed. Wittgenstein's and Russell's views on logical grammar are shown to be very similar. Russell's type theory does not countenance types of genuine entities nor metaphysical truths that cannot be put into words, contrary to conventional wisdom. I relate this to the debate over "inexpressible truths" in the *Tractatus*. I lastly comment on the

- changes to Russell's views brought about by Wittgenstein's influence."

 83. Levvis, Gary. 1998. "The so-called (and actual!) Realism of the *Tractatus*." *Grazer Philosophische Studien* no. 54:45-70.
"David Pears's contention that the *Tractatus* [in: *The false prison* - vol. 1 - Chapter 6: *The basic Realism of the Tractatus*] is to be understood as advancing a form of metaphysical realism is defended against McGuinness's view that *Tractatus* 1-2.063 is to be treated just as introducing a metaphysical myth that may be employed to bring into prominence salient features of propositions. Starting with a discussion of the involved difficulties, e.g., determining (1) whether Wittgenstein does, in fact, provide an argument for the existence of simple objects, (2) what this object is, and (3) what role the existence of simple objects plays within the Picture Theory of the Proposition,

Wittgenstein's argument for the existence of simple objects is reconstructed, augmenting Pears's existing account by providing further details of why Wittgenstein held that determinacy of sense requires the existence of simple objects."

84. Lokhorst, Gert-Jan C. 1988. "Ontology, semantics, and philosophy of mind in Wittgenstein's *Tractatus*. A formal reconstruction." *Erkenntnis* no. 29:35-75.

"The paper presents a formal explication of the early Wittgenstein's views on ontology, the syntax and semantics of an ideal logical language, and the propositional attitudes. It will be shown that Wittgenstein gave a 'language of thought' analysis of propositional attitude ascriptions, and that his ontological views imply that such ascriptions are truth-functions of (and supervenient upon) elementary sentences. Finally, an axiomatization of a quantified doxastic modal logic corresponding to Tractarian semantics will be given."

85. Lombardi, Olimpia Iris. 1999. "¿Qué son los objetos del *Tractatus*?" *Revista de Filosofía (Spain)* no. 12:55-76.

"In this paper we provide an interpretation of the concept "object", in the context of Wittgenstein's *Tractatus*. We argue that (1) "objects" are logical entities, the nodes of the logical net which is common to all possible worlds; (2) general words are not "names" and, therefore, "objects" are particulars."

- " It is argued that the *Tractatus* notion of propositional sense contains an irreducible modal element. An interpretation of Wittgenstein's early notion of "bipolarity" is given. It is further argued that explicit recognition of the modal element helps us to understand the particular form of the *Tractatus* ontology. Wittgenstein's early views on sense and modality are contrasted with Frege's and Russell's views. Part II is a defense of the view that the *Tractatus* objects include predicates. The argument is backed up by reference to later unpublished writings by Wittgenstein. The development of his views on names and predicates are examined."

97. Milkov, Nikolay. 2001. "Tractarian scaffoldings." *Prima Philosophia* no. 14:399-414.

"Wittgenstein's Tractarian ontology has its historical roots in Russell's programme for constructionalism. There is an essential difference between the constructionalism of Russell and that of Wittgenstein though. Whereas Tractarian ontology is approximately Aristotelian, Russell's logical atomism accepts a Platonic penetration of the autonomous world of logical forms into the autonomous world of facts. Russell's logical constructionalism, more precisely, uses the metaphor of a 'logical skeleton' on which the data of experience are fleshed out. In opposition, in the *Tractatus* Wittgenstein doesn't speak of a skeleton but introduces the concept of 'logical scaffolding' and also of the 'scaffolding of the world' instead. This terminology reflects a new type of ontology, as well as a new type of logic, radically different from that of Russell. Its most important concepts are that of 'object' and 'state of affairs', both of them used in new, idiosyncratic sense."

98. Miller III, Hugh. 1995. "Tractarian Semantics for Predicate Logic." *History and Philosophy of Logic* no. 16:197-215.

"It is a little understood fact that the system of formal logic presented in Wittgenstein's *Tractatus* provides the basis for an alternative general semantics for a predicate calculus that is consistent and coherent. essentially independent of the metaphysics of logical atomism. and philosophically illuminating in its own right. The purpose of this paper is threefold: to describe the general characteristics of a Tractarian-style semantics, to defend the 'Fulcrums system against the charge of expressive incompleteness as levelled by Robert Fogelin, and to give a semantics for a formal language that is the Tractarian equivalent of a first-order predicate calculus. Of note in regard to the latter is the fact that a Tractarian-style truth-definition makes no appeal to the technical trick of defining truth in terms of the satisfaction of

predicates by infinite sequences of objects, yet is materially equivalent to the usual Tarski-style truth-definitions."

"Russell's introduction of negative facts to account for the truth of "negative" sentences or beliefs rests on his collaboration with Wittgenstein in such efforts as the characterization of formal necessity, the theory of logical atomism, and the use of the ideal language. In examining their views we arrive at two

conclusions. First, that the issue of negative facts is distinct from questions of meaning or intentionality; what a sentence or belief means or is about rather than what makes it true or false. Second, that the ontological use of the ideal language is incompatible with the requirements of its employment in the logical study of inferences. On this basis we conclude that despite elaborations by recent proponents, the doctrine of negative facts lacks adequate support, and perhaps more importantly, it is proper ontological method to free the ideal language from the exigencies of a symbolism constructed for logical investigation."

110. Page, James. 1997. "Unconfigured Tractarian objects." *Philosophical Investigations* no. 20:39-50.

"According to Wittgenstein's *Tractatus*, the world consists of atomic objects arranged in various configurations and the ways the world might be are determined by the ways these objects can be configured. I question whether these very objects can be unconfigured as well. Black and Fogelin are nearly alone in their attention to this issue but reach opposite conclusions. Black asserts, essentially without argument, that atomic objects can be configured, while Fogelin is committed to the view that they cannot. I think Black is right and my aim is to show why."

112. ———. 1972. "The ontology of the *Tractatus*." *Teorema*:49-58.

"The article is concerned with the status of the ontology of the *Tractatus*. In it I argue 1) that, although the ontology of the *Tractatus* is a metaphysic of language like Kant's metaphysic of

experience, it is supposed to set the standard of objectivity, and to yield the firmest conclusions about reality; 2) that Wittgenstein abandoned this ontology when he abandoned the theory of language from which it had been deduced, because it expressed too narrow a view of the possible forms that language may take. The article is an attempt to establish in what way Wittgenstein's later philosophy is more anthropocentric than his early philosophy."

115. Perszyk, Kenneth. 1988. "The ontology of the *Tractatus*." *Philosophia. Philosophical Quarterly of Israel* no. 18:39-59.

" Reading Wittgenstein's *Tractatus* as an extended answer to the question "what must the world be like for the symbolic logic developed by Frege, Russell, and Whitehead to apply to it?" helps elucidate the connection between its theory of language and its ontology. My main argument is to show that the ontology is derived from the logic of *Principia mathematica* taken to its completion. throughout the *Tractatus*. Wittgenstein takes a stance on a number of traditional problems in the history of philosophy, and my aim in discussing some of these is to place the *Tractatus* in broader historical perspective."

"Un des principaux enjeux de la théorie du jugement de Russell consistait à élaborer une théorie qui n'engage pas à admettre des entités complexes vraies, fausses ou inexistantes tels que les objectifs meinongiens. Dans l'étude du débat entre Russell et Wittgenstein sur cette théorie, on n'a jamais sérieusement envisagé que Wittgenstein n'ait pas suivi Russell sur cette question et qu'il ait plutôt adopté une position plus proche de celle de Meinong. Dans cet article, j'aborde cette question et soutiens que Wittgenstein a trouvé la solution aux problèmes posés par la théorie du jugement de Russell dans la théorie de l'image et qu'il a longuement hésité dans les Carnets entre des versions de la théorie de l'image en accord avec la position de Russell et des versions en accord avec celle de Meinong. Enfin, je soutiens qu'il a finalement tranché la question dans le Tractatus en optant pour une théorie du type de celle privilégiée par Meinong."

"This work is a minimally revised version of my Harvard doctoral thesis, which was written during the years 1994-1998. My understanding of Wittgenstein's early philosophy has, of course, continued to evolve since completing the thesis, but because the attempt to incorporate these new ideas seemed likely to result in a wholly new work, I have decided to present

- the dissertation in its original form, with the exception of a few minor and mostly stylistic changes."
128. ———. 2004. "Wittgenstein on the substance of the world." *European Journal of Philosophy* no. 12:106-126.
- "A reading is offered of Wittgenstein's argument for substance in his *Tractatus Logico-Philosophicus*. Wittgenstein's talk of "substance" is an allusion to Kant's conception of substance in the
- "First Analogy" of the *Critique of Pure Reason*, namely, the concept of some stuff that exists at all times and such that all existence changes are alterations of it. Tractarian substance is the
- modal analogue of Kantian substance. It is that which "endures," not literally through time, but figuratively through a "space" of possible worlds. To argue for substance is therefore to argue for necessary existents. From this starting point, a detailed reconstruction of the argument for substance is developed and its coherence (if not soundness) defended."

- "It is fairly well known that Wittgenstein's criticisms of Russell's multiple-relation theory of judgment has a devastating effect on the latter's philosophical enterprise. The exact nature of those criticisms, however, and the explanation

for the severity of their consequences, has been a source of confusion and disagreement amongst both Russell and Wittgenstein scholars. In this paper, I offer an interpretation of those criticisms which shows them to be consonant with Wittgenstein's general critique of Russell's conception of logic and which serves to elucidate some of the notoriously enigmatic passages of the *Tractatus*. In particular, I seek to show the continuity of Wittgenstein's criticisms of the theory of judgment with his remarks on Russell's paradox and the theory of types."

148. Stokhof, Martin J.B. 2002. *World and life as one. Ethics and ontology in Wittgenstein's early thought*. Stanford: Stanford University Press.

"The book's main thesis is twofold. It argues that the ontological theory of the *Tractatus* is fundamentally dependent on its logical and linguistic doctrines: the tractarian world is the world as it appears in language and thought. It also maintains that this interpretation of the ontology of the *Tractatus* can be argued for not only on systematic grounds, but also via the contents of the ethical theory that it offers. Wittgenstein's views on ethics presuppose that language and thought are but one way in which we interact with reality."

149. Sullivan, Peter M. 2000. "The totality of facts." *Proceedings of the Aristotelian Society* no. 100:175-192.

"Wittgenstein, in the *Tractatus*, conceives the world as "the totality of facts." Type-stratification threatens that conception: the totality of facts is an obvious example of an illegitimate totality. Wittgenstein's notion of truth-operation evidently has some role to play in avoiding that threat, allowing propositions, and so facts, to constitute a single type. The paper seeks to explain that role in a way that integrates the "philosophical" and "technical" pressures on the notion of an operation."

- "This paper puts forward an alternative interpretation of the argument for simple objects advanced in the 2.0s of the *Tractatus*. In my view, Wittgenstein derives the simplicity of objects directly from his account of possible states, complex objects and senseful propositions. The key to Wittgenstein's argument is the idea that, if there were no simple objects, possible states would not be necessarily possible. If this were the case, however, there would be no senseful language, in Wittgenstein's view. One of the subsidiary aims of this paper is to question the idea that Wittgenstein posits simples because, without them, language would be infinitely analyzable."

- "In this paper I will try to show the following two things. First, Wittgenstein's *Tractatus logico-philosophicus* semantically

exiges that Tractarian objects be conceived of as *possibilia* in the sense of Russell (1903), namely as objects that may exist as well not exist. Second, the *Tractatus's* general ontological framework suggests to integrate this onto-semantic conception with a view of such objects not as *qualia* but rather as *sensibilia* in the sense of Russell (1914), namely as *possible sense-data*."

"A generalized Wittgensteinian semantics for propositional languages is presented, based on a lattice of elementary situations. Of these, maximal ones are possible worlds, constituting a logical space; minimal ones are logical atoms, partitioned into its dimensions. A verifier of a proposition is an elementary situation such that if real it makes true. The reference (or objective) of a proposition is a situation, which is the set of all its minimal verifiers. (Maximal ones constitute its locus.) Situations are shown to form a Boolean algebra, and the

Boolean set algebra of loci is its representation. Wittgenstein's is a special case, admitting binary dimensions only."

Contents:

0. Preliminaries;

1. Elementary Situations

1.1.The Axioms; 1.2.Some Consequences; 1.3. W-Independence; 1.4.States of Affairs;

2. Sets of Elementary Situations

2.1.The Semigroup of SE"-Sets; 2.2.The Lattice of Minimal SE"-Sets; 2.3.Q-Spaces and V-Sets; 2.4.V-Equivalence and Q-Equivalence; 2.4.V-Classes and V-Sets;

3. Objectives of Propositions

3.1. Verifiers of Propositions; 3.2. Verifying and Forcing; 3.3. Situations and Logical Loci; 3.4. Loci and Objectives of Compound Propositions 3.5. The Boolean Algebra of Situations;

170. ———. 1983. "Logical space and metaphysical systems." *Studia Logica* no. 42:269-284.

"The paper applies the theory presented in "A formal ontology of situations" (*Studia Logica*, vol. 41 (1982), no. 4) to obtain a typology of metaphysical systems by interpreting them as different ontologies of situations.

Four are treated in some detail: Hume's diachronic atomism, Laplacean determinism, Hume's synchronic atomism, and Wittgenstein's logical atomism. Moreover, the relation of that theory to the "situation semantics" of Perry and Barwise is discussed."

"In this paper I approach some central problems concerning the Tractarian objects, e.g., the picture theory, the internal and external properties of objects, and the debate whether properties and relations should be included as the Tractarian objects, from a study of configurations of objects. I argue that a detailed study of configurations of objects offers us new insights and helps us reach solutions to some of the important disputes concerning the characteristics of objects, e.g., the dispute whether the Tractarian objects include properties and relations."

Martin Heidegger *Gesamtausgabe* (Collected Works Edition)

Preliminary note

In its initial form this section will offer five pages:

- 1) Heidegger's contributions to the interpretation of the Greek word for [Truth \(*Aletheia*\) as Unconcealment](#) and to the history of his translation in Latin as *Veritas*;
- 2) An Annotated bibliography of Heidegger's texts on [Aletheia](#) and a selection of critical studies;
- 3) Heidegger's contributions to the interpretation of the [History of Metaphysics as Ontotheology](#);
- 4) An Annotated bibliography of Heidegger's texts on the History of Metaphysics as [Ontotheology](#) and a selection of critical studies;
- 5) A complete list of Heidegger's German works published in the *Gesamtausgabe* (Collected Works Edition).

Introduction

The edition of Heidegger's Collected Works (*Gesamtausgabe*) is published from 1975 by Vittorio Klostermann, Frankfurt am Main; this is an updated list of the published volumes.

Abbreviations: SS = Summer semester (from May to July); WS = Winter semester (from November to February); n. p. = not yet published.

The first date is that of composition; the date of publication in the *Gesamtausgabe* is in square brackets.

I. Published writings 1910-1976

1. Frühe Schriften (1912-16) [1978]
2. Sein und Zeit (1927) [1977]
3. Kant und das Problem der Metaphysik (1929) [1991]
4. Erläuterungen zu Hölderlins Dichtung (1936-1968) [1981]
5. Holzwege (1935-1946) [1977]
- 6.1 Nietzsche 1 (1936-1939) [1996]
- 6.2 Nietzsche 2 (1939-1946) [1997]
7. Vorträge und Aufsätze (1936-1953) [2000]
8. Was heisst Denken? (1951-1952) [2002]
9. Wegmarken (1919-1958) [1976]
10. Der Satz vom Grund (1955-1956) [1997]
11. Identität und Differenz (1955-1957) [2006]
12. Unterwegs zur Sprache (1950-1959) [1985]
13. Aus der Erfahrung Denkens (1910-1976) [1983]
14. Zur Sache Denkens (1962-1964) [2007]
15. Seminare (1951-1973): Martin Heidegger, Eugen Fink: Heraklit - Vier Seminare - Anhang: Züricher Seminar [1986]
16. Reden und andere Zeugnisse eines Lebensweges (1910-1976) [2000]

II. Lectures (1923-1944)

a) Marburg Lectures (1923-1928)

17. Einführung in die phänomenologische Forschung (WS 1923-1924) [1994]
18. Grundbegriffe der aristotelischen philosophie (SS 1924) [2002]
19. Platon: Sophistes (WS 1924-1925) [1992]
20. Prolegomena zur Geschichte Zeitbegriffs (SS 1925) [1979]

21. Logik. Die Frage nach der Wahrheit (WS 1925-1926) [1976]
22. Grundbegriffe der antiken Philosophie (SS 1926) [1993]
23. Geschichte der Philosophie von Thomas von Aquin bis Kant (WS 1926-1927) [2006]
24. Die Grundprobleme der Phänomenologie (SS 1927) [1975]
25. Phänomenologische Interpretation von Kants Kritik der reinen Vernunft (WS 1927-1928) [1977]
26. Metaphysische Anfangsgründe der Logik im Ausgang von Leibniz (SS 1928) [1978]
- b) Freiburg Lectures (1928-1944)
27. Einleitung in die Philosophie (WS 1928-1929) [1996]
28. Der deutsche Idealismus (Fichte, Hegel, Schelling) und die philosophische Problemlage der Gegenwart (SS 1929) [1997]
- 29/30. Die Grundbegriffe der Metaphysik: Welt, Endlichkeit, Einsamkeit (WS 1929-1930) [1983]
31. Vom Wesen der menschlichen Freiheit. Einleitung in die Philosophie (SS 1930) [1982]
32. Hegels Phänomenologie Geistes (WS 1930-1931) [1980]
33. Aristoteles: Metaphysik IX 1-3. Von Wesen und Wirklichkeit der Kraft (SS 1931) [1981]
34. Vom Wesen der Wahrheit. Zu Platons Höhlengleichnis und Theätet (WS 1931-1932) [1988]
35. Der Anfang der abendländischen Philosophie (Anaximander und Parmenides) (SS 1932) [2012]
- 36/37. Sein und Wahrheit. 1. Die Grundfrage der Philosophie (SS 1933). 2. Vom Wesen der Wahrheit (WS 1933-1934) [2001]
38. Logik als die Frage nach dem Wesen der Sprache (SS 1934) [1998]
39. Hölderlins Hymnen "Germanien" und "Der Rhein" (WS 1934-1935) [1980]

40. Einführung in die Metaphysik. (SS 1935) [1983]
 41. Die Frage nach dem Ding. Zu Kants Lehre von den transzendentalen Grundsätzen (WS 1935) [1984]
 42. Schelling: Vom das Wesen der menschlichen Freiheit (1809) (SS 1936) [1988]
 43. Nietzsche: Der Wille zur Macht als Kunst (WS 1936-1937) [1985]
 44. Nietzsches Metaphysische Grundstellung im abendländischen Denken. Die ewige Wiederkehr Gleichen (SS 1937) [1986]
 45. Grundfragen der Philosophie. Ausgewählte "Probleme" der "Logik" (WS 1937-1938) [1984]
 46. Zur Auslegung von Nietzsches. II. Unzeitgemässe Betrachtung "Vom Nutzen und Nachteil Historie für das Leben" (WS 1938-1939) [2003]
 47. Nietzsches Lehre vom Willen zur Macht als Erkenntnis (SS 1939) [1989]
 48. Nietzsche. Der Europäische Nihilismus (1940) [1986]
 49. Die Metaphysik deutschen Idealismus. Zur erneuten Auslegung von Schelling: Philosophische Untersuchungen über das Wesen der menschlichen Freiheit und die damit zusammenhängenden Gegenstände (1809) (1941) [1991]
 50. Nietzsches Metaphysik 1. (1941-1942). Einleitung in die Philosophie - Denken und Dichten 2. (WS 1944-1945) [1990]
 51. Grundbegriffe (SS 1941) [1981]
 52. Hölderlins Hymne "Andenken" (WS 1941-1942) [1982]
 53. Hölderlins Hymne "Der Ister" (SS 1942) [1984]
 54. Parmenides (WS 1942-1943) [1982]
 55. Heraklit. 1. Der Anfang abendländischen Denkens (Heraklit) (1943) 2. Logik. Heraklits Lehre vom Logos (SS 1944) [1979]
- c) Early Freiburg Lectures (1919-1923)

56/57. Zur Bestimmung der Philosophie. 1. Die Idee der Philosophie und das Weltanschauungsproblem (post war semester 1919); 2. Phänomenologie und transzendente Wertphilosophie (SS 1919); 3. Anhang: Über das Wesen der Universität und akademischen Studiums (SS 1919) [1987]

58. Grundprobleme der Phänomenologie (WS 1919-1920) [1992]

59. Phänomenologie der Anschauung und Ausdrucks. Theorie der philosophischen Begriffsbildung (SS 1920) Phänomenologie religiösen Lebens [1993]

60. Einleitung in die Phänomenologie der Religion 1. (WS 1920-1921); Augustinus und der Neuplatonismus 2. (SS 1921); Die philosophischen Grundlagen der mittelalterlichen Mystik 3. (WS 1918-1919) [1995]

61. Phänomenologische Interpretationen zu Aristoteles: Einführung in die phänomenologische Forschung (WS 1921-1922) [1985]

62. Phänomenologische Interpretation ausgewählter Abhandlungen Aristoteles zu Ontologie und Logik (SS 1922) [2005]

63. Ontologie. (Hermeneutik der Faktizität) (SS 1923) [1988]

III. Private monographs and letters

64. Der Begriff der Zeit. (I. Die Fragestellung Diltheys und Yorcks Grundtendenz; II. Die ursprünglichen Seinscharaktere Daseins; III. Dasein und Zeitlichkeit; IV. Zeitlichkeit und Geschichtlichkeit). im Anhang der gleichnamige Vortrag vor der Marburger Theologenschaft Juli 1924. [2004]

65. Beiträge zur Philosophie (Vom Ereignis) (1936-1938) [1989]

66. Besinnung (1938-1939) [1997]

67. Metaphysik und Nihilismus. 1. Die Überwindung der Metaphysik (1938-1939); 2. Das Wesen Nihilismus (1946-1948) [1999]

68. Hegel. 1. Die Negativität. Eine Auseinandersetzung mit Hegel aus dem Ansatz in der Negativität (1938-1939); 2. Erläuterung der "Einleitung" zu Hegels "Phänomenologie Geistes" (1942) [1993]

69. Die Geschichte Seyns - Die Geschichte Seyns (1938-1940) - Koinon. Aus der Geschichte Seyns (1939) [1998]
70. Über den Anfang (1941) [2005]
71. Das Ereignis (1941-1942) -Vorworte - Der erste Anfang - Der Anklang - Der Unterschied - Die Verwindung - Das Ereignis. Der Wortschatz seines Wesens - Das Ereignis - Das Ereignis und das Menschenwesen - Das Daseyn - Der andere Anfang - Weisungen in das Ereignis - as seynsgeschichtliche Denken (Dichten und Denken) [2009]
72. Die Stege Anfangs (1944) [n. p.]
73. Zum Ereignis-Denken [2013]
74. Zum Wesen der Sprache und Zur Frage nach der Kunst [2010]
75. Zu Hölderlin - Griechenlandreisen [2000]
76. Leitgedanken zur Entstehung der Metaphysik, der neuzeitlichen Wissenschaft und der modernen Technik [2009]
77. Feldweg-Gespräche. (1944-1945) [1995]
78. Der Spruch Anaximander (1946) [2010]
79. Bremer und Freiburger Vorträge. 1. Einblick in das was ist. Bremer Vorträge (1949) 2. Grundsätze Denkens. Freiburger Vorträge (1957) [1994]
80. Vorträge (1915-1967) [n. p.]
81. Gedachtes [2007]
- IV. Notes and recording
82. Zu eigenen Veröffentlichungen - Anmerkungen zu "Vom Wesen Grun" (1936) - Eine Auseinandersetzung mit "Sein und Zeit" (1936) - Laufende Anmerkungen zu "Sein und Zeit (1936) [n.p.]
83. Seminare: Platon - Aristoteles - Augustinus [2012]
84. Seminare: Kant - Leibniz - Schiller [2013]
85. Vom Wesen der Sprache. Die Metaphysik der Sprache und die Wesung Wortes. Zu Herders Abhandlung "Über den Ursprung der

Sprache" [1999]

86. Seminare: Hegel - Schelling [2011]

87. Nietzsche. Seminare 1937 und 1944. 1. Nietzsches Metaphysische Grundstellung (Sein und Schein) (SS 1937); 2. Skizzzen zu Grundbegriffe Denkens (SS 1944) [2004]

88. 1. Die metaphysischen Grundstellungen des abendländischen Denkens. 2. Einübung in das philosophische Denken [2008]

89. Zollikoner Seminare. Protokolle - Zwiegespräche - Briefe -(under construction) - First edition: Frankfurt am Main, Klostermann, 1987 [2004]

90. Zu Ernst Jünger [2004]

91. Ergänzungen und Denksplitter [n. p.]

92. Ausgewählte Briefe I [n. p.]

93. Ausgewählte Briefe II [n. p.]

94. Überlegungen A [n. p.]

95. Überlegungen B [n. p.]

96. Überlegungen C [n. p.]

97. Anmerkungen A [n. p.]

98. Anmerkungen B [n. p.]

99. Vier Hefte I - Der Feldweg; Vier Hefte II - Durch Ereignis zu Ding und Welt [n. p.]

100. Vigiliae I, II [n. p.]

101. Winke I, II [n. p.]

102. Vorläufiges I-IV [n. p.]

The Natorp-Bericht (Report from Paul Natorp)

"In the midst of this linked pair of courses on 'Phenomenological Interpretations to Aristotle,' in January of 1922, word came from

Marburg that Paul Natorp would be retiring shortly, that Nicolai Hartmann would be taking his place, and that as a result the junior position in philosophy would once again be vacant. Natorp had been impressed by Heidegger's book on Duns Scotus and, on the strength of this one publication, had considered Heidegger for this position in both 1917 and 1920. By 1922, Heidegger was renowned in university circles throughout Germany as an outstanding teacher. But he had published nothing since the Scotus book and, moreover, remarks Husserl in a letter to Natorp on February 1, 1922, 'does not want to publish yet,' audibly that this 'highly original personality' is still 'struggling, searching for himself and laboriously shaping his own unique style.' (We have already noted the 'turmoil of transition' evident in WS 1921-22.) But apparently in response not only to Natorp's interest in Heidegger for the chair at Marburg but also to a similar query from Georg Misch regarding Husserl's old chair at Göttingen, plans were soon initiated for Heidegger to publish a work on 'Phenomenological Interpretations to Aristotle' in a forthcoming issue of Husserl's *Jahrbuch* (vol. 7, 1924/1925). Even so, when Natorp wrote Husserl again in late September for at least a 'publishable manuscript' from Heidegger in support of his candidacy for associate professor (*Extraordinarius*) at Marburg, Heidegger was still struggling with the problem of how to introduce such a work. For the next three weeks, into mid-October, Heidegger labored over the manuscripts of his Aristotle courses in order to extract and distill from them an Introduction serving to found and develop the 'hermeneutic situation' in which Aristotle's texts were to be interpreted. To this *Einleitung* (28 pages of typescript), he added an Overview (*Übersicht*: 22 pages) of Part One of the projected book. On the strength of this typescript, essentially a 'private communication' addressed to his older peers at the two universities, Heidegger was appointed to the post at Marburg in the following year."

Martin Heidegger on the History of Metaphysics as Ontotheology

Introduction

"Heidegger's way of understanding the originary phenomenon of truth is to "make clear the mode of being of the cognition itself." His starting point is a proposition that is not based on intuition. Someone says with his or her back to the wall: this picture hangs askew. The proposition embodies the claim to have discovered the picture (as a being) in the "how" (the mode) of its being. The proposition displays this "how" of being in language. In the attempt to verify the proposition by sensuous experience, the recognition, according to Heidegger, is directed only to the intended being (the picture) and not to the proposition. It is directed to the being itself (which is to be verified by perception) in its mode of uncoveredness (Entdeckt-heir), i.e., in its showing-itself. Confirmation (Bewährung) means this showing-itself of the being in the same way in which it is intended in the proposition.

A true proposition shows the being in its mode of uncoveredness. The phenomenon of "originary truth" does not have the character of correspondence. It is the ground of the concept of truth in the sense of correspondence and propositional truth. By unfolding the meaning of alétheia Heidegger shows us a more originary sense of truth as unconcealment (Unverborgenheit). He wants to show that this concept coincides with the first and originary concept of truth in Greek thinking. In this primary sense only the discovering human Dasein can be "true" while it is Being-discovering (Entdeckend-Sein). On the other hand, beings (Seiendes) that we can find in the world can only "be" in a secondary mode, i.e., as being-discovered (Entdecktsein). They can only make a claim to uncoveredness. Their

fundament is the Being-discovering of the human Dasein. The being-true of a discovered being is only possible as being discovered by human Dasein as being-in-the-world.

The authentic Being of Dasein, the being-in-the truth, presupposes disclosedness (Erschlossenheit) of the world in states-of-mind (Befindlichkeiten), understanding, and discourse, i.e., the constitution of the being (Seinsverfassung) of human Dasein as thrownness (Geworfenheit) and project (Entwurf). The mode of being of Dasein is characterized equiprimordially (gleichursprünglich) by the possibility of both authenticity (being-in-the-truth) and the deficient mode (Verfallsform) of inauthenticity. In the mode of the "they" (das Man), of obstruction (Verstelltheit), of gossip (Gerede), Dasein is in untruth. Thus the being-in-the-world of human Dasein is determined at the same time by truth and untruth. We must always fight anew for the truth of Dasein (Being-discovering). Following Heidegger, the negative expression "alétheia" expresses the fact that hiding itself is a main characteristic of Being. In the hiding-itself of Being, human Dasein is hidden for itself in the mode of untruth.

Heidegger wants to make evident how the transition from the originary concept of truth as alétheia to "correspondence" came about. He wants to make clear that correspondence is only a derived form of truth: in a proposition Being should be displayed in the mode of its uncoveredness. In the inauthentic forms of mere reproducing and hearsay, the proposition becomes itself something ready-to-hand (Zuhandenes). Thus we have to engage in the demonstration of the uncoveredness that is preserved in the proposition. In this way the relation between proposition and discovered being then itself becomes something present-at-hand (Vorhandenes) and can be understood as a correspondence of proposition and being (intellectus and res). The fact that we are used to disregarding the originary dimension of truth is an aspect of our forgetfulness of Being (Seinsvergessenheit).

The originary dimension of truth in human Dasein "is given" (gibt es) only as long as there is Dasein. All truth is relative to the being of Dasein. Thus the claim that there could be "eternal truth" seems to Heidegger to be "fantastic." Against the background of this relativity

of truth to the being of Dasein, Heidegger asks anew: why must we presuppose that truth "is given"? His answer is that the possibility of truth (authenticity) and untruth (inauthenticity) belongs to the facticity of human Dasein. From the point of view of existential ontology, the being of human Dasein (its disclosedness) and truth are synonyms." (pp. 711-712)

Main texts on the history of metaphysics as ontotheology

"Ontotheology: Ontologie is the 'study [logos] of beings [onta]', Theologie the 'study of God [theos]'. Heidegger combines these Greek-derived words to form Onto-Theologie or Onto-Theo-Logie. The idea, but not the words, stem from Aristotle, whose 'first philosophy' considers both beings as such and the highest being (*Kant und das Problem der Metaphysik*, 220 / 150; *Einleitung zu 'Was ist metaphysik?'*, 373 / 75). Thus ontotheology asks two distinct questions: 1. What are beings as such in general? 2. What is the highest being, and what is its nature? (Kant *These über das Sein*, 443). The questions are easily conflated in German, since *Was ist das Seiende?*, 'What are beings?', is literally 'What is the being?' or 'What is that which is?', which might be either question 1 or question 2. Sometimes Heidegger gives a different account of the two questions. Question 1 is 'about beings as such [nach dem Seienden als einem solchen]', question 2 is 'about beings as a whole [nach dem Seienden im Ganzen]' (*Kant und das Problem der Metaphysik*, 220 / 150). He imputes this conflation to his earlier self: in *Was ist Metaphysik?*, 'metaphysics is defined as the question about beings as such and as a whole [nach dem Seienden als solchem and im Ganzen]. The wholeness of this whole [Die Ganzheit dieses Ganzes] is the unity of beings, the ground that brings them forth and unifies them. To anyone who can read, this means: metaphysics is Onto-Theo-Logie' (*Identität und Differenz*, 51 / 54. Elsewhere he locates the confusion in the whole phrase *das Ganze des Seienden als solchen*, 'the whole of beings as such', which might mean: 1. 'the most general features of beings', or 2. 'the highest and thus divine being' (*Einleitung zu 'Was ist metaphysik?'*, 373 / 275). (Aristotle is innocent of this confusion:

his god is one being among others, not the whole of beings. But in *Identität und Differenz* Heidegger is dealing with Hegel, whose god is the overall structure of beings, not an individual being.) Biologie is the 'study' or 'science' of living creatures. But in *OntoTheologie*, -logie plays a grander role. Logos, from legein, 'to lay out, arrange, gather, say, etc.', means 'ground [Grund], letting (things) lie before (us) [Vorliegenlassen]', and also 'gathering [Versammlung], uniting' (*Identität und Differenz*, 54f. / 57; 67 / 69). Metaphysics does both. It gathers beings together to consider them 'as a whole'. It regards being as the 'ground' of beings: 'Ontology and theology are '-logies' because they get to the bottom [ergründen] of beings as such and ground [begründen] them as a whole [im Ganzen, lit. 'in the whole']' (*Identität und Differenz*, 56 / 59). Hence Hegel called metaphysics 'logic'; it is Onto-Theo-Logik.

How does God become a being, the highest entity, rather than simply Sein, 'being'? Being and beings are distinct but inseparable. Being 'grounds [gründet]' beings, and conversely beings 'beground [begründen]' being. But beings can beground being only in the form of a single supreme being, a cause that is causa sui, 'cause of itself': 'This is the appropriate name for the god of philosophy. Man cannot pray to this god, nor offer sacrifices to him. Man cannot fall to his knees in awe before the causa sui, nor dance and play music before this god' (*Identität und Differenz*, 70 / 72). Heidegger thinks that 'god-less thinking', in rejecting this god of philosophy, is 'perhaps closer to the divine god' (*Identität und Differenz*, 71 / 72): 'the ontotheological character of metaphysics has become questionable for thinking, not on the basis of any atheism, but from the experience of a thinking which has seen in onto-theo-logy the still unthought unity of the essence of metaphysics' (*Identität und Differenz*, 51 / 55). In thinking about this unity, and about the DIFFERENCE that metaphysics discerns only hazily, Heidegger goes beyond metaphysics." (pp. 149-150)

A Selected Bibliography on the History of Metaphysics as Ontotheology

Heidegger's Main texts on Ontotheology

Abbreviations: GA = Gesamtausgabe (Collected works); SS = Summer semester (from May to July); WS = Winter semester (from November to February)

1. Heidegger, Martin. 2007. *Metaphysische Anfangsgründe Der Logik Im Ausgang Von Leibniz*. Frankfurt am Main: Klostermann.

GA Vol. 26, Lecture course SS 1928. First edition 1978.

Translated by Michael R. Heim as: *The Metaphysical Foundations of Logic*, Bloomington, Indiana University Press, 1984.

2. ———. 1991. *Kant Und Das Problem Der Metaphysik*. Frankfurt am Main: Klostermann.

GA Vol. 3. First edition Bonn, F. Cohen, 1929, Fourth revised edition 1973.

Translated by Richard Taft as: *Kant and the Problem of Metaphysics*, Bloomington, Indiana University Press, 1990; Fifth edition enlarged 1997.

3. ———. 1980. *Hegels Phänomenologie Des Geistes*. Frankfurt am Main: Klostermann.

GA Vol. 32, Lecture course SS 1930-31.

Translated by Parvis Emad and Kenneth Maly as: Hegel's Phenomenology of Spirit, Bloomington, Indiana University Press, 1988.

4. ———. 1988. *Schelling: Vom Wesen Der Menschlichen Freiheit (1809)*. Frankfurt am Main: Klostermann.

GA Vol. 42. Sommersemester 1936.

Translated by Joan Stambaugh as: Schelling's Treatise on the Essence of Human Freedom, Athens, Ohio University Press, 1984.

5. ———. 2000. "Überwindung Der Metaphysik." In *Vorträge Und Aufsätze. I*, 67-97. Frankfurt am Main: Klostermann.

GA Vol. 7. First edition Pfullingen, Neske, 1954 (Essays 1936-1953).

See: *Overcoming Metaphysics* translated by Joan Stambaugh in: Martin Heidegger, *The End of Philosophy*, San Francisco, Harper & Row, 1973. pp. 84-110.

6. ———. 1997. "Die Metaphysik Als Geschichte Des Seins." In *Nietzsche*, 399-454. Frankfurt am Main: Klostermann.

GA Vol. 6.1 and 6.2. First edition *Nietzsche*, Pfullingen, Neske, 1961 (two volumes).

Translated as *Nietzsche* by David Farrell Krell, San Francisco, Harper & Row 1979-1987 (four volumes).

Reprinted 1991 in two volumes:

1-2: *The Will to Power as Art; The Eternal Recurrence of the Same*.

3-4: *The Will to Power as Knowledge and Metaphysics; Nihilism*.

See: *Metaphysics as History of Being; Sketches for a History of Being as Metaphysics; Recollection in Metaphysics*.

These three Essays (with the addition of: *Overcoming Metaphysics*) are also translated by Joan Stambaugh in: Martin

- Heidegger, *The End of Philosophy*, San Francisco, Harper & Row, 1973 (respectively pp. 1-54; 55-74; 75-83; 84-110).
7. ———. 1997. "Entwürfe Zur Geschichte Des Seins Als Metaphysik." In *Nietzsche. Ii*, 455-480. Frankfurt am Main: Klostermann.
- GA Vol. 6.2.
- Written in 1941, First edition in: Nietzsche, Pfullingen, Neske, 1961.
- Translated by Joan Stambaugh as: *Sketches for a History of Being as Metaphysics* in: Martin Heidegger, *The End of Philosophy*, San Francisco, Harper & Row, 1973, pp. 55-74.
8. ———. 1997. "Die Erinnerung in Die Metaphysik." In *Nietzsche. Ii*, 481-490. Frankfurt am Main: Klostermann.
- GA Vol. 6.2.
- Written in 1941. First edition Pfullingen, Neske, 1961.
- Translated by Joan Stambaugh as: *Recollections in Metaphysics* in: Martin Heidegger, *The End of Philosophy*, San Francisco, Harper & Row, 1973, pp. 75-83.
9. ———. 1997. "Die Seinsgeschichtliche Bestimmung Des Nihilismus." In *Nietzsche. Ii*, 335-398. Frankfurt am Main: Klostermann.
- GA Vol. 6.2.
- Written in 1944-46, First edition in: Nietzsche (1961).
- Translated by Frank A. Capuzzi and edited by David Farrell Krell as: *Nihilism as Determined by the History of Being* in: Martin Heidegger, Nietzsche. Vol. IV: Nihilism - New York, Harper & Row, 1982.
10. ———. 1967. "Einleitung Zu "Was Ist Metaphysik?"" In *Wegmarken*, 365-383. Frankfurt am Main: Klostermann.
- GA 9, 1976, First edition 1949, reprinted in *Wegmarken*.
11. ———. 2006. "Die onto-Theo-Logische Verfassung Der Metaphysik." In *Identität Und Differenz*, 31-68. Frankfurt am

Main: Klostermann.

GA Vol. 11. First edition: Pfullingen, Günther Neske, 1957.

See: *Die Onto-theo-logische Verfassung der Metaphysik*.

Translated in English with an introduction by Joan Stambaugh as: *Identity and Difference*, New York, Harper & Row, 1969; second edition: Chicago, Chicago University Press, 2002.

Contents: Introduction by Joan Stambaugh 7; Identity and Difference 19; Preface 21; The principle of identity 23; The Onto-theo-logical constitution of metaphysics 42; Notes 75; Appendix: The German text: Identität und Differenz p. 77-146.

Foreword by William J. Richardson.

"In his long lifetime of thinking, Heidegger safeguarded the originary word of Western philosophical thinking: Being. Several of the Essays in this volume are intended to bring our attention back to this defining feature of his thought. The contemporary analytic and postmodern resistance and even

hostility to the very word 'being' has no doubt contributed to the current tendency in Heidegger studies to shuffle the name of Being to the background, if not erase it altogether. Nevertheless, a careful consideration of the texts -- a primary concern of the studies in this volume -- reaffirms that Heidegger, right to the end of his life, continued to reserve and preserve in his thinking the ancient word 'Being' as the name for the fundamental matter for thought (*die Sache selbst*). The originary, fundamental, and unifying meaning of Being, the *Erfragte* from the outset of his *Denkweg*, was properly named by Heidegger as Beyng (*Seyn*), Being itself (*Sein selbst*), Being as such (*Sein als solches*), and Being as Being (*Sein als Sein*) in distinction from being as *beingness* (*Seiendheit*), which he always maintained to be the proper concern of the metaphysical tradition of thinking. The important but often neglected task of carefully parsing Heidegger's language of Being, beingness, and beings is taken up in a number of the Essays." (p. 3).

"The basic aim of Heidegger's thought is often stated in the following way: to uncover the meaning of Being, in its history,

beginning with the first thinkers in Greece. Western history, we are told, begins with the philosophical question What are beings?, the question concerning beings as such, beings as a whole. Although this view of history is, of course, appropriate for Heidegger's enterprise, it is a limited view because of a restricted historical sense that I submit even Heidegger does not intend. Before the advent of philosophy in Greece, a fully constituted world was in place, a world disclosed through myth and poetry. Furthermore, there was an historical relation between Greek myth and philosophy, regardless of whether this relation is seen as an evolutionary development, a devolutionary decline or a contest between different modes of disclosure. Consequently one might ask: What role does pre-philosophical myth play in the "history of Being"?

Moreover, since the history of philosophy, for Heidegger, is at once a disclosure of Being and a concealing of that which "grants" disclosure by withdrawing itself (and the history of this concealment includes the great Presocratic thinkers) then one might further ask: Since philosophy to a certain extent displaced myth in Greek history, was there any connection between that displacement and concealment? That is to say, did pre-philosophical myth express a kind of openness that philosophy closed off? Put another way: Was Greek myth in any sense a prefiguration of Heidegger's alternative to philosophy, namely poetical thinking, that which seeks an openness to what is concealed in the disclosure of Being? Finally then: In what sense can Heidegger's later thought be called mythical?

My paper will explore these questions in the following way. Part One will examine myth in relation to Heidegger's thought by selecting certain Heideggerian themes and showing how Greek myth presents a pre-philosophical expression of these themes. Part Two will examine Heidegger's thought in relation to myth by first focusing on references to mythical disclosure in Heidegger's early thought, and then sketching the ways in which Heidegger's later thought itself approached a mythical form. In general, by relating Heidegger's thought and myth, I want to suggest a broader scope and somewhat looping shape

for the history of Being, because of certain pre-philosophical echoes in Heidegger's post-philosophical thought."

34. ———. 2006. "L'onto-Théologie Dans L'œuvre De Martin Heidegger. Récit D'une Confrontation Avec La Pensée Occidentale." *Philosophie* no. 91:37-62.

"F. Jaran examine la thèse de la constitution onto-théologique de la métaphysique, qui s'est transformée ces dernières années en un outil exégétique que les historiens de la philosophie n'hésitent plus à reprendre, fût-ce en le critiquant. Il s'attache à en retracer l'élaboration silencieuse dans les textes du début des années 1920, offrant ainsi un éclairage nouveau à la " métaphysique du Dasein " que Heidegger déploie immédiatement après la publication d'Être et temps."

39. Magnus, Bernd. 1970. *Heidegger's Metahistory of Philosophy. Amor Fati, Being and Truth*. The Hague: Martinus Nijhoff.

"Although a few excellent studies of Heidegger's thought have appeared in English in the last decade, they tend to focus on *Being and Time* and, secondarily, on the relationship of the later works to it. To my knowledge, only one book has appeared to-date [1970] in English which treats an aspect of Heidegger's understanding of the history of philosophy, and not a single critical study. This book endeavors to begin to remedy that deficiency.

It is not the case that Heidegger's understanding of the history of philosophy is merely a theme in his works. It is *the* theme of his later works in my view. If *Being and Time* is correctly characterized as a phenomenological description of *Dasein*, of the human way of being, then Heidegger's subsequent works, in the main, attempt to show how the question of Being (*Sein*) has been (mis)understood from Plato to Nietzsche. Presumably, the tradition's failure to grasp the human way of being is grounded in its more fundamental failure to articulate clearly the sense of Being, "to be," in general. It is not at all accidental, in short, that the projected second volume of *Being and Time* was to take as its subject-matter a recapitulation and destruction of the history of ontology. (1)

This book, then, is not intended as still another introduction to the philosophy of Martin Heidegger. It is a critical analysis and exposition of the second phase of his thought.

Heidegger's provocative interpretations of the pre-Socratic philosophers, Plato, Aristotle, Descartes, Kant, Hegel, and Nietzsche, are all conditioned by his inquiry into the meaning of Being. That inquiry determines the character of his historical studies. And although there have been frequent grumblings about the "validity" of such an approach, no sustained efforts have hitherto been made to come to grips with the methodological questions which Heidegger's hermeneutic occasions.

I do not want to suggest that this study covers the full range of problems raised by Heidegger's metahistorical interpretation of the history of philosophy. It does not. I have been forced to circumscribe the range of analysis very sharply. Nietzsche is the center of gravity, point of focus, and, finally, the touchstone for Heidegger's interpretations, in this study. A number of considerations dictated this choice. First, Heidegger has devoted more attention to Nietzsche than he has to all other philosophers combined. His interpretation of Nietzsche as the last metaphysician of the West helps to account for the inordinate amount of material Heidegger has produced concerning Nietzsche. Second, as a consequence of the first, we have a more adequate basis for judging the value of Heidegger's approach to Nietzsche. Third, it is my opinion that Nietzsche's philosophy is inherently more susceptible of conflicting interpretations than is, say, Kant's or Aristotle's.

Rather than serving as a deterrent in explicating and critically assessing Heidegger's interpretation of Nietzsche, I found this to be an asset. It forces one to make difficult decisions and to be painstakingly careful in advancing an interpretation of Nietzsche, rather than merely passing on accepted, allegedly "standard" interpretations. At the same time it affords the reader a point of reference from which to compare methods of historical-textual criticism." pp. IX-XI.

51. Noreña, Carlos G. 1983. "Heidegger on Suárez: The 1927 Marburg Lectures." *International Philosophical Quarterly* no. 23:407-424.

"Heidegger's thought on Suarez has been studied for the most part by scholastic philosophers with a particular doctrinal intent, in the context of Heidegger's views on the history of ontology, and on the narrow basis of a few passing remarks in some of Heidegger's works. (a) The 1975 publication of Heidegger's (Summer Semester, 1927) lectures on *Die Grundprobleme der Phänomenologie*, and their recent translation into English by Professor Hofstadter, make possible a better documented and more conclusive analysis of the subject. (b) Unfortunately, other relevant sources still remain unpublished, such as Heidegger's lectures and seminars on the history of philosophy from St. Thomas to Kant, medieval mysticism, St. Augustine, and Renaissance scholasticism. All of them, however, give a clear indication of Brentano's influence upon Heidegger's early thought and demonstrate an interest in medieval philosophy which one seldom finds among contemporary thinkers. In this essay we intend (1) to summarize Heidegger's views on medieval scholastic philosophy in general and those of Suarez in particular, and (2) attempt to retrieve from the Marburg lectures what Heidegger left unsaid and unthought on the scholastic distinction between essence and existence."

(a) Some scholars have argued that Heidegger's criticism of medieval ontology was fully justified when directed against Suarez, but radically unfair to St. Thomas. To this group belong: G. Siewerth, *Das Schicksal der Metaphysik von Thomas zu Heidegger* (Einsiedeln, 1959); R. Echaury, *Heidegger y la Metafisica Tomista* (Buenos Aires, 1970); B. Rioux, *L'être et la vérité chez Heidegger et Saint Thomas d'Aquin*

(Montreal-Paris, 1963); C. Fabro, *Participation et causalité selon S. Thomas d'Aquin* (Louvain, 1961); J. P. Doyle, "Heidegger and Scholastic Metaphysics", *The Modern Schoolman*, 49 (1972), 201-221; O. N. Derisi, "Aproximaciones y diferencias entre la fenomenología existencialista de Martin Heidegger y la ontología de Santo Tomás," *Sapientia*, 22 (1967), 185-192; W. R. Korn. "La question de l'être chez Martin Heidegger," *Revue Thomiste*, 71 (1971), 33-58.

More favorable to Suarez were H. Meyer, *Heidegger und Thomas von Aquin* (Munich, 1968); and M. Schneider. "Der angebliche Essentialismus des Suarez." *Wissenschaft und Weisheit*, 24 (1961), 40-68. Finally, there are those philosophers who think that both St. Thomas and Suarez fully deserve Heidegger's criticism. See, e.g., H. Siegfried, *Die Wahrheit und Metaphysik bei Suarez* (Bonn, 1967). Heidegger's references to Suarez can be found in *Seitz und Zeit* (Gesamtausgabe, ed. by F. W. von Herrmann, vol. 2. Frankfurt am Main, 1977), 30; *Die Frage nach der Ding* (Tübingen, 1962), 77; and *Nietzsche* (Pfullingen, 1961), 11.418.

(b) *The lectures Grundprobleme der Phänomenologie* were published in 1975 as vol. 24 of the Gesamtausgabe. They were reviewed by M. E. Zimmermann in the *International Philosophical Quarterly*, 17 (1977), 235-237, and in *Philosophy and Phenomenological Research*, 39 (1979), 537-550. Professor A. Hofstadter's excellent translation was published in 1981 by Indiana University Press under the title *Basic Problems of Phenomenology*.

Roman Ingarden and the Realism/Idealism Debate

Ontology and Metaphysics

"Ingarden held that philosophy divides into ontology and metaphysics. Ontology is an autonomous discipline in which we discover and establish the necessary connections between pure ideal qualities by intuitive analysis of the contents of ideas. This is an indispensable preparation for metaphysics, which aims to elucidate the necessary truths of factual existence. Each section of philosophy - theory of knowledge, philosophy of man, philosophy of nature and so on - has ontological and metaphysical aspects.

Ingarden argues that every being is a triple unity of matter (contents), form (of the matter) and existence (in a certain mode). Accordingly, ontology as a whole is divided into material, formal and existential ontology. Existence is neither a property nor one of the material or formal moments of an object; it is always the existence of something and what exists determines by its essence a mode of being which belongs to it. Modes of being are constituted from existential 'moments', of which Ingarden distinguishes the following opposite pairs: originality-derivativity, autonomy-heteronomy, distinctiveness-connectiveness and independence-dependence. Taking into account the modes of being thus constituted, there are four basic spheres of being: absolute (supratemporal), ideal (timeless), real (temporal - it has the most numerous forms) and purely intentional (atemporal, sometimes seemingly in time). Ingarden also draws a distinction between three domains: pure ideal qualities, ideas and individual objects. Each individual object is formally a subject of properties whose identity is determined by its constitutive nature. Individual objects of higher order, such as

organisms, may be superstructured on autonomous individual objects. Ideas and purely intentional beings have a two-sided formal constitution - besides their own structure they also have contents (in the case of ideas it is constituted by constants and variables, and in the case of purely intentional beings by places of indeterminateness).

Analyses of being in time, of the stream of consciousness and of the world show that their existence is derivative and depends on their relation to original (absolute) being. The foundation of being is placed either in its essence (and ultimately in the content of some idea) or is purely factual in its character. In his analysis of the controversy over the existence of the world, Ingarden first formulates Husserl's transcendental starting point, and then demonstrates and states precisely its assumptions concerning the two elements of initial relation: the real world and the stream of consciousness, together with a subject which belongs to it (pure ego). These considerations lead Ingarden to reject both Husserl's solution and his way of setting the question.

What is real appears in three temporal phases: the future, the present and the past. Objects determined in time include objects enduring in time, processes and events. A human being is an object enduring in time and constituted by a soul, which comprises an ego together with a stream of consciousness, and a body (with a subsystem constituting 'the gate of consciousness'). Living on the border of two spheres, the real (nature, animality), and the ideal (values), human beings create a third sphere of culture. Thus their need to transcend this fragility by a process of self-formation that is subordinated to values makes them prone to tragedy."From: Ingarden, Roman Witold (1893-1970) - by Antoni B. Stepien - Routledge Encyclopedia of Philosophy p. 790.

"Ontology, in Ingarden's sense, analyses the necessary structures of possible objects: it seeks to establish alternative possible structures of the world, where metaphysics would establish which of these alternatives is in fact realized. Ingarden distinguishes further between existential ontology, which investigates the modes of existence of different kinds of objects; formal ontology, which investigates the forms of objects (as contrasted with their material or qualitative aspects); and material ontology, which deals with these

qualitative aspects themselves. The Controversy is divided up accordingly: Volume 1 deals with existential ontology, Volumes 2 and 3 with formal ontology.

The Controversy contains extensive analyses of the modes of existence especially of temporal objects (events, processes, states), of the forms of individual objects, of ideas, states of affairs, relations, regions of being, worlds, and consciousness. Volume 3 contains an analysis of the causal nexus (cause and effect are regarded as simultaneous), of relatively isolated systems and of the problem of determinism.

The metaphysical (and concomitant epistemological) parts of the work were not written, but Ingarden's analyses of temporal existence (cf. 1983) and his stress on the reality of free human actions realizing values, seem to imply the possibility of a metaphysical investigation of man, and the final considerations of Volume 3 may be held to imply a certain priority of at least some metaphysical investigations to material ontology. Ingarden's last work (English translation 1983) is devoted to the ontological foundations of responsibility.

Ingarden is principally known, however, not for his investigations in general ontology and metaphysics but for his writings in aesthetics, and especially for his classic work on the ontology of literature (1931, English translation 1973). Even this, however, was undertaken in order to establish a radical difference of structure as between 'intentional objects' -- objects created by and dependent on acts of consciousness - and objects in reality.

Epistemology, for Ingarden, is divided into 'pure' epistemology - which investigates the ideas or essences of cognitive acts as revealed in "immanent eidetic intuition" and establishes ultimate principles of cognition - and 'applied' epistemology, which is partly empirical, and applies these principles to actual cases. In his epistemology, therefore, Ingarden initially embraces Husserl's notion of pure consciousness as the area where structures of mental acts may be indubitably cognized. Ingarden, however, rejects the necessity of any sort of transcendental reduction in philosophy and his analyses lead to a conception of consciousness not as something independent but as a merely abstract stratum in the real self. Ingarden thereby denies all the ontological features - irreality, self-sufficiency, and

separateness - that had been ascribed to consciousness by Husserl. And he thereby undermines, in fact, the very notion of a 'pure' consciousness in the Husserlian mould." (pp. 396-397)

From: Andrzej Poliawski, "Ingarden, Roman" in: Hans Burkhardt & Barry Smith (eds.), *Handbook of Metaphysics and Ontology*, Munich: Philosophia Verlag 1991.

"For Ingarden, as for the other earlier phenomenologists, the decisive characteristic of phenomenology consisted in its program of an intuitive study of essences; as a matter of fact he devoted his habilitation thesis, *Essentiale Fragen*, to a careful analysis of the questions concerning the essence of a thing. To the resulting theory of 'aprioric' necessary truths he gave the name 'ontology.' Husserl himself had been talking in a similar vein of the different regional ontologies (i.e., of the apriori theories of different domains or regions of objects) and of a general formal ontology (i.e., of the apriori theory of the formal structure of any object whatsoever). But Ingarden admitted that he used the term 'ontology' in a somewhat wider sense, because for him ontology included the study of the essence of pure consciousness (*die Wesensanalyse des reinen Bewusstseins*). Husserl had once defined phenomenology as the study of the essence of pure consciousness, but he had never thought to call this investigation 'ontological.' For him phenomenology could not be a proper part of ontology, since on the contrary he conceived of ontology, the study of the objects of consciousness, as a proper part of phenomenology, the study of consciousness.

There was thus more than merely a terminological disagreement between them. What was at issue was the question whether ontology or phenomenology, namely the transcendental phenomenology of the process of constitution, had to come first. Ingarden was of the opinion that an analysis and evaluation of the constitutive processes involved in our knowledge of things presupposed as a 'guiding thread' the prior possession of a clarified notion of those things, while Husserl maintained that a clarified notion of the things could only be obtained on the basis of a prior understanding of the process of constitution. This difference between Ingarden and Husserl is, in fact, the one which separates the realistic from an idealistic approach to this problem.

However, Ingarden did not reject the program of a transcendental phenomenology as such. Already in his account of 1919 he had devoted a special section to the presentation of the phenomenological reduction and the immanent self-knowledge of pure consciousness, and, unlike most other members of the Göttingen and Munich groups, Ingarden had always accepted the transcendental reduction as meaningful and even necessary, namely necessary for the development of epistemology. To understand Ingarden's position one must know that in his Ph.D. dissertation, in his efforts to criticize the relativist and subjectivist claims made by Bergson, and in his struggle to clarify the issues involved in the idealism-realism controversy, he had been led to make a sharp distinction between epistemological and metaphysical assertions, which, together with his conception of ontology, resulted in a three-fold division of all systematic philosophy. The tasks of the three divisions are as follows: ontology investigates the necessary truths, i.e., delimits the bounds of sense, namely the range of the apriori possible (it covers what in Analytic Philosophy is the realm of conceptual analysis); metaphysics makes existence claims, i.e., it tries to decide what is the nature of that which in fact is the case; finally epistemology, which for Ingarden emphatically is not first philosophy, has the task of certifying the validity of the results already obtained by scientific and philosophical investigations. Ingarden's conception of transcendental phenomenology can now be understood. For him the *raison d'être* of the transcendental reduction is epistemological, it has its rightful place in the program of a non-circular certification of all knowledge. And once the reduction is performed, then a new realm for ontological analysis is opened up (cf. the above mentioned study of the essence of pure consciousness). Furthermore, there are the facts of transcendental consciousness and other facts which might be inferred from them, all of which are part of the domain of metaphysics. Thus transcendental phenomenology is for Ingarden a mixture of epistemological, ontological and metaphysical questions." (pp. 1224-1226)

From: Guido Küng, "Roman Ingarden (1893-1970): Ontological Phenomenology", in: Herbert Spiegelberg, *The Phenomenological Movement. A Historical Introduction*, The Hague: Martinus Nijhoff 1963 (Third edition).

"The ontological analyses of works of art affected Ingarden's entire ontology. Its best elaboration is contained in *Spór o istnienie świata* (*The controversy over the existence of the world*, 1947-48). A being, i.e., an object, can be considered in three different respects: (1) the material one, (2) the formal one, and (3) the existential one (modes of being). Ingarden understands ontology as based on eidetic insight and intuitive analyses of the contents of ideas, i.e., upon the eidetic method, which enables one to discover the necessary and purely possible relations between the pure ideal qualities. Ontology is for him the most general theory of objects. He distinguishes it from metaphysics, which fulfills the role of an applied theory of objects and which, being based on ontology, considers the nature and essence of factual beings. The eidetic character distinguishes metaphysics from the so-called real sciences.

Ontology aims at obtaining a general spectrum of eidetic possibilities and necessities with reference to any objects whatever. In the frame of an existential ontology, which has nothing to do with Martin Heidegger's fundamental ontology, Ingarden distinguishes and clearly defines four mutually exclusive pairs of moments of being: something can be (1) existentially autonomous or heteronomous, (2) existentially original or derivative, (3) existentially separate or not separate, and (4) existentially self-dependent or contingent. Considerations connected with the analysis of the second pair has led Ingarden to an original interpretation of the relation of causality. His analysis of time has brought some additional pairs of existential moments, such as actuality and non-actuality; persistence and fragility; and fissuration and non-fissuration. These differentiations enables him to distinguish and describe four basic modes of being (consisting of noncontradictory combinations of existential moments). These are: (1) absolute being (autonomous, original, separate, self-dependent); (2) temporal (real) being; (3) ideal (extratemporal) being; and (4) purely intentional (quasitemporal) being. We cannot experience any existing object without its mode of being.

In epistemology Ingarden distinguishes: (1) the pure theory of knowledge, which is actually a part of ontology, because he describes it as an a priori analysis of the general idea "knowledge"; (2) criteriology, which researches such epistemic values as objectivity

and adequacy; and (3) the critique of knowledge, which evaluates factually obtained results of scientific and philosophical cognition." (p. 349)

From: Andrzej Przylebski, "Roman Ingarden" in: Lester Embree et alii (eds.), *Encyclopedia of Phenomenology*, Dordrecht: Kluwer 1997.

Ontology as a science of pure possibilities

"Ingarden begins with a purely formal ontological analysis, and builds towards an analysis of human being, and the possibility of human meaning. By examining existence in its various modes, he comes to consider the matter and form most readily accessible to cognition: ourselves. Plotting the multiple axes of our existence leads him to an understanding of the nature of our essence. So far, so good, Ingarden appears to be undertaking a classical phenomenological inquiry. But there are several surprises in store for the unsuspecting reader, particularly regarding a few key terms from both phenomenology and existentialism to which Ingarden gives entirely new meaning.

For example, each of his central concerns, essence and existence, turn out to be just the opposite of what we might expect. So too with his fields of inquiry; Tymieniecka's dissertation, *Essence and Existence* could just as easily have been entitled *Ontology and Metaphysics*, for from the outset, Ingarden begins to play with seemingly familiar terms. In his view, ontology is neither "a branch of metaphysics concerned with the nature and relations of being" nor "a particular theory about the nature of being or the kinds of existents." Rather, for Ingarden, ontology precedes metaphysics, and metaphysics is (and must be) grounded in ontology. Ingarden declares that ontology proposes to answer the question: "What is the essence of this thing which exists?"

According to Ingarden, three fundamental groups of questions form the basis for the distinction between ontology and metaphysics, corresponding to three distinct types of knowledge, and three distinct modes of inquiry:

1) Scientific knowledge focuses on facts contained within the limits of the real world, including the existence of the world as such, and all the objects found within it. This is the purview of the "particular sciences": chemistry, physics, and so on. Such sciences do not study the essences of things, but rather only the quality and quantity of the constituent elements of their factual existence.

2) Ontology entertains questions regarding what is "purely possible": ideas. Ontological questions establish the linkages between things, the constitutive structural network underlying the possibility of the existence of the world (for example, "if p, then necessarily q..."). In themselves, ontological questions do not study essences as such, but rather inquire into the conditions that must obtain in order for essences to result, as well as the links between essences.

3) Metaphysical questions, by contrast, study the essences of things. It is here that Ingarden reveals his existentialist side. Metaphysics explores the essential characteristics of things in their "pure incomprehensible facticity." Metaphysics also studies the effects of things on one another. Simply put, both the particular sciences and ontology are empty outlines of existence, which are, respectively, entirely composed of content or form. Metaphysics, on the other hand, is the vibrant canvas stretched on the frame of ontology and painted all over with data waiting to be interpreted. Metaphysics, Ingarden asserts, is dependent on ontology to supply a conceptual framework, but surpasses ontology in claiming to know the essences of things, beyond their constitutive physical elements, in knowing what constitutes the unique individual existence of any object." (pp. 185-186 notes omitted)

From: Nancy Mardas, "Essence and Existence in Phenomenological Ontology: Roman Ingarden", in: A. T. Tymieniecka (ed.), *The Passions of the Soul in the Metamorphosis of Becoming*, Dordrecht: Kluwer 2003, pp. 183-198.

"While it is difficult to find any radical turning points in the philosophy of Roman Ingarden, an inner tension can be detected. Ontology as a science of pure possibilities is set against metaphysics as a science of the essence of actually existing being. The philosopher did not build his metaphysics, he stopped at outlining its conception,

as he believed that metaphysical considerations should be preceded by ontological investigations. Ingarden carried out ontological investigations on various levels: the meta-philosophical level (conception of ontology), systematic existential and formal-ontological investigations; the epistemological level (ontology of cognition); the aesthetic level (the ontology of the work of art and aesthetic object); the axiological level (the ontology of value); the level of the philosophy of language (meanings of words as intersubjective intentional creations). The ontological perspective pervades almost all Ingarden's philosophical thinking, inclining his interpreters to ask the following question: is there a chance of leaving this magic circle of pure possibilities? Let us take into consideration whether the philosopher closed to himself the path leading to actually existing being. Why did Ingarden insist on the necessity of ontological investigations even though they were moving the metaphysical horizon away from him? For metaphysics was, aging the aim and ontology just an introduction to it. What is more, Ingarden's temperament and nature made him a metaphysician (he was interested in being) rather than a phenomenologist (he did not want to confine himself to how being was given to him). On the level of ontological considerations we observe the tension between intuition and discourse (direct and indirect cognition).

The *Controversy about the Existence of the World* is a systematic presentation of Ingarden's ontology. His earlier works constituted an introduction to it: *Essentielle Fragen* (1925), which offered the differentiation between an idea (*eidōs*) and essence (*Wesen*) and an outline of the theory of ideas; *Bemerkungen zum Problem Idealismus-Realismus* (1929), in which Ingarden distinguished three groups of philosophical issues (ontological, metaphysical and epistemological) and distinguished the modes of existence and existential moments as fundamental notions of existential ontology. The philosopher discussed more specific ontological questions in his other works: -- *Das literarische Kunstwerk* (1931, the ontology of a purely intentional object); -- *Vom formalen Aufbau des individuaellen Gegenstandes* (1935, the formal ontology of an autonomous individual object).

Ontology approached as a science on the possible ways of existence occupies a distinguished position in Ingarden's studies. It does not

comprise existential assertions (it does not assert what actually exists). Ingarden distinguishes the following domains of existence: a domain of individual objects, a domain of ideas, a domain of ideal qualities. He refers the notion of essence to individual objects (autonomous and non-autonomous). In various individual objects we observe the identity of certain moments which determine their range. This selection of identical moments, to which correspond many individual exemplifications, Ingarden calls an idea. We think about the existence of an idea only because in the world, which is experienced by us, we come across necessary connections between qualities. What is necessary speaks for the rationality of being and this rationality can be explained through the relations between ideal qualities in the content of ideas. Purely factual dependencies (for example, causal dependencies) or phenomenal dependencies are not enough to acknowledge the rationality of being. Therefore Ingarden presents the following argumentation: starting from the data of experience he asks a question on the conditions of the possibility of what is given in experience. He does not mean subjective conditions (what cognitive powers a subject should be equipped with in order to experience in the way he experiences) but objective, ontic conditions (what has being to be like in order to appear in such a way and not another way in experience). Thus experience suggests assuming a certain theoretical hypothesis--a hypothesis on the existence of an idea.

Ideas are characterized by their dual formal structure:--as ideas they have a characteristic structure which differentiates them from individual objects as well as ideal qualities; --they are ideas of something, i.e., they differ from each other by their content, determining the range of individual objects "subjected to them". This dual structure makes it possible to differentiate between the cognitive competence of ontology and metaphysics. Ontology investigates the content of ideas only (that they are ideas of something) and necessary connections between ideal qualities. It is only metaphysics that can formulate statements on the actual existence of ideas.

In the sphere of facts nothing can exist that would be contradictory to pure possibilities. Thus ontological investigations should constitute the beginning of all philosophical considerations.

Theoretically they precede individual sciences and they are more general. Ontology eliminates problems and conclusions that are inconsistent with an idea of the investigated objects. Ideal qualities occur in the content of an idea in the shape of constants and variables--existential, formal and material. An ontologist employs an a priori analysis of the content idea (a prioric laws of connection and exclusion), but he does not lose the connection with experience broadly approached. The a priori cognition of ideal qualities is understood by Ingarden intuitively and this enables ontology to establish a wide range of studies." (pp. 186-187, notes omitted).

From: Zofia Majewska, "The Philosophy of Roman Ingarden", in: Anna-Teresa Tymieniecka (ed.) *Phenomenology World-Wide. Foundations - Expanding Dynamics - Life-Engagements. A Guide for Research and Study*, Dordrecht: Kluwer 2002 pp. 184-199.

The controversy with Husserl

"Husserl was convinced that rigorous philosophy i.e., phenomenology must begin with a thoroughly elaborated epistemology and eventually develop from that starting point an ontology and metaphysics. Ingarden was equally convinced that any ontology or metaphysics that originated from an idealist epistemology was itself bound and determined to be idealist. His criticisms of Husserl's position bear witness to the legitimacy of that conviction: To attempt to 'defend' Husserl against the charge that his idealism is 'committed to' metaphysical idealism is vain, if for no other reason than that Husserl appears to have felt justified in making metaphysical assertions that he apparently considered to be sufficiently well grounded in his idealist epistemology (although he never explicated this foundational relationship). In the light of Ingarden's criticisms, it seems equally wrongheaded to suggest, as does Farber, that Husserl was committing some kind of transgression against the program of phenomenology as he initially conceived and described it. It appears, rather, that the 'subjectivism' Farber sees winning the day in Husserl's 'system of thought' is not at all the result of any fundamental change in the direction of his thinking but is instead the inevitable conclusion of a development of thought proceeding from his starting point of epistemological idealism. As we have seen, Ingarden found the position of

metaphysical idealism impossible to maintain-indeed he appears to have been dissatisfied with idealism per se. Ingarden was convinced it was the very starting point of Husserl's phenomenology in epistemology that directed him toward the ontological solution of metaphysical idealism, and by restricting his own initial approach to the problems regarding the existence of the world to exclusively ontological investigations he hoped to avoid a similar predetermination of the metaphysical position he would later proceed to establish. Ingarden systematically elaborated these ontological investigations in his magnum opus, *Controversy Over the Existence of the World.*" (p. 65)

From: Jeff Mitscherling, *Roman Ingarden's Ontology and Aesthetics*, Ottawa: University of Ottawa Press 1997.

The debate Realism vs. Idealism

"...the idealism/realism controversy was a central philosophical topic in the early decades of this century. With the subsequent reshaping of phenomenology along existentialist lines, primarily as a result of the work of Heidegger and Sartre, and with the increasing popularity of the 'analytic' concern with problems of logic, epistemology, and language, the interest in the ontological dimension of the idealism/realism controversy had greatly subsided before Ingarden finally published the first volumes of *Controversy*. Throughout his life, however, Ingarden remained committed to working out the ontological problems he had addressed so early in his career, sincerely believing that the idealism/realism debate concerning the existence of the world was of primary philosophical importance. The detailed analyses he presents in *Controversy* support his belief, and they do so in two respects. First, while his innumerable treatments of major historical figures, from Plato to Husserl, are generally offered for the purpose of either dispelling already existing confusion or clarifying his own use of terms-for example, he devotes the first section of the opening chapter of volume I simply to a detailed description of the manner and sense in which the term "idealism" has been variously employed over the centuries-these treatments at the same time indicate the central position the idealism/realism controversy has occupied throughout the history of Western philosophy, and thereby argue for the necessity of understanding this

controversy and appreciating its centrality. But secondly, and more importantly, the excruciating rigour and thoroughness that he brings to his analyses render them compelling: the reader is indeed forced to grant Ingarden his claim that the problems he is dealing with do indeed warrant further investigation, and that our philosophical integrity demands of us that we pursue them further." (p. 80)

Excerpts from his publications (in progress)

Time and Modes of Being

From the Author's Preface:

"In 1946/47 my two volume work, *The controversy over the existence of the World* (*Spór o istnienie Świata* Vol. I, 297 pages, Vol II 848 pages) was published under the imprint of the Polish Academy of Sciences and Letters.

The present volume contains the English translation of parts selected from volume I of this work: the Introduction, Chapter III (with its introduction), Chapter VI, and section 31 from Chapter VII.

This selection covers my most important ontological analyses of modes of being and of time, as it is involved with these, which lead to the establishment of fundamental concepts of modes of existence. These investigations constitute the existential-ontological preparation for Volume II, which contains formal-ontological studies clarifying a number of basic formal concepts that are indispensable to an adumbration of prospective possible solutions of the controversy between idealism and realism. Volume II is in preparation.(...) I wish to express my great and sincere appreciation to Mrs. Michejda for her careful preparation of this excellent translation, which completely satisfies every demand of the author."

CONTENTS: Author's Preface V; Translator's Preface VII;

Chapter I. Preliminary considerations 3;

Introduction 3; The foundation and the tentative formulation of the question at issue 8; Different groups of problems requiring

delimitation 17;

Chapter II. Introduction 22;

Three main groups of ontological problems 22;

Chapter III. Basic existential concepts 28;

The problem of the possibility of analyzing existence 28; Modes of Being and moments of existence 32; Autonomy and heteronomy 43; Existential originality and existential derivation 52; Existential separateness and inseparateness 82; Existential self-dependence and existential contingency 89; Absolute Being - Relative Being 92;

Chapter IV. Time and modes of Being 99;

Preliminary observations regarding concrete time 99; The mode of Being of events 102; The mode of Being of processes 107; The mode of Being of objects enduring in time 124;

Chapter V. The consequences for the possible solutions of the controversy over the existence of the world when time is taken into account 157; New concepts of modes of Being 157;

Name Index 165; Subject Index 167.

Roman Ingarden: Selected Bibliography A - M

Introduction

A bibliography of Roman Ingarden's works for the years 1915-1989 is published in: *Analecta Husserliana* - The Yearbook of Phenomenological Research - vol. 30: *Ingardeniana II. New studies in the philosophy of Roman Ingarden*. With a new international Ingarden bibliography, edited by Hans Rudnik and Jolanta Wawrzycka; the bibliography (pp. 225-296) contains in the first part ("primary sources") 368 items, inclusively of translations and reprints; the second part ("secondary sources") contains 821 references (many in Polish) concerning Ingarden.

I will give an updated bibliography of the most relevant references for Ingarden's ontology.

Bibliography A - M

1. "Roman Ingarden: Forty Years Later." 2010. *Polish Journal of Philosophy* no. 4.

Contents: Sebastian Tomasz Kołodziejczyk: Roman Ingarden: Forty Years Later 5; Władysław Stróżewski: Roman Ingarden: Life and Philosophy 11; Jan Woleński: Meaningfulness, Meaninglessness and Language-Hierarchies: Some Lessons from Ingarden's Criticism of the Verifiability Principle 35; Nancy Billias: Ingarden and Badiou: A Meeting at the Crossroads 49; Arkadiusz Chrudzimski: Composed Objects, Internal Relations, and Purely Intentional Negativity. Ingarden's Theory of States of Affairs 63; Ingvar Johansson: Fictions and the Spatiotemporal World — in the Light of

- Ingarden 81; Victor Kocay: An Evaluation of Ingardenian Values 105; Reiner Matzker: Reality, Mediality and Ideality — Roman Ingarden as Perceived in Thoughts, Letters and Memories 123; Jeff Mitscherling: Aristotelian Metaphysics and the Distinction between Consciousness and the Real World in Husserl and Ingarden 137; Marek Piwowarczyk: Endurance and Temporality 157; Roberto Poli: Spheres of Being and the Network of Ontological Dependencies 171; Daniel von Wachter: Roman Ingarden's Theory of Causation Revised 183-196.

Repris dans *Revue de Métaphysique et de Morale*, 72, 1967, pp. 332-343.

3. Ales Bello, Angela. 2004. "The Controversy about the Existence of the World in Edmund Husserl's Phenomenological School: A. Reinach, R. Ingarden, H. Conrad-Martius, E. Stein." In *Does the World Exist? Plurisignificant Ciphering of Reality*, edited by Tymieniecka, Anna-Teresa, 97-116. Dordrecht: Kluwer.

Analecta Husserliana. Volume 79.

"The aim of the essay consists in analyzing one of the most important points of discussion among some of Husserl's disciples: A. Reinach, R. Ingarden, H. Conrad-Martius, E. Stein, that is the existence of the world and the way to prove it. The research leads to two consequences: to pinpoint Husserl's particular and original interpretation regarding "existence" that concludes to the acceptance of it and the difference between his transcendental phenomenology and that one sustained by his disciples that can be called a realistic phenomenology. In this contest E. Stein assumed a peculiar position that to some extent combines the two attitudes."

"The above outline sought to show very briefly how the discussion about the existence of the world came into being within the phenomenological school. We noted that Husserl's cited disciples are convinced that, as far as the maestro is concerned, the world - understood as external reality that comprises ourselves as human beings - does exist. but doubt

that he succeeded in justifying this view moving from his theoretical assumptions. Nevertheless, the objections are more or less mellow and indistinct and all of them are made within the school, that is to say. within a common style of search.

The great common terrain is constituted by essential analysis, which nobody wants to do without. but precisely because the philosophical tradition regards the theme of the essence as related to that of existence, there arises the fear that this latter aspect might be pushed into the background. Furthermore, because for Husserl essential analysis concentrates on subjectivity and opens the road to the transcendental perspective, what is feared is becoming enclosed in subjectivity and concentrating all of reality in it. as in the great lesson of German idealism.

As can be seen. I have endeavored to defend Husserl against his own disciples, trying to delve into his profound intentions, re-balancing - wherever this proves possible - the results of his analysis. comforted in this by the observations of Edith Stein, who was probably closest to the maestro and therefore managed to grasp the principal lines of his position more accurately. The theoretical core always remains the relationship between idealism and realism. with respect to which Husserl's attitude, at least in my opinion, is very balanced, notwithstanding its peculiarity. On the other hand, it is quite readily understandable that his disciples should have committed the "great parricide," to use the expression that Plato used in connection with Parmenides: it may well be that without it one does not achieve theoretical autonomy. All the same, one also has to hear in mind a saying that once again involves Plato: *amicus Plato. sell magis amica veritas.* which should help us understand the intentions of the other before we raise objections." (p. 113)

Abstract: "It is accepted that certain mereological concepts and phenomenological conceptualisations presented in Carl Stumpf's *Über den psychologischen Ursprung der Raumvorstellung* and Tonpsychologie played an important role in the development of the Husserlian formal ontology. In the third Logical Investigation, which displays the formal relations between part and whole and among parts that make out a whole, one of the main concepts of contemporary formal ontology and metaphysics is settled: ontological dependence or foundation. My main objective is to display Stumpf's concepts of partial content, independent content, spatial wholes, sound wholes, and the different kinds of connection among parts, in particular, fusion. Second, I will show how Husserl improved this background, in particular with regards to the exact nature of the theory of manifolds, in discussion with Georg Cantor, the father of set theory. Third, I will focus on Ingarden's use of formal ontology and on the different modes of being that can be justified by appealing to the concept of ontological dependence in its Ingardenian variations. If my interpretation is adequate, it should be inferred that formal ontology is the operative theory of phenomenological philosophy, and this must be acknowledged in its full significance with respect to the supposed independence of the phenomenological method since 1913. A further consequence, not developed in this essay, is that formal ontology can be mathematised."

6. Barska, Katarzyna. 2015. "Theory of the Whole and the Part - Ontological Perspective (E. Husserl, R. Ingarden)." *Studia Humana* no. 4:12-25.

Abstract: "The purpose of the paper is demonstrate the thesis that Ingarden's ontological system allows a better understanding of the "part-whole" problem than previous theories. Especially, if we take into account the existential ontology of Ingarden, which refers to Husserl "part-whole"

theory, we can see that development of terms made by Ingarden sheds new light on old problem. In this context, particularly important is to distinguish between two existential moments: contingency/inseparateness, because thanks to them we can talk about many different types of relationships and hence many types of objects."

Abstract: "Roman Ingarden and Nicolai Hartmann developed an ontology of the real world in which the analysis of human responsible action and its presuppositions plays an essential role. In this analysis, several common elements can be identified, such as the acknowledgement of the objectivity of values and the centrality of the concept of person, which for both philosophers refers exclusively to the real man in the real world. The aim of the study is to analyze the way in which both Ingarden and Hartmann, on common grounds, explore the specific phenomenon of free will and deal with the issue of its ontological possibility within a deterministically structured world. Despite the differences, what emerges in both cases is a theoretical model that refuses the rigid alternative determinism-indeterminism with the aim of providing the foundations of the self-determination of man."

"Ingarden's ontology is an ontology of an object. An object, as conceived by Ingarden, is, first of all, something which is a unity of matter (referred to by Ingarden as material endowment), form (formal structure) and existence (mode of existence). As examples of objects in this meaning one may offer: a physical object, a process, an event, a Platonic idea, a property of a thing, a negative state of affairs. Yet, not everything is an object. Non-objects are: matter, form and mode of existence as such. The *Controversy over the Existence of the World* was divided by Ingarden into Existential Ontology and Formal Ontology in order to deal with existential and formal aspects of objects." (p. 137)

"In the present work I will focus on Ingarden's theory of the literary work of art, with the special emphasis on its ontology, identity, and value, as well as on the nature of readers' interactions with literary works, such as aesthetic experience, scholarly cognition, and literary criticism. I will also discuss Ingarden's attempts to defend the validity of value judgments against the theories that undermine them, such as psychologism, subjectivism, and relativism. All these themes

are discussed in Ingarden's first book, *The Literary Work of Art*, to be followed by the more detailed analyses of the various types of cognitive, critical and aesthetic experiences of literary works in *The Cognition of the Literary Work of Art*.

Paradoxically, Ingarden's first and more well-known book was written as a preliminary study for his larger concern over the problem of realism and idealism, to which he devoted his next and much larger three volume work, *The Controversy Over the Existence of the World*.⁽⁵⁾ Reversing Ingarden's concerns, I will discuss the latter work only to throw some light on Ingarden's ontological analyses in the first book. Like all of Husserl's students who initially embraced Husserl's new "presupposition-less philosophy", Ingarden was only willing to make a few steps and did not follow his great teacher all the way. In fact, none of Husserl's students followed him beyond his initial and still largely ontological analyses of the *Logical Investigations*, stopping before the gateways into the transcendental phenomenology, i.e., the famed phenomenological reduction or *epoché* which Husserl initiated in the *Ideas*.⁽⁶⁾ In the Preface to the first German edition of *The Literary Work of Art* Ingarden admits that although the subject of his investigation was the literary work of art, his ultimate motives were "connected to the problem of idealism-realism". He was especially worried about "the attempt of Husserl's transcendental idealism to conceive the real world and its elements as purely intentional objectivities which have their ontic and determining basis in the depths of the pure consciousness that constitutes them".⁽⁷⁾ In order to prove Husserl wrong, Ingarden set out to show that the structure of the purely intentional objects, an example of which is a literary work, is radically different than the nature and the mode of existence of the real objectivities.⁽⁸⁾ (pp. 2-3)

26. Chrudzimski, Arkadiusz. 1999. "Are Meanings in the Head? Ingarden's Theory of Meaning." *Journal of the British Society for Phenomenology* no. 30:306-326.

Abstract: "The question in the title should be construed as an epistemological and not an ontological one. Omitting the difficult problems of the ontology of intentionality we will ask if all what is needed to explain the phenomenon of the meaningful use of words, could be found "in our private head" interpreted as a sphere of specific privileged access, the sphere that is in the relevant epistemological sense subjective, private or non-public.

There are many "mentalistic" theories of meaning that force us to the answer: "yes". According to these theories our words are meaningful in virtue of certain intentions of the speaker. And our intentions consist in having some mental states that should be in the relevant sense subjective or private. (Searle, Chisholm) But there are also philosophers (Kripke, Putnam) who claim to have evidence to the contrary. They argue that the meanings of our words could not be "in the head", because of two important reasons. (I) Very often we don't know exactly the meanings of the words that we use meaningfully. Furthermore, our "semantical self-knowledge" is principally corrigible by other people, and hence our access to the meanings we use could be by no means privileged. And secondly (ii) we can imagine a situation in which two subjects with the same mental intention use the same word with the very different meanings.

We will investigate our question on the ground of the Ingarden's philosophy. As we will see, his answer turns out to be in an interesting sense: "yes and no".

"Actually, the majority of philosophers who find Ingarden's work valuable and inspiring belong to the growing community of "naïve" or "straight" realists who typically don't even consider transcendental idealism as a serious philosophical option. Ironically, the main goal of Ingarden's philosophical struggle - the refutation of idealism - remained something that very few of his reader are really interested in.

Most of the papers collected in this volume follow this strand of Ingarden's reception. The first three articles concern the basic ontological categories and distinctions. Gregor Haefliger and Guido Küng concentrate on categories of substance, state, process, and event, and compare Ingarden's solutions with some contemporary developments. Peter Simons investigates several concepts of ontological dependence that are central for the especially Ingardenian branch of ontology that Ingarden called "existential ontology". Daniel von Wachter proposes "a Europe-in-seven-days tour through Ingarden's ontology" (p. 55 in this volume). The next three papers concern the topic of Ingarden's philosophy that happened to become the best known of his achievements: the philosophy of fiction and of cultural objects. Arkadiusz Chrudzimski sketches the general problematic of intentional objects and argues that they are by no means useless fictions. Amie L. Thomasson presents an Ingardenian ontology of social and cultural objects such as money, churches, and flags.

Finally, Jeff Mitscherling investigates the difficult topic of the "life" of a literary work of art.

The last two papers open a somewhat wider perspective on Ingarden's work. Edward Swiderski points out an interesting change of perspective that occurred in Ingarden's late work, which was devoted to the problem of responsibility. He argues that there is a tension between the hypothetical scientific and phenomenological sides of his philosophy. Andrzej Póltawski tries to answer the question of what Ingarden's ontology would look like if he developed it according to his deeply personalist picture of the world." (pp. 7-8)

Chrudzimski, Arkadiusz, 83-114. Frankfurt am Mein: Ontos
Verlag.

Abstract: "Philosophers who, like Franz Brentano and Roman
Ingarden, introduce intentional objects are often criticised. An
efficient theory of intentionality, it is claimed, can be developed
within the framework of a theory assuming a much more
parsimonious

ontology, like the theory of mental content proposed by the
early Husserl. In this paper it is shown that this critique is
unfair. The theory of mental content faces certain formidable
difficulties which don't affect the theory of intentional objects.
The most serious of them is that the relation between the
mental content and the external target object has to be
construed as a primitive (and cognitively accessible) relation,
while in the theory of intentional objects it can be easily defined
and in a sense explained away."

33. ———. 2008. "Truth, Concept Empiricism, and the Realism of
Polish Phenomenology." *Polish Journal of Philosophy* no. 2:23-
34.

Abstract: "The majority of Polish phenomenologists never
found Husserl's transcendental idealism attractive. In this
paper I investigate the source of this rather surprising realist
attitude. True enough the founder of Polish phenomenology
was Roman Ingarden – one of the most severe critics of
Husserl's transcendental idealism, so it is initially tempting to
reduce the whole issue to this sociological fact. However, I
argue that there must be something more about Ingarden's
intellectual background that immunized him against Husserl's
transcendental argumentation, and that the same background
made his students so sympathetic to his "naive" realism. My
claim is that this "something" is Ingarden's realist concept of

truth that he learned (at least partially) from Tarski as opposed to Husserl's epistemic construal that he took from Brentano."

34. ———. 2010. "Composed Objects, Internal Relations, and Purely Intentional Negativity. Ingarden's Theory of States of Affairs." *Polish Journal of Philosophy* no. 4:63-80.

Abstract: "Ingarden's official ontology of states of affairs is by no means reductionist.

According to him there are states of affairs, but they are ontologically dependent on other entities. There are certain classical arguments for the introduction of states of affairs as extra entities over and above the nominal objects, that can be labelled "the problem of composition," "the problem of relation" and "the problem of negation." To the first two Ingarden proposes rather traditional solutions, while his treatment of negation proves to be original and interesting. Ingarden doesn't deny the existence of negative states of affairs altogether, but he (i) accepts only a restricted group of them and (ii) ascribes to them an extremely weak mode of being. Negative states of affairs are construed as supervenient entities, and their supervenience-basis involves two factors: on the one hand the appropriate positive states of affairs, and on the other hand certain mental acts of conscious subjects. They enjoy thus a curious "half-subjective" mode of being."

35. ———. 2012. "Negative States of Affairs: Reinach versus Ingarden." *Symposium. The Canadian Journal of Continental Philosophy* no. 15:106-127.

Abstract: "In Reinach's works one finds a very rich ontology of states of affairs.

Some of them are positive, some negative. Some of them obtain, some do not. But even the negative and non-obtaining states of affairs are absolutely independent of any mental activity. Despite this claim of the "ontological equality" of positive and negative states of affairs, there are, according to Reinach, massive epistemological differences in our cognitive access to them. Positive states of affairs can be directly "extracted" from our experience, while to acquire a negative

belief we must pass through a quite complicated process, starting with certain positive beliefs. A possible and reasonable explanation of this discrepancy would be a theory to the effect that these epistemological differences have their basis in the ontology of the entities in question. Our knowledge of the negative states of affairs is essentially dependent on our knowledge of the positive ones precisely because the negative states of affairs are ontologically dependent on the positive ones. Such a theory has, in fact, been formulated by Roman Ingarden. According to him, negative states of affairs supervene on some positive ones and on certain mental acts of the conscious subjects."

38. ———. 2015. "Intentional Objects and Mental Contents." *Brentano Studien* no. 13:81-119.

Abstract: "In this paper I present a sketch of a theory of intentionality introducing special entities called "intentional objects." Elaborated theories of this kind can be found in the works of Franz Brentano and Roman Ingarden. Nowadays those philosophers who are sympathetic to intentional objects are accused of planting an ontological jungle. All the problems of the theory of intentionality, it is claimed, can be resolved within the framework of a theory assuming a much more parsimonious ontology, like the theory of mental content proposed by the early Husserl or the so-called "adverbial" theory of intentionality. However, I show that the competitors of the theory of intentional objects face serious difficulties, the most important being that within their framework the relation between the representing entity (mental content or "adverbially specified" mental property of the subject) and the external target object has to be construed as primitive, while in the theory of intentional objects it can be easily defined. The consequence is that the partisans of mental contents and

adverbialists are forced to require a distinguished kind of epistemic access not only to the representing entity but also to this "representing relation." This consequence, which is very seldom made explicit, seems indeed to be fatal. Intentional objects appear in this light not as products of an ontological extravagance but instead as entities that are indispensable, if we are to be able to explain the phenomenon of intentionality at all. Moreover, it turns out that we gain nothing if we introduce mental contents in addition to intentional objects. The approach to intentionality that I finally advocate postulates an external relation between a conscious subject and an intentional object, and is thus at bottom Brentanian."

Abstract: "I deal with the relation between phenomenology and realism while examining Ingarden's critique towards Husserl. I exhibit the empiricist nucleus of Husserl's phenomenology, according to which the real is what can be sensuously experienced. On this basis, I argue that Husserl's phenomenology is not idealistic, in opposition to the realistic phenomenology, according to which reality consists in entities which cannot be sensuously experienced and are thus ideal. Finally, I attempt to show that the idealistic elements of Husserl's thinking do not originate from the transcendental turn, but from a remainder of psychologism that contradicts his empiricism."

49. Donise, Anna. 2014. "Roman Ingarden e il problema dei valori." *Archivio di Storia della Cultura* no. 27:545-556.

Abstract: "This essay reconstructs the cultural and historical context in which the Polish philosopher Roman Ingarden (1893-1970) articulated his reflection on values. Starting from the survey conducted in 'The Literary Work of Art' (his best-known work, dated 1931), in which the value is defined as "metaphysical quality," the author shows in what sense the value does not have, according to Ingarden, a self-sustaining "mode of being," but on the contrary, is always in need of an object to inhere to. The interpretative hypothesis is that Ingarden's reflection on the concept of "value" is strongly affected by its being originated in the field of aesthetics. The model referred to by the Polish philosopher for his general theory of value is, in fact, that of the relationship between the "object" and its being an "art object." This approach gives several elements of originality to the reflection on values, which has traditionally taken as its paradigm the ethical practical sphere."

52. Falk, Eugen H. 1981. *The Poetics of Roman Ingarden*. Chapel Hill: University of North Carolina Press.

"This book is meant to introduce the serious student of *literature as art* to a subject he can no longer afford to ignore. Several classes of graduate students at Chapel Hill have furnished the incentive to prepare this work, and their inquisitive and critical minds have helped to fashion its composition over many years. Almost at the outset of this undertaking it became obvious that we could not achieve a sufficient understanding of Ingarden's poetics if we limited our study to the two works that have been published in English in the meantime. The notes to the following chapters specify some of Ingarden's sources and especially parts of his other writings which had to be consulted. In a few instances I felt obliged to develop some points that were left merely implied in Ingarden's texts, and to smooth out a few wrinkles that resulted from modifications in his evolving conceptions.

I must emphasize that my sole purpose here has been to give an exposition of Ingarden's works on literature. When the student has clearly grasped Ingarden's own position, he may wish to assess its merits in relation to different conceptions.

My first chapter contains formulations of basic problems and assumptions, and simplified definitions of terms. It is meant to provide information similar to highway markers indicating principal routes and to the colored lines that explain road classifications. It also contains a geometric theorem which will frequently be used to illustrate some of Ingarden's typical analyses and syntheses and his conception of structure. The

first chapter also hints at the reasons why Ingarden asks certain questions and why he seeks answers that will reveal the essential nature of a literary work of art—of any literary work of art—and what obligations this essential nature imposes on the reader. All the other chapters trace the map (or blueprint) of the “anatomical” structure of the literary work of art, of the functional relations of its elements, of its layers, and of its order of sequence. They also describe the attitude and the procedures a reader of a literary work of art should adopt when he has become acquainted with that map. Literary scholars and critics will find their own functions mapped out.” (from the *Preface*, pp. XI-XII)

"Ingarden's philosophical output does not form a closed system in the sense of a set of statements derived from apriori accepted general assumptions. Following the basic methodological principle of Husserl's phenomenology, Ingarden obtained results in all areas of his philosophy by referring directly to the "things given in experiences" corresponding to the type of object being investigated (in direct intuitive cognition). In spite

of the great breadth of topics studied his results constitute a lucidly organized whole, as I shall presently try to demonstrate.

Ingarden's writings (over two hundred items including twenty-seven large books) belong primarily to three areas of philosophy: epistemology, ontology, and aesthetics (including the theory of the work of art). This does not, however, comprise all of his work, as I shall show later.

The first decade of Ingarden's philosophic work already included basic results which set the direction and paths of development of his thought.

I shall discuss the main core of Ingarden's philosophy in several sections, indicating the thought processes leading from one to another. Epistemology, being the least known chapter of his thought, and ontology, which dominates Ingarden's philosophy, will be discussed more extensively." (p. 2).

"I. Meaning — Removing the Shroud from a Mysterious
"Mental Residue"

Roman Ingarden's work has been generally recognized in the area of ontology, but the same cannot be said about his great contribution to the field of semantics. In appreciation of those endeavors, I have referred to him occasionally as the latter-day "Copernicus of Semantics", an accolade I hope to justify by the end of this study.(1) The majority of contemporary critics, among them his former Marxist countrymen as well as the various proponents of analytic philosophy this side of the Atlantic, have largely considered Ingarden's ideas on phenomenological semantics too abstruse, his nomenclature too esoteric, much as they themselves have failed to make any progress in this rather complex field.(2) I shall first reveal some of these crucial problem areas and subsequently explain how they can be solved with the aid of Ingarden's thesis. Certainly, with Western civilization about to enter its third millennium, the time seems ripe!(3) In the limited space afforded me here, I shall have to put the problematic issues before their eras. Nor is a strictly chronological order called for precisely because there has been no genuine step-by-step advancement in ideas." (pp. 21-22)

(1) Liselotte Gumpel, *Metaphor Reexamined: A Non-Aristotelian Perspective* (Bloomington; Indiana UP, 1984), p. 8. ff. The work will be identified as "Gumpel, 1984."

See also Liselotte Gumpel: "Metaphor as Nominalized Meaning: A Phenomenological Analysis of the Lyrical Genre," diss., Stanford University, 1971; an article of this study (same title) appeared in the *Jahrbuch für Internationale Germanistik*, 2 (1975), 48-56; "Die Metapher als fragwürdiges Prinzip sprachlicher Verfremdung," in *Akten des VIII. Internationalen Germanisten-Kongresses*, Tokyo 1990, vol. 5 (1991).

(2) Some of these reservations and objections are cited in Robert Fieguth, ed., *Roman Ingarden, Gegenstand und Aufgaben der Literaturwissenschaft: Aufsätze und Diskussionsbeiträge* (1937-1964) (Tübingen: Max Niemeyer Verlag, 1976), pp. xi, xxvi, 30, 153, and 139, where Ingarden contends with Marxists attacking his "Häresien." This work will be identified as "Fieguth, 1976."

(3) Indeed, my work on metaphor (Gumpel, 1984) based on a new premise of "non-Aristotelian semantics," has been dedicated to that new millennium.

"Introduction

"The main subject of the investigations presented here is the basic structure and the mode of existence of the literary work, and in particular of the literary work of art." [cited in German by Haeflinger]

This is the first sentence in the preface of Ingarden's *Das literarische Kunstwerk* (1931), with which he began his

extensive work towards a phenomenological aesthetics.(1) But already in this preface Ingarden stated clearly that his interest in an ontology of the work of art is founded on quite different motives.(2) In fact, on an more general philosophical level, Ingarden (1931) was intended as a “Vorstudie” for an extensive critical examination of Husserl’s transcendental idealism.(3)

Now, one important thesis of Ingarden (1931) is that a literal work exists in a “purely intentional” way. This thesis was later refined in Ingarden (1964), where a theory of the different ways of being is elaborated. Even today, however, his theory has not yet received widespread attention. This is so despite the originality and conceptual transparency of the programme he developed for his theory. And more importantly, his position contains novel viewpoints for an answer to the question of the equivocality of ‘to be’ — a question that has long been one of the fundamental questions of ontology.

The aim of this paper is to elucidate Ingarden’s answer to this “old” question. To this end we must first acquaint ourselves with the fundamentals of his theory of the different ways or modes of existence. Then we shall consider the unique position that Ingarden’s thesis of the equivocality of ‘to be’ occupies in the history of philosophy. Finally some suggestions towards a systematic evaluation of Ingarden’s position will be made." (pp. 59-60)

(1) Later Ingarden published in German *Untersuchungen zur Ontologie der Kunst* (1962), *Vom Erkennen des literarischen Kunstwerks* (1968) and *Erlebnis, Kunstwerk und Wert* (1969). By this publications Ingarden tried to show to a german public “die Umriss einer phänomenologisch behandelten Ästhetik, wie ich sie verstehe” [the outlines of a phenomenologically treated aesthetic, as I understand it] (Ingarden 1931, XIX).

(2) See Ingarden (1931), XII.

(3) Incidentally, Husserl himself was quite aware of this; see, for example, Husserl, 61 ff. (letter XLVI) — Concerning Ingarden’s critical studies on Husserl’s idealism see — from a

genetical point of view — Haefliger (1991b); and — from a systematical point of view — Haefliger (1991a).

"This book is a monograph study of Ingarden's investigations into existence. Its aim is to give a clear and formally precise account, as well as a critical evaluation, of his contributions. In the first chapter the basic principles of Ingarden's ontology are reformulated and, contrary to Ingarden, a nominalistic point of view is adopted. Chapters 2 to 4 give a reconstruction of the arguments for the following Ingardenian theses: (1) Existence is not a property; (2) The concept of existence is a principle *sui generis* of classification; (3) "exist(s)" is an equivocal word. On the basis of this critical doxography Chapters 5 and 6 provide a systematic examination of the Ingardenian position, by confronting it with the results of analytic philosophy (such as early Husserl, Frege, Russell, Moore, Meinong, Bergmann, Hochberg, Castaneda)."

"In his *Contemporary European Philosophy* Bochenski declared Ingarden's work, *The Controversy over the Existence of the World* to be one of the most important philosophical publications of our time. The work had then been published only in Polish, a fact which occasioned Bochenski to deplore the widespread habit of publishing professional philosophy in languages other than the main European ones.

Now *Spór o istnienie swiata* has become *Der Streit um die Existenz der Welt*, and the decisive language barrier has been broken. Other obstacles may remain: the 1100 pages do offer, even in non-Polish, a certain resistance. Not that the author has not done his share of the work, for he expresses himself with exemplary precision and by no means leaves the reader with the task of reducing confusion to clarity. But his perseverance in analysis and the wealth of rigorously differentiated concepts give us a complicated whole to survey. It is the limited purpose of the present paper to give a short outline of this comprehensive system, and some hints of its place in a larger context." (p. 401)

"The paper ends with an argument that says: necessarily, if there are finitely spatially extended particulars, then there are monadic universals. Before that, in order to characterize the distinction between particulars and universals, Roman Ingarden's notions of "existential moments" and "modes (ways) of being" are presented; and a new pair of such existential moments is introduced: Multiplicity-Monadicity. Also, it is argued that there are not only real universals, but instances of universals (tropes) and fictional universals, too."

98. ———. 2010. "Fictions and the Spatiotemporal World -- in the Light of Ingarden." *Polish Journal of Philosophy* no. 4:81-103.

Abstract: "The paper is an attempt to take Ingarden's unfinished critique of idealism one step further. It puts forward a schematic solution to the external-world realist's problem of how to explain the fact that we can identify and re-identify fictions, entities that in one sense do not exist. The solution contains three proposals :to accept, with Husserl and Ingarden, that there are universals with intentionality (Husserl's "intentional essences"), to accept, contra Husserl and Ingarden, an immanent realism for universals, and to accept Ingarden's view that there is a mode of being distinct from those put forward in traditional metaphysics, that of purely intentional being. Together, these views imply that all the instances of a specific intentional universal are directed towards the same intentional object; be this object a really existing object or a fiction, a purely intentional being."

99. ———. 2013. "The Basic Distinctions in Der Streit." *Semiotica* no. 194:137-157.

Abstract: "The paper presents Ingarden's views on what he calls "modes of being" ("ways of existence") and "existential moments"; the latter being constitutive parts of the former. Mainstream analytic philosophy has been dominated by the view that "existence" can mean only existence simpliciter. Ingarden, on the other hand, discerns four possible modes of being, one of which is of special interest to semiotics: purely intentional being. It is of relevance for the ontological understanding not only of texts, but also of pictures and other sign-related entities. At the end, an extrapolated Ingardenian semiotic triangle is presented."

115. ———. 2010. "An Evaluation of Ingardenian Values." *Polish Journal of Philosophy* no. 4:105-121.

Abstract: "From recent work on Ingarden it is apparent that values are central to his philosophy, even in the context of his realist ontology. In this evaluation of Ingarden's work we consider his principal philosophical notions (i.e. his realist ontology, his aesthetics, his reflections on language, and his consideration of values) in the light of what Nietzsche referred to in his own philosophy as the "re-evaluation" or the "inversion" of all values. It is argued that two of Ingarden's most fundamental values are the notion of communication and the aesthetic dimension of thought."

Translated from the Polish by the author with the assistance of E. M. Swiderski.

"Ingarden's views concerning man are scattered throughout his writings. But the bulk of them is contained in the chapter entitled "The problem of the form of pure consciousness" in the second volume of *Controversy over the Existence of the World* (1) and in the posthumous *A Booklet on Man*, (2) which is a collection of previously published articles, lectures, etc. The most advanced considerations on this subject are contained in the essay *On Responsibility. Its Ontic Foundations*. (3) What is new in this essay and what proves to be theoretically fruitful is the application, not only to man as a whole, but to his body and to the psychic side of his being as well, of the conception of relatively isolated systems. This notion had been previously

employed by Ingarden to explain various types of connections within the world as a whole. (4)"

Abstract: "Roman Ingarden, one of Husserl's most gifted students, devoted several thousand pages to the development of an ontological, epistemological, aesthetical and even anthropological framework that would allow him to firmly reject the so-called "idealistic turn" of his master Husserl. This paper aims at reconstructing an often overlooked side of his philosophy: his theory of consciousness and his analysis of the constitutive process involved in sense perception. After emphasizing the distinctive character of Ingarden's ontological frame and its impact on understanding concepts as fundamental as consciousness or intentionality, this paper tries to sketch Ingarden's answers to several genetic questions raised by Husserl: the relation between time and consciousness, the nature of the ultimate sense data and the question of motivation."

Abstract: "With great sympathy for Roman Ingarden and his work, Edith Stein edited his book project 'The Literary Work Of Art'. In the letters she exchanges with him she reflects on relationship between reality and ideality; she writes that those who do not see the world as a reality must be fools. The political events in the 1930s had an impact on phenomenology. While Edmund Husserl dissociates himself from his protégé Martin Heidegger with regard to the content of his philosophy, as well as with regard to his ideology, Edith Stein distances herself more and more from the phenomenological method, seeing it as removed from reality, and she eventually become a Carmelite nun. Roman Ingarden, on the other hand, reconsiders interpreting phenomenology as aesthetic theory. Literature and film are being reanalysed in terms of phenomenological mediality and as factors of human communication."

Chapter 11: *Ingarden and Aesthetic Structures*, pp. 274-304.

"In this final chapter I look at still another aspect of the problematic notion of the aesthetic and draw on still another figure in the realist backgrounds of modern aesthetics, in the interest of exploring further reflections on aesthetic objects. In dealing with these complicated issues, as we have seen in the cases of Twardowski and Meinong, some unity has seemed especially requisite. Hence I have decided to treat the issues largely with the help of critical and argumentative contrasts. Although others who deal with these topics are also brought in when their views seem particularly relevant, I have tried to center this discussion mainly on the extremely rich and profound work of Roman Ingarden. This work for some years has strongly influenced that of more widely known theorists such as Mikel Dufrenne in France, Wolfgang Iser in Germany, René Wellek in the United States, and Stefen Morawski in Poland. And now the work deserves a careful rereading in the changing contexts of contemporary aesthetics.

It will be useful to begin with some generalities about Ingarden's work in order to situate the much narrower examination into questions about aesthetic structure that follows. I will turn to the exposition of that doctrine in section 2, reserving a long appendix for the key issue of aesthetic

objects, then use section 3 to contrast it with the important alternative views of Monroe Beardsley. Finally, I will attempt to defend Ingarden's position against these particular criticisms and alternatives while leaving the general question about the existence of aesthetic objects open for further reflection. Throughout, my aim will be to draw attention to many of the interesting perspectives Ingarden's work opens up on questions that too often continue to be viewed only in terms of either analytic or hermeneutic approaches." - "In the Preface to the second edition of *The Literary Work of Art*, Roman Ingarden calls attention to one of the unfortunate but unavoidable shortcomings of his book: "I am quite conscious of the fact that for literary critics this book would be much more accessible and plastic if I had devoted a series of concrete analyses to individual works of art. But I had to abandon this from the first, since the book would have become unmanageable." In this paper I present, as briefly as possible, two such concrete analyses. Throughout my analyses, I employ Ingarden's terminology. For the reader who is unfamiliar with this terminology, and perhaps with Ingarden's work in general, these analyses must prove difficult to follow, if not entirely incomprehensible. For this reader, I have added, as Part I of this paper, a preliminary exposition of *The Literary Work of Art*. The reader who is already acquainted with Ingarden's work may wish to skip this and turn immediately to Part II, in which I present my analyses. In Part III, I conclude with a few remarks on the material presented in both the previous parts." (p. 351)

"Roman Ingarden was Husserl's pupil, and remained in lifelong contact with him, continuously questioning Husserl's positions, especially his transcendental idealism. Whereas the members of the Munich and Göttingen schools simply abandoned the master as having deviated from the path of philosophy as a rigorous science, Ingarden continued his efforts to understand the motives and the arguments which led Husserl in that direction. In this relentless effort, he seems to have gone a long way toward understanding, and even agreeing with, Husserl's transcendental-constitutive phenomenology, but he would nevertheless draw a line that he did not want to cross—thereby preserving his own realistic intuitions from being overtaken by what he took to be an idealistic philosophy. While thus seeking to understand Husserl, Ingarden also undertook first his famous work *Das Literarische Kunstwerk*, and then the large, carefully argued work on the controversy regarding the existence of the world, *Die Streit um die Existenz der Welt*. One could say that Ingarden's central interest lay in the realism-idealism dispute, and it may also be safely said that no one in the history of philosophy has more carefully analyzed that issue than he. While *Das Literarische Kunstwerk* is deservedly more famous, Ingarden undertook it as much out of his interest in the subject matter of art as out of the desire to advance the discussion of the realism-idealism issue." 7. Plotka, Witold. 2019. "Twardowski, Ingarden, and Blaustein on Creative Imagination. A Study on Early Phenomenology." *Social Imaginaries* no. 5:121-141.

Abstract: "The article is a critical elaboration of two phenomenological theories of imagination formulated by Ingarden and Blaustein in their discussion with Twardowski. Ingarden, as well as Blaustein were students of both Twardowski and Husserl, however, they defined imagination in two different contexts: whereas for Ingarden a proper way of analysis of imagination is ontology, for Blaustein imagination is the object of descriptive psychology, connected mainly with an aesthetic experience. As a result, the question of creativity of imagination is described in two different, but intertwined ways. For Ingarden, creative imagination is understood as a noematic structure which generates the imagined object as a purely intentional object. Ingarden’s description expresses the ontological status of the imagined object as ontologically dependent on the act of imagining, and on the content of the imagined object. In his review of Ingarden’s *Das literarische Kunstwerk*, Blaustein was clear that one has to revise Ingarden’s theory of purely intentional object by adopting it to imaginative intentionality and aesthetic experience. To elaborate Ingarden’s theory of imagination, Blaustein discusses it also with reference to Twardowski. Blaustein claims that Twardowski’s Cartesian differentiation between perceptive, reproductive, and creative imagination is based on a vague criterion, and moreover it does not refer to two key notions of descriptive psychology, i.e., the notion of the representative content, and the intentional object. As a result of his critique, Blaustein limits the concept of creative imagination to ‘fantasy’, understood as secondary imagination."

8. Plotka, Witold. 2019. "From psychology to phenomenology (and back again): A controversy over the method in the school

of Twardowski." *Phenomenology and the Cognitive Sciences*:1-27.

Abstract: "This paper seeks to define the main trends, arguments and problems regarding the question of method formulated by Twardowski and his students. In this regard, the aim of the paper is twofold. First, I situate Brentano's project of descriptive psychology within the context of disputes in the school of Twardowski concerning the method of both psychology and phenomenology, arguing that descriptive-psychological analysis was dominant in this respect.

Second, the study explores the notion of eidetic phenomenology, as founded on a methodological procedure, which supposed to guarantee infallibility of its descriptions. To show this, I first reconstruct Brentano's concept of descriptive psychology, its object, its method and aims. Second, I track the changes and reinterpretations provided by Twardowski in his view of descriptive psychological analysis. Third, I explore Witwicki's and Bandrowski's—both early students of Twardowski—discussions of the descriptive approach. I try

to show that the former accepted psychologism, while the latter overcame it by means of logical analysis. Fourth, I suggest that the only student of Twardowski who renounced the Brentanian method was Ingarden, who developed eidetic phenomenology. Finally, I present Blaustein's—one of the last students of Twardowski—reappraisal of descriptive psychology and his critique of Ingarden's method. This controversy over the method of descriptive psychology reveals how one can situate Twardowski's legacy within early phenomenology in Poland."

"1. Introduction

Classical phenomenologists regarded visual perception as their basic field of investigation and tried to substantiate at least some of their main assertions by analyzing perception. Therefore painting, as a way to create the visual quasi-presence of absent things, seems to be placed in the very centre of the thematic field of phenomenological philosophy, a philosophy which likes to put such a stress on intuition, on seeing.

In consequence, one might wonder why the phenomenologists, while investigating perception and the human senses, did not take full advantage of the analyses of visual arts, and in particular of painting, in order to clarify the nature of consciousness. The reason seems to have been their acceptance of the Cartesian idea of consciousness. In this essay, I shall try to show, starting from a critical analysis of Roman Ingarden's conception of 'aspects' and of their function in our perception of paintings, that an analysis of our contacts with paintings may be of some use in understanding the conscious life of human beings." "1 Art and Philosophy

Of the many works of Ingarden in which axiological motifs appear, his aesthetic writings, especially his analyses of various kinds of art, deserve our notice first. Ingarden was very eager to apprehend and describe not only the characteristics common to all works of art but also the special features of the particular kinds of art, of works of literature, music, painting, architecture, etc.

These aesthetic writings were very closely related to Ingarden's other theoretical pursuits, his investigations into ontology, axiology, philosophical anthropology and theory of culture. We shall sketch these relations briefly at the end of this chapter.

We begin with the example of Ingarden's remarks concerning works of architecture. This will allow us to introduce the main ideas of Ingarden's "general theory of works of art", and then to pass on to the relations between Ingarden's aesthetics and his ontology, axiology, anthropology, etc." (p. 55)

Abstract: "Edmund Husserl devoted much attention to the analysis of internal time consciousness beginning as early as the turn of the twentieth-century. His various notes and lectures were left unorganized and unpublished until Husserl's capable assistants were given the responsibility of organizing his work for publication. This paper provides a social and philosophical account of the redaction of Husserl's materials on time consciousness as it involved the activity of his famous assistants Edith Stein, Roman Ingarden and Martin Heidegger. Special attention is given to the way that both Stein and Heidegger appropriated Husserl's work and at the same time challenged fundamental elements of the master's phenomenology."

35. Rosiak, Marek. 2007. "Existential Analysis in Roman Ingarden's Ontology." *Forum Philosophicum: International Journal of Philosophy* no. 12:119-130.

Abstract: "Ingarden conceives ontology as a philosophia prima, which deals with being as purely possible (it complies with the essentialistic tradition of Duns Scotus and Wolff). It is an intuitive (anschaulich) and a priori analysis of the content of the relevant ideas (rein apriorische Analyse der Ideengehalte). It consists of three parts: existential, formal and material ontology. Existential ontology deals with the possible modes of existence (Seinsweise). Problems of factual existence pertain to metaphysics, which is a separate branch of theoretical philosophy, based on ontology."

36. ———. 2009. "Formal and Existential Analysis of Subject and Properties." In *Essays in Logic and Ontology*, edited by Malinowski, Jacek and Pietsuzczack, Andrzej, 285-299. Amsterdam: Rodopi.

Abstract: "The paper is a contribution to the object ontology. The general approach assumed in the investigation is that of Roman Ingarden's *The Controversy Over the Existence of the World* where an object is the subject-of-properties. The analysis of the form and the mode of existence of properties leads to the rejection of both negative and general properties. Each property is an individual qualitative moment of a particular object. Its form reveals existential heteronomy: the quality of the property is not immanent but refers to the object. The subject of properties has not its own qualitative content: its form is just the internal causality establishing the unity of an object. An object is not causally isolated from other objects, but external causation differs from internal either by being ramified

- in case of the composition and destruction of an object or reciprocal in case of interaction between coexisting objects."

44. Ruttkowski, Wolfgang. 2007. *Essays on Aesthetics, Poetics and Terminology of Literary Studies*. München: Grin Verlag.

Essay I: *Stratum, structure, and genre* (1973) pp. 4-30.

"The concept of *genre* can be satisfactorily explained only in comparison with the concepts of *stratum* and *structure*."

Proceeding from this conviction we shall try here to establish a demarcation of these often used terms and at the same time prove their interdependence." (p. 4)

Essay III: *The main differences between Roman Ingarden's and Nicolai Hartmann's Strata systems* (1990) pp. 31-48.

"Although both designed strata-models for various kinds of art and especially for literature, the philosophers Nicolai Hartmann and Roman Ingarden never entered into any kind of dialogue. Also in secondary literature there is no exact comparison of their systems to be found.

For that reason, the two strata systems are compared here for the first time and their respective advantages and deficiencies are being pointed out.

Amongst other things, the following topics are being discussed:

1. In what way Hartmann's "Real Foreground" ("Realer Vordergrund") is more specifically subdivided in Ingarden's system. - 2. How, on the other hand, Ingarden's "Stratum of Depicted Objects" ("Schicht der dargestellten Gegenständlichkeiten") was more thoroughly subdivided by Hartmann. 3. Why there cannot be found in Hartmann's system a corresponding stratum for Ingarden's "Stratum of Schematized Aspects" ("Schicht der schematischen Ansichten") - and 4. Why Hartmann's two strata of the Treat Background ("Irrealer Hintergrund") are consolidated by Ingarden and expressly not seen as a stratum." (p. 31)

Abstract: "Ziel des vorliegenden Aufsatzes ist es, die Existenz von eventuellen Berührungspunkten zwischen Wittgenstein und Ingarden nachzuweisen. Nach einer kurzen Einführung wird anfangs der Hintergrund der Analyse des Problems formuliert. Darauf hin werden die Positionen Wittgensteins Ontologie mit wenigen Begriffen und Ingardens dreistufige Ontologie jeweils skizzenhaft dargestellt und kritisch auf das Vorhandensein von gemeinsamen Grundlinien geprüft. Als Gesichtspunkte gelten dabei folgende Begriffe: Ontologie, Welt und Mensch, Sprache und Ästhetik. Abschließend werden die charakteristischen Merkmale von Berührungspunkten genannt."

"We recall that according to Ingarden each literary work of art manifests four strata: the stratum of word sounds and sound-

complexes; the stratum of meaning-units or of word-meanings and higher-order meaning complexes (the meanings of sentences, etc.); the stratum of represented objectivities (made up of the characters, actions, moods, scenes, etc. which are represented, for example, in a novel); and the stratum of schematized aspects (made up of the sequences of adumbrations in which the represented objectivities are given to the reader).(2(

Our topic here is Ingarden's account of sentence-meanings, and more precisely his theory of quasi-judgments."

(...)

"5. Concluding remarks

Ingarden's discovery that there are quasi-judgments, quasi-questions, quasi-wishes, etc., is a very important one for the understanding of literature, and his reflections on apparent judgments, too, represent a philosophical discovery of note. But his views on these matters can nonetheless be criticized, and part of this criticism touches upon the theory of stratification itself; for it appears that an adequate theory of the structure of the literary work must be more complex and subtle than the theory which Ingarden defends. Before concluding, however, it will be worth our while to consider how Ingarden might respond to the charges levied against him in the above, for this will reveal that there are in fact two distinct approaches to literature, only one of which has been properly acknowledged by Ingarden himself." "Ingarden's most substantial contribution to philosophy was his ontology. Ontology, the science of being as being, was conceived in Plato's wrestling with the Eleatics' *to on*. Its birth to Aristotle was not without complications for it seemed a single science should have a single genus as object, yet Aristotle denied that *to on* formed a genus. Given the role Aristotle gives to genera in definition, this is not surprising, but the outcome is that 'to be' is not said according to one genus, and hence has several meanings. Can there then be a science of being as being? Aristotle's solution lay in the idea that all these meanings revolved around the central one of to be said of substances. However, not all philosophers shared Aristotle's denial of a single all-embracing class of objects. Plotinus regarded 'ti', 'something', as denoting a highest genus. Bolzano, Brentano, Meinong and Husserl all used univocal term: like 'etwas' and 'Gegenstand' to mark such a class, while Quine has insisted that 'there are' is univocally rendered by the existential quantifier. Ingarden on the other hand follows Aristotle.

The question of the univocity or multivocity of be is still one of the first questions of ontology. In this paper I use historical comparisons to point to where a solution to the problem may lie. Ingarden's account of the different ways or modes of being (*Seinsweisen, modi essendi*) is a most important philosophical contribution to the problem. By chance 1985 marks not only the fifteenth anniversary of Ingarden's death but also the official 700th anniversary of the birth of the greatest of the late scholastics, William of Ockham, who is also celebrated here. My

motive is however primarily systematic: I think be is indeed analogically ambiguous, though for different reasons than Aristotle or Ingarden. (1) But to be precise about what this mean involves comparisons in which one looks for help and enlightenment to the great minds of the past." (pp. 377-378)

"Abstract

This paper examines the concept of stratum as employed by Ingarden in his ontological investigations of works of art. Attention is focussed on literary works, which are said to have four strata, two belonging to language itself. I find Ingarden's stratified account of language correct in principle but defective in execution. In the ontology of literary works, the stratum of schematized aspects is particularly problematic, and I interpret these as complex meanings, correlated with another element of the work not given sufficient recognition by Ingarden: the Reader. I suggest the terminology of strata for artworks in general is dispensable." (p. 119)

English translation by Elias J. Schwartz and Valentine Urbanek.

"Genology—the theory of literary genres—did not lie at the center of Roman Ingarden's scholarly interests, nor did its object have for him a primary character; it can be said that genology was derivative in the most general sense, in his theoretical-literary considerations, and that these considerations in turn resulted from his philosophical inquiries—for philosophy was the principle domain of Roman Ingarden's scientific work. Thus his views on literary genres crystallized only on the third descending rung of successively emerging levels of investigation.

The consequences of this dual derivativeness of genological problems in Ingarden's research are of two types: those relating to his own scientific achievements, and those relating to the reception of his genological pronouncements in the scientific community. In regard to his own scientific achievements, this derivativeness expressed itself in the fact that genology did not appear as a complete unit,— though it would have been easy to derive such a unit by following the path of Ingarden's particular statements, his theses, and his manner of reasoning; above all, this refers to his later scientific work, that begun after the Second World War, because during the war such a unit was programmed only—and that merely in a then projected work entitled: *Poetyka, Teoria literatury artystycznej* ("Poetics, The Theory of Artistic Literature"). In regard to the reception of Ingarden's views in the world of science, the dual derivativeness of genological problems had as its consequence

that his contribution to genology attracted only relatively slight attention from other theoreticians of literature, in spite of the fact that its originality, at times, provoked discussions. Thus there arose, as a result, a general inability to appreciate this contribution." (pp. 391-392, note omitted)

"The present paper may be conceived both as a working introduction to certain aspects of the ontological theory put forward by the Polish phenomenologist Roman Ingarden in his mammoth treatise *Der Streit um die Existenz der Welt*, (1) and also as a development of Ingarden's views in the light of current tendencies in analytic philosophical logic. The central theme of the paper – though one which does not become apparent until very near the end – is the ontological analysis of states of affairs, and in particular of negative states of affairs, a topic which is of some specific interest in forming a connecting link between the Brentano-Meinong-Husserl tradition to which Ingarden belonged, and the (Frege)-Russell-Wittgenstein tradition which gave rise to modern philosophical logic." (p. 39)

Abstract: "Here I should like to explore a conception of ontological structure that has but few precedents. The idea is that certain structures are basic in the formation of the world, deep structures that define basic modes of being for things in the world, modes that make a thing the thing it is. We might

think of this deep structure of a thing as an algorithmic formation of the thing itself. I'll develop a variation on Whitehead's model of "concrecence," or "becoming" a concrete entity, drawing on Husserl's conceptions of dependence, dependent parts, and manifolds, and Ingarden's conception of modes of being. In the end I'll apply this model of concrecence to Husserl's analysis of the deep structure of consciousness, including time consciousness and body consciousness. Into this model I'll draw Hintikka's conception of intentional modalities, including perceptual possibility, to bring out a structure of modes-of-being for a conscious visual experience."

"The aim of this article is an attempt at justification of the thesis that the concept — and the connected with it theory — of participation, *methexis*, is one of the “keys” necessary to render the mystery of art. It is known how many conceptions have grown around this concept in the history of philosophy. It is also known how important they are for Platonic and Neo-Platonic thought and what role the theory of participation plays in Thomas Aquinas’ metaphysics. The concept of participation, which was almost forgotten in modern philosophy, has revived in our times, not only in contemporary Thomism, but also in the works of such thinkers as L. Lavelle, G. Marcel, M. Buber, Simone Weil. There it appeared not only in metaphysics, but also in the philosophy of man and society. We should also remember that one chapter of Cardinal Karol Wojtyła’s work *The Acting Person* is entitled “An Outline of the Theory of Participation”." (pp. 167-168)

(...)

"According to Roman Ingarden’s theory, each work of art is existentially dependent on the real object in which it is fixed (recorded). In different kinds of art it is done in different ways: it is even suggested that the way of this recording should become a criterion for classification of fine arts. Ingarden calls the relation of an intentional object and, therefore, of each work of art, to its material basis with the name “founding”. Thus, an image is founded in a painting, an architectonic work — in spatial arrangement of material blocks, a musical or literary work — in the conventional records (e.g., manuscript, print), magnetic tape, etc.

Accepting Ingarden’s theory we can, however, pose a question what the essence of this “founding” of a work of art in its existential foundation consists in: in particular — what this work of art actually owes to this existential foundation, and whether the existential foundation exerts any influence on the work of art, and if so, then what this influence consists in...

The hypothesis which I wish to set up in connection with these questions makes use of the concept of participation. " (p. 170)

87. Strózewski, Władysław. 2008. "On Modes of Existence (a Review of Selected Positions)." *Dialogue and Universalism* no. 18:83-104.

Abstract: "Problems connected with the questions of: being-nonbeing, existence, modes of existence and alike, belong to the basic and most important in metaphysics. The article discusses some answers to the aforementioned issues, as proposed by the ancient philosophers, St Thomas Aquinas, R. Ingarden and A.N. Whitehead. In the Appendix some remarks are made on Aristotle's and S. Thomas' theory of act and potency."

88. ———. 2008. "Roman Ingarden's Philosophy of Time." *Dialogue and Universalism* no. 18:97-116.

Abstract: "In his classic essay *Man and Time*, Roman Ingarden outlines two contradictory experiences of time. The paper presents and investigates them."

89. ———. 2010. "Roman Ingarden: Life and Philosophy." *Polish Journal of Philosophy* no. 4:11-34.

Abstract: "My paper is devoted to the most important and fundamental issues of Roman Ingarden's philosophy, including the contention between idealism and realism, the controversy between objectivism and subjectivism in the area of axiology, the problem of validity of cognition, and the structure and role of language. I argue for the claim that Ingarden solved several specific philosophical problems (like, for instance, the issue of causality, theory of systems, etc.) and he also frequently shed new light on various issues that had been discussed throughout the history of philosophy, showing how important and up to date they were. Moreover, it is worthy to say that his philosophy is marked by the precise and subtle character of the analyses and the range of the examined problems. It is the whole in which every specific problem finds a proper place for itself."

91. Swiderski, Edward M. 1975. "Some Salient Features of Ingarden's Ontology." *Journal of the British Society for Phenomenology* no. 2:81-90.

"Ingarden conceived and developed his ontology on the basis of the assumed existence of certain ideal entities, namely pure ideal qualities and Ideas. An examination of these entities provides, according to him, a knowledge of the corresponding individual essences of individual objects. Although his starting point in this matter reproduces Husserl's original conceptions, what he found in Husserl's writings on the subject proved finally to be neither sufficient nor clear. For example, with respect to the problem of the existence and nature of Ideas, Ingarden wrote in the second volume of the *Controversy over the Existence of the World*: "Actually, what he gave us, his students, in this matter was solely the conviction that a rejection of the existence of Ideas-in some special manner-must lead to contradictions". (1) At the same time, the associated problem of the essences of individual objects was felt, not only by Ingarden, but Hering and Spiegelberg as well, (2) to have been inadequately dealt with by Husserl in Ideas I, and it became, consequently, a subject of their own extensive investigations. But what was certainly of value in Husserl, as far as the foundations of ontology were concerned, was his discussion in the Logical Investigations of the a priori, i.e., of the ideal necessities governing the formal and material aspects of objects. (3) It is rather this side of Husserl's work which prompted Ingarden to inquire further into the nature of ideal entities, for they, according to him, are the foundations of the ideal necessities regulating the determinations and the structures of objects.

Accordingly, there are several related subjects to be considered. First, it should be seen how Ingarden conceives objects and their structures in general. This discussion will help clarify the problem whether Ingarden's theory of objects owes its content to the theory of ideal entities, or whether the reverse is true, that the theory of Ideas, etc., is fashioned after the requirements of the theory of objects. The possibility that they might be independent theories is excluded because Ideas, etc.,

are supposed to furnish a certain kind of knowledge about all sorts of entities whose structures, on the other hand, are already described, in a preliminary general way, by the theory of objects. Second, it should be clarified whether, and if so in what sense, the structures of objects themselves reflect or indeed embody necessary connections of an ideal character. This calls for an analysis of the notions of "concretion" and "moment" and of their relation to ideal entities. Finally, after these discussions, it will be possible to deal with the central task of ontology according to Ingarden, namely with the analysis of Ideas as the proper field of investigations in ontology."

92. ———. 1987. "Ingarden's Puzzling Ontology - Metaphysics Distinction." *Reports on Philosophy (Jagiellonian University)* no. 11:67-85.

"In this paper I will examine the distinction as well as the connection Ingarden drew between ontology and metaphysics. I want to show that the distinction is problematic and that therefore the connection remains nebulous. The reason Ingarden gives for the distinction is that a philosopher needs to be clear about what in general, for example, a world is and what sorts of things can in general "furnish" the world before he can claim that the factual world, as apprehended in ordinary and scientific experience, is "really" thus and so. Now Ingarden had comparatively little to say about the connection of ontology to

metaphysics. However, speaking in his name it seems plausible to envisage a negative and a positive connection. On the negative side, as it cannot be merely assumed that ontology has some special purchase on the factual world, it may be that no, so to speak, "metaphysical commitment" to what is "really real" would be justifiable on ontological grounds. On the positive side, if metaphysical statements are grounded in the same evidence that sustains ontological statements, and the latter do have purchase on the facts, then it follows that ontology has a *prima facie* metaphysical import to start with." (p.67)

93. ———. 1994. "Individual Essence in Ingarden's Ontology." In *Kunst und Ontologie. Für Roman Ingarden zum 100. Geburtstag*, edited by Galewicz, Włodzimierz, Ströker, Elisabeth and Strózewski, Władysław, 183-206. Amsterdam: Rodopi.

"Essence as a framework category

Roman Ingarden elaborated his stock of ontological categories with an unerring sense of purpose and direction. Each acquisition complemented the categories already in place and reinforced the bulwark of the world structure Ingarden envisaged. *The Controversy over the Existence of the World* is testimony to the years of unstinting toil given to the analysis of categories apt to capture the ramifications of the idealism-realism issue.

Among these categories several can be designated 'framework categories' because of their pivotal role in Ingarden's overall conception of-the world." (p. 183)

(...)

"It remains, however, that essence is a category to which Ingarden returned repeatedly, at moments coinciding more or less with the treatment of problems that became crucial at given stages of his investigations. At least three such stages are evident. Early in his career, when Ingarden was seeking to champion the benefits for philosophy of phenomenology, he took pains to clarify the concept of essence in the state in which he found it in texts by Husserl and Jean Hering.(3) Later, in the second volume of the *Controversy*, Ingarden devoted a chapter to the category of the individual essence of an object; the

ramifications as well as the preconditions of that analysis were of capital importance in assessing the adequacy or limitations of the categorial framework in which the idealism-realism controversy was couched.(4) Finally, Ingarden broached the issue once again in a posthumously published, unfinished study on the foundations of the theory of knowledge, which remained one of the 'danglers' in his doctrine.(5)" p. 184)

(...)

"In considering these accounts from different periods of Ingarden's career, one question that comes to mind is whether there was any significant change over the course of time in Ingarden's conception of essence; another question is whether the reiterated concern for essence testifies a deeper concern, 'unease even, with the overall picture of the world Ingarden had constructed by the time he completed the first two volumes of *Controversy*. The answer is clear on the first point, hypothetical on the second: Ingarden did not substantially revise his account of essence, however I believe that he came to question his initial views about its trans-regional significance and consequently its status as a framework category (although the same does not appear to be true concerning the status of the individual object, the concrete particular). The main consideration for the latter contention springs from Ingarden's shift of emphasis in the last period of his life: the move away from the idealism-realism problematic, in particular the conception of transcendental consciousness, to what can be described as an anthropological orientation based on the standing of the 'person' in the world.(6)"

102. Szczepanska, Anita. 1975. "Perspectives of the Axiological Investigations of the Work of Roman Ingarden." *Journal of the British Society for Phenomenology* no. 6:116-125.

Translated from the Polish by the author with the assistance of G. Kung and E. Swiderski. The Polish version of this paper appeared in *Studia Estetyczne*, Warsaw, vol. 10 (1973), 239-254.

"It is not my concern here to repeat Ingarden's well-known theses on the aesthetic quality-structure of a work of art. I want, instead, to do the following: (1) to examine the relationship between Ingarden's axiological investigations and his earlier inquiry into the general "anatomy" of works of art - literature, painting, music, etc., (2) to attempt a more detailed characterization of the system of aesthetically significant qualities and, in particular, to state what the system is not, (3) to show the wide field of investigations opened up by the concept of the system of qualities, (4) to show possible directions and make certain suggestions concerning further study of the system of qualities, together with an account of previous attempts and of the difficulties thus brought to light."

the Concept of Encounter." *ESPES*:47-56.

Abstract: "Entering the discussion about European Aesthetic traditions, their aspirations and achievements, their metamorphosis and developments, author argues in favor of acknowledging the importance of what in her opinion should be seen as milestone in Polish tradition of aesthetics. One such important element of European Aesthetic tradition that author wishes to acknowledge is the phenomenological aesthetics developed by Roman Ingarden (1893-1970) in the 30-ties and especially two concepts which best show lasting power of Ingraden's contributions. Author describes the concept of aesthetic experience used by Ingarden in his lectures on aesthetics (Ingarden, 1958-70) and its persuasive application to the field of music and literature. She suggests that its meaning deserves to be further explained and appreciated. It is argued that contemporary cognitive theories of aesthetic experience come very close to what Ingarden discovered and outlined in this writings without ever acknowledging preceding examples of complex approaches to aesthetics experience. Author suggests that one more concept from Ingarden's aesthetics should be appreciated. It is the concept of aesthetic encounter between author, performer and the listener/recipient (spotkanie) that Ingarden tried to introduce as the important category for aesthetic research. These concepts where meant to be discussed and researched across different areas. Underling the differences and developments within European aesthetics in the last century author stresses the achievements and aspirations of axiologically orientated aesthetic theory of Ingarden and purports to affirm its lasting contribution to the European tradition."

"I am interested in the possible relationship between painting and the philosophy of Roman Ingarden. Obviously, the relationship is there where Ingarden deals explicitly with painting, and when, starting from the picture, he forms his own conception of the pictorial work of art. But we can also approach the topic from the other way round. So we are free to ask whether Ingarden's theories can have an effect on artistic creations. In the latter case, Ingarden could provide painters with themes for meditation. This is precisely how I now intend to consider Ingarden's thought.

Ingarden devoted two essays exclusively to painting: On The Structure of Painting(1) and On So-Called Abstract Painting(2).

The content of the first essay — an accurate and inspiring vision of picture as a multi-layered formation — was treated in greater depth in the second."

"While Roman Ingarden is well known for his work in aesthetics and studies in ontology, one of his most important and lasting contributions has been largely overlooked: his approach to a general ontology of social and cultural objects. Ingarden himself discusses cultural objects other than works of art directly in the first section of "The Architectural Work", where he develops a particularly penetrating view of the ontology of buildings, flags, and churches. This text provides the core insight into how his more lengthy studies of the ontology of works of art in *The Literary*

Work of Art and the rest of *The Ontology of the Work of Art*, combined with the ontological distinctions of *Der Streit um die Existenz der Welt*, may be used to understand social and cultural objects. The view that results, I will argue, is based in foreseeing problems with the reductivist and projectivist views that remain popular, and is capable of resolving central

problems still thought to plague those who would offer a theory of cultural objects.

Social and cultural objects such as money, churches, and flags present a puzzle since they seem, on the one hand, to be entities that clearly -- in some sense -- depend on minds, and yet, on the other hand, seem to be objective parts of our world, things of which we may acquire knowledge (both in daily life and in the social sciences), and which we cannot merely modify at will. But it is hard to see how any entity could exhibit both of those characteristics - if, on the one hand, we take their objectivity and mind-externality seriously, and consider them to be identifiable with physical objects, we find ourselves saddled with absurd conclusions about the conditions under which such entities would exist and persist, and neglect their symbolic and normative features. If, on the other hand, we treat them as mere creations of the mind, they seem either reduced to phantasms that could not have the recalcitrance and impact on our lives cultural objects apparently exhibit, or we seem to be positing 'magical' modes of creation whereby the mind can generate real, mind-external objects.

Ingarden, I will argue, foresees the problems with each of these alternatives and diagnoses of the root of the problem as lying in too narrow an understanding of the senses in which an entity may be mind-dependent, and too narrow a set of ontological categories for entities there may be.

Once we can make evident the different senses in which something may be mind-dependent, and the different kinds of object there may be, we can find room for cultural objects considered as entities that are neither mere physical objects nor projections of the mind, but instead depend in complex ways on both foundations. Such a moderate realist view, I will argue, can provide the means to overcome the problems thought to plague social ontology and show the way to a more comprehensive ontology."

"Ingarden's ontology is an impressive biotope. It takes Ingarden 1840 pages to set it up. His style is not cryptic, but he

writes down not only how he thinks things are and his arguments for his views, but all his thoughts about the matter, in good phenomenological tradition. The editors of this book have asked me to move on a bit more swiftly. As life is short, let us take a Europe-in-seven-days tour through Ingarden's ontology. Preparing the travel we need to clarify what *ontology* is for Ingarden, how it relates to semantics, and how it relates to metaphysics. Then we shall turn to different kinds of *existential dependence* and to the distinction between *form and matter*. Having considered these preliminaries we shall consider Ingarden's conception of a substance and, more briefly, his other categories. While my main aim is to guide you through Ingarden's ontology I shall also indicate where I think the actual world is not as Ingarden describes it." (pp. 55-56)

132. ———. 2010. "Roman Ingarden's Theory of Causation Revised." *Polish Journal of Philosophy* no. 4:183-196.

Abstract: "This article presents Roman Ingarden's theory of causation, as developed in volume III of *The Controversy about the Existence of the World*, and defends an alternative which uses some important insights of Ingarden. It rejects Ingarden's claim that a cause is simultaneous with its effect and that a cause necessitates its effect. It uses Ingarden's notion of 'inclinations' and accepts Ingarden's claim that an event cannot necessitate a later event."

137. ———. 1975. "On the Absoluteness of Values." *Journal of the British Society for Phenomenology* no. 6:109-115.

Translated from the Polish by E. M. Swiderski.

"In his axiological considerations, undertaken with increasing intensity in the last years of his life, Roman Ingarden devoted much attention to the problem of the relativity of values. Above all, he attempted to determine what it is that we have in mind when we talk about this particular aspect of values. He also pointed out in a more or less decided way whether and how it is possible to ascribe "relativity" to a given type of values. He himself was reluctant to accept an axiological relativism, especially in its extreme form according to which all values would be relative in every possible way. He felt that such a radical view on values leads inevitably to subjectivism, to a denial of various axiological qualifications for various spheres of being. Though he was indeed opposed to this view it was not only because of its theoretical and practical consequences, but above all because of the far-reaching simplifications it entailed, the superficiality of the argumentation as well as its disregard for the factual state of affairs accessible to the unprejudiced researcher of value-phenomena.

Nevertheless, Ingarden's opposition to a radical axiological relativism does not mean that he spoke out for a radical axiological absolutism. Such an inference would be too hasty since, as I shall try to show, it would impute to Ingarden a point of view which has no foundation in his investigations of values. In order to ascertain whether Ingarden's theory of values eventually does allow for some conception of an axiological

absolutism, a closer analysis must be carried out of those of its assertions which directly or indirectly touch upon the absoluteness of values. In this regard Ingarden's significant methodological postulate must be kept in mind, namely that in axiological considerations the essential differences among types of values are not to be obscured. This means, in the first place, that a mechanical transference of assertions that apply to one type of values to some other type or types is invalid; and, in the second place, that a mechanical extension to various types of values of the validity of a series of general axiological theses having the character of pure theoretical possibilities is also invalid. Hence to determine in what sense Ingarden would be willing to admit an axiological absolutism is not at all the same thing as resolving the question of what kind of absoluteness belongs, according to him, to the given types of values. Most of the remarks in Ingarden's axiology refer to ethical and aesthetic values which makes it possible to determine more exactly their "absoluteness-character" and, at the same time, to indicate which purely theoretical possibilities are "realized" in the case of these types of values.

It is possible to infer from certain of Ingarden's statements that he excludes certain forms of the absoluteness of values encountered in axiological thought. Thus he rejects the view which was once current that values are autonomous objects of a particular kind existing independently of everything and having in themselves the foundation of their continued existence. According to this view, values are simply ideal objects. Ingarden rejects this form of a radically conceived absoluteness of values if only because he considers that a value is always a value of something, or in something, or for something. Moreover, it does not possess the form of an object, whether or not it exists ideally or otherwise, and it always requires the appropriate foundation for its existence. This conviction applies to all values." p. 109.

138. ——. 1994. "The Function of Ontology and Experience in Roman Ingarden's Axiological Investigations." In *Kunst und Ontologie. Für Roman Ingarden zum 100. Geburtstag*, edited

by Galewicz, Włodzimierz, Ströker, Elisabeth and Strózewski, Władysław, 219-228. Amsterdam: Rodopi.

"Ontology plays a peculiar function in Roman Ingarden's philosophy. This is partly due to Ingarden's interest in ontology, partly to his endeavour to construct a philosophy which would lead to metaphysical conclusions, conclusions reached by way of extensive and detailed ontological analyses. Also Ingarden's persistent efforts to make philosophy as clear and precise as possible, and in particular his stress on elaborating an adequate philosophical terminology have contributed to the status of ontology in his work, inciting him to extensive ontological investigations.

This particular position of ontology understood as 'an investigation of pure possibilities and necessary relations between elements occurring in the content of an idea'(1) appears in the very structure of Ingarden's work." (p. 219)

(...)

"This central position of ontology seems to be almost natural, flowing from the nature of philosophy itself; indeed, ontology elaborates various categories of being which enable us to deal with any object we choose to deal with. Without initial ontological — existential, formal and material concepts we cannot speak of anything and in any way. Thus, ontology is fundamental to any region of philosophical reflection.

Could axiology have a position as central as ontology? Could we regard axiological categories as equally fundamental as the general ontological categories? It would probably require a particular, rather metaphysical reinterpretation of the categories of both kinds. But such 'axiological' reinterpretation of the general categories of being does not seem to make any sense. Does it, e.g., make sense to speak about 'the value of a thing as a thing' or 'the value of an event as an event' etc.? Thus, it seems to be rather difficult to ascribe to axiology the central status proper for ontology. However, can we conclude that the domain of axiology is but of marginal importance? Is its position not central in the sense that at least some clues of

the philosophical inquiry lead inevitably to it? This seems precisely to be the case in Ingarden's philosophy. Nevertheless, the part played by axiology in his investigations is rather modest; and thus the position of axiology in relation to ontology seems indeed to be peripheral." (p. 220)

Washington D.C.: Council for Research in Values and Philosophy.

"The very achievement of Ingarden in matters of truth and meaning, which could be compared with the achievements of representatives of twentieth century hermeneutics like Heidegger and Gadamer, was his interpretation of the work of art as a creation by its author, though not limited to any defined end as expressed through its intended (deliberate) schematic: rather, it has no ultimate concretization. The significance of Ingarden's conception consists in the fact that many authors of works of art left 'empty' places in their artifacts: these schemata cause allow the life of a work of art to persist, and these gaps and schemata rely on perpetual, ever-new concretizations undertaken by new receivers. Thus every receiver of a work of art is simultaneously its co-creator and there are always many possible new concretizations. A work of art constantly provokes its receivers to discover new meanings in it and to create new interpretations. A great work of art speaks to people of different times and to men shaped in and by different cultures; it offers many meanings and tells them many truths. Ingarden underlined that the work of literature after release (i.e.,

publishing) leads its own life; it lives in the experiences of receivers as long as its vocabulary retains the same sounds which it possessed in the moment of its arising, and (especially) as long as its words and sentences are comprehensible to future generations. The same is valid for other spheres of art which likewise live in the many concretizations of their receivers.

And so in the case of Ingarden's phenomenology of aesthetics, the existing work of art causes its permanent transformation into many aesthetic objects, and this status, as in the case of hermeneutical understanding and interpretation, involves peoples and cultures in continual dialogue and communication." (p. 509)

"In the summary I should like to say that various problems of Ingarden's existential ontology can be profitably analysed by means of contemporary modal logic. On the other hand, it is highly probable that some elements of Ingardenian ontology may be helpful for modal logicians. In spite of the known Ingarden's very critical assesment of formal logic, there is a need for close cooperation between logicians and philosophers in Ingarden's style. I hope that my considerations justify such an opinion."

"What I wish to do in this paper is to apply tools of formal semantics to characterize some Ingarden's intuitions connected

with concepts indicated by the terms “sentence”, “proposition”, and “quasi-proposition”.

For Ingarden, sentences as well as propositions present states of affairs which are determined by their senses; this function is very closely connected with intentionality of our language.(1) The main difference between sentences and propositions consists in the nature of states of affairs as their objectual correlates. Purely intentional states of affairs are correlates of sentences, whereas propositions (true) refer to objective states of affairs." (p. 229)

144. ———. 2010. "Meaningfulness, Meaninglessness and Language-Hierarchies: Some Lessons from Ingarden's Criticism of the Verifiability Principle." *Polish Journal of Philosophy* no. 4:35-47.

Abstract: "Roman Ingarden offered a strong criticism of the verifiability principle in his talk delivered at the 8th International Congress in Prague in 1934. Ingarden argued that this principle either violates itself or smuggles a hidden sense. In this paper I show that Ingarden-like arguments about smuggled (but this pejorative qualification is skipped) meaning apply not only to the criteria of sense, but also to other semantic assertions within language-hierarchies in Tarski's sense."

Roman Ingarden: English translations

Bibliography

1. Ingarden, Roman. 1948. "The Scientific Activity of Kazimierz Twardowski." *Studia Philosophica 1939-1946* no. 3:17-30.
2. ——. 1958. "The Hypothetical Proposition." *Philosophy and Phenomenological Research* no. 18:435-450.

Translated by Fritz Kaufmann.

"It is well known that the proper meaning and function of the hypothetical proposition became a problem as early as Theophrastus and Eudemus. Since that time numerous conceptions and interpretations have been propounded. Fundamentally, however, the problem has never been solved.

It is characteristic that the interpretation which is perhaps the best known and most widely recognized one, that of contemporary symbolic logic, is at the same time the one that says least of all about the structure of this type of judgment. At bottom, it abandons any attempt to clarify its meaning - and prides itself on this renunciation even as its greatest merit. Nonetheless, this interpretation plays an extremely important role in the way systems of symbolic logic are constructed. In close connection with the concept of the so-called "material implication," it leads to a number of propositions which are considered "paradoxical," as, for instance, by C. I. Lewis, one of the leading symbolic logicians.

Both this result and the fact of a large variety of interpretations which differ from it as well as amongst each other, suggest a

new attempt to understand the meaning and function of the hypothetical proposition in a more adequate way.(1)" (p. 435)

(1) I have listed and, to some extent, critically examined the main types of the prevalent theories in "O sadzie warunkowym," *Kwartalnik Filozoficzny*, vol. XVIII, Cracow, 1949. In the present article I restrict myself to representing my own interpretation of the hypothetical proposition.

3. ———. 1960. "Reflections on the subject matter of the history of philosophy." *Diogenes* no. 7:111-121.

Also in French as: *Note sur l'objet de l'histoire de la philosophie*, pp. 130-140.

"One must distinguish the object of study of a certain science regarded as something which should be examined—the discovery and knowledge of which constitute in various respects the duty of one branch of human knowledge—from the state it is in when encountered at a given moment, which, having been furnished to the scholar, constitutes the points of departure for scientific investigations and becomes the source of knowledge regarding the object of study in the preceding sense.

The object of study of the history of philosophy is therefore:

A. Philosophy itself, in the historical sense—hence the content and characteristics (structural, for example) of the philosophic conceptions and theories that have actually existed in the history of philosophy.

B. The numerous processes related to the existence and development of philosophy in the historic sense, the most significant variations of which we have pointed out above." (p. 119)

"The reconstruction of the conceptions or philosophic works alone does not constitute the history of philosophy; it is only the taking into consideration and examination of facts in the evolution of philosophy which gives a historic character to the history of philosophy. Yet, on the other hand, to omit the reconstruction, in the elaboration of the history of philosophy,

of philosophic conceptions themselves in their real aspect under which they had appeared at a given time would deprive the history of philosophy of its specific character as a special study of philosophy. To understand that the object of the study of the history of philosophy possesses this particular double character of process and at the same time of a certain product, arising in the course of history and always in evolution, is one of the indispensable conditions for taking clear cognizance of the cognitive means which the history of philosophy can employ and for being able to constitute the methods proper to its investigation." (p. 121)

4. ———. 1960. "The General Question of the Essence of Form and Content." *Journal of Philosophy* no. 57:222-233.

"This is a translation of section 2 of the chapter "Form and Content of the Literary Work," contained in Vol. 2 of "Studia z estetyki" (Studies in Esthetics) published by the State Institute of Scientific Publications, in Warsaw, 1958." (p. 222)

"Among the groups of problems that I have distinguished thus far the question of the essence of form and content is relatively least dependent on the solution of the remaining questions and its solution constitutes the basis of their solution. I shall therefore start my further considerations from it.

I have made detailed investigations of this topic elsewhere.(1)

Here I shall be satisfied to give the most important results, taking into consideration especially those things that have a special meaning for the literary work.

As I have mentioned, the words "form" and "content" (matter) have been used with many meanings. These meanings must be distinguished and made more precise if possible.

1. The leading idea of one of the most ancient contrasting conceptions of "form" (morphe) and "content" (matter, *hyle*) is the concept of determining something by something else. In this case the determining factor is the "form"; what is determined, qualified by form, is "matter" (contents). Within this meaning every property of something, for instance the redness of a sphere, its smoothness, its weight, etc., is "form"

while the things which these properties serve are matter.(2)
This is the main concept of form (3) as used by Aristotle." (pp-
222-223)

(1) Compare R. Ingarden, *Spor o istnienie swiata* (Argument about the Existence of the World) , Krakow, 1947-48, Chapter VIII.

(2) This answer can be stated in another way. One could say that every property of something is its form. But in this formulation we have to do already not with the problem of essence but with a certain solution of the constitutive problem of form.

(3) "Main concept" because even in Aristotle this concept is not unequivocal, because it is possible to find with him also other meanings of these terms.

5. ———. 1961. "A Marginal Commentary on Aristotle's *Poetics*. Part 1." *Journal of Aesthetics and Art Criticism* no. 20:163-173.

Translated by Helena Michejda.

Reprinted in *Selected Papers in Aesthetics*, pp. 45-50.

"My aim here is not historical inquiry. It is not my purpose to evaluate Aristotle in the light of Greek thought or to consider his role in its development, leaving him all the while in a world distant and apart from us. Instead, it is my intention to bring Aristotle's views closer to our own by asking him questions that are important to us today, and thus to discover whether or not he can help solve some of our problems-in short, whether the theories we propound today cannot be found already in embryo in his thought. Through such an approach, it is possible that some of his observations shall appear more significant than they have in the past to scholars who had not yet elaborated a clear formulation of these questions. In particular, I shall discuss some of the statements made by Aristotle in his *Poetics* from the vantage point of the principles developed for the study of literature by Polish theoreticians in the period between the First and Second World Wars." (p. 163)

(...)

"First of all, let us try confronting Aristotle's ideas about the literary work of art, which he set forth in the *Poetics*, with the questions that engage us today. Let us ask what general statements about the literary work of art we should accept if certain of his assertions prove to be true. Aristotle was acquainted - as will be seen - with at least some of the issues that interest modern theoreticians of literature; as to others, he seems to have been conversant with them and, although he did not deal with them *expressis verbis*, to have solved them indirectly. Finally, there are problems and views of which Aristotle was not aware at all, but these are such that they are not excluded by his basic approach, lying, rather, within the scope of his investigations." (p. 167)

6. ———. 1961. "Aesthetic Experience and Aesthetic Object." *Philosophy and Phenomenological Research* no. 21:289-313.

Translated by J. Makota and S. Moser.

Reprinted in *Selected Papers in Aesthetics*, pp. 107-132.

"As I have already stated, an aesthetic experience is not - contrary to what is often heard - a momentary experience, a momentary feeling of pleasure or displeasure, arising as a response to some data of sense perception, but a composite process having various phases and a characteristic development which contains many heterogeneous elements. That the opposed theory seems plausible is due to the fact that, many a time - in consequence of some irrelevant factors - the process does not attain its full development: it is either interrupted before the aesthetic object has been constituted and before the experience of it has culminated, or in consequence of an artificial preparation, or of some professional habits, it does not commence from the beginning, but from the moment in which an aesthetic object is already constituted (e.g., when we look at a painting which we have already seen many times and which we have learned to see in the way it had been once constituted to us as an aesthetic object of peculiar properties). The duration and the complexity of this process depend, of course, on whether we have before us in a given case a complicated or a simple aesthetic object. Sometimes it is simply a quality of

colour or a sound of voice which alone become such objects: than the process of aesthetic experience is correspondingly a more “fleeting” one, but even then it is not a momentary “feeling of pleasure” or “displeasure”.” (p. 295)

Note: This paper is a small part of my book in Polish about the cognition of a literary work (Lwow, 1937). It is a complementary study to the book *Das literarische Kunstwerk*, Halle: 1931.

A literary work, and especially a literary work of art can be read in many different ways: with a pure cognitive attitude as when we read, for example, a scientific work to obtain knowledge, and likewise with an aesthetic attitude, when we read it as literary consumers. It was therefore necessary to study the aesthetic experience (in German: “Erlebnis”) in general to make clear what occurs in us during an aesthetic perception of a literary work of art.

7. ———. 1962. "A Marginal Commentary on Aristotle's *Poetics*. Part 2." *Journal of Aesthetics and Art Criticism* no. 20:273-285.

Translated by Helena Michejda.

Reprinted in *Selected Papers in Aesthetics*, pp. 51-78.

"Let us examine now, in turn, which of the statements in the *Poetics* deal with the question: Is there a difference between literary works of art and other written works, and, if so, what is that difference?

But first, let us recall that those of our contemporaries who deny that there is any essential difference between the writings under consideration, and who also contend that the study of “literature,” and of its history in particular, embraces all written productions indiscriminately, take the position that predicative sentences in a literary work are the same kind of judgments as the analogous sentences in scientific works, and therefore that both the first and the second are to be examined as to their being “true” or “false”. Consequently, they also believe that literary works of art fulfill the function of supplying certain information to the reader, and that the value of such works

fundamentally hinges upon this function - that is, if being “untrue”, they do not supply such information, they are “bad” or worthless”, and, in the opposite case, they acquire value.

But what can we find on this subject in the Poetics') “Even when a treatise on medicine or natural science is brought out in verse, the name of poet is by custom given to the author; and yet Homer and Empedocles have nothing in common but the meter, so that it would be right to call one poet, the other physicist rather than poet. On the same principle, even if a writer in his poetic imitation were to combine all the meters, as Chaeremon did in his Centaur, which is a medley composed of meters of all kinds, we should bring him too under the general term poet. So much then for these distinctions” (1447 b, 16-23).

Reading these words of Aristotle, we can be satisfied that he definitely distinguished “poetic” works from the unpoetic, the scientific in particular. " (p. 273)

8. ———. 1962. "Edith Stein on Her Activity as an Assistant of Edmund Husserl. Extracts from the Letters of Edith Stein with a Commentary and Introductory Remarks." *Philosophy and Phenomenological Research*:155-175.

Extracts from the Letters of Edith Stein with a Commentary and Introductory Remarks. [The text of the Letters is published in German, without and English translation].

An English translation is available: *Edith Stein Letters to Roman Ingarden: Edith Stein Self-Portrait in Letters* (The Collected Works of Edith Stein Book 12), Washington, D.C. ICS Publications 2014 (162 letters).

"I became acquainted with Edith Stein in 1913 when she came to Göttingen to study the tutorship of Edmund Husserl. But it was only in 1916, when she came to Freiburg to pass her doctor's degree examination, that we made a closer personal acquaintance and became friends. From the summer of 1916 till the beginning of January 1917 we conversed together every day on many subjects, but especially on various details of her personal activities as an assistant. When eventually I went for

several months to my own country, a lively correspondence took place between us.

At the end of September 1917 I came back to Freiburg, and remained there till the end of January 1918. Hardly a day passed during that period in which we did not meet and talk together. Having passed my doctor's degree examination I returned to Cracow, and from that time till the outbreak of war in 1939 we only met twice, for a few days at a time; but during the whole of that period we continually wrote letters to each other.

After the end of the war I was told that she had been killed.

I have intended several times to select and to publish some excerpts from her letters, considering that she writes a great deal not only about her personal activity as an assistant of Husserl's but also about Husserl himself and his work. However it is an undertaking that would require a great deal of work, and would be a very bulky publication.⁽¹⁾ So I kept putting it off for some other time in the future." (p. 155)

(1) There are over 150 letters, often of two or three sheets of paper each.

9. ———. 1964. *Time and Modes of Being*. Springfield: Charles C. Thomas.

Translated by Helen Michejda.

Selected part of the first volume of the Polish edition of: *Der Streit um die Existenz der Welt* (1947).

Contents: Author's Preface V; Translator's Preface VII; Chapter I: Preliminary Considerations 3; Introduction 3; The Foundations and the Tentative Formulation of the Question at Issue 8; Different Groups of Problems Requiring Delimitation 17; Chapter II: Introduction 22; Three Main Groups of Ontological Problems 22; Chapter III: Basic Existential Concepts 28; The Problem of the Possibility of Analyzing Existence 28; Modes of Being and Moments of Existence 32; Autonomy and Heteronomy 43; Existential Originality and Existential Derivation 52; Existential Separateness and

Inseparateness 82; Existential Self-Dependence and Existential Contingency 89; Absolute Being - Relative Being 92; Chapter IV: Time and Modes of Being 99; Preliminary Observations Regarding Concrete Time 99; The Mode of Being of Events 102; The Mode of Being of Processes 107; The Mode of Being of Objects Enduring in Time 124; Chapter V: The Consequences for the Possible Solutions of the Controversy over the Existence of the World When Time Is Taken into Account 157; New Concepts of Modes of Being 157; Name Index 165; Subject Index 167-170.

"In 1946/47, my two-volume work, *The Controversy over the Existence of the World* (*Spor o istnienie swiata*, Vol. I, 297 pages, Vol. II, 848 pages) was published under the imprint of the Polish Academy of Sciences and Letters.

The present volume contains the English translation of parts selected from Volume I of this work: the Introduction, Chapter III (with its introduction), Chapter VI, and Section 31 from chapter VII.

This selection covers my most important ontological analyses of modes of being and of time, as it is involved with these, which lead to the establishment of fundamental concepts of modes of existence. These investigations constitute the existential-ontological preparation for Volume II, which contains formal-ontological studies clarifying a number of basic formal concepts that are indispensable to an adumbration of prospective possible solutions of the controversy between idealism and realism. Volume III is in preparation." (From *Author's Preface*)

10. ———. 1964. "Artistic and Aesthetic Values." *British Journal of Aesthetics* no. 4:198-213.

Reprinted in R. Ingarden, *Selected Papers in Aesthetics*, pp. 91-132.

"In this lecture I shall be concerned mainly, with the differentiation of artistic and aesthetic values. With this in view it will be necessary for me to make various other distinctions: first that between the work of art and the aesthetic object, and also a distinction between an aesthetically valuable quality on

the one hand and value and its further determinations on the other. These distinctions have been elaborated in my various writings on aesthetics and theory of art, beginning with the book *Das Literarische Kunstwerke* (1931), but I shall here try to take further than before the differentiation between artistic and aesthetic values." (p. 198)

(...)

The work of art is the true object to the formation of which the creative acts of the artist are directed, while the fashioning of its existential substrate is a subsidiary operation ancillary to the work of art itself which is to be brought into being by the artist.

Every work of art of whatever kind has the distinguishing feature that it is not the sort of thing which is completely determined in every respect by the primary level varieties of its qualities, in other words it contains within itself characteristic lacunae in definition, areas of indeterminateness: it is a schematic creation. Furthermore not all its determinants, components or qualities are in a state of actuality, but some of them are potential only. In consequence of this a work of art requires an agent existing outside itself, that is an observer, in order—as I express it—to render it *concret*." (pp. 198-199)

(...)

"In composing his work the artist as it were sees ahead by creative intuition into possible complexes of aesthetically valuable qualities and how they will conduce to the emergence of an over-all aesthetic value in the work as a whole.

At the same time he tries to find the technical means to realize a particular complex by his choice of those aesthetically neutral qualities (colours, sounds, shapes, etc.) which by forming the skeleton of a work create the objective conditions (i.e. those on the side of the work of art) necessary for the realization of the subjective conditions, that is the existence of a suitable observer and the achievement of an aesthetic experience, without which neither these neutral qualities could be exhibited nor the aesthetically valuable qualities which together cause the emergence of a particular complex of qualities and the

constitution of a corresponding aesthetic value determined by this whole complex substrate.

It will be apparent from what has been said that aesthetic value, made concrete on the basis of a given work of art, is nothing else but a particular quality determination markedly a selection of interacting aesthetically valuable qualities which manifest themselves on the basis of the neutral skeleton of a work of art reconstructed by a competent observer." (p. 213)

11. ———. 1967. "Jean Hering 1890-1966." *Philosophy and Phenomenological Research* no. 27:308-309.

"Hering was the first to present the phenomenological style of investigation to France in his book, *Phénoménologie et la Philosophie Religieuse*, and he developed an interesting and profound analysis of religious knowledge. Along with the prolific activity of Alexander Koyré, Hering's work as writer and teacher helped Husserl's phenomenology to win its first adherents in France. The Paris lectures of Husserl (1928) which were later published as *Méditations Cartésiennes* are closely associated with this result. Both Jean Hering and Alexander Koyré represented the viewpoint of the "younger" Husserl and could not identify themselves with the transcendental idealism of Husserl. But Hering was the intimate friend of Husserl until his last years and visited him in Freiburg even in the worst years." (p. 309)

12. ———. 1969. "The Physicalistic Theory of Language and the Work of Literature." In *Problems of Literary Evaluation: Yearbook of Comparative Criticism, Vol. 2*, edited by Strekla, Joseph P., 80-98. University Park: Penn State University Press.

Translated by Maria Pelikan.

Reprinted in *Selected Papers in Aesthetics*, pp. 163-179.

"The physicalistic theory of language does not, strictly speaking belong to the theory of art and is not part of aesthetics. However, questions about the nature of language, and about the physicalistic concept of language especially, are important ingredients of contemporary philosophy. This latter theory is not an isolated phenomenon of the twentieth century. As we

know, there is a certain interplay of philosophy, science, art, and so on in every cultural epoch. Thus, towards the end of the nineteenth century we can see a relationship between, for instance, impressionism and Bergsonism, as in their treatment of the dimension of time. Certain works of literature are also related: Marcel Proust's novel in France, and Thomas Mann's Magic Mountain in Germany, and so on. There are analogous situations in the twentieth century. You can see it beginning with post-impressionist painting which led to abstract art. In literature, too, there was Dada in France, and there were other, similar attempts at creating a kind of "abstract" literature-that is, at tracing the work of art back to a mere combination of sounds or to a combination of verbal sounds." (p. 80)

(...)

"Thus, I simply cannot accept the formalistic theory of language and literature because it contradicts my experience. You may now say: "Well, yes, you may be right, there are such experiences and one must give in to them. But what is being experienced? Does that which one experiences exist? Do the people who are depicted exist? No, they are not really existing persons, real people are encountered only in real life and in real surroundings". And then I must answer: of course, they are not realities. They are not autonomously existing objects; they are, if you like, fictions. But there are such fictions - and this is the core of the matter. It is something I can relate to. And if I were now to think: "There are no depicted worlds, they do not exist in any sense; all these fictions that have been created in European literature for the last three thousand years, and many other fictions, do not exist at all" - well, then I simply lose all of human civilization. There is nothing left but the people who love or do not love each other, who kill each other, and who do not even have anything over which they could fight one another.

What is the manner of existence of these fictions? How is it possible that these non-existent, non-real objects can move me, that they can delight me or awaken hatred in me? That is a problem, I admit. But it is a problem worth considering, worth

clarifying. Let us not say right away: "It is so difficult that we do not want to work on it, we would rather work on signs and numbers, which is much easier". Yes, unfortunately it is true that it is hard to say just how these fictions exist and in what sense they belong to our world, how it is possible that something non-existent can somehow transform me when I am in touch with it. That is the problem, that is the problem of civilization, its existence and its role. And I cannot renounce the possibility of somehow coming to grips with this problem, if I can find the approach to it, and of somehow, in no matter how small a way, making it clear to myself." (pp. 97-98)

13. ———. 1970. "Letters Pro and Con." *Journal of Aesthetics and Art Criticism* no. 28:541-542.

Letter to Professor John Fizer with a reply by Fizer.

"The problem of areas of indeterminateness in a literary work and particularly in the objects represented in it was important for me in connection with the transcendental idealism of Husserl. It was important to demonstrate that real things must be determinate in all their aspects and also in their individuality, whereas pure intentional objects projected from language means or from conscious acts have necessarily areas of indeterminateness in their content -they contain them not only because they are correlates of language creations but also because a literary work of art (and every literary work) contains only a finite number of propositions and other linguistic determinations. In consequence of it, if there is not difference between the principal functions of language creations and the direct perception (which I mentioned above) in the sense that they both leave areas of indeterminateness, then it is necessary that a finite number of proposition and other modes of determination of a literary work cause the existence of gaps, areas of indeterminateness in the work. And the finiteness of the set of direct perceptions of one and the same things causes only some inadequacy of our knowledge of the object (thing) which in itself is determined in all its parts as aspects; "schematism" in this case is only a "partiality" of what is effectively given; but that which is given is always concrete and

strictly individual, and also in these properties and moments which are common to things of the same kind." (p. 542)

14. ———. 1970. "On Responsibility. Its Ontic Foundations." In *Man and Value*, 53-117. München Wien: Philosophia Verlag.

"Main Thesis of the Study

The problem of responsibility has heretofore been treated primarily as a special problem of ethics, without any more precise investigation of its wider contexts. The main contention of the present discussion is that this is insufficient and that other underlying factual matters (*Tatbestände*), that lead into deeper problems, have to be taken into account before we can discover the conditions under which one can speak of responsibility in a meaningful way. It also seems that responsibility comes up in realms other than the moral. Moral responsibility is only a certain special case. Thus, the range of cases and examples to be taken into consideration has to be expanded." (p. 53)

(...)

"The circle of problems and of possible solutions which stand in connection with the problem of responsibility in its various forms and contexts is hereby closed. They seem to me to be the most important problems to come into question in this connection, although I would not wish to state that they have been entirely exhausted. The thesis which I should want to defend affirms only that the essence of responsibility in its various forms and contexts not only points to the questions discussed here, but at the same time also demands definite answers. But should it turn out in further investigations that these questions must be answered otherwise, then the danger would arise that the generally accepted postulates for responsible acting, for assuming responsibility and for the right to call to account would have to be put in question. Yet, perhaps the further course of the analysis could show that in order to be better able to ground the meaningfulness and possibility of the realization of responsibility, not the solutions to the problems given here would have to be improved but rather their linguistic formulations." (pp. 112-113)

15. ———. 1970. "Man and Nature." In *Man and Value*, 17-20. München Wien: Philosophia Verlag.

A contribution to the discussion of the problem "Man and Nature" during the plenary session of the XII. International Congress of Philosophy, Venice, 1958. The main speaker on this theme was Professor Johannes B. Lotz, S.J.

"I agree with the speaker, Prof. Lotz, that man transcends nature, and that by the "power of his essence" he "projects (*entwirft*) a world, which, despite its always self-sustaining, fundamental form, takes on countless historical guises." It is also true that his "conscious activeness [*Wirken*] is expressed primarily in three basic forms: as the cognition of what is true, the doing of good and the shaping of beauty." But it still remains to be explained what makes up his creative activeness, and the relation between the world created by man and the nature in which he finds himself at the inception of his activity. The essence of man can be clarified by explicating, among other things, the sense and mode of existence of his works, which find their support in nature. It is not important for this problem how one conceives nature itself: whether as the totality of things, or as the totality of what is visible or, finally, as the totality of what is [*Gesamtheit des Seienden*], The only important thing is the fact that nature exists prior to any activity by man and that it changes within itself, for the most part independently not only of man's activity, but also of his existence. Nature is also the ultimate foundation of his being, as well as of the existence of his works. This is apparent not so much in the fact of human knowledge as in the intrinsic content and mode of existence of the products of human culture." (p. 17)

16. ———. 1970. "On Human Nature." In *Man and Value*, 21-24. München Wien: Philosophia Verlag.

"It is surely difficult to define the nature of man. Through his deeds, sometimes heroic but at times horrifying, through the immense diversity of his character and the goals he strives to realize, through the inexhaustible novelty of his works and admirable capacity to regenerate after almost every fall - man

transcends the confines of every imposed definition. All efforts at comprehending the plenitude of his essence with a satisfactory and adequate definition have proven vain. Every feature we find in his essence can be juxtaposed to concrete facts appearing to demonstrate something diametrically contrary. And it is certain that there are many irrefutable facts of man's reality, in the annals of humanity as a whole, which, though real and in fact actualized by him, are still something less than his true nature. But at the same time, there is occasionally in man's life an occurrence so lofty and exceptional that it could not possibly mark anything but some direction along the path of his noblest evolution, and not a commonly realized goal.

Though we are well aware of the great difficulties inherent in the attempt to grasp man's very nature, to make the attempt once more is, after all, something enticing - even at the risk of giving, at best, only a partial definition, or one which points to features that are only very seldom realized." (p. 21)

17. ———. 1970. "Man and His Reality." In *Man and Value*, 25-31. München Wien: Philosophia Verlag.

"I once heard a paper by an eminent biologist concerning man's status on earth. One of the paper's main theses was the assertion that man was able to conquer nature to a greater extent than any other species of animal and that his exceptional status among living beings on earth is based precisely on this fact. I then entertained the question whether the unquestionably higher degree of man's dominion over nature, and for that very reason his greater independence of what happens in it, is really what distinguishes him from beasts in an essential way. This would perhaps be true only if the conception of man defined as *homo faber* had to be employed as the basis of this contrast. But such a conception does not indeed touch on what is essential for his humanity. Man's exceptional status in the world does, in fact, depend on something else, so that the fact of his domination over nature and beast is only a certain phenomenon which is, if not altogether derivative, still not the most important. I wish to share a few thoughts with the reader on this topic.

Man is distinguished from the beasts in that, among other things, he not only dominates nature within limits that are incomparably wider than those attainable by animals, and even transforms and adapts it to suit his needs and demands, but more importantly - and in this lies his essential feature - in that he creates for himself an entirely new reality or, one might say, *quasi-reality*. Once created, it becomes a significant constituent of the world surrounding him." (p. 259)

18. ——. 1970. "Man and Time." In *Man and Value*, 33-52. München Wien: Philosophia Verlag.

"We all live in time, and we know it. There are, however, two fundamentally different ways of experiencing time and ourselves in time. According to the first it seems that what 'truly' exists is we ourselves', time, on the other hand, is only something derivative and merely phenomenal (*erscheinungsmäßig*). But according to the second it is time and the changes occurring in it which make up the sole reality; we, on the other hand, are, as it were, subject to complete annihilation by these changes. At best we sustain ourselves in existence as a pure phenomenon, as a certain kind of phantom produced by the changes occurring in the present.

The extreme polarity of these experiences and their apparently equal claim to veracity makes them the ultimate (sometimes unarticulated) basis of mutually opposed metaphysical standpoints. Thus for example at the very beginning of European philosophy the view of Heraclitus on the one hand, and the metaphysics of the Eleatics on the other, have their origin in these experiences. In modern philosophy, the conflict between realism and transcendental idealism is a manifestation of this opposition. More detailed historical analyses could likewise show how two different experiences of time play their role in the particular views concerning time which have appeared in the course of the history of European philosophy. Yet, perhaps the difference between the two experiences of time is most acutely reflected in the problem of the essence of the self, in the conception of the human being in general, and makes this essence into the central problem of philosophy. Let us examine this matter in greater detail." (p. 33)

19. ———. 1970. "What we do not know about Values." In *Man and Value*, 131-164. München Wien: Philosophia Verlag.

"Interest in various problems concerning values has grown considerably in the post-war years. Some progress even appears to have been made in this direction. Nonetheless, there has been little success in finding satisfactory answers to a series of important questions and in overcoming difficulties encountered by value theory. Great effort is being expended in the treatment of various special problems, mainly within particular realms of values, whereas fundamental, general problems lie fallow."

(...)

"The following are the problems to which I wish to devote some attention here:

(1) On what basis are we to distinguish the fundamental types of values and the realms of values that are correlated with these?

(2) What is the formal structure of a value and its relation to what 'possesses' the value (to the 'bearer' of the value)?

(3) In what way do values exist, insofar as they exist at all?

(4) What is the basis for the differences between values in regard to their 'rank', and is it possible to establish a general hierarchy amongst them?

(5) Are there 'autonomous' values?

(6) What is the status of the so-called 'objectivity' of values?(1)"
(pp. 131-132)

(1) The problem of the so-called 'relativity' of values is discussed in a separate paper. [*Remarks on the Relativity of Values*]

20. ———. 1970. "An Analysis of Moral Values." In *Man and Value*, 165-178. München Wien: Philosophia Verlag.

"Let us review the main results of the previous lecture. I tried to establish a series of necessary conditions for some conduct or fact to have a moral value. They are actually the conditions for

the realization of the kind of value which characterizes some human virtue or conduct as moral. There were six such conditions in all. The question came up, however, whether all of them taken together provide a sufficient condition for some value to be of a moral nature. That issue was left open. Let us then first of all recall these six conditions (there was still another, whose necessity was not really settled).

1. In every situation where it makes sense to speak of a moral value, an alert, acting subject must participate in the realization of this value, and 'in functioning as the subject' of his action [Handeln], this conscious subject must fulfill some further conditions. That is to say, the subject must guide or direct his action, while at the same time recognizing certain facts - in particular, certain values. Both presuppose not only the existence of the subject of action, but also his conscious awareness.

2. Some sort of conduct must be effected by the conscious subject, conduct in a very wide sense of the word, which could also be covered by the expression: some sort of behaviour by the subject. In a special case this will be some active doing, that is an activity that changes something in the world.

3. Values must somehow come into play when this conduct is placed within the context of a more encompassing situation. To the question as to what sort of values these have to be, I answered that they can be of various types. They can be values related to matters of life and death, economic or, more generally, utilitarian values, cultural values, and the like, but I do not exclude the possibility that these can also be moral values. I carried out my analysis within the scope of the problem of fairness. Being fair involves some sort of judgment or the appropriation of some sort of values to someone; these values can be extra-moral just as well as moral ones.

4. There has to be accountability on the part of this alert subject who behaves in a particular manner. There can be no question of any fact or behaviour, in particular of any deed, falling under the category of moral values, without the presence of this accountability. Accountability, for its part, requires the

fulfillment of certain conditions for its realization. Some sort of conscious awareness of the acting subject belongs among these conditions, along with his self-identity, which needs be preserved in the course of an action that may extend over a period of time. Responsibility weighs on the subject even after the action has terminated. And in order to be able to weigh on him, his self-identity must have been preserved. Sometimes we speak of a collective responsibility. There were times in European culture when such a notion was operative. There was collective responsibility in the guise of clan law; the whole clan was responsible for any one of its members. In such a case, irrespective of how many accountable subjects there are, there ultimately exists some super-ordinate collective subject, and this too must retain its self-identity if any of this is to make sense.

5. The fifth necessary condition, in my opinion, is the freedom of decision and conduct. Freedom must of course be maintained in the course of executing the decision, that is during the subject's behaviour, in the course of some prospectively carried out activity and its performance. The subject must also have the option of withdrawing from an action he has already initiated. Once someone is uninvolved, so that from a particular moment on everything runs its course independently of him, he ceases from that instant to be responsible. But if he is to be responsible, if his being morally responsible is to come into play at all, he must be free to behave as he wishes.

6. The sixth point is the thesis that the person himself, the 'I' governing in this person, must be the source of decision and the basis of responsibility in the course of executing the given activity. Not only the making of the decision comes from the person, but also backing it in the course of its implementation. This is not to be regarded as some peripheral, external or only physical source of behaviour. The subject's behaviour ought to have its starting point in the very centre of his whole psycho-physical organization." (pp. 165-166)

21. ———. 1970. "Some Words Concerning Fruitful Discussion." In *Man and Value*, 179-181. München Wien: Philosophia Verlag.

"Freedom of discussion? - Why, yes, of course. That is a necessary condition of all progress in science, and an equally essential factor in all cultural and social development. Surely there is no need to write anything more about it.

Still, if the discussion is to be essentially fruitful, its freedom cannot be purely formal, cannot consist merely in the fact that one does not beset the discussion with any external, formal obstacles. Fruitful discussion must be characterized by other essential features. First of all, it must emanate from the genuine, inner need of all the participants, and must be conducted under observance of their inner freedom. This inner freedom is borne of the absolute earnestness of thinking, of honesty toward oneself and of striving, undaunted by any circumstances, to attain to an explanation of unexplained matters, matters which are sometimes dogmatically accepted on faith or on the strength of authority. It is borne of the need to check accepted assertions or nurtured beliefs through critical, unbiased research." (p. 179)

22. ———. 1972. "What is New in Husserl's 'Crisis'?" In *The Later Husserl and the Idea of Phenomenology. Idealism-Realism, Historicity and Nature*, edited by Tymieniecka, Anna-Teresa, 23-47. Dordrecht: Reidel.

Analecta Husserliana. Vol. 2.

"It is now almost common-place to speak of the 'later' Husserl, as if this 'later' Husserl had assumed an entirely new position. In this connection one usually thinks of his *Crisis* [*The Crisis of European Sciences and Transcendental Phenomenology*]. What are the facts of the matter?" (p. 23)

(...)

"In the *Crisis* there is a tendency which was never expressed so clearly before, to view phenomenology as it were as the end state for which European philosophy was yearning, to see phenomenology as the mature state of European philosophy. Husserl's personal situation makes this understandable. But the interpretations of various schools of modern philosophy which he actually carries out are not persuasive, mainly

because there is almost a complete lack of precise textual analysis of the works under discussion. Only the discussion of the manner in which Galileo placed modern natural science upon a mathematical foundation, and the related tendency of a rationalizing nature, forms an important enlargement of our stock of knowledge. Together with the Galileo researches of Alexandre Koyré it is among the true achievements of phenomenology." (p. 25)

(...)

"Husserl has reduced all reality to purely intentional objects (*Gegenstandlichkeiten*) but he never inquired into the mode of being, and the peculiar form of, intentional objects; he consequently overlooked that they are essentially different in both these aspects from objects with autonomous being (particularly real objects). Thus he also did not see that purely intentional objects have a strange ambivalence of form; on the one hand, they have an intentionally formed content; as such they are supposed to be e.g., a tree, a man, etc. On the other hand, they have a structure which belongs to them *qua* intentional structures.(9)" (p. 44)

(9) It was no accident that I chose the product of literary art as the topic of the book which I published in 1931. I had supposed that literary productions and the objects which are depicted in them are purely intentional structures (*Gebilde*) and that they differ in their mode of being as well as in their form from the mode of being and form of real objects in such a way that the latter must not be reduced to the former. My inquiries have confirmed this supposition, and this was the first step in the dispute with transcendental idealism. In that book I made for the first time a distinction between the content and the structure of purely intentional objects (l.c. §20). But the formal difference between (purely intentional) objects of autonomous and of heteronomous being was first conclusively demonstrated with the *Streit um die Existenz der Welt*.

23. ——. 1973. *The Literary Work of Art. An Investigation on the Borderlines of Ontology, Logic and Theory of Literature*. Evanston: Northwestern University Press.

With an Appendix on the Functions of Language in the Theatre.
Translated and with an introduction by George G. Grabowicz.

The main subject of the investigations presented here is the basic structure and the mode of existence of the literary work, and in particular of the literary work of art. Their primary purpose is to indicate its peculiar construction and to free the concept of the work from the various kinds of blurring that in the studies to date stem, on the one hand, from the still strong psychologistic tendencies and, on the other, from considerations of a general theory of art and art works. I will deal with the former at greater length in Part I of this book, so it will suffice for me merely to mention it here. Concerning the latter, however, one has wavered, since the time of Lessing, between two opposite conceptions. Either one brought the literary work, and in particular the literary work of art, into too close a relationship with the "visual arts" (above all with painting), or one sought—following Lessing's first impulse—(as, for instance, T. A. Meyer did) to lay too much stress on the purely linguistic element of the literary work and hence deny the intuitive elements of the literary work of art.⁽¹⁾ In my opinion these two extremes arose from the fact that the literary work was always considered to be a formation having one stratum, whereas in fact it consists of a number of heterogeneous strata; in consequence, one always considered some—and, according to the various theories, always different—elements of the work as the only constitutive ones. Since my study attempts to bring out the many-layered structure, and consequently the attendant polyphony, as that which is essential for the literary work and thus to take into consideration all the elements appearing in it, my position occupies a middle ground between the two conflicting camps. To avoid undue expansion of my already sizable book and to enable the reader to take a pure attitude toward the object of investigation, I have dispensed with providing extensive connections to existing theories. Usually this has the effect of making the reader attune himself primarily to already existing conceptual schemata, with the result that the pure observation

of situations that are really at hand is substantially impeded." (pp. LXXi-LXXII)

(1) For a history of this problem see, among others, Jonas Cohn, *Zeitschrift für Ästhetik und allgemeine Kunstwissenschaft*, II, no. 3 (1907); in addition, see R. Lehmann, *Deutsche Poetik* (Munich, 1908), § 8.

24. ———. 1973. *The Cognition of the Literary Work of Art*. Evanston: Northwestern University Press.

Translated by Ruth Ann Crowley and Kenneth R. Olson.

"Scholars discussed methods of investigation or of "criticism" without even having asked themselves two crucial questions: (i) How is the object of cognition —the literary work of art— structured? and (2) What is the procedure which will lead to knowledge of the literary work; that is, how does the cognition of the work of art come about and to what does or can it lead? Only after having answered these two questions can one meaningfully ask how the literary work of art should be cognized in order to achieve satisfactory results.

In my book *The Literary Work of Art* I tried to answer the first question. It is now time to take up the second question, before we can even begin to consider methodological problems. I proffered an answer to this question as early as 1936, in the Polish version of my book *The Cognition of the Literary Work of Art*. I do not doubt that much has changed since that time, in Germany as well as other western European countries. Nevertheless, it seems to me that there is still no satisfactory treatment of the problems concerning the cognition of the literary work of art, and thus my book, now in an expanded edition, can be useful even today." (p. 4)

(...)

"The main question which I am trying to answer is: How do we cognize the completed literary work set down in writing (or by other means, e.g., in a tape recording)? Cognition is, however, only one kind of intercourse a reader can have with the literary work. To be sure, we will not completely ignore the other ways of experiencing the work, but neither will we pay particular

attention to them at the moment. Even “cognition” itself can take place in many different ways, which can bring about various results. The type of work read also plays an essential role in determining how cognition takes place.” (pp. 5-6)

25. ———. 1973. "On So-Called Truth in Literature." In *Aesthetics in Twentieth-Century Poland. Selected Essays*, edited by Harrel, Jean and Wierzbianska, Alina, 164-204. Lewisburg: Bucknell University Press.

Translated by J. G. Harrel.

Reprinted in *Selected Papers in Aesthetics*, pp. 133-162.

"Are declarative sentences in a literary work judgments in the strict sense of the word?

In my book *Das literarische Kunstwerk* I argued that declarative sentences, and especially predicating sentences, in literary works are not strictly judgments but quasi-assertive sentences, and that all other types of sentence, like, say the interrogative sentence, undergo an analogous modification. I then said that in quasi-assertive sentences “nothing is seriously asserted”. As a result of this, objects presented in a literary work acquire the character of reality, but this is merely an external apparel which has no pretension to be taken quite seriously by the reader, although in practice literary works are often read improperly and readers think that they are joining the author in judgments and seriously but mistakenly regard the presented object as real.

The question is whether my position is correct and whether, assuming that quasi-assertive sentences appear in literary works judgments in the strict sense also appear." (p. 133 of the reprint)

(...)

"In conclusion I would like to make two further observations.

(1) The distinction that I have just drawn amounts to a diagnosis based on observation of actual works of art and it is not a value judgment or a statement of principles according to which literary works of art ought to be composed.

(2) Those who maintain that even pure works of literary art contain either general or singular judgments regard the rejection of such a view as tantamount to denying that literature can have a fundamental and positive influence on man's life. They say that this amounts to taking up a formalistic attitude, according to which the so-called content of the work is of no consequence, and that they ought to oppose such so-called "aestheticism". (p. 160 of the reprint)

28. ——. 1974. "Main Directions in Polish Philosophy." *Dialectics and Humanism* no. 1:91-103.

Originally written in German in 1936.

"The beginning of philosophical research in Poland dates from the end of the XV century. The Polish philosophy from the Renaissance period has to its credit more than one important achievement, highly appreciated in that period, also abroad. This philosophy is connected with the first period of the blossoming of the Cracow Jagiellonian University." (p. 91)

(...)

"Twardowski, a pupil of Franz Brentano and once Privatdozent in Vienna, and then in the years 1895-1931 professor of the Lwow University, unfolded in Lwow a very lively and most effective activity in the field of pedagogics. In the course of only a few years he created there a big philosophical research centre which was constantly gaining in importance, and was predominant in Poland in the first decades of the 20th century. Twardowski educated several generations of independently working philosophers who are today teaching at numerous

Polish universities. Naturally, part of them are following other ways than his." (p. 95)

29. ———. 1974. "Psychologism and Psychology in Literary Scholarship." *New Literary History: A Journal of Theory and Interpretation* no. 5:215-223.

Translated by John Fizer.

Reprinted in R. Ingarden, *Selected Papers in Aesthetics*, pp. 79-90 and in J. Fizer, *Psychologism and Psychoaesthetics: A Historical and Critical View of Their Relations*, Amsterdam: Benjamin Press 1981, pp. 202-216.

"I. Psychology and Psychologism.

First of all, we tend to confuse psychologism with psychology in its application to certain literary matters. As a result, we consider the opponents of psychologism to be enemies of psychology. Whereas in fact they are two different things. Psychology is a science which investigates mental phenomena and subjects and which has its own field of investigation, its own more or less well-defined methods and aims; it is, moreover, a science that has authority not only in its own field but is also one of the important and fundamental branches of science about reality, a branch which can be neither eliminated nor "relegated" to anything else (as, for example, the so-called physicalists wanted to do). However, when psychological research begins to transcend its own field and to dominate, the competence of psychology is terminated. At this point, as for example in logic, epistemology, etc., we begin to deal with "psychologism" in the sense in which it was historically introduced by Husserl. "Psychologism" is a certain philosophical point of view whose essence lies in the fact that it ascribes psychological characteristics to certain objects." (pp. 215-216)

(...)

"IV. The Goal of Psychology in Literary Scholarship.

Finally, there is a group of psychological problems which enters into literary scholarship. The work per se is not psychological.

But in its contents there is a stratum of presented objects in which, among other things, there are presented psychophysical subjects - people or animals. Even though these persons (or animals) are only presented and are derivative-intentional in their ontological essence, determined by the work's text, in their contents they are nevertheless persons with their own mental life and their own structure which in the investigation of the work must be analyzed as carefully as other components of the work. ... The following has to be kept in mind: (1) In this case the only source is the text of a given work; (2) it is an investigation of certain components of the work rather than some independent thing; (3) finally, it is a preparation for the subsequent study of the work. While studying the experiences and structure of the persons presented in the literary work, we must not use information acquired elsewhere...." (pp. 221-222)

30. ———. 1975. *On the Motives which Led Husserl to Transcendental Idealism*. The Hague: Martinus Nijhoff.

Translated from Arnór Hannibalsson.

Contents: Translator's Preface VII; Introduction 1; Part I: Husserl's Position 4; Part II. Critical Remarks 34; Index 72.

"I have often asked myself why Husserl, really, headed in the direction of transcendental idealism from the time of his *Ideas* whereas at the time of the *Logical Investigations* he clearly occupied a realist position. In later years he at last reached a solution whose correctness he could not doubt.

For everyone who knows Husserl's methods of work it will not be surprising that various arguments emerging from his investigations should move him in this direction. For a long time Husserl worked on a certain set of problems which he elaborated according to his interests at the time without being explicitly conscious of the broad connections between them. Only as the years went by did there begin to emerge a certain unified pattern of philosophical problems which Husserl tried to grasp either from a single methodological point of view or by studying the clusters of problems themselves and the relations between them. The totality of this set of problems reached at

once in Husserl's eyes such vast dimensions that a single person could not be expected to solve them. Husserl makes many attempts to draw up the outlines of this totality but - in spite of all his efforts - he has to be contented with more or less detailed sketches of parts of it. After he had worked out each of them there followed usually long periods of physical exhaustion and during these periods he never succeeded in organizing any work of great dimensions. These fragments are elaborated in various periods of Husserl's life and differed from each other in various details and crystallized themselves around different central problems or fundamental theses. When we look now at the whole of Husserl's investigations (which are now known to us) it appears necessary to make distinctions between different groups of motives or arguments which, in the last resort, result in transcendental idealism whose total picture is, perhaps, painted most carefully in *Formal and Transcendental Logic* and in the *Cartesian Meditations* but which is nevertheless never finally substantiated by Husserl. It will be useful to isolate these groups of arguments or motives which led Husserl to transcendental idealism. It will be of help for a critical consideration of the foundations of his solution. These groups are, to mention only the most important ones, as follows:

- I. Assertions regarding Husserl's concept of philosophy as rigorous science.
2. Postulates defining the right method of the theory of knowledge.
3. Positive results of the analysis of outer perception of material objects and also the so-called constitutive analysis.
4. Some fundamental assertions regarding formal ontology.

Before discussing these assertions and their role in the argument for transcendental idealism it may be useful to make clear whether and to what extent it is possible to argue for the view that Husserl was a realist during the period of his *Logical Investigations*." (pp. 1-3, note omitted)

31. ———. 1975. "On the Ontology of Relations." *Journal of the British Society for Phenomenology* no. 6:75-80.

"In previous chapters I have occupied myself almost exclusively with the states of affairs holding "within" an object or, to put it more accurately, with those involving only one subject, i.e. those states in which it is only one individual object or one object of a higher order which functions as the subject of an inhering property or as the subject of a process or an action which takes place. But there exist also other states of affairs in which partake more than one object, be it that they all function as a foundation for the inherence

of a property in one or more of the objects or that they all function as the foundation for the occurrence of a process or an action." (p. 75)

(...)

"1. A relation of the lowest degree, and in particular its core, has its ontic basis in, at least, two individual, non-relational objects which are included in it as its terms. A relation of a higher degree has its ontic basis in at least two relations which are its terms and which determine its core.

An individual non-relational object, on the other hand, has no such ontic basis.

2. The relation taken in its primary form and before its objectification is one single state of affairs involving two or more genuine subjects in the manner explained earlier. The relation taken as an object which possesses a number of properties is constituted secondarily on the basis of the relation in its primary form. An individual non-relational object, on the other hand, contains an infinite multiplicity of states of affairs with one subject, which states coalesce with one another because the subject is the same. Actually, in this respect there is a formal similarity between an individual, non-relational object and a relation taken as an object (as a subject of properties).

3. Relations differ materially, by the specific moments of their constitutive nature, from nonrelational objects; and also by the possession of properties such as symmetry, transitivity, the having of many places, etc., whose matter is of such a kind that the non-relational objects cannot possess these properties.

Inversely, the non-relational objects possess some properties whose matter excludes their appurtenance to relations.

What could be the sense of saying, e.g., that a certain relation was green or heavy, or that it was a good conductor of electricity? The question whether it is possible to detect a general law distinguishing all the non-relational properties (resp. constitutive natures) from the relational ones, could only be answered by a material ontology." (p. 80)

32. ———. 1975. "Remarks Concerning the Relativity of Values." *Journal of the British Society for Phenomenology* no. 6:102-108.

Translated by Guido K ung and E. M. Swiderski.

New translation by Arthur Szylewicz with the title *Remarks on the Relativity of Values* in R. Ingarden, *Man and Value*, M nchen Wien: Philosophia Verlag 1983, pp. 119-130.

"The old problem of the relativity of values depends on a number of theoretical attitudes and commitments which as a rule remain hidden beneath the plane of analysis. In striving for a deeper treatment of this problem, we have to proceed carefully, and attempt to unveil the obscurities and ambiguities in the proposed solutions to the attendant problems, solutions which are quite frequently accepted without a detailed and conscientious discussion.

There are three auxiliary problems that are important in connection with the problem of relativity. First, what is the sense of 'relativity'? Secondly, what are the differences between the particular kinds or types of values, assuming that a multiplicity of values is to be admitted at all? Thirdly, should the problem of the relativity of values be treated quite generally, hence for all values, or should it be formulated separately for each kind of values?" (p. 119)

33. ———. 1975. "Phenomenological Aesthetics: An Attempt at Defining Its Range." *Journal of Aesthetics and Art Criticism* no. 33:257-269.

Translated by Adam Czerniawski.

Reprinted in R. Ingarden, *Selected Papers in Aesthetics*, pp. 25-44 and in Hazard Adams and Leroy Searle (eds.), *Critical theory since 1965*, Tallahassee: University Press of Florida 1986, pp. 185-197.

"We now began to hear about "a general science of literature" ("allgemeine Literaturwissenschaft") and in Poland about "theory of literature". In Germany, as far as I know, only Ermatinger used the expression "philosophy of literature" in a collection of essays entitled *Philosophie der Literatur* (1930).

It is not clear how one is to interpret these three concepts. Nor is the meaning of that generality clear, especially of the way in which "general" predication was to be arrived at. Was it to be by empirical generalizations based on the experience of specific works, and what sort of "experience" was it to be? Was it, for instance, to be achieved in the way that it is done in comparative literature studies, or in some other manner: for instance, through a consideration of specific works, through an analysis of the general content of a work of art, as the phenomenologists themselves wished to do?

When in 1927 I began writing my first book on this subject it was quite clear to me that one cannot employ the method of empirical generalization in aesthetics, but that one must carry through an eidetic analysis of the idea of a literary work of art or a work of art in general. So I thought it a mistake to set against each other the two lines of enquiry: (a) the general enquiry into a work of art, and (b) the aesthetic experience, whether in the sense of the author's creative experience or as a receptive experience of the reader or observer. I had therefore suitably shaped the thesis of my book, even though its title was *Das literarische Kunstwerk*, and even though the German edition of my *Untersuchungen zur Ontologie der Kunst* (*Ontological Investigations in Art*) published thirty years later also has a title suggesting a purely object-directed aesthetic enquiry, with not a word about aesthetics." (p. 259)

34. ———. 1976. "The Letter to Husserl about the VI Logical Investigation and Idealism." In *Ingardeniana: A Spectrum of*

Specialised Studies Establishing the Field of Research, edited by Tymieniecka, Anna-Teresa, 419-438.

Analecta Husserliana, Volume 4.

"Miss [Edith] Stein wrote to me a few weeks ago that you are working again on the problem of 'Idealism'. (2) I immediately sat down to work since I am especially interested in the subject. Unfortunately, my finishing touches on the last part of the Bergson-thesis had to suffer from this, but the working hours of the last weeks will actually be for the thesis' benefit. I have once more very thoroughly studied the 5th and 6th *Investigation* besides having thought over everything essential in this respect from the Ideas. (3) Certainly, and unfortunately too, I cannot say that I have come to a conclusion. But at least I know what I cannot hold as defensible.

Perhaps it will be of interest to you, dear Professor, if I write something about it." (p. 420)

(...)

"But to come to the problem of Idealism, about which I actually wanted to write and which has tormented me already several years. It seems to me that under this name different and fundamentally different problems are concealed. Usually in literature these problems run into one another, and often a system is called 'idealistic' which actually would not so be named. I do not want to talk here about the equivocations, respectively about all the problems laying here, but, with respect to the things interesting us, it seems to me that one has to differentiate three groups of problems: (1) the ontological, (2) the metaphysical (in a slightly different sense as you use this word), (3) the epistemological problems. Naturally, between all groups essential relationships do exist." (p. 422)

(...)

"Presupposed, to begin with, that the meaning of reality is actually to be conceived as I have done, and that it also would be maintained in the constitutive consideration; (in other words, that everything real would be a 'being-in-itself' and the

real external world something essentially alien to consciousness). First of all an ontological question arises: is the essence of reality an autonomous essence and especially an essence autonomous over against the essence of consciousness - as essence -, or not?

Principally spoken, four possibilities are given:

(1) Reality (as essence) is dependent and the essence of consciousness is autonomous, i.e. the latter could exist without the essence of reality.

(2) The essence of reality and the essence of consciousness are autonomous.

(3) The essence of reality is autonomous. Consciousness is dependent.

(4) Both are dependent and dependent on each other." (pp. 435-436)

Notes

(2) The letter is dated 24.VI.1918.

(3) It concerns the Investigations of the Vol. II of *Logische Untersuchungen*.

35. ———. 1978. "On Moral Action." In *The Human Being in Action: The Irreducible Element in Man: Part II Investigations at the Intersection of Philosophy and Psychiatry*, edited by Tyminiecka, Anna-Teresa, 151-162.

Analecta Husserliana. Volume 7.

This section and the following are the first English translations, by Dr Barbara Haupt Mohr, from Roman Ingarden's work entitled *Ueber die Verantwortung*, which appeared originally in German, Reclam Universai-Bibliothek, Stuttgart, 1970.

"We have treated the question of the responsibility that exists after the completion of an action. But how does the problem of responsibility that grows out of action present itself? How does action take place when it is undertaken in the first place with

regard to (or for) the fact that it will result in a particular responsibility on the part of the actor?

It is possible to act without concerning oneself at all with any "responsibility" that one may have for the action. One may simply surrender to the action and aim at bringing about a result. Nevertheless, a person who acts in this way incurs the responsibility for having acted in this way, unconcerned about anything. But one can direct all one's action in such a way that it can result in something evil or something good, aiming to avoid the former and to achieve the latter. One who acts in this manner also takes into consideration that - aside from the possible harm that may ensue - guilt or merit may be assigned to him, the actor. One can act in such a manner that one asks himself at every step of the way whether one's action is "just." The actor must then retain the overview of the values that

may be achieved or destroyed in this way, for it is on the scope of this overview that not only the course of his actions but also his responsibility for them depends." (p. 151)

36. ——. 1983. *Man and Value*. München Wien: Philosophia Verlag.

Translation by Arthur Szylewicz of *Über die Verantwortung*.

Table of Contents: Foreword to the Original Polish Edition 9; Foreword to *Man and Value* 11; Translator's Preface 16; *Man and Nature* 17; *On Human Nature* 21; *Man and His Reality* 25; *Man and Time* 33; *On Responsibility. Its Ontic Foundations* 53; I. Main Thesis of the Study 53; II. Differentiation of Various Situations Involving Responsibility 53; III. Bearing Responsibility 54; IV. Assuming Responsibility 66; V. Responsible Action 67; VI. Value as Ontic Fundament of Responsibility 69; VII. Responsibility and the Identity of its Subject 77; VIII. The Substantial Structure of a Person and Responsibility 80; IX. Freedom and Responsibility 84; X. The Causal Structure of the World 101; XI. The Temporality of the World and Responsibility 105; Remarks on the Relativity of Values 119; What we do not know about Values 131; An Analysis of Moral Values 165; Some Words Concerning Fruitful Discussion 179; Index 183-185.

"Some words about the genesis of this volume.

It was the author's intention to have it published at some future time. This intention was born at the beginning of 1969, when it was necessary to make a final decision as to which works (including some previously published and scattered in various periodicals and conference acts) were to be included in vol. III of *Studies in Aesthetics*, the next in the series of Roman Ingarden's *Collected Philosophical Works*, issued by the Polish Scientific Publishers (PWN). Several very small papers fell into the author's hands at the time (primarily, the first four contained in the present little volume) which he did not want to include in the projected volume (*Aesthetics III*), due to its cohesive composition. A somewhat different thematic thread ties these papers together: the nature of man." (Danuta Gierulanka, from the *Foreword to the Original Polish Edition*, p. 9)

(...)

"The three last major essays of the collection primarily illustrate Ingarden's approach relative to problems of the first group, i.e. problems concerning the essence of values. As with the pieces that made up the Little Book, these essays differ in their analytical style (from the attempt at a conceptual ordering of the relevant issues in "Remarks on the Relativity of Values", through a setting out of the general approach to fundamental problems in "What we do not know about Values", to an attempt at specific phenomenological analyses in "An Analysis of Moral Values") and make up a small but representative selection of the author's approach, a fragment of his researches in the domain of axiology. Ingarden never tried systematically to develop axiological investigations in complete generality - in accord with the standpoint of axiological pluralism that emerges in these essays, which dictates that we reckon with the need for separate investigations in each sphere of values."

(...)

"It so happens that thus far I have not mentioned the essay "Man and Time", the fourth piece in the collection. In a certain

sense, more so than all the others, it speaks for itself. It speaks both through the way it was written (most vibrant, and perhaps most fascinating to the reader) and the 'existential' (as some are wont to say today) commitment of the author, especially in that part of it that was added on during the War, a part that is most fervently searching and culminates in a solution. This solution, indeed, strikes the most perspicuous chord in the whole book, which binds what is perhaps of the greatest importance to man - the selfrealization of his person, threatened by the annihilating experience of passing on - with the relation of man to values." (Danuta Gierulanka, from the *Foreword to Man and Value*, p. 12 and 14)

37. ——. 1983. "On Philosophical Aesthetics." *Dialectics and Humanism* no. 10:55-59.

Translated by A. Póltawski and A. Potocki.

Reprinted in R. Ingarden, *Selected Papers in Aesthetics*, pp. 17-24.

"Philosophical aesthetics comprises the following subordinate fields of investigation:

(a) The ontology of different works of art (e.g. paintings, literary works, musical compositions).

(b) the ontology of the aesthetic object so far as it is the aesthetical concretization of a work of art, i.e. the ontology of its form and mode of existence.

(c) The phenomenology of creative aesthetic behaviour (of the creative process).

(d) The philosophical investigation of the style of a work of art and of its relation to value.

(e) The phenomenology and ontology of values inherent in works of art and aesthetic objects, i.e. of artistic and aesthetic values; this includes the possible foundation of values in a work of art or in an aesthetic object and also the constitution of values in the aesthetic experience whereby they are actively discovered.

(f) The phenomenology of the receptive aesthetic experience and of its function in the constitution of an aesthetic object.

(g) The theory of cognition of a work of art and of an aesthetic object, in particular the cognition of artistic and aesthetic values; the theory of aesthetic valuation.

(h) The philosophical theory of the meaning and function of art (or aesthetic objects) in human life. (The metaphysics of art?)

All these fields stand in different relations one to another and none can be studied entirely apart from the problems and achievements of others. This interdependence is the basis for the systematic unity of the whole of philosophical aesthetics." (pp. 18-19)

38. ———. 1983. "Lectures on Aesthetics." *Literary Studies in Poland* no. 11:15-37.

"Last time I talked about the ontological foundation of a work of literature in contrast with itself and I distinguished between the vocal material from the sounding of word (analogically, it is necessary to separate writing from auditory form of word). Writing can either

be equally diversified, non-homogenous, as the vocal material of particular individuals reading or singing a given work, or in a certain way it can approximate the sound of word. Namely. I was saying that the sound of word in a language is a certain typical form, typical

sound quality, one and the same, appearing on diverse backgrounds of voice material. The writing of individual persons is as variable and diversified as voice is, a concrete voice material or manners of speaking. On the other hand, printing or even the writing used

in copying books e.g. in medieval times, are both equally typified to the same extent as word sound is. The point is to retain possibly the same graphic shape that is repeated multiply as very similar." (pp. 23-24)

(...)

"The relation occurring between a work of literature and its ontological foundation in fact concerns only some elements or some aspects of the sound stratum of a literary work while the semantic stratum, strata of presented objects and their external appearance

go fully beyond that ontological foundation and beyond any relationship or similarity to it." (p. 37)

39. ———. 1985. *Selected Papers in Aesthetics*. Washington: Catholic University of America Press.

Edited by Peter J. McCormick.

Contents: On Ingarden's Selected Papers in Aesthetics: An Introduction by Peter J. McCormick 7; On Philosophical Aesthetics 17; Phenomenological Aesthetics: An Attempt at Defining its Range 25; A Marginal Commentary on Aristotle's Poetics 45; Psychologism and Psychology in Literary Scholarship 79; Artistic and Aesthetic Values 91; Aesthetic Experience and Aesthetic Object 107; On So-Called Truth in Literature 133; The Physicalistic Theory of Language and the Work of Literature 163; Roman Ingarden Bibliography by R. Jagannathan, P. J. McCormick, A. Poltawski and J. Sidorek 181; Introduction 183; Works by Roman Ingarden: Polish 185; German 209; English 217; French 221; Works about Roman Ingarden 224; Index 262; Editor's Note 268.

"A number of [Ingarden's] shorter pieces on aesthetics are collected in Polish under the title *Studia z estetyki* in three volumes, and some of these too have been translated into English. It is the purpose of this volume to gather this material together in one place and, with the help of an extremely comprehensive bibliography of Ingarden's writings and of writings about him in English, French, and German, to situate this work in the development of his thought in general.

(...)

Some idea, however fragmentary, of the range of his work may be gathered from the analysis Ingarden gave of the different areas of philosophical aesthetics in his late and important

paper "Asthetik und Kunstphilosophie" presented at the 14th International Congress of Philosophy at Vienna in 1968.

Philosophical aesthetics involves the following areas of discussion: (1) The ontology of the work of art, and indeed a) the general philosophical theory of the structure and the mode of being of the work of art in general, b) Ontology of the work of art in the several arts (painting, architecture, literary works of art, etc.). (2) Ontology of the aesthetic object as an aesthetic concretization of a work of art. (3) Phenomenology of the creative artistic behaviour. (4) The problem of the style of the work of art and its relation to its own value.

(5) Aesthetic value doctrine (artistic and aesthetic values, their founding in the work of art and their constitution in aesthetic experience). (6) Phenomenology of aesthetic experience and the constitution of the aesthetic object. (7) Theory of knowledge of the work of art and the cognition of aesthetic objects and especially the cognition of aesthetic values (critique of evaluation). (8) Theory of meaning and the function of art (with respect to aesthetic objects in the life of human beings (metaphysics of art?)).(10)

(10) "Asthetik und Kunstphilosophie", Akten des XIV. Internationalen Kongresses für Philosophie, Wien, 2-9 September 1968, 4, Vienna: 1969, p. 216.

40. ———. 1985. "Reminiscences of Stanislaw Ignacy Witkiewicz." *Dialectics and Humanism* no. 12:53-59.

41. ———. 1985. "On the Cognition of the Literary Work of Art." In *The Hermeneutics Reader: Texts of the German Tradition from the Enlightenment to the Present*, edited by Mueller-Vollmer, Kurt, 187-213. New York: Continuum.

Selections taken from the first section of *The Cognition of the Literary Work of Art*.

"Preliminary Sketch of the Problem

The main question which I am trying to answer is: How do we cognize the completed literary work set down in writing (or by other means, e.g., in tape recording)? Cognition is, however,

only one kind of intercourse a reader can have with the literary work. To be sure, we will not completely ignore the other ways of experiencing the work, but neither will we pay particular attention to them at the moment. Even "cognition" itself can take place in many different ways, which can bring about various results. The type of work read also plays an essential role in determining how cognition takes place." (pp. 187-188)

42. ———. 1986. *The Work of Music and the Problem of Its Identity*. London: Macmillan.

Translated by Adam Czerniawski.

"The starting point for our reflections upon the musical work will be the unsystematized convictions that we encounter in daily life in our communion with musical works before we succumb to one particular theory or another. Naturally, I do not intend in advance to accept these convictions as true. On the contrary, I shall submit them to critical investigations at specific points. But, for the moment at least, they must indicate the direction of further investigations.

For how else could this direction be indicated? These convictions, although naively acquired and perhaps burdened with various mistakes, do after all stem from an immediate aesthetic communion with musical works, a communion that furnishes us, or at least may furnish us, with an ultimate experience of those works, thus endowing with truth the views that match the given of the experience. However fully developed, every theory of musical works that is not mere speculation but seeks a base in concrete facts must refer to

the presystematic convictions that initially gave direction to the search. It seems that there is another reason why we must refer to the given of the immediate musical experience. It is that various theories in the realm of so-called aesthetics or the psychology of music are conditioned too powerfully by the general state of philosophy and of sciences particular to a given epoch and therefore too heavily burdened with theoretical prejudices that make it difficult to reach the experientially given facts. In addition I intend to discuss various problems

which have not been raised within the existing literature on musical theory." (p. 1)

43. ———. 1988. "Theory of Knowledge as Phenomenology of the "Essence" of Cognitive Experiences and Their Correlates." *Aletheia: An International Journal of Philosophy* no. 4:1-106.

Translated by Arthur Szylewicz.

"The following text constitutes a translation of Chapter IV from Roman Ingarden's *U podstaw teorii poznania* [Foundations of Epistemology], Part I, PWN, Warszawa, 1971. (Part II, announced in the Preface to this volume, has not yet appeared in print.)

Ingarden suggests in his "Introductory Remarks" that epistemology is still relatively young as a self-aware, distinct science. Consequently, it is still struggling to consolidate both a definition of its realm of objects and suitable methods of their investigation. "The truth is . . . that the factual state of research, which in view of the problems it treats has to be assigned to epistemology, is inadequate. We cannot today [1948] point to a single set of epistemological assertions that are adequately grounded or universally accepted. This is doubtless tied up with the fact that thus far epistemology has not been clearly enough bounded off from other disciplines. For neither its domain of research, nor its tasks or methods have been defined in a manner free from basic doubts and objections . . .""In this theoretical situation", he continues further on, "epistemological investigations proper have to be preceded by considering whether and how epistemological problems can be formulated in a way that would avoid the fundamental difficulties which it has thus far encountered in the course of its development; we also need to elucidate what kind of cognitive means can or have to be applied toward their solution. The present book is devoted to this task.... It will turn out in the course of our considerations, however, that we shall have to present and critically discuss certain epistemological standpoints which have with greater or lesser clarity been formulated to this point in the evolution of philosophy."

After having discussed some of the difficulties involved in circumscribing a theory of knowledge, Ingarden proceeds to differentiate five such attempts in the annals of the history of philosophy and, distinguishing them in accordance with their objects of investigation, gives them the following titles:

- I. Psychophysiological theory of knowledge.
- II. Descriptive phenomenology of knowledge.
- III. Apriori-phenomenological theory of knowledge.
- IV. Logicistic theory of knowledge.
- V. Autonomous theory of knowledge."

"... each successive attempt", according to Ingarden, "will try to avoid the errors and difficulties encountered by the preceding ..."

The titles of the three Chapters of the Foundations which precede the one offered here are:

- I. The Psychophysiological Theory of Knowledge
- II. Critique of the Psychophysiological Theory of Knowledge
- III. A Second Attempt at Defining a Theory of Knowledge. Descriptive Phenomenology of Conscious Experiences and their Correlates.

Thus, as the reader may easily convince himself, Chapters I and II correspond to title I, Chapter III to title II, and Chapter IV to title III. Presumably, the unpublished Part II of the Foundations contains discussions of theories corresponding to the remaining two titles." (from *Translator's Introduction*, pp. IX-X).

"The Issue of "Eidetic" Cognition and Its Employment in a Theory of Knowledge

A new delineation of a theory of knowledge has to take into account the results of the discussion regarding the psychophysiological theory of knowledge as well as eliminate the flaws that surfaced in the descriptive-phenomenological

theory of knowledge. Thus, with this new attempt, we have to acknowledge the indispensability of the phenomenological *epoché*, that is the adoption of a stance of cognitive reserve with respect to all pieces of knowledge acquired in transcendent cognition (1); in addition, we have to satisfy the requirement that follows from the necessity of preserving the rigorous character of a theory of knowledge as well as from the function that the latter is supposed to perform over against all the remaining investigative disciplines, the special sciences in particular. Finally, its domain of research needs to be defined so as to encompass all the factors necessary for a treatment of the problem of the "objectivity" [*obiektywnosci = Objektivität*] of knowledge in general." (p. 1)

44. ———. 1989. *Ontology of the Work of Art: the Musical Work, the Picture, the Architectural Work, the Film*. Athens: Ohio University Press.

Translated by Raymond Meyer with John T. Goldthwait.

"The studies collected in this volume were written, in their first version, in the early months of 1928, immediately after, and as an appendix to, my book *The Literary Work of Art*. However, as I prepared that book for the press in 1930, it became apparent that the volume had become too bulky, so that I had to forego publication of the appendix. In 1933 I translated a large part of the essay on "The Musical Work" into Polish and published it under the title "The Problem of the Identity of the Musical Work." The preparation of other publications at that time made it impossible for me to publish these studies before the outbreak of war in 1939. Immediately after the war, in the year 1946, I expanded somewhat the works "On the Structure of the Picture" and "The Architectural Work" and published them here in Polish. In the year 1956, when I was preparing the two volumes of my *Studies in Aesthetics* for the press, I once again expanded somewhat the study on "The Picture" and published it in Polish in the second volume, together with the study on the architectural and the musical work. In 1957 I rewrote these three works in German, but only now has the opportunity to publish them presented itself. The article on the film was first published in French under the title "Time, Space, and the

Feeling of Reality”; it appeared later in Polish in the second volume of *Studies in Aesthetics*, and is given here in exact translation.

Despite later revisions, all the fundamental ideas of the three first-named studies were already contained in the versions of 1928. They stand in a very close relation with the chief assertions of *The Literary Work of Art*, and form only an extension of the investigations of that volume. The principal problem with which I was concerned at that time was that of the structure and the mode of being of works of art as determinately constituted, purely intentional objectivities. From the first, clarification of these questions was intended as preparation for unraveling the problem of reality. The continuation of these investigations was in fact given in my work *The Controversy over the Existence of the World*, in the form of existential and formal-ontological reflections which sought to lay the foundation for working out the problem of idealism versus realism. In consequence of this aspect of my investigations of the ontology of art, as well as of the relationship of these investigations with fundamental philosophical problems, considerations of the problem of artistic or aesthetic value fell outside the focus of the work, as had also been the case in *The Literary Work of Art*. This was tied in with the conviction I held already that ontological problems must be attacked first in order to create an ontological foundation for the investigation of the problem of value. This, however, does not mean that I wished to exclude or belittle the problem of value, as was often said about *The Literary Work of Art*. Investigation of the above-mentioned problems of value, however, requires still another basis, namely, clarification of the structure of aesthetic experience, and of the cognitive acts contained in it, with reference to the aesthetic value that is revealed in aesthetic experience." (pp. IX-X, notes omitted)

45. ———. 1991. "On Translations." In *Ingardeniana III: Roman Ingarden's Aesthetics in a New Key and the Independent Approaches of Others: the Performing Arts, the Fine Arts, and*

Literature, edited by Tymieniecka, Anna-Teresa, 139-192.
Dordrecht: Kluwer.

Analecta Husserliana. Volume 33.

"1. General Definition of Translation of the Literary Work of Art

All written ("literary") works of art are characterized by the fact that they are many-layered and multi-phase due to the successive arrangement of their parts. There are at least four strata: (a) the stratum of word sounds and phonetic formations; (b) the stratum of semantic units of various orders; (c) the stratum of represented objects; and, finally, (d) the stratum of schematized aspects. According to widely known theories of language, there is no necessary connection between the sound of a word and its meaning. It seems therefore, possible to "tie" the same meaning to different word sounds. And conversely, it happens that some word sounds are "tied" to two different meanings. This constitutes the phenomenon of polysemy. It is, therefore, conceivable to substitute all actual sounds in a given work of art with the altogether different sounds taken from another language and thus produce what is commonly known as a "translation" of a work from one language to another. If in the course of this procedure the meanings in the semantic stratum remain unaltered, we usually say the translation is "faithful."

This general definition of translation and its fidelity, however, will have to be subjected to certain alternations, especially in the context of the translation of the literary work of art. It is necessary then to take a look at the structure of the literary work of art and how it differs from the work of scholarship." (p. 131)

46. Szylewicz, Arthur. 1993. "Roman Ingarden's Review of the Second Edition of Husserl's *Logical Investigations*." *Husserl Studies* no. 10:1-12.

Contains the English translation of Ingarden's *Review* at pp. 4-12.

"The review of the Second Edition of E. Husserl's *Logische Untersuchungen* was Roman Ingarden's very first publication.

At the time of its appearance, 1915, Ingarden was still studying in Freiburg, working on his Ph.D. under Husserl. What could have prompted the youthful Ingarden to write such a review? The fact that the review was written in Polish suggests that Ingarden may simply have grasped an opportunity to arouse the Polish philosophical community's interest in a work that he regarded as monumental and, perhaps more generally, to stir its awareness of phenomenology as a movement. It may be no accident that the review appears in a section of the journal entitled "Survey of Contemporary Systems". More compelling evidence for this occasional motive is the fact that Ingarden's first major publication was an extensive "introduction" to phenomenology. It was meant to remedy the deplorable state of almost total ignorance of phenomenology that Ingarden encountered on his return to Poland following the completion of his studies with Husserl." (Arthur Szylewicz, *Introduction*, p. 1)

"We may give a general characterization of the new edition of the *Investigations* by noting that, worked out as it is with the utmost scrupulousness, it offers, aside from the radical changes (whose correctness I cannot go into here), considerably greater clarity in the formulation of statements, as well as a better adaptation of expressions to the intuitively given objects under consideration.

Numerous supplementations with new analyses (such as, e.g., that of nominal presentation and its relation to the judgment, or those concerning the structure of the various forms of the matter of judgments, or the analysis of "thetic" and "synthetic" acts); a more detailed analysis of the problems previously investigated (e.g., that of the association of presentations, or the analysis of the relation between "das Bedeuten" and the intentional presentations fulfilling (*erfüllend*) it); finally, a precise distinction of the noematic and the noetic "sides" of investigation, accompanied by sharpened assertions and a greater decisiveness in resolving earlier doubts - all this shows that the years separating the two editions brought not only a clarification of the essential significance and goals of phenomenology, but also a rich harvest of newly attained

truths. The depth of these truths, and their links to the broadest horizons of philosophical problems, leaves far behind the results obtained fifteen years earlier, but this [maturation] does not emerge in fullest relief until the *Ideas Pertaining to a Pure Phenomenology*." (p. 9)

47. Ingarden, Roman. 2013. *Controversy over the Existence of the World. Volume I*. Bern: Peter Lang.

Translated and annotated by Arthur Szylewicz.

Table of Contents: Translator's Note 7; Jan Woleński: Introduction 11; Preface 19; Addendum to the German Edition 25; Chapter I: Preliminary Reflections 27; Chapter II: Partition of the Three Major Problem Groups 47; Part I. Existential-Ontological Problems of the Controversy over the Existence of the World 93; Chapter III: Basic Existential Concepts 95; Chapter IV: Provisional Survey of the Currently Feasible Variants of a Solution to the Controversy 167; Chapter V: Time and Mode of Being 227; Chapter VI: Consequences of the Time Analysis for the Solution Possibilities of the Idealism / Realism Problem 279; Appendix A - K 301-320.

"Ingarden intended to give a systematic account of realist phenomenology in a work with the general title *Spór o istnienie świata (Controversy over the Existence of the World)*. He projected five volumes, but completed only three.

Volumes I and II appeared in 1947-48. The 2nd, corrected (and supplemented by additional notes) edition of both volumes was published in 1960-61. In 1964-65, Max Niemeyer Verlag, Ingarden's life-long publisher, issued a German "translation" (by Ingarden himself) as *Der Streit um die Existenz der Welt*, Vol. I: *Existentialontologie* and Vol. II: *Formalontologie, Welt und Bewusstsein*. On Ingarden's own admission, it was not a straightforward translation, but involved considerable revision – especially in Vol. I. The same house published Vol. 3 (*Der Streit um die Existenz der Welt: Über die kausale Struktur der realen Welt*) in 1974; this volume deals with the causal structure of the real world. The last Polish edition of Vols. I and II of *Spór* appeared in 1987 in an edition that

represents a splicing by Danuta Gierulanka, Ingarden's assistant, of the Polish and German versions; her Polish translation of Vol. III of *Streit* appeared in 1981." (Jan Wolesnki, *Introduction*, pp. 13-14)

"The two volumes I hereby present to the public constitute but a fragment of the analyses needed to bring to a resolution the controversy over the existence of the world. They do, however, deal with a sphere of intimately connected problems which, when solved in a particular way, contribute to narrowing the scope of possible options relative to the mode of existence of the real world, so that the further course of research begins to be more sharply delineated. In that sense therefore the two volumes constitute a unified whole containing a closed range [Umkreis] of findings that may prove significant for future research." (From the *Preface* (1946), p. 24)

(...)

"The Material Ontology of the Real World, which had initially been envisioned as the third volume, had meanwhile to be postponed, because it turned out that a yet more extensive formal-ontological analysis of the world had to be undertaken relative to its causal structure. Thus, I spent the years 1952-54 working on a third volume that was devoted to the problem of causation. The purely ontological treatment of this problem (as a problem pertaining to the structure of the world) had also been concluded sometime toward the

end of 1954. But these ontological conclusions have to confront the findings of contemporary natural science. And this I have not yet managed to do. Hence, this volume will still have to wait for some time before being completed and published.(16) For the time being then, the first two volumes make their appearance (as three volumes in the German version) as a self-contained whole, and may they pave the way for further investigations into the entire problem-complex." (from the *Addendum to the German Edition* (1962), p. 25

"§ 81. Outlook on the Possible Ontological Resolutions of the Controversy over the Existence of the World with the Findings Obtained Taken into Account

In Sections 26 and 33 [of Vol. I] I gave a summary of the potential resolutions of the controversy over the existence of the world that are suggested on the basis of our existential-ontological investigations. Since we now have at our disposal some formal-ontological results pertaining to the world and pure consciousness, it is time to ponder the consequences that follow from these for the main issue of our controversy.

Perhaps the most important result to emerge from our formal considerations is that every world must be existentially self sufficient, but that it can at the same time be dependent on some external factor – thus, for example, on pure consciousness, provided it does not belong to the world. On the other hand, however, the thesis is important that the constituents of the world must be temporally determined

objects, and precisely therewith also autonomous – if they are to exist at all. The autonomy of the (potentially existing) world also follows from other peculiarities of its formal structure, namely from its being everywhere dense and cohesively linked internally, as well as from its being so ordered that it does not permit any completely isolated objects within its realm." The Ontological Realism of Gustav Bergmann

Introduction

"An ontology may be described as consisting of three kinds of statements: those that set the problems; those that list the kinds of entities that exist; those that show how the existents solve the problems. Ontologies may thus differ in different ways. The most decisive way concerns the kinds of entities deemed to exist. With respect to this way, there are but two types of ontology. One is lavish, cluttered; the other, frugal, sparse. The ontologies of Plato, Meinong, and Frege are lavish; those of Hume, Brentano, and Wittgenstein are frugal.

Gustav Bergmann has propounded both types of ontology in the course of his thirty years of philosophizing. The Bergmann of *The Metaphysics of Logical Positivism* (1954) and *Meaning and Existence* (1959) propounds a frugal ontology. The Bergmann of *Logic and Reality* (1964) and *Realism: A Critique of Brentano and Meinong* (1967) propounds a lavish ontology. In a way of speaking that Bergmann himself has used, the world of the early Bergmann is a desert, the world of the later Bergmann a jungle. In a way of speaking that is suggestive, speculative, had the early Bergmann written *Realism*, he would have dedicated it to Brentano rather than to Meinong, as did the later Bergmann.

The difference between the ontologies of the two Bergmanns is great, though it does not greatly strike one in reading Bergmann's *Essays*. One is rather struck, on the one hand, by his unswerving commitment to the so called ideal language method of philosophizing and, on the other, by his persistent concern with the solutions to, and dialectical connections amongst a seemingly limited

number of problems-individuation, universals, necessity, and intentionality. Bergmann's Essays thus appear to be a set of variations on several ontological themes. And at first glance the variations are slight enough to cause one to overlook the amazing difference between the ontologies struck by the early and later Bergmanns. Furthermore, Bergmann himself tends to minimize the difference. He does so, I suspect, first, because he naturally stresses how his later views evolve naturally from 'his earlier ones and, second, because he tries to mediate between the two Bergmanns, telling the early one that the later's ontology is less cluttered than one might initially think. The later Bergmann seems somewhat uncomfortable in the jungle into which he has led himself. Be that as it may, in Bergmann's Essays the difference between the two Bergmanns is muted, obscured, by Bergmann's constant and conspicuous use of the ideal language method, his persistent preoccupation with the same problems, and his reluctance to dwell on and dramatize his evolution from frugality to lavishness.

The emergence of the later Bergmann is ironic. The lavishness is the outgrowth of his method, the very method developed by the early Wittgenstein as a device for solving frugally the problems Frege solved lavishly. The emergence of the later Bergmann is also, and more significantly, inevitable. The ideal language method dictates a lavish ontology. Upon realizing that, Bergmann abandoned frugality and clung to the method. In contrast, Wittgenstein, upon realizing the same thing, abandoned the method and clung to frugality." (pp. 38-39)

Bibliography

A complete and updated bibliography of Gustav Bergmann (128 titles) and the studies about him (107 titles) is available in *Rivista di Estetica*, 25, 2004 pp. 113-126; I give only the most relevant publications.

1. Bergmann, Gustav. 1954. *The Metaphysics of Logical Positivism*. New York: Longmans, Green & Co.

Second edition: Madison, University of Wisconsin Press, 1967.

Contents: Preface V; Preface to the Second edition IX-X; 1. Logical Positivism (1950) 1; 2. Semantics (1950) 17; 3. Logical Positivism, language, and the reconstruction of metaphysics (1953) 30; 4. Two cornerstones of Empiricism (1953) 78; 5. Two types of linguistic philosophy (1952) 106; 6. Bodies, minds, and acts (1952) 132; 7. Remarks on Realism (1946) 153; 8. Sense data, linguistic conventions, and existence (1947) 176; 9. Russell on particulars (1947) 197; 10. Professor Ayer's analysis of knowing (1949) 215; 11. On nonperceptual intuition (1949) 228; 12. Conditions for an extensional elementaristic language (1948) 232; 13. A note on ontology (1950) 238; 14. Logical Atomism, elementarism, and the analysis of value (1951) 243; 15. Comments on Professor Hempel's "The concept of cognitive significance" (1951) 255; 16. The identity of indiscernibles and the formalist definition of "identity" (1953) 268; 17. The problem of relations in classical psychology (1952) 277; 18. Ideology (1951) 300; Author's note 326; Index 328-340.

"This is not a collection of my papers on first philosophy but a selection from them. Nor is the order in which they are arranged chronological. This requires some comment. The papers fall into three groups. Taken together, the first six, of most recent origin, provide an outline of the views I now hold. The second group consists of the next three, which are the earliest included in this volume. Together with three other still earlier ones which I have excluded, they form a unit centered around the realism phenomenism issue. The excluded papers are "Pure Semantics, Sentences, and Propositions" (*Mind*, 53, 1944), "A Positivistic Metaphysics of Consciousness" (*Mind*, 54, 1945), "Undefined Descriptive Predicates" (*Philosophy and Phenomenological Research*, 8, 1947). I omit them because for the most part they merely say very badly what I have since said again, a little less badly, in the six essays of the first group. I mention them because there I first struck out on my own, trying to free myself from the influence of Carnapian positivism

though not yet, alas, from its apparatus. Having said that much, as I believe I should, I wish to add, as I believe I also should, that this by now radical dissent has not at all affected either my gratitude or my admiration for Carnap. I still think of him as the outstanding figure in a major phase of the positivistic movement. The third group consists of all the remaining essays, some of them very short. These are in the main elaborations of themes struck in the first nine pieces. The arrangement within this last group represents a compromise between their subject matter and the order in which I remember having written them. The concluding essay differs from the rest. Quite nontechnical, it touches at least indirectly on my philosophy in that broader sense in which everyone who is not himself an analytical philosopher speaks of a man's philosophy. Thus it is, perhaps, not out of place at the end of a volume that is otherwise rather technical.

Aside from a few editorial changes I have left the papers as they were originally written."

From the Preface to the Second edition: "The logical positivists of the Vienna Circle were my first teachers. Thus I was faced with an unpalatable choice. Dialectically, metaphysical materialism always seemed and still seems to me the greater evil. (Scientific materialism is but common sense.) So I began my philosophical career as a reluctant phenomenalist in the style of the Circle. Now I am, and have been for some time, a realist of the phenomenological variety. The break occurred in the early fifties, when I proposed an analysis of the act. This book, my first, a collection of essays originally published in 1954, reflects the struggles which led to that break. Much of it I now reject. Yet there are also many analyses, of issues and of movements, including pragmatism, logical positivism, and the so-called linguistic philosophy, which I still think are right.

Two of the essays introduce the act. Another, about semantics, mentions the meaning nexus which has come to play so great a role in my thought. The essay on the problem of relations in classical psychology first manifests what has since become one

of my major concerns. The concluding piece, on ideology, has been well received by many social scientists.

By now logical positivism belongs to history. Yet it was a vigorous movement; some of its members were brilliant; its contribution to the philosophy of science remains most valuable. From the record of such a movement much can be learned. This book, in its own peculiar way, is part of the record. Thus, since it is still in demand although it has been out of print for some time, a new edition seems justified." (From the Preface)

2. ———. 1957. *Philosophy of Science*. Madison: University of Wisconsin Press.
3. ———. 1959. *Meaning and Existence*. Madison: University of Wisconsin Press.

Contents: Preface V-X; 1. Intentionality (1955) 3; 2. The revolt against Logical Atomism (1958) 39; 3. Analiticity (1958) 73; 4. Particularity and the new nominalism (1954) 91; 5. (with Herbert Hochberg) Concepts (1957) 106; 6. Elementarism (1957) 115; 7. Individuals (1958) 124; 8. Sameness, meaning, and identity (1958) 132; 9. Professor Quine on analiticity (1955) 139; 10. Some remarks on the ontology of Ockham (1954) 144; 11. Russell's examination of Leibniz examined (1956) 155; 12. Some remarks on the philosophy of Malebranche (1956) 189; 13. Frege's hidden nominalism (1958) 205; 14. Some reflections on time (1958) 225; Author's note 265; Index 267-274.

"The main theme of this book is the analysis of mind. But even the basic problems fall into each other's scopes. Thus other themes had to be sounded, some of them rather fully. Foremost among these is the basic problem of ontology, that is, the search for a complete inventory of the several kinds of existent. An analysis which denies mind the status of an existent, in the full ontological sense of 'existent', is patently inadequate. That shows the connection. Yet, all attempts to place mind in any of the less extravagant ontological schemes available led to consequences which flaw the over-all pattern. That shows the difficulty. The book propounds how I propose to conquer it.

The characteristic feature of minds is their intentionality. That makes "Intentionality and Ontology" an accurate two-word title. "Meaning and Existence" sounds less formidable. Ontology asks what exists. This justifies the substitution of 'existence' for 'ontology'. That of 'meaning' for 'intentionality' will be justified in a moment.

What a philosopher takes a question to be as well as the sort of answer (rather than, which specific answer) he considers a (possible) solution depends on his conception of the philosophical enterprise. Or, what amounts virtually to the same thing, it depends on his method. That is why philosophers always were method conscious. At the beginning of this century analytical philosophy took what has been called the linguistic turn. The issue, and it still is an issue, is one of method. That is why our generation is even more method conscious than some of its predecessors. My work is in the linguistic stream. Inevitably, therefore, the basic theme of method runs through the whole book. One essay develops it in considerable detail.

The linguistic stream has several currents. I philosophize by means of one of the schemes known as ideal languages. My being in this current in part determines the content of the book. Analyticity, every one agrees, is a very fundamental problem. For a practitioner of my method it is basic. (I am even prepared to grant that the adequate explication of analyticity is the one and only major task for which the method is indispensable.) Moreover, there is a very close connection between the problem of analyticity and the analysis of mind.

To whatever current a linguistic philosopher may belong, the analysis of mind is for him virtually indistinguishable from that of the various ontological and logical aspects of meaning. (This justifies the substitution of 'meaning' for 'intentionality' in the two-word title.) If he belongs to my current, then the core of the problem is to construct an ideal language into which the relevant uses of 'to mean' can be adequately transcribed. I propose such an ideal language. Not surprisingly, for anyone familiar with the course of analytical philosophy in this century, it turns out that this proposal requires radical re-examination

and eventual modification of the classical analysts' explicit or implicit notions of analyticity. The connection of my main theme with this major subtheme is thus close indeed.

(...)

This is the second essay collection I publish. *The Metaphysics of Logical Positivism* (1954) was the first. Since the public for anything of this sort is rather limited, quite a few prospective readers of the second will have either read or at least heard of the first. I shall therefore answer a question which is likely to occur to such readers. What, if any, is the connection between the two books? The central thesis of this book is the proposed analysis of the act (I use the classical term). Its central idea is clearly stated in the first book. However, there is an important difference between a full statement and its central idea, just as there is such a difference between even a full statement and the exploration of its consequences. (Remember what was said about the scopes of philosophical problems.) In the Preface to the first book I promised to apply myself to the tasks I had thus set myself. This book fulfills that promise. In this respect, and I believe also in some others, the first book stands to the second as flower stands to fruit. Whether the fruit was worth gathering is not for me to say." (From the Preface)

4. ———. 1964. *Logic and Reality*. Madison: University of Wisconsin Press.

Contents: Preface VII-VIII; 1. Acts (1960) 3; 2. Ineffability, ontology, and method (1960) 45; 3. Generality and existence (1962) 64; 4. Meaning (1962) 85; 5. Duration and the specious present (1960) 98; 6. Physics and ontology (1961) 108; 7. Ontological alternatives (1963) 124; 8. Inclusion, exemplification, and inherence in G. E. Moore (1962) 158; 9. Strawson's ontology (1960) 171 10. The ontology of Edmund Husserl (1960) 193; 11. The glory and misery of Ludwig Wittgenstein (1961) 225; 12. Stenius on the *Tractatus* (1963) 242; 13. Synthetic *a priori* (1963) 272; 14. Realistic postscript 302; Author's note 341; Index 343-355.

"Some philosophers never change their minds. Those who do are of two kinds. One kind vacillates, often abruptly, between

two extremes such as, say, phenomenism and materialism. With the other kind the changes are gradual and show a direction. I belong to the latter kind.

This is my third book in first philosophy. In *The Metaphysics of Logical Positivism* (1954) the major concern is with epistemology; the implicit ontology is a reluctant phenomenism. Since the act is recognized, the phenomenism is atypical. Recognition, though, is not enough; it merely opens the way. The task is to find a dialectically adequate ontological assay of the act. If this decisive step has been made, then, structurally, realism has been achieved. In *Meaning and Existence* (1960) ontology has come to the fore; structurally, realism is achieved; much of the phenomenist debris is cleared away. In this book the realism is explicit and fully articulated. In the concluding essay the last piece of debris is buried. That leaves no doubt about the direction of the several changes. They took me over twenty years. The reprieve, even if only conditional, is welcome.

One who has struck out on his own, either ignoring or challenging the fashions of the day, will not, if he is sober, be certain that everything he has gradually come to believe is true. I am very sober. Yet there is one belief I have come to hold very firmly. One cannot arrive at a dialectically adequate realism without recognizing that the world's form exists. Logic is but a reflection of the world's form. Hence, one cannot fully articulate one's realism without ontologizing logic. That accounts for the title of this book and, more importantly, for its thematic unity. The belief I so firmly hold is the theme. The fourteen essays are fourteen variations on it." (From the Preface)

5. ———. 1967. *Realism. A Critique of Brentano and Meinong*. Madison: University of Wisconsin Press.

Contents: Preface VII-VIII; Book One: Facts, things, ideas; Part I: General ontology; One: Facts and things 3; Two: Two fundamental ties 22; Three: Connections 42; Four: Parts 71; Five: Perfect particulars and universals 85; Six: Substances; Part II: Representationalism; Seven: Introductory reflections

125; Eight: Cores and fringes 138; Nine: Three schemata 155; Ten: Perception 180; Eleven: Three predicaments 195; Book Two: Brentano and Meinong; Part III: Brentano; Twelve: Introduction 221; Thirteen: The truncated world 238; Fourteen: Minds 264; Fifteen: Double judgments 284; Sixteen: Existence, truth, evidence 302; Seventeen: Places, moments, selves 320; Part IV: Meinong; Eighteen: The truncated world 335; Nineteen: Minds 374; Twenty: Earlier stages 399; Twenty-one: Flaws and gaps 399; Bibliographical note 445; Index 447-458.

"Freud said of *The Interpretation of Dreams* that it was the sort of book a man writes only once in his life. This book is of that sort. It is also very long. Such a book ought to speak for itself. So I send it into the world without any introduction except for one remark about the way it is written.

There are two kinds of philosophical criticism, and, perhaps, only two kinds of writing in philosophy. The inductive critics try at the same time to make the cross and nail their intended victim onto it. Those who write deductively first make the cross and, while making it, affect, except for an occasional glance, an almost studied unconcern for the victim. I am virtually incapable of writing inductively. The best I can do, therefore, is to do without disguise, pretext, or apology, the one thing which I may hope not to do too badly. This book has four parts. The first is a short treatise on general ontology. The second expounds the dialectics of representationalism. The third deals critically with Brentano; the fourth, with Meinong. The criticism in the last two parts requires a minimum of exposition. But both criticism and exposition are highly selective." (From the Preface)

6. ———. 1992. *New Foundations of Ontology*. Madison: University of Wisconsin Press.

Edited by William Heald.

Contents: Foreword by Edwin B. Allaire IX-XII; Editor's Note XIII-XX; Editor's introduction 3; 1. Simples and canons 43; 2. Facts and modes 61; 3. Diversity and order 101; 4. Functions and analiticity 134; 5. Thought and language 201; 6. Classes

239; 7. The Linguistic Turn contained 317; Glossary 357; Index 369-372.

"During the last two decades of his life—from the publication of *Realism* in 1967 until his death in 1987 - Gustav Bergmann published only five essays. One, 'Diversity,' his presidential address to the Western Division of the American Philosophical Association, appeared in 1968; the other four, between 1977 and 1981.

In those decades Bergmann worked as hard and as steadily as he ever had; and he was a hard worker indeed. In the twenty-five years prior to *Realism*, Bergmann published over a hundred essays, many of which are contained in four essay collections, and *Philosophy of Science*.

In his presidential address Bergmann made known his dissatisfaction with certain aspects of his ontology, in particular his assays of the facts expressed by universal and existential statements. (See 'Generality and Existence,' *Theoria*, 28, 1962.) He thus set about to rethink his system. *New Foundations of Ontology* is the result.

The manuscript seems to have been begun sometime in 1974 and completed in late 1975. Bergmann decided to delay its publication: he had reservations about the penultimate chapter, which deals with classes and arithmetic. He never returned to the manuscript per se. Instead, he led himself into the depths of set theory, a subject he had once known well. (Bergmann earned a PhD in mathematics and from 1928 to 1935 published eight papers in mathematics proper.) " (From the Foreword)

7. ———. 2003. *Collected Works. Vol I: Selected Papers I*. Frankfurt am Mein: Ontos Verlag.

Edited and with an introduction by Erwin Tegtmeier.

Contents: Introduction 9; Remarks on Realism 18; Sense data, linguistic conventions, and existence 41; Russell on particulars 62; On nonperceptual intuition 80; A note on ontology 84; Bodies, minds, and acts 89; Two types of linguistic philosophy 110; The identity of indiscernibles and the Formalist definition of identity 136; Logical Positivism, language, and the

reconstruction of metaphysics 145; Particularity and the new Nominalism 193; Some remarks on the ontology of Ockham 208; Professor Quine on analyticity 219; Intentionality 224; Russell's examination of Leibniz examined 258; The revolt against Logical Atomism 292; Frege's hidden nominalism 324; Sameness, meaning, and identity 344-350.

8. ———. 2003. *Collected Works. Vol II: Selected Papers II*. Frankfurt am Mein: Ontos Verlag.

Edited and with an introduction by Erwin Tegtmeier.

Contents: Introduction 7; Acts 13; Ineffability, ontology, and method 55; Ontological alternatives 75; Inclusion, exemplification, and inherence in G. E. Moore 109; Strawson's ontology 121; The ontology of Edmund Husserl 145; The glory and misery of Ludwig Wittgenstein 177; Stenius on the *Tractatus* 195; Synthetic a priori 225; Realistic postscript 255; Diversity (1968) 295; Sketch of an ontological inventory (1978) 309; Notes on ontology (1981) 321; Notes on the ontology of minds (1981) 345-370.

2. Bonino, Guido. 2007. "Why there are no facts in Meinong's world (according to Gustav Bergmann)." *Meinong Studies / Meinong Studien* no. 2:239-275.

"The paper deals with Gustav Bergmann's analysis of Meinong's ontology, carried out in *Realism: A Critique of Brentano and Meinong* (1967); more specifically it aims at making it clear in what sense Meinong can be regarded as a "reist". Reism is characterized by Bergmann as a position -- largely dominant in the philosophical tradition -- which

(i) neglects the ontological category of facts;

(ii) neglects or downplays nexus (and more in general subsistents);

(iii) tends to consider all entities as things or thing-like.

As a by-product, some light will be thrown on the sense of Bergmann's ontological enterprise."

The limits of ontological analysis by Panayot Butchvarov 3;
Bergmann's ontologies by Edwin Allaire 38; To Gustav Bergmann: a humble petition and advice by Henry B. Veatch 65;

II: Ontological problems

Bergmann's ontology and the Principle of Acquaintance by Reinhardt Grossmann 89; Consciousness by Timothy L. Sprigge 114; Time, substance, and analysis by Laird Addis 148; Intentions, facts, and propositions by Hebert Hochberg 168;

III. Language, logic, and the philosophy of science

Seeing, seeming, and sensing by Wilfrid Sellars 195; Belief and error by Keith Lehrer 216; Bergmann on the analytic-synthetic

distinction by Alan Hausman 230; The problem of color incompatibility by Erik Stenius 245; Perspicuous languages by Robert Ackermann 264; Why I am not aware of your pain by Fred Wilson 276;

Bibliography: Works by Gustav Bergmann 301

Index 311-314.

"The initial plans for this volume in honor of one of the world's most distinguished philosophers were conceived four years ago. After much labor, and with the patience and assistance of all who participated, we are happy to have brought it at last to birth.

It may seem premature to some, at this time, to publish a volume of essays on Professor Bergmann's philosophy, since his recent work has not yet been published. But the widespread interest in many countries in his work, and the growing number of philosophers -- even those who disagree with him -- who have followed his philosophical pursuits and have written extensively about them, makes it fitting to present a collection of critical studies now." (from the Preface).

5. ———. 1994. "From Carnap's Vienna to Meinong's Graz: Gustav Bergmann's ontological odyssey." *Grazer Philosophischen Studien* no. 48:1-50.

"The development of the systematic ontology of Bergmann's posthumous 1992 work *New Foundations of Ontology* from its roots in his early criticisms of R. Carnap's work on semantics to his acceptance of fundamental Meinongian ideas, is traced, critically examined and compared to views of others, such as G.E. Moore, B. Russell, W.V. Quine, and J. Searle. The discussion, focusing on main themes of his final metaphysical system, deals with problems posed by universals and particulars, predication and the Bradley "paradox", facts, truth, intentionality and non-existent objectives, classes and the

membership relation, logic and the analytic-synthetic distinction, arithmetic and logicism, ontological categories and canons, modalities, internal relations, and the question of the phenomenological ground of ontological claims. Some of the critical analyses are developed into alternative analyses."

7. ———. 2001. *The Positivist and the Ontologist. Bergmann, Carnap and Logical Realism*. Amsterdam: Rodopi.

Contents: Preface V-VI; 1. From Positivism to metaphysics: Bergmann's critique of Carnap's semantics 1; 2. Reism, ontological types and *Aufbau*-type ontological constructions 33; 3. Bergmann's *Realism* and the critique of Bundle and Trope ontologies 57; 4. Carnapian consequences: Realism and semantic refutation of Realism 105; 5. Bergmann's Reism: Brentano's and Carnap's revenge 147; 6. Relational order, the Russell-Wittgenstein dispute and Meinongian Realism 175; 7. Negation, quantification and intensional isomorphism 217; 8. The phenomenology and ontology of logic, classes and modality 233; 9. Dispositions and laws of nature: Hume, Husserl and the *New Causal Realism* 289; 10. Avoiding absurdity: Physical Realism, Phenomenalism and Mindless Materialism 319; 11. Extensions, intensions and Carnap's critique of reference 349; 12. Reference reconsidered 371; 13. Logical truth, logical paradoxes and Logical Realism 393-400.

Preface: "Gustav Bergmann's remarkable intellectual journey, beginning as one of the youngest members of the Vienna Circle, and ending, in Hector Castaneda's judgment, as 'the foremost ontologist of the decade' focused on three metaphysical issues that he continuously discussed for thirty years: the problems of individuation, of universals, and of intentionality. Bergmann's turn to metaphysics began with his 1947 paper 'Russell on Particulars,' though he had long insisted that his later concerns with the metaphysics of intentionality, expressed in a 1955 paper on intentionality, are already present in two criticisms of Carnap's semantics published in 1944 and 1945. But a careful reading of the earlier papers, which Carnap (in a letter to

Bergmann in the Bergmann archives at the University of Iowa Library) found to be 'mostly Chinese,' show that Bergmann, in 1944 and 1945, is writing as an extreme early Carnapian positivist. In fact he is criticizing Carnap for moving away from positivism and towards a kind of metaphysical realism, by introducing a designation relation between linguistic items and non-linguistic reality. Irrespective of when his turn to metaphysics took place, it was unique among the positivists that emigrated to the United States and England.

This book will trace lines in Bergmann's development from his early philosophical writings, in the mid 1940s, to what I have called, in one chapter, his 'middle phase,' epitomized in his long and complex book, *Realism: A Critique of Brentano and Meinong* of 1967, and finally to its culmination in his last work in three final published papers and a book manuscript, *New Foundations of Ontology*, that was posthumously published in 1992 (and from which the final papers were obviously taken). It will also relate them to various themes in Carnap's work in semantics of the 1940s. But, as I am mainly concerned with the basic philosophical issues raised, the book is a study of various attempts to deal with questions posed by the relation between thought and language, on the one hand, and the objects of thought and the referents of linguistic items, on the other. Thus I will be setting out critical assessments of the work of philosophers other than Bergmann and Carnap, including a number of other major figures on the contemporary scene, and of the recent past, in attempting to arrive at a viable realistic ontology that I have called Logical Realism. The basic themes set forth owe much to Bergmann, Carnap, Moore, Russell and the 'early' Wittgenstein. It will also be clear that the analyses set forth owe much to what has come to be called the Austrian Tradition, and the "realism" many of its members espoused, especially Meinong. It is no accident that the early figures of the 'analytic' tradition, Russell, Moore and Wittgenstein, were heavily influenced by the Brentano school -with Russell and Moore reading the works of various members of that school at the turn of the century. Russell, as is well known, wrote extensive critical, but appreciative, studies of Meinong and

other members of the Graz school and was influenced by what he read, in spite of being mostly known in that connection for his widely discussed criticisms of Meinong. Moore's development of his philosophy of mind, with its focus on 'mental acts,' clearly derived this theme from his reading of the Austrians, and he, in turn, influenced Russell, who did not abandon mental acts until the years 1919-1921. One no longer needs to comment on Wittgenstein's connection to Austrian thought of the period.

Bergmann was a unique figure in being the only one of the positivists of the Vienna Circle to recombine, in a most fruitful way, the metaphysical themes set forth by Russell and Moore, in what Russell had termed the 'revolt against idealism,' with fundamental ideas derived from the logical positivism of the Vienna Circle, influenced by Wittgenstein and Russell, and important ideas from the Brentano school - particularly Brentano's philosophy of the act, Meinong's theory of objects, and Husserl's phenomenology. In this he would be a remarkable contemporary philosopher and, as Castaneda noted, play a distinctive role on the philosophical scene from the early 1950s thru the 1970s."

exemplification 173; 10. Luc Schneider: On Ties and Copulae within the Ontological Square 193; 11. Bruno Langlet, Jean-Murice Monnoyer: Gustav Bergmann et les complexions meinongiennes 209-235.

"The essays collected in this volume were read at the *Gustav Bergmann (1906-1987) International colloquium*, held in Aix-en-provence, from December 9th to December 11th 2006, for the centennial anniversary of Bergmann's birth. The conference was organized within the framework of the *Séminaire de Métaphysique* (SEMa), which is hosted by the IHP (*Institut d'Histoire de la Philosophie*). The (non-official) purpose was to promote some liberal exchanges and debates between some Bergmann's interpreters (American and European) focusing on the "actuality" of his thought; the official one was to greet the first meeting devoted to this philosopher in France, where he is still widely little-known. We publish some of these contributions in French, with the hope of a better understanding of the great influence his philosophy should exert in the next future." (p. 1).

Justus Buchler and the Metaphysics of Natural Complexes

Introduction

"Justus Buchler is an American philosopher, long well known as a scholar and teacher and now becoming more widely recognized as the author of a new metaphysics. Utilizing his own system of categories, Buchler has given us an analysis of the basic traits of nature and man, experience and judgment, method and meaning, art, science, and philosophy that differs strikingly from the analyses provided or presupposed by other philosophers. There are others who share some of his commitments or take similar positions on particular topics, but Buchler's major categories are distinctively his own, and his systematic outlook (the position I have called "ordinal naturalism") is without precedent in the history of philosophy." (p. 11)

(...)

Buchler calls the ontology that determines his view of nature a 'metaphysics of natural complexes.' (I shall use the word 'ontology' to refer to metaphysical systems of the highest level of generality, as contrasted with metaphysical theories of lesser scope, such as a metaphysics of morals or Buchler's 'metaphysics of utterance.') His treatment of such topics as experience, knowledge, meaning, truth, inquiry, and art reflect the same metaphysical stance as his ontology and utilize some of the same generic concepts, and he sometimes refers to his entire system by the same name. The root concept of Buchler's ontology is the concept of 'natural complex.' While it retains something of its ordinary sense, within the framework of Buchler's metaphysics this term takes on a special meaning and is his most general ontological category. Rather than seeing nature to be

composed of substances, events, processes, matter, spirit, or any other specific type of entity or being, Buchler finds all such categories too narrow. Given the other categories and principles of his ontology, he maintains that there is nothing that cannot be accurately construed as a natural complex. The term is applied by him to attributes as well as entities, to ideas and terms of discourse as well as bodies, human individuals, and the constituents of human experience.

In the language of Buchler's metaphysics, every natural complex is an order. This word, too, has a technical sense for him, resting upon his systematic concepts of 'trait' and 'relation.' All of these will be discussed at length in the chapters of this book devoted to Buchler's ontology. The concept of an order, however, must be introduced here to convey some of the features of "s version of naturalism. Roughly, an order is an organized multiplicity: a complex distinguishable as a unity in virtue of the pattern of relatedness among its components. In "s systematic usage, the terms 'natural complex' and 'order' are not completely synonymous: a natural complex is also, in another respect, a trait. But the terms 'complex' and 'order' are coextensive, and Buchler calls the central principle of his metaphysics 'the principle of ordinality.' Thus his system may also be termed a 'metaphysics of orders' or 'metaphysics of ordinality,' or, as some have called it, an 'ordinal metaphysics,' and his outlook may be characterized as an 'ordinal naturalism.' The principle of ordinality that governs Buchler's system is inseparable from his concept of a natural complex, and is the fullest expression of what it means to be a natural complex. For reasons that will later be made clear, Buchler denies that complexes can be composed of simples. Briefly and, perforce, inadequately stated, the principle of ordinality asserts that every complex must be constituted by other complexes, and also that every complex must be a constituent of some other complex or complexes. The term 'order' refers to a complex viewed as having constituents. For a complex viewed as a constituent of an order, Buchler uses the term 'trait', giving to this term a generalized sense which makes words that might be considered synonymous with it (such as 'characteristic' or 'attribute') only types of trait." (pp. 21-22)

Abstract: "The principles of ontological parity and ordinality have distinct functions in Buchler's ontology. Ontological parity could be independently subscribed to, whereas ordinality signals the positive conception of the nature of reality as irreducibly complex or indefinitely related, which Buchler's metaphysical system seeks to articulate. Both principles inform Buchler's system, but each has a distinctive function. They are not, I suggest, necessarily at odds with one another, as some critics claim. I do identify several difficulties that follow from (1) the level of generality claimed by Buchler and (2) the claim of *irreducible* complexity or indefinite relatedness."

Roman Suszko and the non-Fregean Logics

Introduction

"I. Roman Suszko (9.11.1919, Podobora – 3.06.1979, Warsaw) was one of the most fascinating personalities in Polish academic community after the Second World War and one of the most outstanding logicians of the time. He was above all a scientist but he also participated in academic life. He was Dean of the Faculty of Philosophy at Warsaw University for two terms of office. He studied abstract problems of logic, but also played a part in the satirical film *Rejs* [The Cruise] directed by M. Piwowski.

Suszko was involved in various scientific problems, for example: logical syntax of natural language, liar antynomy, logical probability; but two of his achievements have the greatest value for philosophy of science, i.e., diachronic logic and non-Fregean logic.

Like Ferdinand de Saussure, who, in his monograph *Cours de Linguistique Générale* (Lausanne 1916), made a distinction between synchronic and diachronic linguistics, Suszko draws a distinction between synchronic and diachronic formal logic. Diachronic formal logic was for Suszko the application of the models theory to formalized languages in order to describe the abstract structure of the development of knowledge. Non-Fregean logic, on the other hand, was a term used by Suszko to refer to classical logic enriched by identity connective and quantifiers binding sentential variables. The identity connective joins two sentences into a true sentence when sentences describe the same situation. It turns out that nonFregean logic is such a general logical calculus that the classical predicate calculus, classical sentential calculus, Łukasiewicz's finitely-many-valued logics and some modal systems are particular

cases of non-Fregean logic. Because of some interpretational difficulties concerning the notion of situation, the logic has not gained among logicians the regard which it deserves.

(...)

In 1966, via Bogusław Wolniewicz's monograph *Things and Facts, Introduction to the First Philosophy of Wittgenstein* [written in Polish], Suszko became acquainted with Wittgenstein's metaphysical views included in *Tractatus Logico-Philosophicus*. Since that moment, a new, so-called non-Fregean period in Suszko's work began. In his *Tractatus*, Wittgenstein expressed his belief that names designate objects and sentences describe situations. According to Suszko, in order to formulate adequate statements concerning objects as well as situations in a formalized language, there must be two types of variables in that language: nominal variables running through the universe of objects and sentential variables running through the universe of situations.

Then, according to the famous principle No entity without identity, Suszko introduced into the language of classical logic the identity connective which is used to mark that two sentences describe the same situation. Such logical calculus was termed by Suszko non-Fregean logic. The name "non-Fregean logic" originates from the fact that it is not an assumption of this logic that the universe of sentential variables, i.e. the universe of situations is two-elements set. Non-Fregean logic is the most general extensional and logically two-valued logical calculus. Its logical two-valuation consists in that each sentence of the language for which this logic is valid, for all interpretations allowed by this logic, is either true or false. Particularly, the assumptions of this logic are classical laws: the law of the excluded middle and the law of non-contradiction. Extensionality, on the other hand, consists in that what any complex expression relates to is marked by the particular constituent expressions of this complex expression. The generality of this logic consists among others in that the principles of that logic do not put any limits on universes, and that the universe of nominal variables is not empty and the universe of sentential variables has at least two elements. The principles of non-Fregean logic require only consequent application of symbols not leading to non-contradiction,

while they do not require us to assume any equality which does not result from previously assumed identities.

This logic has interpretations by which it is entirely characterized from the formal point of view and which may be applied to constructing the models of the theory of situations.

In my opinion, the formalization of all ontologies assigning sentences semantic correlates that are different from their logical values and not changing, in any essential aspect, the intuition that they are the correlates of sentences and not of names, requires non-Fregean logic or, at least, a theory based on it. However, non-Fregean logic is a logical calculus and - just as any logical calculus - it can be developed independently of its origins and philosophical motivations and without making any assumptions concerning reality. Non-Fregean logic does not establish univocal meanings of such terms as "situation" and "object", just as geometry does not establish univocal meanings of such terms as "point" or "straight" line and despite it geometry is applied to the description of the world. What is the universe of nominal and sentential values depends on the application. Similarly, in geometry or the standard models theory, it is the particular application that determines what the point or the object is.

The non-Fregean period was the most creative time in Suszko's life: during that period he wrote 36 scientific papers, all of which concerned non-Fregean logic (compared to the total of 85 publications which he wrote in his lifetime), he supervised 7 doctoral dissertations during that time, 5 of which concerned non-Fregean logic." (pp. 153)

(...)

In science, it happens that an accurate description of certain problems goes beyond the potentiality of natural language. For example, the notion of continuity could not be precisely expressed until the quantifiers were introduced. According to the standards of contemporary logic, in a given formalized language we consider as many categories of beings as many types of variables there are in a given language. In a language in which there appear only various non-sentential variables, we cannot, in turn, formulate philosophical

statements concerning the world as a whole. According to Suszko, the invention in the history of human thought of such conceptions as Fregean sentential logic, Leśniewski's Protothetics and Wittgenstein's Tractatus are important, among others, as their formalized versions require languages with sentential variables contrary to theories known from mathematics and other sciences, which require only various nominal variables. Suszko, while inventing non-Fregean logic, had apparent semantic and philosophical reasons, two of which are, in my opinion, most important:

(1) the conviction that reality should be regarded not only as a universe of objects possessing certain features and connected with certain relations, but, for more complete description of the world, reality should be also regarded as a universe of situations some of which at least are describable by the sentences of a certain language;

(2) ontological propositions can be divided into two types: a) those which are manifested in logical syntax and semantics of a language, particularly in relationships of logical consequence holding in a given language, b) those which are explicitly expressed in a object-language and which are ontological propositions that are not of metatheoretical nature.

According to Suszko, in the language of non-Fregean logic we can precisely formulate theorems concerning the world perceived after Wittgenstein as the whole of facts." (pp. 158-161)

From: Mieczyslaw Omyla, "Roman Suszko. From Diachronic Logic to Non-Fregean Logic", in: Wladyslaw Krajewski (ed.), *Polish Philosophers of Science and Nature in the 20th Century*, Amsterdam: Rodopi 2001, pp. 153-162.

An overview of Suszko's thought

"In Roman Suszko's logical writings there are to be found many remarks and reflections on the idea of logic which is closely related to his work in formal logic. Though the scope of this paper makes it impossible to deal with them all, I would like nevertheless to draw the reader's attention to some of Suszko's views concerning the philosophy of logic. The aim of this study is to call the reader's

attention to the most important of them. They may be presented in a knowing way:

1. The subject-matter of logical investigations are any conceptual structures emerging from the process of world cognition. The totality of such structures Suszko calls logical material. It is linguistic in nature and given in the shape of scholarly papers, philosophical treatises and, more loosely, in disputes and lectures of various sorts. The state of logical studies at any time is largely determined by the logical material available as well as the research tools at hand, for logical structures must be based upon the structures originating in direct world cognition. Among various research tools used for studying logical material Suszko -- in agreement with the trends of contemporary logic -- clearly gives priority to mathematical instruments, especially to those of the set-theoretical and algebraic type.

Logic is for Suszko closely linked with epistemology and in [5], [6] he even calls it part of epistemology or even formal epistemology. In [1] Suszko writes: "Science, the progress of cognition and natural language which plays an important part in it are the points reference for investigations in formal logic."

2. The intersubjective sense of the expressions of any language L stems from the fact the expressions of this language refer to the same reality R and that they stand in semantic relations to certain appropriate fragments of R . The understanding of expressions by language users is therefore, according to Suszko, derivative with respect to semantic relations, which hold between language and its objective sphere R . In order to study semantic relations of a language one must formalize it, and the reality must be structured within a certain framework, which is, set-theoretical in character. In logic, theory of sets and relations is usually assumed as formal theory of reality.

Set theory was even called by Suszko formal ontology, although in [4] he allows for ontologies other than set-theoretical to be assumed in semantics. However, he considers set theory as the most natural ontology for investigations within formal logic. Suszko thinks that in logical syntax two kinds of investigations can be distinguished: the classificatory-analytical and the constructive ones. The classificatory-

analytical investigations are a preliminary phase for the construction of formalized languages. In [2] is presented a method of classificatory-analytical investigations, stressing the semantic aspect of the structural investigations conducted in logical syntax. In logical syntax only those kinds of expressions are distinguished whose syntactic role is closely connected with their semantic function. The simplest of such expressions are called-by Suszko "words in the logical sense". Words in the logical sense include according to Suszko: variables of all sorts-sentential as well as nominal-functors, operators and, possibly, simple names and simple sentences.

From the syntactico-semantic point of view formalized languages studied in logic are more or less exact replicas of natural languages fragments or of languages of particular sciences or hypothetical assumptions about those languages. In logic we investigate some consequences of those assumptions. In [3] [4] Suszko maintains, that

- (i) all languages investigated in logic so far may be represented by a one common syntactic scheme,
- (ii) there is a scheme of the relation of semantic reference which is common to all those languages.

As a hypothesis which could explain these facts Suszko assumes in [6] that there is a structural syntactic frameworks, by means of which consciousness can grasp reality. This framework has been determined by "the surface of the world" as Suszko calls it in [6]. The surface of the world is anything, whatever has been an objective correlate of the discursive human consciousness, merging from the remotest past. In [6] Suszko writes: "It consists (the surface of the world) of a universe, whose elements are things, not too big and not too small, persisting in the spatio-temporal environment of the primitive man -- as well as of a characterization including simple external features of those things and the relations between them. Upon this model the primitive conceptual apparatus has been built, whose syntactic structure mirrors the ontological structure of the surface of the world".

The logical structure of a language paired with a certain fragment of reality is never arbitrary and purely linguistic but is determined by:

(a) the ontological structure of the fragment of reality to which the language refers.

(b) the semantic principles adopted.

3. The appearance in the logical material of Fregean sentential semantics, Leśniewski's protothetics and Wittgenstein's *Tractatus* has been important in the development of logico-philosophical reflection. The importance of it consists, in the fact, that contrary to theories known from mathematics and other sciences the formalized of these theories require languages with sentential variables. The sentential variables range over a universe of whatever is presentable in sentences. Suszko follows Wittgenstein in calling the denotations of sentences situations. According to Suszko situations are primitive with respect to events for the latter are objects abstracted from the former. In contemporary science only these theories are studied which are expressed in languages with nominal variables; theories of situations expressed in languages with sentential variables not being considered. In [7] is proved that:

(i) certain theories of situations are mutually translatable into theories of events,

(ii) certain algebras of situations are isomorphic with algebras of events,

and then Suszko asks:

"...What, then, makes our thinking and natural languages discriminate to some extent sentential variables, especially general and existential sentences about situations?

...however, what gives preference to theories of events over theories of situations?"

And in the same paper Suszko answers:

"This is probably due to some deep, historically motivated feature of our thinking and natural language -- a feature, whose investigation and explanation will certainly take much time and effort." These features of our thinking make us grasp world rather as a universe of objects possessing certain properties and connected by certain

relations and not like Wittgenstein did in *Tractatus* as the totality of facts taking place within the logical space.

One of the aspects of this bias in our thinking is, according to Suszko, tendency (originating from logical empiricism) of shifting philosophical problems from the object language to metalanguage. For Suszko, the sentence:

(*) there is a real world

is an extralogical, ontological statement, which Suszko formulates in W-languages (constructed by himself) and whose logical consequences he studies. Suszko maintains that languages which does not contain sentential variables ranging over a certain universe cannot formalise such statements as (*) or any propositions on situational ontology for that matter. W-language (W-from Wittgenstein) have been constructed by Suszko in order to formalise the ontology of the *Tractatus*. In W-languages both sentential and nominal variables are contained as well as quantifiers binding variables of both sorts, the identity predicate and the identity connective. In those languages a logical calculus called non-Fregean logic is defined.

Non-Fregean logic is a logical calculus created by Suszko in order to formalise a fragment of the ontology in Ludwig Wittgenstein's *Tractatus Logico-philosophicus*.

4. When we define a logical calculus in a formalised language, we specify the meaning of its logical constants. But this is not always all. It may happen that by assuming certain semantic principles we can impose some quantitative and structural conditions on the universe of sentential variables. According to Suszko logic should not impose any conditions upon the universes of situations and objects, that are correspondingly universes of sentential and nominal variable, except that the set of sentential denotations should consist of least two elements and that universe of nominal variables should be non-empty. This condition is satisfied by the non-Fregean logic in contrast with the truth-functional logic (the Fregean one), whose logical thesis is, under the assumptions adopted by Suszko, that the universe of sentential variables (situations) is two elements. The non-Fregean logic is a bi-valued one, because for any admissible

interpretation of a language every sentential formula is either true or false. This logic is extensional as well because the denotation of any expression is a function of denotations of its constituent expressions.

The construction of non-Fregean logic and its formal semantics seems to reveal quite a few of Suszko's views on language and logic. Some of these views might be summarised in a simplified form as follows:

The analysis of logical constructions reveals that there are least two kinds of ontological principles:

- (i) those reflected in the syntax of a language and the principles of interpretation assumed,
- (ii) philosophical theorems, which are explicitly expressible in the sentences of a given language and accepted as theses of that language.

Every logical thesis is an ontological theorem, there are however formal ontological theses which are not logical theorems. The rules of logical inference in a given language should not impose any conditions on the universe of situations and objects if these conditions are not theses of pure logic i.e. they are not consequences of the postulate of consistency. What is peculiar about the ontological principles formulated by Suszko is that no extralogical constant is needed in order to formulate them, for they are expressible in a language which includes logical constants and sentential and nominal variables only. Hence Suszko's ontology constitutes a general and formal theory." (pp. 175-179)

Non-Fregean logic

"14. (...) The story whose outcomes are described below began with a seminar on the Tractatus organized by Tadeusz Czezowski in Torun at the end of the 1950s. The seminar was attended by Bogusław Wolniewicz, who recast its contents in original form. The results of this re-elaboration were set out in *Rzeczy i facty* [Things and facts], 1968, and in *Ontologia sytuacji* [Ontology of situations], 1985 (some of Wolniewicz's works in English are cited in the references). During the 1960s, Roman Suszko met Wolniewicz and read the manuscript of the former book. Thereafter he developed the so-called W-languages (W for Wittgenstein) from which derive the non-Fregean logics outlined below (see the references for Bibliographical details).

Independently of the Polish logicians, Barwise and Perry developed a somewhat similar theory in *Situations and Attitudes*, As far as I know, a systematic comparison between the two perspectives has not yet been conducted.

15. Semiotic preliminaries

As we know, for Frege there were only two ontological correlates of propositions: the True and the False. All true propositions denote the

True, and all false propositions denote the False. From an ontological point of view, if all true propositions denote exactly one and the same entity, then the underlying philosophical position is the absolute monism of facts.

In what follows I shall seek to disprove what Suszko called 'Frege's axiom': namely the assumption that there exist only two referents for propositions.

Frege's position on propositions was part of a more general view. Indeed, Frege adopted a principle of homogeneity (Perzanowski, 1992) according to which there are two fundamental categories of signs (*Bedeutungen* and truth-values) and two fundamental categories of senses (*Sinn* and *Gedanken*). Both categories of signs (names and propositions) have sense and reference. The sense of a name is its *Sinn*, that way in which its referent is given, while the referent itself, the *Bedeutung*, is the object named by the name." (201-202)

6.1. The Fregean Axiom.

The idea of distinguishing between Fregean and non-Fregean logic is mainly due to Roman Suszko [1968]. The main feature of non-Fregean logic is the distinction made between reference, or denotation, of a sentence and its truth-value. In the logical systems defined by Suszko the distinction between reference and truth-value is embodied in a new binary connective called identity. Connecting two sentences by identity expresses the fact that the two sentences refer to the same thing (they have the same semantic correlate) while the "ordinary" equivalence connective expresses the fact that the two sentences have the same logical value.

The origin of non-Fregean logics is strictly connected with the abolition of the so called Fregean Axiom by Suszko [1975].

(...)

In the Suszko's times the situational theory of meaning did not exist. Thus the principle that the meaning of a sentence coincides with the situation described by this sentence had a purely postulative character at that time - building a situational semantics was a task for future. This task was performed by Wojcicki [1984], [1986] who developed foundations of situational semantics for Suszko's non-Fregean logic with identity. (The restricted, purely sentential version of this logic is discussed below.) He also proved the completeness theorem for this logic with respect to situational semantics. The crucial point consists obviously in the explication of the notion of a situation. This problem gives rise to many questions: what are the components of a situation?; does every situation encompass pragmatological aspects, strictly connected with the process of communication, such as the time, the place, the addressee of an utterance?; are the truth-values situational components? There is no doubt that the situation described by the sentence

"Rome is the capital of Italy"

depends on the meanings of the words that make up this sentence but it also depends on the moment when the sentence was uttered (say, at the beginning of the 19th century or in the 20th century)".
(pp. 373-374)

From: Janusz Czelakowski, *Protoalgebraic Logics*, Dordrecht: Kluwer 2001.

"The expression *non-Fregean logic* was introduced by Roman Suszko in the article *Non-Fregean Logic and Theories* (1968). Its cornerstone is the omission of the Fregean axiom. Recall that according to G. Frege, sentences are not only true or false, but they are also names of their truth values. Hence the Fregean axiom can be formulated as follows: all true statements (likewise, all false statements) have the same common referent, the truth (respectively, the falsehood). The Fregean axiom lies at the heart of classical logical calculi. In a model for a language based on classical logic there is no universe corresponding to the sentences of the language, but only a basis for an unambiguous division of the sentences into true and false ones. The Fregean axiom can be seen as the formal counterpart of a philosophical view on the meanings of sentences.

On the other hand, the philosophical foundation of the non-Fregean logic can be summarized as follows: a description of the world is incomplete (in the non-technical sense of the word) if it consists solely of a description of objects, their properties and their relations to each other. A full and adequate description of reality should reflect also the fact that reality is a collection of possibilities, some of which are realized and which can be described with sentences. While maintaining the view that a logical sentence is always either true or false, we should also be able to take into account the fact that reality, which we want to describe, contains denotations for expressions having more than merely syntactic content. Therefore, we should acknowledge the fact that the denotations of names are objects, that the denotations of predicates are sets or relations and that the denotations of sentences are the situations described by them.

The above observations show that the basic philosophical assumption of non-Fregean logic is that the denotations of the sentences of a given language are different from their truth values; the universe of the denotations is commonly called the universe of situations. In order to be able to speak about the situations, we add to the language a new connective, known as the identity connective, which links a pair of sentences to truth when their denotations are the same in a given model, that is, when the sentences describe the

same situation. According to Suszko, the identity connective is more basic than other non-truth-functional operators, for instance, the various modal operators. It is basic in the sense that it cannot be eliminated from the logics that have been used and studied without trivializing it into another name for the equivalence connective. In the general case, the identity connective is different from the equivalence connective: two sentences with the same truth value can have different denotations. In other words, the truth value of a sentence is distinct from the situation described by the sentence. Adding the identity connective to classical logic does not, however, conflict with two-valuedness. Non-Fregean logic is two-valued as well as extensional, and it is the weakest logic with that property, while classical logic is the strongest one. Moreover, two-valuedness implies that the universe of situations must have at least two elements. That is the only limitation that non-Fregean logic imposes on the size of the universe of situations. On the other hand, if we add the condition that the universe of situations has at most two elements, we obtain the classical logical calculus, and the identity connective becomes indistinguishable from the equivalence connective. In fact, the Fregean axiom claims exactly this: that the two connectives are the same. Therefore Suszko called the classical logical calculus Fregean logic and the calculus without this axiom non-Fregean logic.

Thus, in a sense non-Fregean logic is an extension of classical logic: the language for building formulae is expanded. However, from another and perhaps more relevant point of view, classical logic is a strengthening of non-Fregean logic. On the other hand, the latter provides such a general logical calculus that most known logics -- classical first-order logic, classical sentential calculus, the many-valued logics of Łukasiewicz as well as some modal logics -- can be formulated in its general framework.

One should not forget about the philosophical applications of non-Fregean logic either. Most importantly, this logic provides excellent tools for the precise formulation of an ontology, for the formalization of the correspondence theory of truth and such concepts as fact, necessity, possible world, state of affairs and event. However, the value of non-Fregean logic does not derive solely from its applications. Non-Fregean logic constitutes an autonomic logical

calculus, which can be studied in its own right, irrespectively of any connections with reality.

The sentential calculus based on the principles of non-Fregean logic is called the Sentential Calculus with Identity (SCI)." (pp. 193-194)

From: Joanna Golinska and Taneli Huuskonen, "Number of Extensions of non-Fregean Logics", *Journal of Philosophical Logic*, 34, 2005, pp. 193-206.

The Fregean Axiom (FA): "all true (and, similarly, all false) sentences describe the same, that is, have a common referent."

"1° How do we have to understand the abolition of the Fregean axiom in the sense of the paper? To answer this question we must follow Suszko's argumentation taken from the section 'Final remarks'. First, we have to remember that from the very beginning the author's intention was to follow essentially Frege's program without, however, accepting the axiom (FA). And pure logic, according to Frege, should be as weak and general as possible. Actually, the non-Fregean logic is very weak (cf. p. 192). On the other hand, there are in fact more important ontological reasons for abolishing the Fregean axiom. The author argues that "non-Fregean logic contains the exact theory of facts, i.e., situations described in true sentences or, in other words, situations which obtain. If one accepts the Fregean axiom one is compelled to be an absolute monist in the sense that there exists only one and necessary fact" (p. 218). Subsequently, R. Suszko takes Wittgenstein, the great opposite of Frege, to task for advocating the non-Fregean approach discussed. Let us remember that the main ontological thesis of the famous *Tractatus* is, that "The real world is a totality of facts and not objects". In contrast to the Fregean logic, NFL suits the ontology of the *Tractatus* and is the weakest and most general two-valued logic. This is the crucial argument against (FA).

A semi-abolition of (FA) is also discussed in the paper. The idea comes from the simple possible-worlds semantics (i.e. in which relational frames of type (W, R) are considered). In that semantics, models associated with frames have just one designated element.

This is referred to as the semi-Fregean postulate. The ontological content of that postulate is that there exist plenty of distinct situations, but only one among them is distinguished. But the simple-worlds semantics works only for invariant Boolean G-theories. This means that this semantics is too narrow to comprise other SCI-theories; and it implies a very undesirable ontological assertion which says that there is only one distinguished situation described by true sentences.

2° The paper under review is a summary of a period of investigation of non-Fregean logic by the author and his collaborators. Incidentally, the paper contains general remarks on many logical areas and while reading it R. Suszko appears as a logician:

Suszko's theoretical framework is the general theory of entailment relations. By 'logic' is meant an entailment relation operating on the algebra of formulas. This is an extension of Tarski's methodological ideas, dating back to the thirties, connected with the notion of consequence operation. The author teaches us that in order to learn the properties of a given entailment one must investigate its theories, i.e. sets of formulas closed under the entailment. The smallest theory of a given entailment coincides with the set of all tautologies, that is, the formulas entailed by the empty set of formulas. It is obvious that distinct entailments may have a common set of tautologies.

Consequently, given a logic \vdash and an entailment \vdash . we ought to ask whether \vdash . equals \vdash (strong completeness) or whether only the sets of tautologies of both entailments are identical (weak completeness). Now, if we did not stop describing the general framework, we would have to discuss problems such as the importance of the so-called complete theories, the problem of adequacy and so on.... But the reader can easily find it in the paper. Actually, we just want to draw the reader's attention to the fact that he can also find there a lot of very deep and original remarks on the theory of entailment. As an example, let us quote the author's opinion about completeness theorems (pp. 216, 217). "Thus, we see that a completeness theorem for a logic is not a golden crown on semantics but just the beginning of it. Already the relativity of completeness theorems forces us to ask how far we can go in semantics beyond (!) the completeness theorem. To construct a logical calculus and prove a kind of

completeness theorem for it (not to speak of a weak completeness theorem) appears very often as just a waste of time."

R. Suszko does not tolerate any intensional notions and contexts and he is strongly opposed to intensional formal logic. He is deeply convinced that there is no modal logic which cannot be demolished (by breaking its logical rules) by some intensional construction in natural language. Therefore, on page 200, we are warned that "the building of such logics is a kind of naiveté". On the other hand, we know that some systems of modal logic have appeared to be SCI-theories. This is the reason why the author is afraid of NFL being incorrectly understood as a kind of modal logic. If one has doubts about the non-intensional background of non-Fregean logic, one should carefully read Sections 10-14." (pp. 376-378)

From: Grzegorz Malinowski and Jan Zygmunt, Review of: "Roman Suszko. Abolition of the Fregean Axiom", *Erkenntnis*, 12, 1978 pp. 369-380.

"3. Abolition of Fregean Axiom.

According to Frege, denotations (*Bedeutung*) of sentences are logical values. Thus, each sentence denotes either Truth or Falsehood. Suszko, who sought support for his ideas in Wittgenstein, rejects this point of view. For him, the denotation of a sentence is what the sentence says about: a certain "situation". This term was chosen by Suszko to interpret Wittgenstein's *Sachlage* -- the state of affairs. Situations which exist create positive facts, those which do not exist create negative facts. Sentences having the same logical value need not denote the same. It is a certain fact that Wittgenstein knew Frege just like it is a fact that Wittgenstein exchanged letters with Russell, but these two facts are quite different, and thus two sentences stating these two facts have different denotations although their truth value is the same.

Obviously, Frege was not of the opinion that all true (or false) sentences "say the same" either. In Suszko's apprehension the differences lay in the sense (*Sinn*) of sentences and not in their denotations. For comparison of Suszko's ideas with those of Frege it is essential that neither *Sinn* itself nor any of its components is an element of the objective world. *Sinn*, is a way in which sentences are

assigned their logical values (one is tempted to repeat after Ajdukiewicz "the way of how the sentence is understood"), or -- which also can be found in Frege's works -- "the thought conveyed by the sentence". The thought, let me add, understood as a certain abstract object and not an individual mental experience. The differences between Suszko's and Frege's approaches are by no means of verbal character: among the concepts used by Frege there is no counterpart for the notion of situation.

As known, the predicate calculus may be employed only to non-empty domains; analogously, in order to apply SCI -- and more generally NFL -- one must accept certain ontological theses; namely the ones given by the following semantical postulates:

S1. Each sentence has its denotation.

S2. True sentences denote positive facts while false sentences denote negative facts.

S3. The classical truth conditions are satisfied; in particular, the truth value of sentences built by means of truth connectives is determined by the truth values of its components in the usual (i.e. accepted in the classical logic) way.

Observe that S1 stands in disagreement with Wittgenstein's ideas developed in *Tractatus*. According to Wittgenstein both logical tautologies and inconsistent logical sentences are "senseless" (*sinnlose*), which however does not mean they are "nonsensical" (*unsinnige*). With Wittgenstein, nonsense is an expression which does not meet the requirements of grammar which amounts to the fact that nonsensical sentences are not sentences at all. The statement "Rome is Rome" is grammatically correct but it does not convey any information, is senseless, and consequently as it means nothing it denotes nothing.

In order for (S1) - (S3) to be satisfied, there have to exist at least two situations, one of which must be a positive fact and the other -- a negative one. This existential thesis is fundamental for the ontology of SCI. The set of ontological postulates for the entire non-Fregean logic is richer since the logic refers not only to situations but also to individual objects and sets built from them. Consequently, NFL

inherits the ontological postulate of the predicate calculus stating that there must exist at least one object." (pp. 326-327)

From: Ryszard Wojcicki, "R. Suszko's Situational Semantics", *Studia Logica*, 43, 1984, pp. 323-340.

***EE*Excerpts from his publications: Abolition of the Fregean Axiom**

This paper is partly stimulated by a talk given by Dana Scott on Lewis' systems in the Symposium on Entailment, December 1971, [Scott 1971]. Any endeavour, however, to reconstruct Lewis' program or to defend it is far beyond my intention. What matters here is the following. Scott makes a great deal of propaganda on behalf of (a) the general theory of entailment relations (or consequence operations) and (b) truth-valuations. Furthermore, "a nagging doubt" in Scott's mind, concerned with possible-world semantics induces him to use both (a) and (b) and a trick of making inferences visible, to arrive eventually at the strong modal systems, S4 and S5.

There are, of course, plenty of ways to obtain modal-systems. Here, I want to call your attention in particular to the somewhat disquieting fact that the strong modal systems (but by no means all modal systems) are theories based on an extensional and logically two-valued logic, labelled NFL, exactly in the same sense that axiomatic arithmetic is said to be based on (pure!) logic [created essentially by Frege, (hence labelled FL) and well-known from text-books of mathematical logic]. This paper is not, however, another exercise in so-called modal logic. I essentially agree by the way, with Quine's comments [Quine 1963] on that kind of logic. The main subject here is the construction of NFL and its basic properties. Also, the relation between NFL and FL will be discussed. The general theory of entailment will serve as a framework for three methods of building NFL. In fact, we will arrive at NFL using truth-valuations, models and logical axioms and rules of inference.

As an intelligent reader you instantly conjecture that there must be some hocus-pocus underlying NFL. Indeed, there is. It consists essentially in following Frege in building pure logic but only to certain decisive point. Of course, you need not use his archaic notation or terminology. Also, you may easily avoid his syntactic

shortcomings. For example, you are naturally inclined to keep formulas (sentences) and terms (names) as disjoint syntactic categories. But, when you come to his assumption, called here the Fregean axiom, that all true (and, similarly, all false) sentences describe the same thing, that is, have a common referent, just forget it, please; at least until NFL is constructed. At that time, I am sure, you will better understand what the Fregean axiom is and you'll be free to accept it, if you still like it so much.

The trick underlying NFL is fairly easy and also quite innocent. It is true that it seduced me successfully and I am now addicted to it. I even reject the Fregean axiom. However, I do not insist that you go so far. But try NFL cautiously. I assure you that NFL offers you an intellectual experience, unexpected in its simplicity and beauty, far surpassing all "impossible worlds". But I am frank and fair, by my nature. So I tell you keep the Fregean axiom hidden in your pocket when entering the gate of NFL and be ready to use it at once, when you feel a confusing headache. Formally, you will be collapsing NFL into FL. Informally, you will be expelling yourself from a logical paradise into the rough, necessary world.

Surprisingly enough, logicians do not want NFL. I know it from five years of experience and this is the right way of putting it, believe me. Being even so close to NFL sometimes, Logicians stubbornly strive after something else. When not satisfied with FL they choose to work with the powerset 2^I as exposed convincingly by Scott [Scott 1970]. They even can, I admit, work on it as hard as in a sweatshop. So mighty is, Gottlob, the magic of your axiom! Whatever (cheatingly) one calls elements of the index set I , the powerset 2^I remains a distinct shadow of the Fregean axiom.

If we want to follow Frege we must consent to his basic ideals of unambiguity and extensionality. To stress this point we start with his famous semantical scheme of *Sinn and Bedeutung*. It is obvious today that the abyss of thinking in a natural language does not fit into the Fregean scheme. But this is another story. Here, it must suffice to notice that we all live (and cannot completely get out of) that messy abyss with all its diffuse ghosts (in Hermann Weyl's [1940] phraseology) of ambiguity, vague flexibility, intensionality and modality. We really enjoy them. But not always. When forced to

construct a theory, we try to make our ideas precise and climb to the heights of extensionality. Then, the structure of our theoretical thought corresponds sufficiently well to the syntax of the *Begriffsschrift*, i.e., a formalized language which does fit into the Fregean semantical scheme." (pp.169-171)

From: "Abolition of the Fregean Axiom". In: Rohit Parikh (ed.), *Logic Colloquium. Symposium on Logic held at Boston, 1972-73*, Berlin: Springer-Verlag 1975, pp. 169-239.

"14. Final remarks.

The fight with intensional ghosts is boring, unprofitable and, may never end. But, I must finish this paper. So, I conclude with some unelaborated remarks.

1) Modal logicians think that NFL is a kind of modal logic and one badly done at that. Extensionally minded logicians consider FL as the only extensional logic. Thus, either intensional ghosts or the Fregean axiom and, everything else comes from the devil. I know this well. But, why is this so? This is a longer story. Indeed, you must first look at the history of modern logic and you will find there many relevant facts. Secondly, you must dig deeper and deeper in the nonFregean logic and its relationship to the Fregean one.

2) But, if you do that then you will certainly meet a fact which suggests that we may easily get rid of the identity connective and NFL. It is sufficient to translate NFL into FL as shown in [Cresswell 1966] by Cresswell, again. Now, this is something quite different from diffuse intensional ghosts. But things never are so simple as they seem. You know that translations may be better or worse and, the bad translations may not be translations at all. What always matters about translations is what are their invariants. If you ask for invariants of Cresswell's translation you will find only a few. It may be considered as a translation only if one wants to get rid of identity connective at any price. But, the real paradox is that it is impossible to get rid of the identity connective at all. What can be done is to equate it with material equivalence. Also, one cannot get rid of situations unless one agrees that thought is about nothing, or, rather, stops talking with sentences.

3) Stimulated by Cresswell's "translation" and some ad hoc construction by Slupecki I built a theory of *reification* of *situations* in [Suszko 1971]. It resembles, in a sense, what Quine called reification of universals and also the relationship between Fregean FUNKTIONEN and their WERTVERLAUFE. Reification of situations is performable within a theory in some W-language, based on non-Fregean logic, of course.

If based on a logic as strong as \vdash WB it automatically leads to what we are used to talking about in probability theory, viz., events being objects constituting a Boolean algebra in ordinary sense. Finally, this theory is the basis for a translation of Cresswell's type. This translation does not preserve entailment perfectly. But, equations are translatable exceptionally well, naturally.

4) Non-Fregean logic contains the exact theory of facts, i.e., situations described in true sentences or, in other words, situations which obtain. If one accepts the Fregean axiom then one is compelled to be an absolute monist in the sense that there exists only one and necessary fact. So, you see that Fregean axiom should be abolished. Also, only the non-Fregean logic allows us to repeat with full understanding Wittgenstein's thesis that the real world is a totality of facts and not objects. Indeed, what I tried to do in [Suszko 1968] was a formal reconstruction of the Ontology of the *Tractatus*, OT for short, as interpreted by Dr. B. Wolniewicz.(...) At that time, I only had a general idea of which logic OT has to be based on. Now, I may say that NFL suits OT and is the general and weakest extensional and two-valued logic.

(...)

6) Yet, this is not all. SCI-models are structures which may be considered as models of the Fregean logic which makes sentential variables trivially superfluous. Thus, again, we may get rid of sentential variables and identity connective similarly as in the Cresswell translation. We may and we really do. This is the point. Of course, this fact does not discredit NFL at all but it hints to some tendency in our thinking which is codified, in a sense, by the Fregean axiom. Be it right or wrong, this tendency is certainly very strong and much older than modern logic. So it seriously calls for an

explanation. This may not be easy. Why do we tend to describe the world as consisting of a single necessary fact? But, anyway, I feel -suggested by the fact that Cresswell's translation is not so good. Moreover, one may say even that the conventional semantics which uses SCI-models is not adequate. Elements of these models are objects; but sentential variables do not actually run over any totality of objects. One cannot denote a situation by a name. It can only be described by a sentence. Thus, an adequate semantics of non-Fregean theories should use a W-language with non-Fregean entailment in it. Hence, we face the task of using(!) a new kind of language with a new entailment. I have shown to you how good this new logic is. Therefore, I think we should try to use it and I hope we will be successful. Frankly, however, I am not sure if we are able to do that." (pp. 217-220)

5. ———. 1958. "Syntactic Structure and Semantical Reference (First Part)." *Studia Logica* no. 8:213-244.

"The syntactical and semantical investigations in contemporary formal logic refer always to the languages with specified syntactic structure, as with respect to such languages one can formulate exactly and, subsequently examine with mathematical tools 1) the rules of transformation (axioms, rules of inference) and the systems based on these rules (formalized theories), 2) the relations of semantical reference which occur between linguistic expressions and elements of objective sphere.

Our considerations belong to that part of logical syntax and semantics which is independent of any assumptions concerning the rules of transformation.

The syntactic structure of some language L is determined 1° by the *vocabulary* of L i.e. by the list of simple (undecomposable) expressions in L , and 2° by the *rules of construction* L of which state how the expressions of L , especially the sentences in L are built of simple expressions.

In the first part of this paper we consider the general principles of the syntactic structure of languages. Namely, we shall formulate a scheme of the syntactic structure of language. This scheme will be called the *standard formalization* and the languages which fall under this scheme will be called the *standard formalized languages* (1).

The scheme of standard formalization is based on a purely syntactical classification of expressions into so called *semantical categories*.

The standard formalization is an abstract from the concrete material of artificial symbolic languages which are considered in formal logic. It is general in the following sense: every symbolic language known in formal logic - after carrying some modifications in its calligraphy -- falls directly under the scheme of standard formalization.

In the second part of this paper we consider the fundamental properties of semantic reference. First, we introduce a classification of objects into so called *ontological categories*. Further making use of some simple and quite natural connexion of conformity between semantical categories of simple expressions and ontological categories of corresponding objects, we can introduce the general notion of a *model* of any standard formalized language. Namely, for every standard formalized language L we define the family $M(L)$ of all models of L . Every model of L is a totality to which the expressions of L can refer semantically and, conversely, every totality to which the expressions of L can refer semantically, belongs to the family $M(L)$. Thus, we obtain a general scheme of the relations of semantical reference which is quite closely connected with the scheme of standard formalization. This shows the ideographic character of standard formalized languages.

It may be a reasonable conjecture the content of this paper to be connected with the structural inquiries in linguistics and with some problems of the philosophy of language and of thinking. But, we do not discuss here these connexions." pp. 213-214.

"§ 9. *Introductory remarks concerning the relation of semantical reference.*

We begin the considerations about semantics of standard formalized languages with some general remarks belonging to the theory of signs or semiotic in the sense of Ch. Morris [1938].

We consider the languages as systems of signs participating in the process of communication between persons belonging to some human group (speech community). Communicative

employment of linguistic signs in some group is intertwined into the whole of activity of members of this group and of their relations to the environment, and the connection between the employment of linguistic signs and the activity of persons of the given speech community grants an intersubjective meaning to the employed signs.

The considerations about signs and languages may be conducted from a historical and descriptive point of view as well from systematical and theoretical one. On the other hand one can distinguish in these considerations three following ranges: syntax, semantics and pragmatics [Morris 1938]. The syntax deals with the relations which do occur between the signs alone. The principles of combination of simple signs into the composite signs are considered by it. Generally speaking with the syntax it is investigated the syntactic structure of languages. Semantics deals with the relations of semantical reference of signs to objects belonging to the objective sphere. These relations bind the signs with that *about what the signs in the process of communication are speaking*. Finally, pragmatics take into account the role of persons employing the signs.

One may say that the division of the science of signs and languages into syntax, semantics and pragmatics is made from the point of view of formal logic. Namely, pragmatics is strictly connected with the psychology, sociology, history of culture and other sciences dealing with members of speech communities. On the contrary the considerations about linguistic expressions conducted in formal logic are included in the syntax and semantics.

If a language L of some syntactic structure is meaningful in some circumstances (i. e. the expressions of L are participating in the process of communication in some human group) then the language L - as a system of expressions - semantically refers to some complex R of objects which may be called the referent of the whole language L in the given circumstances of meaningfulness of L . I think that the existence of this referent R and the occurrence of the relations of semantical reference

between the language L and the referent R (and between the expressions of L and fragments of R) is a basis of the intersubjective meaning of expressions of L . On the other hand the syntactic structure of the language L depends 1°) on the referent R and 2°) on the members of the given speech community; *the principle of the dual control of linguistic structure*, [1938] p. 12.

In the case of formalized languages the situation is much more simple. Firstly, in formal logic we abstract from pragmatical properties and relations of linguistic expressions. In formal logic we consider only the syntactic structure of languages and the relations of semantical reference. Therefore, instead of the referent of a given formalized language L (in the given circumstances of its meaningfulness) we consider here the family of all possible referents of L which are called *models of L* and the principle of dual control mentioned above is reduced to the connection between the syntactic structure and the common structure of all models of L . This is *the connection of conformity of semantical categories with the ontological categories*. It will be explained later.

We do not intend here to prove the connection of conformity of categories. It will be enough to remark that this connection is fulfilled in all semantical interpretations of artificial symbolic languages considered in formal logic. We take in our paper the connection of conformity of categories as a fundamental principle by which are characterized the formal properties of relation of semantical reference and, consequently, it is possible to determine the family of all models of any given standard formalized language." pp. 63-64.

17. ———. 1968. "Ontology in the *Tractatus* of L. Wittgenstein." *Notre Dame Journal of Formal Logic* no. 9:7-33.

"The *Tractatus Logico-Philosophicus* of Ludwig Wittgenstein is a very unclear and ambiguous metaphysical work. Previously, like many formal logicians, I was not interested in the metaphysics of the *Tractatus*. However, I read in 1966 the text of a monograph by Dr. B. Wolniewicz of the University of Warsaw² and I changed my mind. I see now that the conceptual scheme of *Tractatus* and the metaphysical theory contained in it may be reconstructed by formal means. The aim of this paper* is to sketch a formal system or formalized theory which may be considered as a clear, although not complete,

reconstruction of the ontology contained in Wittgenstein's Tractatus.

It is not easy to say how much I am indebted to Dr. Wolniewicz. I do not know whether he will agree with all theorems and definitions of the formal system presented here. Nevertheless, I must declare that I could not write the present paper without being acquainted with the work of Dr. Wolniewicz. I learned very much from his monograph and from conversations with him. However, when presenting in this paper the formal system of Wittgenstein's ontology I will not refer mostly either to the monograph of Dr. Wolniewicz or to the Tractatus. Also, I will not discuss here the problem of adequacy between my formal construction and Tractatus. I think that the Wittgenstein was somewhat confused and wrong in certain points. For example, he did not see the clear-cut distinction between language (theory) and metalanguage (metatheory): a confusion between use and mention of expressions."

"The notion of quasi-completeness (or O-completeness) has been introduced by J. Los [1], [2] into the semantics of theories in open languages with nominal variables. An analogous notion known as Hallden-completeness [3], [4] is applicable to sentential logics. Both notions are of the same formal nature and can be uniformly treated when formulated with respect to W-languages which contain two kinds of variables, sentential and nominal, as well. W-languages considered here are open, that is, not containing bound variables. The aim of this paper is to show that the main theorems of Los concerning the quasi-completeness also hold in non-Fregean logic and semantics.

The author is indebted to Dr. Stephen L. Bloom from Stevens Institute of Technology for comments on the first draft of this paper."

"The SCI (Sentential Calculus with Identity) is obtained from the classical sentential calculus by the addition of 1° a new binary connective, the identity connective (denoted by =) and 2° axioms which 'say' that = means "p is identical to q" (also: "the situation p is the same as the situation q"). The new axioms are the weakest possible; no presuppositions about the meaning of "is identical to" are included (other than $p = p$). We do not attempt to say what the range of the sentential variables p, q, r, ... is. (In the classical propositional calculus, they are intended to range over a two element set.) In this paper, a number of results about the semantics of the SCI are given without proof. The proofs of these and other results are contained in the much longer *Investigations into the Sentential Calculus with Identity*."

Abstract

29. ———. 1972. "Investigations into the Sentential Calculus with Identity." *Notre Dame Journal of Formal Logic* no. 13 (3):289-308.

Co-author: Stephen L. Bloom

"The sentential calculus with identity (SCI) is obtained from the classical sentential calculus by the addition of a binary 'identity

connective' = and axioms which 'say' that $p = q$ means p is identical to q . the study of the semantics of the resulting consequence operation using Tarski's matrix method yields insights into consequence operations in general and the classical and modal consequence operations in particular. One finitely axiomatizable SCI theory is studied. It is shown that this theory consists of those formulas valid in all topological boolean algebras."

52. ———. 1979. "On the Antinomy of the Liar and the Semantics of Natural Language." In *Semiotics in Poland 1894-1969*, edited by Pelc, Jerzy, 247-254. Dordrecht: Reidel.

English translation by Oligierd Wojtasiewicz of an article published in Polish in 1957.

"The antinomy of the liar has been discussed many times in formal logic. It is associated with remarkable advances in logic: the formulation of the semantic theory of truth [4] and the discovery of undecidable statements and the impossibility of proofs of consistency under specified conditions ([2]; see also [3], Vol. II, pp. 256ff).

All those results make fundamental use of *self-referential expressions*, which were first used, in the history of logic, in the antinomy of the liar. The aim of this paper is to demonstrate, by quite elementary methods; something that has been known

since the birth of semantics, namely, that the concept of truth and other semantic concepts are relative in nature [5] and that using relative semantic concepts, including the construction of self-referential expressions, does not result in antinomies in natural language.

Semantics, and in particular the semantic theory of truth, presupposes syntax. The wealth of semantic analysis thus depends on the wealth of syntactic information about those expressions to which semantic analyses refer. Since in this paper no systematic syntactic studies on the structure of expressions are made, except for the construction of self-referential expressions, the set of concepts used in the semantic theory of truth discussed here is very modest.

(...)

The semantic theory of truth does not result in the antinomy of the liar if we use concepts restricted to a set of statements which does not include statements from the theory of truth which we are studying in a given case.

It can be shown that the same applies to other parts of semantics, namely those in which the other semantic concepts (denoting, satisfying, etc.) are used [4], [5], [6].

To do this it suffices to analyse other antinomies constructed with the aid of semantic concepts, and to modify them in a manner analogical to that applied above in the case of the antinomy of the liar.

The semantic concepts which we can use in semantic research without being involved in antinomies are relative (restricted). They have a certain reference to a type L of expressions, which includes neither those semantic terms which have a reference to L , nor statements containing those semantic terms. Within those semantic analyses in which we use semantic concepts restricted to type L of expressions we can construct, in accordance with general syntactic rules, an expression which can be proved not to be of type L . The proof consists in a reasoning which changes into an appropriate antinomy if the

restrictive reference to L , applied to the semantic concepts used in that case, is disregarded."

English translation by Olgierd Wojtasiewicz of an article published in Polish in 1966.

"Russell's antinomy of the class of normal classes, i.e., the class of those classes which are not their own elements, emerged when the current concept of class was being given more precision. It is this current concept of class which is blamed for Russell's antinomy.

The task of the present paper is to offer a fairly precise definition of the current concept of class, which has subsequently come to be split into the collective (concretistic) concept of class and the distributive (mathematical) concept of class or set. S. Leśniewski's mereology, to which T. Kotarbinski's concretism refers, is a theory of classes in the

collective sense. The theory of classes in the distributive sense has taken the form of mathematical set theory, which originated with E. Zermelo; other versions of the theory of classes in the distributive sense are provided by B. Russell's type theory and S. Leśniewski's Ontology.

After making the current concept of class more precise, which will consist in a systematization of the assumptions concerning that concept, we shall define normal and non-normal classes as well as the class of normal classes and the class of non-normal classes. Several variations of these definitions are possible, and Russell's antinomy can be reconstructed in each case. We shall see, however, that his antinomy cannot be reconstructed in current language, since the corresponding reasonings do not yield a contradiction. The thesis of this paper is that the current concept of class, as described below, is not self-contradictory."

54. ———. 1979. "Normal and Non-Normal Classes Versus the Set-Theoretical and the Mereological Concept of Class. Studies in the Concept of Class. Ii." In *Semiotics in Poland 1894-1969*, edited by Pelc, Jerzy, 273-283. Dordrecht: Reidel.

Co-author: Zdzislaw Kraszewski.

English translation by Oligierd Wojtasiewicz of an article published in Polish in 1968.

°We shall concern ourselves here with the transition from the current concept of class to the distributive (set-theoretical) and the collective (mereological) concept of class. This transition is linked to the concepts of normal and non-normal class. Preliminary remarks on that issue have already been made in Sec. 8.

We assume here a non-existential axiom system for the current concepts of class and element, as described in Secs. 2 and 3. Consequence and equivalence are interpreted, as before, as consequence and equivalence in the light of that axiom system."

56. ———. 1994. "The Reification of Situations." In *Philosophical Logic in Poland*, edited by Wolenski, Jan, 247-270. Dordrecht: Kluwer Academic Publishers.

English translation by Theodore Stazeski of an article published in Polish in 1971.

"The great task of the theory of reification is to show in what way the so-called ontological assumptions of the structure of the universe of situations are transferred to events by reifications, and to impose an algebraic structure on them. Such an approach to the theory of reification flows from the earlier expressed opinion that situations are primary and events are derived. One should not confuse this point of view with the false opinion, I believe, that situations are primary in relation to all objects. It is an altogether different and difficult matter, and in this case a certain consultation of Wittgenstein would be very useful. But the fact that situations are primary in relation to their reification is rather natural. The abstract process, of which the formal expression is the reification of a situations, finds - I think - its fragmentary expression in ordinary language; I write 'I think' since I enter into the competence of linguists. These examples given by Slupecki are an illustration. Thus, forest fire = reification of the situation that the forest is burning, and Matt's death = reification of the situation that Matt died. These examples do not give evidence that an explicit symbol of the reification of situations, corresponding to the star of Slupecki of our T, exists in natural language. They are examples giving evidence that the grammatical apparatus of a natural language can often, though certainly not always, transform sentences p (describing situations) into names x (designating particular events) such that $x = T(p)$, and sentences containing those names. The opposite transformation is something unnatural, and is hardly taken into consideration by grammarians.

This observation obviously does not remove the most serious difficulties which appear in connection with situations. The principal difficulty appears at the moment of incorporation of non-trivial theories written in natural language with help of

(bound) sentence variables. Reading formulas appearing in this theory in natural language immediately raises serious doubts for many logicians with regard to sense or correctness. There are no such difficulties, or they are considerably less, in the reading of formulas with name variables (not sentential). It is probably the symptom of some deep, historical attribute of our thought and natural language, whose examination and explication will certainly be prolonged and arduous.

From the rather narrow point of view of formal logic the following considerations are suggested. The difference between a sentence and a name is not exhausted in their syntactical properties. A certain syntactic analogy even exists between the category of sentences and the category of names, which can stretch very far (for example the rules of operations for quantifiers are formally similar in the case of sentential and name variables). The difference between sentences and names appears first of all in that sentences, and not names, are subject to assertion, as well as that sentences are premises and conclusions in reasoning. These distinctions on the language level are transferred in some manner to that to which the sentences and names semantically refer. Semantical relation (reference), however, of sentences and names are also - formally - to a certain degree analogical.

Names designate and sentences describe. The difference in terminology (designate, describe) is not essential. The essential point is that we attribute reference to something both to names and to sentences, and that this, in the case of a given name and a given sentence, is exactly one; with the assumption, obviously, of a univocal sense of expression and with exclusion of mythological terms.

This analogy, however, is not complete, just like the analogy between sentences and names, with result that a categorial gap exists between that which a sentence describes (a situation) and that which a name designates (an object). The fact that the expressions $p = x$ and $p x$, where on the left we have a sentence and on the right a name, are not well formed formulas, shows this profound gap.

The analogies between situation and objects as well as that between sentences and names are not complete. But it does not stop at the level of the formation of sentences and names, not at the level of the formal operation on them in accordance with logic. What, therefore, is the cause that our thought and natural language discriminate sentence variables to a certain degree, and particularly, general and existential sentences about situations?

The above considerations about the reification of situations show that the theory of situations and the theory of events are, in certain manner, equivalent. Why, therefore, prefer the theory of events to the theory of situations?" pp. 249-250.

Presented at III World Congress on Paraconsistency, Toulouse, France, July 28-31, 2003.

"A well-known result by Wojcicki-Lindenbaum shows that any tarskian logic is many-valued, and another result by Suszko shows how to provide 2-valued semantics to these very same logics. This paper investigates the question of obtaining 2-valued semantics for many-valued logics, including paraconsistent logics, in the lines of the so-called "Suszko's Thesis". We set up the bases for developing a general algorithmic method to transform any truth-functional finite-valued semantics satisfying reasonable conditions into a computable quasi tabular 2-valued semantics, that we call dyadic. We also discuss how "Suszko's Thesis" relates to such a method, in the light of truth-functionality, while at the same time we reject an endorsement of Suszko's philosophical views about the misconception of many-valued logics."

7. Czelakowski, Janusz, and Pigozzi, Don. 2004. "Fregean Logics." *Annals of Pure and Applied Logic* no. 127:17-76.

"The main results of the paper: Fregean deductive systems that either have the deduction theorem, or are protoalgebraic and have conjunction, are completely characterized.

They are essentially the intermediate logics, possibly with additional connectives.

All the full matrix models of a protoalgebraic Fregean deductive system are Fregean, and, conversely, the deductive system determined by any class of Fregean 2nd-order matrices is Fregean. The latter result is used to construct an example of a protoalgebraic Fregean deductive system that is not strongly algebraizable."

9. Golinska, Joanna, and Huuskonen, Taneli. 2005. "Number of Extensions of Non-Fregean Logics." *Journal of Philosophical Logic* no. 34:193-206.

"We show that there are continuum many different extensions of SCI [sentential calculus with identity] (the basic theory of non-Fregean propositional logic) that lie below WF (the Fregean extension) and are closed under substitution. Moreover, continuum many of them are independent from WB (the Boolean extension), continuum many lie above WB and are independent from WH (the Boolean extension with only two values for the equality relation), and only countably many lie between WH and WF."

10. Lukowski, Piotr. 1990. "Intuitionistic Sentential Calculus with Identity." *Bulletin of the Section of Logic*:92-99.

"The paper concerns the intuitionistic sentential calculus with identity IISCID, mentioned by professor R Suszko in his several papers. The work presents a semantics for ISCI, which combines the ideas of the matrix semantics for sentential calculi with the well-known Kripke-Grzegorzczuk for the intuitionistic logic. Besides sketching a proof of the strong completeness theorem for ISCI, there are some straightforward connections between the new semantical construction and the modeling of SCI, i.e., the ordinary calculus with identity. The end of the work deals with a simplified version of the frame-matrix semantics for the intuitionistic logic without sentential identity."

11. ———. 1990. "Intuitionistic Sentential Calculus with Classical Identity." *Bulletin of the Section of Logic*:147-151.

"Sentential calculus with identity /SCI/ has been created by Professor R Suszko. The discussion on SCI was a subject of many works. The intuitionistic weakening of this calculus /ISCI/ is presented in Pslukowski's "Intuitionistic sentential calculus with identity", *Bulletin of the Section of Logic*, 19, 3. In fact SCI is a classical propositional calculus with classical identity, while

ISCI an intuitionistic propositional calculus with intuitionistic identity. Thus in the present paper two strengthenings of ISCI, i.e., intuitionistic propositional calculus with classical identity /ISCI CI/ and classical propositional calculus with intuitionistic identity /SCI II/ are considered. There are also presented adequate semantics for both calculi."

13. ———. 1987. "Non-Fregean Logic and Other Formalizations of Propositional Identity." In *Essays on Philosophy and Logic. Proceedings of the Xxth Conference on the History of Logic, Dedicated to Roman Suszko. Cracow, October 19-21, 1984*, edited by Perzanowski, Jerzy, 159-166. Cracow: Jagiellonian University.

The aim of the paper "is to present Sentential Calculus with Identity in comparison with other formalizations of propositional identity."

"Final remarks. It is evident that any comparative question concerning the logic of propositional identity may be posed either in reference to a particular language or to a special feature of a formalisation. Among several current requirements the three following seem to be of it particular importance:

(1) Extensionality in the sense at Leibniz Law of indiscernibility of identicals.

(2) Formal character of identity: nothing except general properties such as e.g. reflexivity, symmetry or transitivity has either be assumed or proved

(3) Purely sentential character of formalisation: the language has to contain only sentential variables.

(...)

If one agreed that all the properties (1)-(3) are basic for the logic of propositional identity, SCI would be considered as the only genuine logic of this kind. [The property that logics of identity corresponding to S4 and S5 proved to be axiomatic

strengthenings of SCI, cf. [Bloom & Suszko 1972] and [Suszko 1971] supports the conclusion.]

"On semantic principles of Frege and non-fregean definition of the concept of propositional identity. A non-fregean realization of the semantic programme of G. Frege elaborated by R. Suszko is one of the most interesting recent logical constructions. The aim of the paper is to present formal and philosophical aspects of the sentential calculus with identity, SCI, constituting the base of that realization."

15. Malinowski, Grzegorz, and Zygmunt, Jan. 1978. "Review Of: Roman Suszko - Abolition of the Fregean Axiom (1975)." *Erkenntnis* no. 12:369-380.

"According to Professor Suszko's declaration on page 169, the main subject of his paper is the construction of non-Fregean logic (NFL) and its basic properties. To satisfy the reader's curiosity, we may say that NFL is generally speaking a result of the rejection of the Fregean axiom. This amounts to the following:

(FA) all true (and, similarly, all false) sentences describe the same, that is, have a common referent.

Before describing the content of the paper in some detail, we would like to draw the reader's attention to the facts that (1) the paper is concerned with the philosophy of logical constructions and the properties of logic but not with the proofs of theorems; (2) the paper is a survey in which the author presents his own

results as well as those of his colleagues. The presentation is against the broad background of the historical development of modern logic and recent research in possible world semantics, modal logics, intensionality and entailment, and all this is in order to strongly criticize 'that messy abyss with all its diffuse ghosts of ambiguity, vague flexibility, intensionality and modality' (cf. p. 171).

The paper under review consists of an introduction, 14 main sections, a supplement and a bibliography. The supplement contains 53 notes which provide us with deeper elaboration of some of the networks, comments, complements, sketches of proofs, etc. presented earlier. The bibliography, also containing 53 items, is not arranged alphabetically but in order of their citation in the main text, and includes the titles of almost all the important works by R. Suszko and his colleagues on non-Fregean logic - and in particular, sentential calculus with identity."

16. Metzler, Helmut. 1987. "Some Remarks on Roman Suszko's Discussion of the Frege-Axiom from the Point of View of Philosophy and Methodology." In *Essays on Philosophy and Logic. Proceedings of the Xxxth Conference on the History of Logic, Dedicated to Roman Suszko. Cracow, October 19-21, 1984*, edited by Perzanowski, Jerzy, 167-174. Cracow: Jagiellonian University.

"Roman Suszko writes: "The semantical assumption that all true (and, similarly, all false) sentences describe the same, i.e. have a common referent (Bedeutung) is called the Fregean Axiom" (Suszko 1977, p. 377). He himself distinguishes in a strict way between logical and algebraic valuations of expressions of languages and speaks of an amalgamation into an inseparable unity of logical valuations (truth and falsity) and algebraic valuations (reference assignments) in Frege's thinking which he rejects (Suszko 1977, p. 378).

From the point of view of the history of logic it is of interest to know something about the reasons why Frege used this amalgamation of two kinds of valuations. The main theses of this talk are the following

(1) The amalgamation is based on epistemological assumptions.

(2) Analysing semantical aspects of his general scientific problem of the foundation of mathematics Frege treated a similar subject as the two kinds of valuations, distinguishing referent (truth and falsity) and sense ("Gedanke") of sentences.

(3) The difference between Frege's approach in solving his problem and other authors' approaches is based on different epistemologies.

(4) Distinguishing between the two kinds of valuation of sentences is of interest not only with respect to philosophical aspects of logic but also from the point of view of methodology." p. 167

"The distinction between the two different dimensions of valuation of sentences or logical formulae claimed by Suszko seems to me relevant especially from the point of view of methodology but also for the philosophical dispute over logic. For the second aspect the discussion of so called "paradoxes of material implication" provided an example.

I shall exemplify at this special case how the distinction of the two kinds of valuation can help us to come to a deeper understanding of logical expressions. From the philosophical point of view we can't discuss tautologies only as truth-value functions as they work in inferences, or with other words, we can't discuss them only with respect to inference relation. We have also to ask, which kind of reality will be represented by logical tautologies? What is the ontological aspect of logical tautologies? To find some understanding in this topic we will take attention to the so called paradoxes of material implication.

In so far as formulations like "from the False anything follows" or "the True follows from anything" are regarded only with respect to transformation of truth-values, they have the appearance of paradox. But if we assume that there are other reference assignments besides those of truth-values, then the two logical tautologies can stimulate us to seek them. Then we

can reflect that tautologies relate not only to inferences but also to conditions of being. With respect to such reference assignments the two tautologies above lose their paradoxical character. Their interpretation as theorems on being of truth says nothing more than "truth exists by itself" ("truth needs no assumptions") and "falsity is no basis of inference". A methodological value of the claimed distinction is given by a twofold sharpening of scientific research; controlling simultaneously methodical aspects of thinking and the association of content of thoughts. By this I mean: Suszko's criticism has it that logicians should think about the objects of scientific research the way other, practically minded scientists do in their research, because scientists in individual or teamwork control their procedures with concern both for the content of their ideas and the logical validity of their inferences. When we focus logical analysis of scientific labour more strongly on the unity and distinction of the two dimensions of valuation, I think we shall obtain new information for the automation of scientific work, and promote the development of applied logic. Comparing the intention behind, and the results of Frege's distinction between sense and referent may, on the one hand, help to describe scientific work; and, on the other hand, Suszko's distinction between the two kinds of valuation may give new insight in modelling scientific research-processes and help us to increase the efficiency of scientific labour."

"Professor Roman Suszko introduced a broad class of languages into the literature of logic. In honour of Wittgenstein Suszko named these languages W-languages. Syntax, semantics and

consequence operations in these languages are based on the famous ontological principle: whatever exists is either a situation, or an object, or a function. The distinguishing property of W-languages is that they contain sentential and nominal variables, identity connectives and identity predicates. The intended interpretation of W-languages is such that sentential variables range over the universum of situations, nominal variables range over the universum of objects. All other symbols in these languages except sentential and nominal variables are interpreted as symbols of some functions both defined over the universum of situations and the universum of objects. Identity connectives correspond to identity relations between situations, and identity predicates correspond to identity relations between objects. It is obvious that the ordinary predicate calculus with identity is a part W-language excluding sentential variables, but the most often used sentential languages are the part of W-languages without nominal variables and identity predicates. In this paper, I will discuss only W-languages containing sentential variables, connectives and possibly quantifiers binding sentential variables." p. 195

"In this paper I intend to present the general and formal principles of non-Fregean semantics for sentences and to derive the simplest consequences of these principles. The semantic principles constitute foundation of non-Fregean sentential calculus and its formal semantics and the philosophical interpretations of it. Non-Fregean sentential calculus is the basic part of non-Fregean logic. Non-Fregean logic is a generalization of classical logic. It was conceived by Roman Suszko under the influence of Wittgensteinian's *Tractatus Logico-Philosophicus*. The term "non-Fregean" indicates that the set of semantic correlate of sentences need not contain of just two elements, as it assumed by Frege in *Über Sinn und Bedeutung* (1892). Frege accepted the following semantic principle:

(A.F.) all true sentences have the same common referent, and similarly all false sentences also have the one common referent.

J. Łukasiewicz interpreted the common referent of true sentences as "Being" and analogically the common referent of all false sentences as "Unbeing". Suszko called the principle (A.F) the "semantical version of the Fregean axiom".

In *Abolition of the Fregean Axiom* (1975) Suszko wrote: "If one accepts the Fregean Axiom then one is compelled to be an absolute monist in the sense that there exists only one and necessary fact".

According to Suszko (A. F.) has a counterpart in the language of classical logic which is a formula asserting that the universe of sentential variables is a two-element set. This formula is not expressed that fact in the language of non-Fregean logic.

In *SCI and modal systems* (1972) Suszko presents the properties of his logic as follows: "... non-Fregean logic is the

realization of the Fregean program in pure logic, logically bivalent and extensional with two modifications: (1) keep formulas (sentences) and terms (names) as disjoint syntactic categories, having sense and denotations, as well, and (2) drop the desperate assumption that all true or false sentences have the same denotation (not sense that is proposition)." pp. 153-154.

25. ———. 1996. "A Formal Ontology of Situations." In *Formal Ontology*, edited by Poli, Roberto and Simons, Peter M., 173-187. Dordrecht: Kluwer Academic Publishers.

"The theoretical foundation for this paper is the system of a non-Fregean logic created by Roman Suszko under the influence of Wittgenstein's *Tractatus Logico-Philosophicus*. In fact, we use just a fragment of it called here a non-Fregean sentential logic.

Our basic term is that of a 'situation'. We do not answer the question what situations are. We simply assume that sentences present situations, and we provide a criterion determining when two sentences of some fixed language present the same situation.

The lay-out of this paper is the following. First we set out certain philosophical consequences of the assumption adopted in classical logic that the only connectives of the language in question are the truth-functional ones. Then we sketch out briefly the axiomatics of non-Fregean sentential logic, and of a formal semantics of the algebraic type for it.

Next, for an arbitrary model for a non-Fregean sentential logic, we pick out from the formulae true in that model a theory to be called the 'ontology of situations determined by the model in question' - in contradistinction to all sentences holding contingently in that model, i.e. not determined by its algebra. In the ontology of situations determined by a model we point out those propositions which pertain to possible worlds." p. 173

3. Philosophical Interpretations of non-Fregean Sentential Logic

According to the principles of non-Fregean semantics as presented in Omyla 1975, all sentences of an interpreted language have their references. However, not in every such language are we in a position to put forward universal and existential theorems with regard to the structure of the universe of those references. To be in such position the language in question must contain as its sublanguage the language of non-Fregean sentential logic, or at least a significant part of it. As we are not interested here in the universe of any particular language, but only in that of a quite arbitrary one, let us consider now some philosophical aspects of arbitrary models of that kind. Let $M = (U, F)$ be such a model. The elements of the universe of U do not generally answer to the intuitions we have about the reference of sentences, and about situations in particular. However, the algebraic structure imposed on U by the theory $TR(M)$ is the same as that of a possible universe of situations, with regard to the operations corresponding to logical constants. Moreover, the set F has the formal properties of a possible (or 'admissible') set of situations obtaining in that universe. This is so because sentential variables are at the same time sentential formulae, and because the logical constants get in the model M their intended interpretation. Thus for any model $M = (U, F)$ its algebra U is a formal representation of some universe of situations, and the set F is a formal representation of some admissible set of facts obtaining in some universe of situations. Not all the generalized SCI-algebras represent some algebra of situations; for not all of them contain a set F representing the facts, i.e. such that the couple (U, F) is a model. This depends on how the operations in the algebra U are defined. For the sake of simplicity the algebra of any model $M = (U, F)$ for the language of a non-Fregean sentential logic will be called the *algebra of situations* occurring in the model M , and the designated set F will be called the set of *facts* obtaining in M . Such a terminology is appropriate here for we are interested only in the formal properties of those universe of situations which in view of our semantic principles find expression in the logical syntax of the language in question, and in consequence operation holding in it. By the completeness theorem for non-Fregean logic it

follows that for any consistent theory T in L there is a model M such that $T \in TR(M)$. Hence any theory in the language of non-Fregean sentential logic will be called a *theory of situations*.

The term 'ontology of situations' we take over from the title of Wolniewicz 1985 [*Ontologia sytuacji: Ontology of situations* in Polish], but we understand it a bit differently. By an *ontology of situations* we mean a theory describing the necessary facts of universe of situations fixed beforehand. I.e. an ontology of situations is a set of formulae holding in some fixed universe of situations, independently of which situations there are facts. To be more accurate, by an ontology of situations we mean a set of formulae with the following three properties:

(1) An ontology of situations is a theory having in its vocabulary just one kind of variable - e. the sentential one. Under the intended interpretation they range over a universe of situations. (Like in modern set theory there are variables of just one kind, i.e. those ranging over sets.)

(2) An ontology of situations is formulated in a language containing logical symbols only, i. e. logical constants and variables. To justify that postulate let us note that such a basic theory should not presuppose any other terminology except the logical one. At most it might adopt some specific ontological terms as primitive, characterizing them axiomatically. However, we shall deal here only with such ontologies of situations which are expressed exclusively in logical terms." pp. 180-181.

27. ———. 2003. "Possible Worlds in the Language of Non-Fregean Logic." *Studies in Logic, Grammar and Rhetoric* no. 6:7-15.

"The term "possible world" is used usually in the metalanguage of modal logic, and it is applied to the interpretation of modal

connectives. Surprisingly, as it has been shown in Suszko *Ontology in the Tractatus L. Wittgenstein* (1968) certain versions of that notion can be defined in the language of non-Fregean logic exclusively, by means of sentential variables and logical constants. This is so, because some of the non-Fregean theories contain theories of modality, as shown in Suszko *Identity Connective and Modality* (1971).

Intuitively, possible worlds are maximal (with respect to an order of situations) and consistent situations, while the real world may be understood as a situation, which is a possible world and the fact.

Non-Fregean theories are theories based on the non-Fregean logic. Non-Fregean logic is the logical calculus created by Polish logician Roman Suszko in the sixties. The idea of that calculus was conceived under the influence of Wittgenstein's *Tractatus*. According to Wittgenstein, declarative sentences of any language describe situations."

"Suszko's thesis maintains that many-valued logics do not exist at all. In order to support it, R. Suszko offered a method for providing any "structural" abstract logic with a complete set of bivaluations. G. Malinowski challenged Suszko's thesis by constructing a new class of logics (called "q"-logics by him) for which Suszko's method fails. He argued that the key for logical two-valuedness was the "bivalent" partition of the Lindenbaum bundle associated with all structural abstract logics, while his "q"-logics were generated by "trivalent" matrices. This paper will show that contrary to these intuitions, logical two-valuedness has more to do with the geometrical properties of the deduction relation of a logical structure than with the algebraic properties embedded on it."

Selected Bibliography on the Scientific Philosophy of Mario Bunge

Introduction

"The Treatise encompasses what the author takes to be the nucleus of contemporary philosophy, namely semantics (theories of meaning and truth), epistemology (theories of knowledge), metaphysics (general theories of the world), and ethics (theories of value and of right action).

Social philosophy, political philosophy, legal philosophy, the philosophy of education, aesthetics, the philosophy of religion and other branches of philosophy have been excluded from the above quadrivium either because they have been absorbed by the sciences of man or because they may be regarded as applications of both fundamental philosophy and logic. Nor has logic been included in the Treatise although it is as much a part of philosophy as it is of mathematics. The reason for this exclusion is that logic has become a subject so technical that only mathematicians can hope to make original contributions to it. We have just borrowed whatever logic we use.

The philosophy expounded in the Treatise is systematic and, to some extent, also exact and scientific. That is, the philosophical theories formulated in these volumes are (a) formulated in certain exact (mathematical) languages and (b) hoped to be consistent with contemporary science.

Now a word of apology for attempting to build a system of basic philosophy. As we are supposed to live in the age of analysis, it may well be wondered whether there is any room left, except in the

cemeteries of ideas, for philosophical syntheses. The author's opinion is that analysis, though necessary, is insufficient - except of course for destruction. The ultimate goal of theoretical research, be it in philosophy, science, or mathematics, is the construction of systems, i.e. theories. Moreover these theories should be articulated into systems rather than being disjoint, let alone mutually at odds.

Once we have got a system we may proceed to taking it apart. First the tree, then the sawdust. And having attained the sawdust stage we should move on to the next, namely the building of further systems. And this for three reasons : because the world itself is systemic, because no idea can become fully clear unless it is embedded in some system or other, and because sawdust philosophy is rather boring." (vol. I pp. V-VI)

From: Mario Bunge, *General Preface to the Treatise*, in: *Treatise on Basic Philosophy*, Dordrecht: Reidel 1974.

Main publications

1. Bunge, Mario. 1959. *Causality. The Place of the Causal Principle in Modern Science*. Cambridge: Harvard University Press.

Third revised edition in 1979 with the title: *Causality and modern science* - New York, Dover Publications.

From the preface to the first edition:

"This is an essay on determinism, with special emphasis on causal determinism -- or causality, for short. To some, causation and determination -- and consequently causalism and determinism -- are synonymous. But to most people, determinism is a special, extreme form of causality -- and even a particularly displeasing one, for it is wrongly supposed to deny man the possibility of changing the course of events. I take sides with the minority that regards causal determinism as a special form of determinism, namely, that kind of theory that holds the unrestricted validity of the causal principle to the exclusion of every other principle of determination. The rational ground for regarding causality as a form of determinism, and not conversely, is that modern science

employs many noncausal categories of determination or lawful production, such as statistical, structural, and dialectical, though they are often couched in causal language.

In this book, the causal principle is neither entirely accepted nor altogether rejected. My aim has been to analyze the meaning of the law of causation, and to make a critical examination of the extreme claims that it applies without restriction (causalism), and that it is an outmoded fetish (acausalism). I have tried to do this by studying how the causal principle actually works in various departments of modern science. However, I hope I have succeeded in avoiding technicalities -- save in a few isolable passages. The book is, in fact, addressed to the general scientific and philosophic reader.

The chief result of the above-mentioned examination is that the causal principle is neither a panacea nor a superstition, that the law of causation is a philosophical hypothesis employed in science and enjoying an approximate validity in certain fields, where it applies in competition with other principles of determination. a by-product of this analysis is a fresh examination of various topics in metascience, ranging from the status of mathematical objects to the nature and function of scientific law, explanation and prediction." (pp. V-VI).

From the Preface:

"The aims of this book are two. First, to contribute to the elucidation of some key concepts of both philosophy and science, such as those of conceptual analysis, analyticity, truth, law, level, and simplicity. Second, to show the complexity, i.e., the richness, of those very concepts, thereby exploding the myth that simplicity is always either a fact or a desideratum of research. To the extent to which the book succeeds in attaining both goals it should discourage the concoction of naive, oversimplified pictures of knowledge.

The method employed is a kind of philosophic procedure that may be called metascientific elucidation. This kind of clarification may be analytic or synthetic: it may consist either

in the analysis or reduction of conceptual entities (concepts, propositions, theories), or in the construction of such entities. In either case, whether in the phase of analysis or in the phase of synthesis, I call this work metascientific if the objects of elucidation are relevant to science and if the task is performed in a way congenial to science and with the help of some of the tools of contemporary scientific philosophy, such as formal logic, semantics, and theory formalization.

To the extent to which the ideas dealt with in this book are relevant to science and therefore of interest to both scientists and philosophers of science, and to the extent to which the analyses and syntheses proposed do take advantage of the tools of scientific philosophy, this is a work on metascientific elucidation." (p. V).

43. ———. 1974. *Treatise on Basic Philosophy. I: Sense and Reference*. Dordrecht: Reidel.

"This is a study of the concepts of reference, representation, sense, truth, and their kin. These semantic concepts are prominent in the following sample statements: 'The field tensor refers to the field', 'A field theory represents the field it refers to', 'The sense of the field tensor is sketched by the field equations', and 'Experiment indicates that the field theory is approximately true'. Ours is, then, a work in philosophical semantics and moreover one centered on the semantics of factual (natural or social) science rather than on the semantics of either pure mathematics or of the natural languages. The semantics of science is, in a nutshell, the study of the symbol-construct-fact triangle whenever the construct of interest belongs to science. Thus conceived our discipline is closer to epistemology than to mathematics, linguistics, or the philosophy of language. The central aim of this work is to constitute a semantics of science -- not any theory but one capable of bringing some clarity to certain burning issues in contemporary science, that can be settled neither by computation nor by measurement. To illustrate: What are the genuine referents of quantum mechanics or of the theory of evolution?, and Which is the best way to endow a mathematical formalism with a precise factual sense and a definite factual reference -- quite apart from questions of truth? A consequence of the restriction of our field of inquiry is that entire topics, such as the theory of quotation marks, the semantics of proper names, the paradoxes of self-reference, the norms of linguistic felicity, and even modal logic have been discarded as irrelevant to our concern. Likewise most model theoretic concepts, notably those of satisfaction, formal truth, and consequence,

have been treated cursorily for not being directly relevant to factual science and for being in good hands anyway. We have focused our attention upon the semantic notions that are usually neglected or ill treated, mainly those of factual meaning and factual truth, and have tried to keep close to live science. The treatment of the various subjects is systematic or nearly so: every basic concept has been the object of a theory, and the various theories have been articulated into a single framework." pp. XI-XII.

44. ———. 1974. *Treatise on Basic Philosophy. Ii: Interpretation and Truth*. Dordrecht: Reidel.

"The present volume start with the problem of interpretation. Interpretation is construed as the assignment of constructs (e.g. predicates) to symbols. It can be purely mathematical, as when the dummy x is interpreted as an arbitrary natural number, or also factual, as when such a number is interpreted as the population of a town. Now, as we saw a while ago, predicated and propositions have both a sense and a reference -- and nothing else as far as meaning is concerned. These, then, are taken to be the meaning components. That is, the meaning of a construct is defined as the ordered couple constituted by its sense and its reference class. Once the meaning of a proposition has been established we can proceed to finding out its truth value -- provided it has one. If the proposition happens to be factual, i.e. to have factual referents, then it may be only partially true -- if true at all. Hence we must clarify the concept of partial truth of fact. This we do by building a theory that combines features of both the correspondence and the coherence theories of truth. The remaining semantical notions, notably those of extension, vagueness, and definite description, are made to depend on the concepts of meaning and truth and are therefore treated towards the end of this work. The last chapter explores the relations between philosophical semantics

and other branches of scholarship, in particular logic and metaphysics.

This volume, like its predecessor, has been conceived with a definite goal, namely that of producing a system of philosophical semantics capable of shedding some light on our knowledge of fact, whether ordinary or scientific. We leave the semantics of natural languages to linguists, psycholinguists and sociolinguists, and the semantics of logic and mathematics (i.e. model theory) to logicians and mathematicians. Our central concern has been, in other words, to clarify and systematize the notions of meaning and truth as they occur in relation to factual knowledge. For this reason our semantics borders on our epistemology." pp. Xi-XII.

45. ——. 1974. "The Relations of Logic and Semantics to Ontology." *Journal of Philosophical Logic* no. 3:195-219.

"Philosophers have argued untiringly, over many centuries, about the ties of logic with ontology. While some have followed Parmenides in identifying the two, others - particularly since Abelard - have asserted the ontological neutrality of logic and, finally, a third party has oscillated between those two extremes.

Unfortunately it has seldom been clear exactly what is meant by the 'ontological commitment' of logic: mere reference to extralogical objects, the presupposition of definite ontological theses, or the ontological interpretation of logical formulas? Nor has an adequate tool for investigating this problem - namely a full-fledged semantical theory - been available. (Recall that the only existing semantical theory proper, i.e. model theory, is not competent to handle this problem because it is solely concerned with the relations between an abstract theory and its models, as well as with the relations among the latter.) Much the same holds for semantics, though with a remarkable difference. If semantics presupposes logic, and the latter is ontologically committed, so must be semantics. But of

course semantics could be tied to ontology even if logic were ontologically neutral. Therefore we need an independent investigation of the ontological commitment, if any, of semantics.

The purpose of this paper is to investigate the relations of logic and mathematics to ontology and to do it with the help of a theory of meaning. This theory has been sketched elsewhere (Bunge 1972, 1973) and will be fully expanded in a forthcoming book. We assign meanings to constructs, in particular predicates and propositions, and distinguish two meaning components : sense and reference. The sense of a construct p in a context C is the totality of logical relatives of p in C . If p belongs to a theoretical context then the sense of p is the collection of statements within the theory that either entail p or are entailed by p . And the reference class of a construct p is the totality of individuals "mentioned" (truthfully or not) by p . Finally the meaning of p is the ordered pair constituted by the sense of p and the reference of p . We shall apply these ideas to find out the meaning of the typical constructs of logic and semantics. But before doing so we must formulate those ideas somewhat more carefully. An before we tackle this task we must explain what we mean by a predicate and by a context."

"This book and its companion, namely Volume 4 of our *Treatise*, concern the basic traits and patterns of the real world. Their joint title could well be *The Structure of Reality*. They constitute then a work in ontology, metaphysics, philosophical cosmology, or general theory of systems. Our work is in line with an old and noble if maligned tradition: that of the pre-Socratic philosophers, Aristotle, Thomas Aquinas, Descartes, Spinoza, Leibniz, Hobbes, Helvetius, d'Holbach, Lotze, Engels, Peirce, Russell, and Whitehead. But at the same time it departs from tradition in the matter of method. In fact our aim is to take the rich legacy of ontological problems and hints bequeathed us by traditional metaphysics, add to it the ontological presuppositions of contemporary scientific research, top it with new hypotheses compatible with the science of the day, and elaborate the whole with the help of some mathematical tools.

The end result of our research is, like that of many a metaphysical venture in the past, a conceptual system. It is hoped that this system will not be ridiculously at variance with reason and experience. It is intended moreover to be both exact and scientific: exact in the sense that the theories composing it have a definite mathematical structure, and scientific in that these theories be consistent with and moreover rather close to

science - or rather the bulk of science. Furthermore, to the extent that we succeed in our attempt, science and ontology will emerge not as disjoint but as overlapping. The sciences are regional ontologies and ontology is general science. After all, every substantive scientific problem is a subproblem of the problem of ontology, to wit, *What is the world like?*

After a long period underground, talk about metaphysics has again become respectable. However, we shall not be talking at length about ontology except in the Introduction. We shall instead do ontology. In the process we shall attempt to exhibit the mathematical structure of our concepts and we shall make the most of science. Being systematic our ontology may disappoint the historian. Being largely mathematical in form it will be pushed aside by the lover of grand verbal (but sometimes deep and fascinating) systems - not to speak of the lover of petty verbal matters. And being science-oriented it will fail to appeal to the friend of the esoteric. Indeed we shall be concerned with concrete objects such as atoms, fields, organisms, and societies. We shall abstain from talking about items that are neither concrete things nor properties, states or changes thereof. Any fictions entering our system will be devices useful in accounting for the structure of reality. (Constructs were dealt with in Volumes 1 and 2 of this work.)" pp. XIII-XIV.

"This volume continues and concludes the task begun in Part 1, titled *The Furniture of the World* - namely the building of an exact and systematic ontology consistent with contemporary science. However, it can be read independently by anyone willing to take for granted the basic notions analyzed and systematized in the companion volume, namely those of substance, property, thing, possibility, change, space, and time.

The three main themes of this book are wholeness (or systemicity), variety, and change. These three notions are analyzed and systematized, and they occur in some of the main assumptions of our ontology. One of these hypotheses is that the universe is not a heap of things but a thing composed of interconnected things - i.e. a system. This supersystem is composed of subsystems of various kinds: physical, biological, social, etc. Only physical systems may be composed of things that are not themselves systems, such as elementary particles and field quanta. However, even nonsystems are components of some system or other, and every system but the universe is a subsystem of some system: there are no strays. Ours is, in sum, a world of interconnected systems. Moreover it is the only one.

Another postulate of this system of ontology is that concrete systems are not all alike except insofar as they are systems and therefore tractable with the help of a unifying systems-theoretic framework. There are different kinds of system and each is characterized by its own peculiar properties and laws. Surely we sometimes succeed in accounting for the emergence and the

history of a system in terms of its composition, environment, and structure. Nevertheless, explaining need not be explaining away: explained systems are not heaps, explained emergence is no mere resultant, and explained novelty is not old.

Systemicity, emergence, and qualitative novelty and variety are as genuine as they are capable of being explained. Far from being incompatible with reason, wholeness and emergence can be understood.

A third major thesis of this work is that no system, except for the world as a whole, lasts forever. Systems get assembled, change, and break down. If natural, systems emerge as a result of self-assembly processes - often from debris of former systems. Even modest accretion processes can ensue in systems possessing emergent properties. Order can thus emerge from randomness, systems from physical precursors, living systems from nonliving ones, and so on. (Entropy need not increase in open systems.)

All three theses are by now common knowledge or nearly so. Now they - jointly with many others - have become part and parcel of a science oriented ontological system couched in a fairly exact language. Thus the novelty of this system resides sometimes in its components, and at other times in their organization." pp. XIII-XIV

From the Introduction: "This book deals with one of the oldest, most intriguing, and most difficult of all the problems belonging in the intersection of science and philosophy, namely the so-called *mind-body problem*. This is the system of ancient questions about the nature of the mental and its relations to the bodily.

Here are some of the problems belonging to the mind-body problem circle. Are mind and body two separate entities? If so, how are they held together in the living organism? How do they get in touch in the beginning, how do they fly asunder at the end, and what becomes of the mind after the breakdown of the body? How do the two entities manage to function synchronically: what does it mean to say that mental states have neural correlates? Do these entities interact, and if so how? And which if any has the upper hand?

If, on the other hand, mind and body are not different entities, is the mind corporeal? Or is it the other way around, namely is the body a form of the mind? Or is each a manifestation of a single (neutral) underlying inaccessible substance? In either case: what is mind? A thing, a collection of states of a thing, a set of events in the thing-or nothing at all? And whatever it is, is it just physical or is it something more? And in the latter case -- i.e. if mind is emergent relative to the physical level can it be explained in a scientific manner or can it be described only in ordinary language?

The mind-body problem is notoriously a hard nut to crack -- surely even more so than the problem of matter -- so much so that some scientists and philosophers despair of it being soluble at all. We submit that the problem, though tough, is soluble, and shall outline a solution to it in this work. But

before doing so we shall have to do some philosophical scouting and conceptual cleansing, because part of the problem is that it is usually formulated in inadequate terms -- namely in those of ordinary language. These are inadequate not only because ordinary language is imprecise and poor but also because the European languages are loaded with a preconceived solution to the problem, namely psychophysical dualism, or the doctrine that mind and body are separate entities." (pp. XIII-XIV).

65. ———. 1983. *Treatise on Basic Philosophy. V: Epistemology and Methodology I: Exploring the World*. Dordrecht: Reidel.

"This volume is devoted to general epistemology and methodology; the next, to some epistemological and methodological problems arising in contemporary science and technology. Epistemology, or the theory of knowledge (French *gnoséologie*, German *Erkenntnistheorie*), is the field of research concerned with human knowledge in general-ordinary and scientific, intuitive and formal, pure and action-oriented. And methodology -- not to be mistaken for methodics, or a set of methods or techniques - -is the discipline that studies the

principles of successful inquiry, whether in ordinary life, science, technology, or the humanities.

In this work epistemology is conceived as a merger of philosophy, psychology, and sociology: it describes and analyzes the various facets of human cognitive processes, whether successful or not, and whether or not they bear on everyday matters. Methodology too is descriptive and analytical, but in addition it is prescriptive or normative: it attempts to find out not only how people actually get to know but also how they ought to proceed in order to attain their cognitive goals. Thus both the epistemologist and the methodologist are supposed to describe and analyze experiment, but the methodologist is primarily interested in well designed experiment. In short, whereas epistemology is concerned with inquiry in general, the task of methodology is to find or perfect optimal inquiry strategies. (...)

This book continues an old tradition or, rather, a whole fan of traditions started in ancient Greece and India. But at the same time this work departs from tradition with regard to method. It is hoped that our inquiry into inquiry will be closer to the cognitive sciences and, in general, closer to contemporary research, than to obsolete dogma. More particularly, we shall proceed as follows. We shall pick up the rich legacy of epistemological problems and hints (often optimistically called 'theories') bequeathed to us by the epistemological tradition. We shall enrich it with some of the problems and findings of contemporary scientific, technological and humanistic research, topping it with new hypotheses compatible with the science of the day-in particular neuroscience, psychology, and social science. And we shall elaborate and systematize the whole with the help of a few modest tools such as the concepts of set and function. However, in contradistinction with the former volumes in this *Treatise*, here we shall adopt a far more modest level of formalization. The result is a greater intelligibility-and length. (The formalizations have been put in parentheses and in the Appendices.)"

66. ———. 1983. *Treatise on Basic Philosophy. Vi: Epistemology and Methodology Ii: Understanding the World*. Dordrecht: Reidel.

"This is the sequel to *Epistemology I: Exploring the World*. In that work we studied cognition as a brain process, and communication as a social transaction. In particular, we studied perception and conception, the formation of propositions and proposals, exploration and systematization, discovery and invention. We regarded knowledge as an outcome of processes occurring in animals that learn by themselves and from one another. We took concepts and propositions, problems and proposals, to be equivalence classes of brain processes rather than ideal objects detached from brains and from society. However, we also stressed the need for studying such abstractions as well as the corresponding real processes.

In other words, we admitted that cognition ought to be studied both concretely (as a biopsychosocial process) and abstractly (with disregard for personal and social idiosyncrasies). We hoped in this way to favor the merger of the various hitherto separate approaches to the study of knowledge and knowledge-directed action: the neurophysiological and the psychological, the sociological and the historical, the epistemological and the methodological ones. After all, these various approaches have a single aim, namely to improve our understanding of the ways we get to know reality, and the ways knowledge can be utilized to alter reality.

In this volume we will study the ways theories and proposals (e.g. technological designs) are put to the test and used to understand or alter reality. We will stress the difference between belief and inquiry. We will study the kinds of knowledge and the ways human knowledge grows, declines, or alters course. We will distinguish basic science from applied science, and both from technology and ideology, and we will seek to demarcate genuine knowledge from bogus. We will analyze the two mechanisms for enhancing the cross-fertilization and the unity of the various branches of knowledge: reduction and integration. We will stipulate the conceptual and empirical conditions a proposition has to fulfill in order to be valued as (sufficiently) true, and a proposal to be regarded as (suitably) efficient. (We shall do so in the light of real cases drawn from contemporary research rather than in obedience to a priori philosophical principles.) We will analyze a number of important yet vague notions, such as those of truth and efficiency, background and framework, paradigm and revolution. And we will explore the possible limits to our exploration of the world, as well as the limitations of the classical philosophies of knowledge.

The upshot of our study is a descriptive and normative epistemology that cannot be compressed into a couple of slogans, although it combines some features of rationalism with others of empiricism. This synthesis may be called *scientific realism* because the criterion for adopting or rejecting any given thesis is its compatibility or incompatibility with the practice of research in contemporary science (basic or applied), technology, or the humanities. We find no use for a theory of knowledge, however exact or ingenious it may be, that is divorced from knowledge." pp. XI-XII

"This is a systematic study in the philosophy of science and technology, or PS & T for short. It struggles with some of the so-called Big Questions in and about contemporary S & T, i.e. questions supposed to be general, deep, hard, and still *sub judice*. Here is a random sample of such problematics. Is verbal psychotherapy scientific? Is political economy ideologically neutral? Are computers creative? What is the ontological status of machines? Is engineering just an application of basic science? What is language? Are there laws of history? Which are the driving forces of history? Which is the most fruitful approach to the study of mind? Are genes omnipotent? Are species collections or concrete systems? Do the earth sciences have laws of their own? Is chemistry nothing but a chapter of physics? Does contemporary cosmology confirm theology? Has the quantum theory refuted scientific realism? Is there a viable philosophy of mathematics? How are we to choose among alternative logics? What is the ontological status of concepts?

These and other questions of interest to philosophy, as well as to science or technology, are tackled in this book from a viewpoint that is somewhat different from the dominant PS & T. An instant history of our discipline should help place our viewpoint. Modern PS & T began together with modern science and it was cultivated by scientists and philosophers until it became professionalized in the 1920s. At this time it took a *logical* turn: it was equated with the logical analysis and orderly reconstruction of scientific theories. Experimental and field work were deemed to be ancillary to theorizing, and technology was praised or deprecated, but hardly analyzed. Later on PS &

T took *a linguistic* turn: only the languages of S & T seemed to matter. Facts, problems, theories, experiments, methods, designs and plans were overlooked. More recently, PS & T took *a historical* turn: everything was seen from a historical viewpoint. The logic, semantics, epistemology, ontology and ethics of S & T were declared subservient to its history or even irrelevant. Even more recently there have been attempts to force PS & T to take *a sociological* turn. Facts are said to be the creation of researchers, who would act only in response to social stimuli or inhibitors; there would be neither norms nor objective truth.

I believe the time has come for PS & T to take, or rather retake, a *philosophical* turn: to investigate the logical and semantical, epistemological and ontological, axiological and ethical problems raised by contemporary S & T, leaving the sociological and historical studies to social scientists. The time has also come to approach the problematics of PS & T in *a scientific* fashion, by paying close attention to current developments in S & T and checking philosophical hypotheses against the findings of S & T. At least this is the approach adopted in the present volume.

Although this book is part of an eight-volume treatise, it is self-contained: it can be read independently of the others. Moreover, each chapter can be read independently of the others. The book is addressed to philosophers, scientists, technologists, and culture watchers. It may be used as a textbook in a one year advanced course in PS & T. Each chapter may also be used in a course in the corresponding branch of PS & T.

To facilitate its use as a textbook, the present volume has been divided into two parts. Part I is devoted to the philosophy of the formal and physical sciences, whereas Part II covers the philosophy of the biological and social sciences as well as of the technologies." p. IX-X.

78. ———. 1989. *Treatise on Basic Philosophy. Viii: Ethics: The Good and the Right*. Dordrecht: Reidel.

"This book is about values, morals, and human actions. It is also about axiology (the study of value systems), ethics (the study of moral codes), and action theory. It is concerned with both private and public values, morals, and actions. In particular, it seeks to uncover the roots and functions (biological and social) of valuation and morality. As well, it attempts to sketch a value system, a moral code and a general plan of action that may help us tackle the dreadful problems of our time.

(...)

The revival of value theory and ethics can be attested to by anyone who bothers to peruse the philosophical journals published in the course of the latest few years. This revival is particularly welcome at a time when philosophy as a whole is at a low ebb - so much so that some philosophers have proclaimed its death while others have taken leave of reason. But the current flourishing of ethics may be an indicator of the general crisis of modern civilization, for people do not usually reflect on problems about values and morals until they face them, and nowadays most of us face them daily by the dozen.

This is the last volume of my *Treatise on Basic Philosophy*, on which I started to work two decades ago. It is consistent with the previous volumes, in particular with the naturalistic, dynamicist, emergentist and systemist ontology, as well as with the realistic and ratioempiricist semantics and epistemology formulated therein. However, the present book may be read independently of its companions." p. XIV-XV.

From the preface: "This book has been written for social scientists curious about philosophy, as well as for philosophers interested in social studies. As suggested by its title, it focuses on the philosophy involved in social studies -- albeit, usually in a tacit manner. I will argue that all social studies,

whether scientific or literary, are crammed with philosophical concepts, such as those of fact, system, process, theory, test, and truth. They also contain or presuppose some philosophical assumptions, such as that societies are (or are not) mere aggregates of individuals, that people can (or cannot) choose and act rationally, and that social facts can (or cannot) be studied scientifically.

Regrettably, most students of society rarely pause to examine the philosophical ideas they adopt. When they do, they often fall under the influence of philosophies that do not match the practice of contemporary social science research. Most of the philosophers who have paid attention to the philosophy in or about social science have held some or all of the following three theses: that there is a clear divide between the social and the natural sciences, there being no mixed or socio-natural sciences; that science and philosophy are mutually disjoint, so cannot learn from one another; that the philosophy of social science is the same as that of the natural sciences -- or else that the two are utterly disjoint. I will argue that all three, and many more received opinions, are false. I will examine some of the

key philosophical ideas inherent in the social (and socio-natural) sciences, as well as some of the topical philosophical problems raised by them. Thus I will elucidate the ontological notions of event and causation, the semantic concepts of meaning and truth, the epistemological ideas of hypothesis and indicator, the axiological notions of value and utility, and the ethical concepts of right and duty, I will also wrestle with such classical controversies as individualism versus holism, rationalism versus empiricism, explanation versus understanding, and nomothetic versus idiographic science."

From the Introduction: "The *ontology* of social science examines the nature of society, the kinds of social process, the difference between law and rule, the roles of causation and chance, and the nature of planning. Hence it is concerned with questions such as: Are there social systems, or only aggregates of individuals? Are cultures systems of values and norms, or concrete social systems? What is a micro-macro link? What are the engines of history: the environment, biological factors, the economy, politics, culture, or all of these? Are there occasionally leaps in social evolution, or was Marshall right in inscribing the maxim *Natura non facit saltum* on the title page of his classic *Principles of Economics*? Is society a text to be deciphered by hermeneutics or semiotics? Is human history analogous to biological evolution?" (p. 7).

Fred Sommers on the Logic of Natural Language

Introduction

"The essay before you is the fruit of some fifteen years of investigation into the logical syntax of natural language. In the summer of 1965 I read a paper to the Congress on Logic and Scientific Method at Bedford College, London, that presented an algorithm for the algebraic treatment of syllogistic arguments in which categorical propositions were transcribed as fractions and reciprocals.(1) I spent the next two years looking for a more general algorithm with greater expressive power, one that could transcribe relational, multi-general propositions as well as simple categoricals. (...)The first article on the more general calculus was published in *Mind*, January 1970, as *The Calculus of Terms*. Unfortunately its message had little effect although I followed it by a series of articles that exploited the new notation and exposed some important consequences for the philosophy of language. It became clear that the current Fregean logic had fully replaced the more traditional logic of terms and that articles could not do justice to the neo-classical alternative that I was advocating.

I had for some years been planning to write a book on the logic of categories but the lack of response to my more recent interests, the logic of terms and its relation to natural syntax, strongly suggested that I must first do book-length justice to these latter topics. I began writing this essay in 1975 and, after several long interruptions and two revisions, completed it in the summer of 1980. I still hope to write the book on category theory. In the present work chapter 13) I do little more than indicate how traditional logic's way with contrariety leads to the conception of categories that is at the basis of

Ryle's seminal work in the forties and my own more formal treatment of categories in the early sixties. Indeed it was my recognition of the need for a notion of contrariety that would allow for saying, for example, that Saturday is neither fed nor unfed (which renders both 'Saturday is fed' and 'Saturday is unfed' 'category mistakes') that prompted me to re-examine traditional Aristotelian logic with its characteristic distinction between contrary terms or predicates and contradictory propositions. This distinction is absent in modern logic which uses the forms 'Px' and '-Px' to represent contrary predicates thereby conflating the two oppositions of contrariety and contradiction so fundamental to the classical term-theoretic standpoint. (2) The current use of propositional negation as the sole form of opposition 'precludes the kind of internal term and predicate structure that makes it possible to treat negation as a means of changing around concepts inside the meanings of terms and predicates'. The quoted words are Jerrold Katz's but they are typical of the sort of reaction one gets from linguists who find the restricted grammar of 'standard' logical languages to be at odds with their intuitions into the logical grammar of empirical languages.

More generally the theory of logical form that has its source in the formation rules for standard languages poses severe problems for the linguist. The older subject-predicate logic with its classical binary noun-phrase verb-phrase analysis of sentences has been discredited and while some linguists appear prepared to abandon the classical analysis in favour of analyses that conform more closely to the syntax of modern predicate logic others may welcome a rehabilitated classical logic of 'categorical' sentences that leaves the fundamental binary structure in place." (pp. VII-VIII)

Notes

(1) 'On a Fregean Dogma'. Apparently I was not alone in representing categorical propositions as fractions. Charles Merchant, a mathematician at the University of Arizona, subsequently wrote me of his independent work on this algorithm.

(2) Early treatments of the distinction between negating a sentence and denying predicate may be found in my 'Predicability' (1963) and 'Truth Functional counterfactuals' (1964).

From: Fred Sommers, *The Logic of Natural Language*, Oxford: Clarendon Press 1982.

"Today's orthodox logic came into existence about a hundred years ago when it replaced the traditional syllogistic logic, which itself had been the orthodoxy for many centuries. The arguments for abandoning the old logic were not conclusive. Once entrenched, the new logic felt no need for supporting arguments. Today logic students are given at best some bad old arguments against the old logic, and then are simply presented with the new logic to be learned. No one asks 'Why?'. But Sommers has. He has challenged the deeply entrenched presumption that no syllogistic logic can measure up to the great power and beauty of the predicate calculus. What is more, not only has Sommers shown the emperor to have no clothes, he has produced a fine new suit. He has returned to the venerable but forgotten logic of Aristotle, Ockham, and Leibniz, and has shown that it does have hidden assets which make it more than adequate as an alternative to the orthodox system. So I think this rebellion is well worth joining. And, of course, there's that pleasure I referred to earlier. Sommers speaks of "the perverse pleasure of advocacy-in this day and age-of Aristotle over Frege." I have put this collection together for several reasons. As a supplement to Sommers' own work it illustrates the broad scope of Sommers' challenge to modern orthodox views about logic and language. Not all of those whose work is represented here fully endorse Sommers' programme. Some may explicitly reject parts of it. But all recognize its importance." (Preface by the Editor, pp. X-XI)

From: George Englebretsen (ed.), *The New Syllogistic*, New York: Peter Lang 1987.

"Frederic Sommers was born on 1 January 1923 in New York City. He was educated at Columbia University, where he received his BA and then his PhD in philosophy in 1955, writing a dissertation on "An Empiricist Ontology: A Study in the Metaphysics of Alfred North Whitehead." Sommers began his academic career at Columbia University, where he was assistant professor of philosophy from 1955 to 1963. He moved to Brandeis University in 1964 as associate professor of philosophy, was promoted to full professor in 1966, and

held the Harry Austryn Wolfson Chair of Philosophy from 1965 until his retirement in 1993.

Sommers was a staunch proponent of a traditionalist view of logic, albeit in a "modern" guise. He has consistently expressed the view that progress in logic should have stopped, if not with Leibniz, than at least before Frege, devising a variant of syllogistic very close to that undertaken by Leibniz. His "Calculus of Terms" applies a system of pluses and minuses to the subjects and predicates of categorical syllogisms, to indicate inclusion and exclusion, the copula and the negation of the copula, as well as for affirmation and denial, with a universal statement having the form $+ (-...)$ or $- (+...)$ for the subject term and a particular statement having the form $+ (+...)$ or $- (-...)$ for the subject term. His system is essentially that of Leibniz's, with Leibniz's "=" and "±" replaced in Sommers's notation by "+" and "-" respectively. In *Logic of Natural Language* Sommers developed the system in more detail together with a consideration of its purported philosophical implications. He argued that his calculus of terms is significantly different from the predicate logic; but Gregory McCulloch [1984] argued that there really is no such difference. Sommers claims that his calculus of terms is an elaboration of Leibniz's proposal.

Sommers argued that the subject–predicate semantic analysis of syllogistic propositions with the proper treatment, retains as much deductive power as Frege's calculus, and in an important sense is more expressively powerful than Frege's function-theoretic quantification theory, because it is closer to natural language while being able to handle polyadic relations.

In Sommers's calculus, relational terms are represented in the form ' $R \pm A \pm B \pm \dots \pm K$ ', where R is the relation and some/all A , some/all B , ..., some/all K are objects of R . Thus Sommers is able to analyze such propositions as "All censors withhold some books from minors" as " $W + B - M$."

Sommers's "Ordinary Language Tree" for mapping relations among Aristotelian categories was based upon his efforts to arithmeticize Aristotelian syllogistic as a calculus of terms. In Sommers's tree, genera and species give way to subjects and predicates, treated as classes. His book *The Logic of Natural Language* (1982) provides a

detailed, systematic and unified elaboration of the Ordinary Language Tree and the Calculus of Terms and explores the philosophical import of this logical system. His *Invitation to Formal Reasoning: The Logic of Terms* (2000) provides a textbook elaboration of the logic of terms."

Excerpts from his publications (in progress)

"The thesis I will be arguing for belongs to the premodern -- which is to say, pre-Fregean-tradition of logical theory whose major figures from Aristotle to Leibniz never doubted that the sentences of a natural language like Greek or English that entered into deductive reasoning could, for logical purposes, be parsed in ways familiar to the grammarian. Implicit in the program of traditional formal logic is the idea of a logical syntax of natural language in which the grammarians' nounphrase/verb-phrase analysis is the fundamental pattern. (...)The idea of a logical syntax of natural language stands opposed to what the Fregean believes about logical form. Frege himself held that an adequate account of inferences expressed in natural language requires translation into a new idiom, the idiom of a language expressly constructed for use by logicians.

This new logical language is no mere convenience: Frege believed that the syntax of natural language was logically useless, misleading, and incoherent. Being convinced of this, Frege did not criticize the grammarian for misconstruing natural language. On the contrary, from Frege's standpoint the grammarian could well be right in his description of the syntax of natural language. If so the inadequacy is not in the grammarian but in his subject-matter. Michael Dummett aptly sums up Frege's reaction to the phenomenon that the natural languages lack a perspicuous logical grammar with the words 'so much the worse for natural language'." (pp. 1-2)

From: Fred Sommers, *The Logic of Natural Language*, Oxford: Clarendon Press 1982.

Extensions of Sommers' Term Logic

"Conclusion.

NTL [*Numerical Term Logic*] works within the assumption that all logical statements are affirmations as to the quantity of members of a set (or subset). Sommers' logical system and Modern Predicate Logic, although opposed in many ways, have at least one thing in common: they may each formulate statements that affirm only either that a set is empty, or that it is not. In Sommers' system's primary scheme, whether a subset is non-empty is indicated by the copulation of two terms (with a primary "+"), each of which represents one of the intersecting sets; and whether a set is empty is indicated by the denial of such a copulation (with a primary "-"). Despite its quantificational difficulties, Sommers' system is remarkably expressive, deductively powerful, theoretically well founded (as well as relatively faithful to the structure of natural language); indeed, it surpasses MPL [*Modern Predicate Logic*] in each of these respects. In building upon the notational foundation of Sommers' system, NTL not only retains these important advantages, but, in fact, amplifies them enormously. In NTL, variable numerical quantity is incorporated as a formal element of logical copulation; thus, in an NTL primary scheme analogous to Sommers', to what degree a subset is non-empty would be indicated by the copulation of two terms (with a binary "+x"), each of which represents one of the intersecting sets; and to what degree a subset is empty would be indicated by the denial of a copulation of this kind. NTL therefore becomes infinitely more expressive than Sommers' system—not merely in the fact that it may formulate statements with quantities of infinite magnitude, but also in the fact that it accounts for various types of quantification (fractional, subjective natural language quantification, etc.); it also becomes far more powerful than Sommers' system in its deductive scope (for it handles inferences involving different kinds of numerically quantified statements uniformly), is theoretically stronger (for example, in its accounts of "wild quantity", vacuosity, and subalternation), and is more loyal than Sommers' system to the structure of natural language (for it requires no contortionism in its expression)." (pp. 103-104)

"An important part of any investigation into the meaning of an expression E consists of finding what may be called its sense location. This is done by noting which expressions may be conjoined with E and which may not. "E is that expression which goes well with A, C, or G in a sentence but E fails to make sense when used with B, D, F or H, etc." When the mutual sense relations of A, B, C, D, E, F, G . . . are known, then we have a map in which each expression has a sense location with respect to the other expressions under consideration. The question we shall consider is whether the natural language provides any rules for the construction of such a map, whether there is, as it were, an invariant structure to "linguistic cartography" in terms of which it would be possible to give the

sense location of any of the expressions in the language. To this question we shall eventually offer an affirmative answer.

The theory of meaning adopted here is a current one. It is the theory of meaning-in-use. Employing a convenient distinction of Ryle's between two kinds of knowing, we may say that a knowledge of meaning is a "knowing how" rather than a "knowing that": to know the meaning of an expression is to know how to use it. Such knowledge includes an ability to formulate a piece of non-absurd discourse containing the expression. Thus to know the meaning of a word is to know how to formulate some sentences containing the word, to know the meaning of a sentence is to know how to formulate some coherent discourse containing the sentence. It is almost true to say that the meaning is this use, i.e. the meaning of E (if "E" is a word or phrase) is the set of sentences containing E and that my knowledge of the meaning of E grows (though not in direct proportion) with my ability to formulate more and more sentences in which E has a proper use. A complete knowledge of E would then be represented by the set of all such sentences. The trouble with this view is that even such a set would not specify uniquely the meaning of any one expression since the set would also specify the meaning of all those expressions which have the same use-at this level of use. For example, the word "short" might be specified by the sentences in which it has a non-absurd occurrence from a purely semantic point of view, but those sentences may also specify the word "tall". We must therefore keep in mind that a map of sense relations giving the locations of a group of expressions does not tell the whole story of "their use in the language", i.e., their meanings. Nevertheless, we shall see that such a map removes ambiguity, ensuring univocity for the expressions located on it. For this reason we shall identify the sense of an expression with its location on a map. This entails a distinction between sense and meaning, a distinction which we shall enforce rather than justify. The sense of an expression will be its location with respect to other expressions, its semantic range. It is what it "makes sense" with as contrasted with what it fails to make sense with. Its meaning is governed only in part by sense rules.

" Tall " and " short " may have the same " sense " ; it is because of other rules governing their use that they diverge in meaning. Thus, giving the sense of an expression is not yet the same as giving its meaning. One who wishes to know more about the meaning of a given located expression will enquire at that address." pp. 160-161.

5. ———. 1963. "Types and Ontology." *Philosophical Review* no. 72:327-363.

Reprinted, with minor corrections, in: Peter Frederick Strawson (ed.) - *Philosophical logic* - Oxford, Oxford University Press, 1967 pp. 138-169 and in Dale Jacquette (ed.) - *Philosophy of logic. An anthology* - Oxford, Basil Blackwell 2002 pp. 103-119.

"In this paper (*) I shall be examining several notions of types which have important application in natural languages. I shall show that one of Russell's definitions of a type can be combined with one of Ryle's to give us two other and more powerful type conceptions which are free of the criticisms advanced against each of the former. The results cast considerable light on the relation of 'a language' to the sorts of things one can use the language to make statements about; for example, it becomes clear that the number of 'sorts of things' discriminated by any natural language is always finite. But far more important, the new type concepts enable us to exhibit formally the type structure of any natural language. It is this structure which determines the way the language discriminates different sorts of things. Since the question of ontology is 'What sorts of things are there?' the results may be construed as a formal ontology. The old Russell programme for an ontology which is defined by a logically correct (or corrected) language is thereby reinstated, though in a revised form. That programme has foundered on the type problem for natural languages. Black, for example, has brought out grave difficulties in Russell's type theory as it applies to natural languages, and he used those difficulties to promote scepticism about the Russell programme. But if I am right, a simple and adequate theory of types governs natural language and dictates its ontological commitments to different sorts of things."

(*) There are four sections to the paper. Section I isolates the problem of types for natural language and develops four type concepts appropriate to it. Section II reformulates these concepts syntactically and reconsiders Black's general criticism of a formal theory of types for natural language. In Section III the relation of types to ambiguity, and a problem raised by Black, is examined in detail. Section IV is constructive; the type-structural principle is stated and proved. The ontological meaning of the principle is discussed and the principle is illustratively applied.

6. ———. 1963. "Meaning Relations and the Analytic." *Journal of Philosophy* no. 60:524-534.

"In his critique of the analytic-synthetic distinction Quine distinguishes two classes of analytic statements: (a1) those that are logically true and (a2) those that lean on extralogical meaning relations. In this paper the same critique that Quine applies against a2 statements is used against a1 statements. By showing that both suffer the same fate at Quine's hands, it is shown that Quine's vital contrast is not a contrast at all and that his criticism goes further than he wants it to go. The paper concludes that the "flight from intension" can become a flight away from the grounds presupposed for any application of logical and linguistic rules."

7. ———. 1964. "A Program for Coherence." *Philosophical Review* no. 73:522-527.

"The following are some points made in reply to criticism of the author's *Types and ontology*: (1) if p is a property, define the category of p (cp) as the set of individuals that can "significantly" be said to have p. (2) if any "individual" belongs both to cp and cq, then either cp includes cq or cq includes cp or cp=cq. (3) an ontology is coherent only if it satisfies (2) for all individuals.

Suppose that spirits cannot be characterized as colored or colorless, i.e., they are not in c-colored. Assume also that chairs are not in c-sad. Then neither category includes the other. yet persons are in both. To avoid incoherence we must deny that persons are individuals.

Coherent alternatives to Cartesianism put chairs in c-sad (panpsychism) or spirits in c-colored. The thesis supports Russell's general idea than any coherent ontology is formally isomorphic to linguistic type structure."

11. ———. 1966. "Why Is There Something and Not Nothing?" *Analysis* no. 26:177-181.

"The question is not why it is possible there is something but (granting that something is possible) *why* is there something? Why not nothing?

This can be answered by way of an ontological proof. For this purpose we define a neglected but important kind of possibility which we call categorial. We say for example that things older than the square root of 2 are not possible things or that unfed theorems are 'categorially' impossible. A thing older than the square root of 2 is not a possible thing because while there is nothing that is older than the square root of 2, neither is there anything that fails to be. Again the statement 'some theorems are fed' is a category mistake. There is nothing that is an unfed theorem and nothing that fails to be one since what failed to be one would be a fed theorem or an unfed non-theorem, or a fed non-theorem and there are no such things. So understood, categorial impossibility is existentially definable. More generally, if D is a monadic descriptive term and \bar{D} is its logical contrary (2) (applicable to all those D-less things that are 'privative' to the state of being D) then D-things are categorially impossible, if and only if there is nothing that is D and nothing that is \bar{D} .

By this definition things that are red and blue (all over)-though presumably impossible in some other way-are categorially possible since any table is either red (failing to be blue) or blue

(failing to be red) or it fails to be red and also fails to be blue. The logical contrary of the term 'red and blue' is truly affirmable of all material objects of whatever colour and also of those that are colourless.

Without having defined possibility in any general way, we are accepting as a premiss of our argument that something is possible. We assume further that whatever is not a categorially possible thing is not a possible thing.

Now suppose there were nothing. It is then true for every predicate term P, that nothing is P. It is also true that there is nothing that fails to be P so that P-things are categorially impossible. If P-things are categorially impossible, they are not possible things. Since this holds for every P, nothing at all is possible. But we have assumed that something is possible and this is incompatible with the nihilist hypothesis. We see then that if something is possible, something is actual.

The same argument can be viewed another way. If something is possible it is categorially possible. For something to be possible there must be some terms predicable of some things. But if there were nothing at all, all terms would be like 'older than the square root of 2'. That some terms are predicable can be argued from the fact that-as matters actually stand-there are many things and many terms truly applicable to those things. But if there were nothing at all, not only would terms like 'old' not be truly applicable, they would be altogether impredicable. Nothing would then be possible. But we recall that our question was not 'why is anything even possible?' And we see again that if anything is possible, something is actual." pp. 177-178.

(1) Heidegger considers this the crucial question for the philosophy of existence. What is given here is the traditional or "essentialist" reply.

(2) The relation of contrariety holding between a pair of terms (or attributes) does not force us to consider either one of the pair to be negative. Just as being D is a privation of D, so (equally) is being D (or -D) a privation of D. Coloured objects, for instance, fail to be colourless.

12. ———. 1966. "On a Fregean Dogma." In *Problems in the Philosophy of Mathematics*, edited by Lakatos, Imre, 47-62. Amsterdam: North-Holland.

Proceedings of the International Colloquium in the Philosophy of Science (Bedford College, 1965).

Discussion: L. Kalmár: *Not Fregean and not a Dogma* 63; M. Dummett: *A Comment on 'On a Fregean Dogma'* 63; C. Lejewski: *The Logical Form of Singular and General Statements* 68; W. V. Quine: *Three Remarks* 70; F. Sommers: *Reply* 71-81.

"In the following passage Russell states an accepted and familiar thesis :

The first serious advance in real logic since the time of the Greeks was made independently by Peano and Frege -- both mathematicians. Traditional logic regarded the two propositions 'Socrates is mortal' and 'All men are mortal' as being of the same form; Peano and Frege showed that they are utterly different in form. The philosophical importance of logic may be illustrated by the fact that this confusion - which is still committed by most writers -- obscured not only the whole study of the forms of judgment and inference, but also the relation of things to their qualities, of concrete existence to abstract concepts, and to the world of Platonic ideas . Peano and Frege, who pointed out the error did so for technical reasons ... but the philosophical importance of the advance which they made is impossible to exaggerate.(*)

In what follows I wish to be understood as criticising the quantificational "translation" of general categoricals like 'All men are mortal' only insofar as this is represented as exhibiting such statements to have a different logical form from singular predications. I am not criticising quantification theory as an indispensable logical tool, especially for inference involving statements of more than one variable. The standard general categoricals however are not of this type ; it is for example well-known that quantification is not needed for syllogistic inference. What is not known is that we can treat the

categoricals as simple subject-predicate statements on an exact par with singular predications. There is therefore no good logical reason for saying that general and singular statements must differ in logical form.

The doctrine that (1) 'Socrates is mortal' and (2) 'Men are mortal' differ in logical form assumes that the following is the correct account of what these statements say: (a) Both say that 'is mortal' is true of some, thing or things; the first says it is true of Socrates; the second that it is true of whatever 'is a man' is true. It follows (b) that the logical form of the second statement differs from that of the first. For while the first is a simple predication, the second is a "quantified" statement." pp. 48-48.

"Remarking on alternatives to his conception of truth Tarski rejects a formulation associated with correspondence theories:

If we should decide to extend the popular usage of the term "designate" by applying it not only to names, but also to sentences, and if we agreed to speak of the designata of sentences as "slates of affairs" we could possibly use for the same purpose the following phrase:

(C) A sentence is true if it designates an existing state of affairs. However [this] formulation can lead to various misunderstandings for [it is not] sufficiently precise and clear . . . It is up to us to look for a more precise expression of our intuitions. (1)

The purpose Tarski speaks of is "to do justice to our intuitions which adhere to the classical Aristotelian conception of truth." Tarski takes this to be some form of correspondence theory. He has earlier considered and rejected an even less satisfactory formula of this sort: 'a sentence is true if it corresponds to

reality'. His own semantic conception of truth is meant to be a more precise variant doing justice to the correspondence standpoint. In this spirit I shall presently suggest a revised version of (C).

15. ———. 1969. "Do We Need Identity?" *Journal of Philosophy* no. 66:499-504.

"Identity is shown to be definable within traditional syllogistic logic. the idea is to treat singular terms as general terms syntactically. this means we allow singular terms in predicate positions and also allow them to be prefixed by 'every', 'some' and 'no' when in subject position.

However universal and particular singular statements are logically equivalent: if K is a singular term then $K \text{ is } p \text{ every } K \text{ is } p$ some $K \text{ is } p$. This equivalence is called the law of wild quantity.

Identity is defined thus: $J \text{ is identical with } K \text{ df. some } J \text{ is } K$. This definition together with the law of wild quantities gives all the formal properties of the identity relation."

18. ———. 1971. "Structural Ontology." *Philosophia. Philosophical quarterly of Israel* no. 1:21-42.

"Whether a certain sort of things exists is commonly disputed in philosophy. I argue that in some important classical instances the dispute is grounded in another more fundamental one: whether certain entities are individuals or composite. Disputes over individuality or compositeness are generated

when certain accepted conditions for individuality seem not to be satisfied. In the last part of the paper I examine the formal condition for non-compositeness (it is not yet a criterion for individuality) tracing it to its logical source. The condition is shown to provide the structural constraints for coherent ontologies."

19. ———. 1973. "Existence and Predication." In *Logic and Ontology*, edited by Munitz, Milton K., 159-174. New York: New York University Press.

"To contemporary philosophers the question whether 'exists' is a predicate is a syntactical question. Using an older terminology, it is the question whether 'exists' is an autocategorematic or a syncategorematic expression. In more recent parlance it is the question whether 'exists' belongs among the formative-logical signs or among the descriptive-extralogical signs of a logically adequate language.

Those who give canonical status to the idioms of quantification theory have a ready answer to this question. In the syntax of modern logic 'exists' is a syncategorematic expression. In canonical translations 'exists' is never a predicate. To accept this popular view is to assume that the formative expressions enumerated in the formation rules for predicate logic constitute a definitive list. But this overlooks the fact that the line distinguishing certain signs as formative, logical, or syncategorematic from other signs that are descriptive, extralogical, or autocategorematic has been arbitrarily drawn. How, indeed, do we decide whether a sign is syncategorematic or autocategorematic?

There is, of course, the indirect appeal to the power of a logic with this or that list of formatives. For example, if identity is added to the list of logical signs of the lower functional calculus, there is a significant increase in inference power. This, however, is an argument for adding identity to a system whose logical syntax has already been determined by an arbitrarily enumerated list of formatives. It can, for example, be shown that identity is not needed in a logical language whose syntax differs radically from that of the standard first-order functional

calculus.(1) The point is that the question whether a certain sign is formative or descriptive cannot be fruitfully answered by considering how an already-constituted logical language will fare with this sign or without it. This retail approach begs the more fundamental question raised by the distinction between logical and extra-logical signs: What principle governs the distinction; what distinguishes the logical signs from the extralogical signs?

The problem in this general form has been raised by Tarski and since discussed by many other writers, most notably by Pap, Popper and Quine. However, the state of the problem has not been significantly advanced beyond the conclusion tentatively offered by Tarski:

Perhaps it will be possible to find important objective arguments which enable us to justify the traditional boundary between logical and extralogical expressions. But I also consider it quite possible that investigation will bring no positive results in this direction so that we shall be compelled to regard such concepts as 'logical consequence', 'analytic statement' and 'tautology' as relative concepts which must, on each occasion be related to a definite, although in greater or less degree, arbitrary division of terms into logical and extralogical.(2)

In this larger perspective the syntactic status of existence can only be determined within some general theory of logical syntax that "justifies" and sharpens the boundary between logical and extralogical signs. As Tarski noted, such a theory will have important bearing on such fundamental notions of logical theory as tautology and validity. But it should also, and, as it were, incidentally, answer our own question, namely, whether 'exists' is a syncategorematic or autcategorematic expression." (pp. 159-160).

"Modern thinkers regard logic as a purely formal discipline like number theory, and not to be confused with any empirical discipline such as cognitive psychology, which may seek to characterize how people actually reason. Opposed to this is the traditional view that even a formal logic can be cognitively veridical -- descriptive of procedures people actually follow in arriving at their deductive judgments (logic as Laws of Thought). In a cognitively veridical logic, any formal proof that a deductive judgment, intuitively arrived at, is valid should ideally conform to the method the reasoning subject has used to arrive at that judgment. More specifically, it should reveal the actual reckoning process that the reasoning subject more or less consciously carries out when they make a deductive inference. That the common logical words used in everyday reasoning -- words such as 'and', 'if', 'some', 'is', 'not', and 'all' -- have fixed positive and negative charges has escaped the notice of modern logic. The present paper shows how, by unconsciously recognizing 'not' and 'all' as 'minus-words', while recognizing 'and', 'some', and 'is' as 'plus words', a child can intuitively reckon, for example, 'not (-) all (-) dogs are (+) friendly' as equivalent to 'some (+) dogs aren't (-) friendly': $-(-D+F) = +D-F$."

Forthcoming.

"In 2006 I began working on a book that was to consist of two parts: (1) an account of the tree theory, including a historical background and an appraisal of reactions to the theory, and (2) a summary of Sommers' newer ideas regarding metaphysical issues, with an attempt to integrate the older and newer ideas. By 2009 I had nearly completed part (1), but then, as so often happens with the best laid plans, things changed. Assuming, no

doubt based on my sketchy account of what I was up to, that my new book would be primarily about the tree theory, Sommers wrote to me that he was hard at work on a new book of his own, a book in which he was laying out, once and for all, in detail his new metaphysical theory ("mondialism").

Needless to say, that theory and its relation to the tree theory was to be the subject of my part (2). He asked me to help him with his book and I was both eager and happy to do so.

Anything I had to say could wait - not so for Sommers (then well into his ninth decade). Sommers' book, *The Mondial and the Ontological* is forthcoming. As it turned out, much of the work of tying together the tree theory, the term logic, the truth theory and mondialism still needs to be done. So I returned once again to that task."

53. Sommers, Fred, and Englebretsen, George. 2000. *An Invitation to Formal Reasoning. The Logic of Terms*. Aldershot: Ashgate.

Co-author: George Englebretsen.

The book "introduces the discipline of formal logic by means of a powerful new system formulated by Fred Sommers.

This system, term logic, is different in a number of ways from the standard system employed in modern logic; most striking is, its greater simplicity and naturalness. Based on a radically different theory of logical syntax than the one Frege used when initiating modern mathematical logic in the 19th Century, term logic borrows insights from Aristotle's syllogistic, Scholastic logicians, Leibniz, and the 19th century British algebraists.

Term logic takes its syntax directly from natural language, construing statements as combinations of pairs of terms, where complex terms are taken to have the same syntax as statements. Whereas standard logic requires extensive 'translation' from natural language to symbolic language, term logic requires only 'transcription' into the symbolic language. Its naturalness is the result of its ability to stay close to the forms of sentences usually found in every day discourse. Written by the founders

of the term logic approach, *An Invitation to Formal Reasoning* is a unique introduction and exploration of this new system, offering numerous exercises and examples throughout the text. Summarising the standard system of mathematical logic to set term logic in context, and showing how the two systems compare, this book presents an alternative approach to standard modern logic for those studying formal logic, philosophy of language or computer theory."

With J. Jarvis

Studies about his work

For the bibliography of [George Englebretsen](#) see the page about him.

1. Altham, J.E.J. 1971. "Ambiguity and Predication." *Mind* no. 80:253-257.

"Recommends abandoning Sommers' rule about ambiguity, in his *Predictability*. The rule enforces many implausible judgments. Three arguments for it are defective. One involves confusions over negation of a universal conditional, one rests on a seemingly arbitrary definition, the third rests on an unrealistic assumption about universes of discourse."

2. Brody, B.A. 1972. "Sommers on Predicability." *Philosophical Studies* no. 23:138-140.

"Sommers has proposed a principle as to when cross-categorical predication is univocal. In this note, I offer some counterexamples, both to his principle and to the premises from which he derives it."

3. Cogan, Robert. 1976. "A Criticism of Sommers' Language Tree." *Notre Dame Journal of Formal Logic* no. 17:308-310.

"In *The Ordinary Language Tree* and three later papers, Fred Sommers has made a number of valuable contributions to formal type theory. Anyone familiar with this work of Sommers understands why it is philosophically attractive: the logical ingenuity shown by Sommers is admirable. However, presuming such familiarity I shall argue that Sommers' restriction to ordinary language is a necessary yet counterfactual way of securing mapping applicability for his work, and that it obscures a major obstacle to such application: the fact that genuine doubt about sense-value is systematic in a way rendering it unresolvable by his formal methods. I shall first distinguish between "doubt" in the ordinary sense, and genuine doubt. Next I will show that Sommers' examples of sense arguments are not ones in which genuine doubt is resolved and then define the sense in which genuine doubt is systematic, using his own symbolism. Fourth, I will explain how his restriction to ordinary language tends to obscure this fact, and fifth, in what way the restriction is both necessary and counter-factual."

4. De Sousa, Ronald Bon. 1966. "The Tree of English Bears Bitter Fruit." *The Journal of Philosophy* no. 63:37-46.

6. "A discussion of Fred Sommers' proposal for a new "test of coherence" for ontologies based on a revised theory of types. The theory leads to intolerably counterintuitive proliferations of senses of terms in natural languages. Its "proof" is shown to rest on the very propositions which the theory is supposed to establish. It presupposes the existence of a well defined set of grammatical but absurd sentence types. This assumption takes two forms. on the first interpretation, it prohibits an individual from turning up in two different categories; on the second interpretation, it amounts to the principle of transitivity of predication. But the first is supposed to be a "consequence" of the theory, ruling out Strawsonian persons; and the second turns up as a "theorem"."

5. Elgood, A.G. 1970. "Sommers's Rules of Sense." *Philosophical Quarterly* no. 20:166-169.

"There has recently been some discussion on Sommers's rules of sense. Dan Passel (1969) has drawn attention to the incompleteness of one of these rules (R (U)) but is prepared to accept it as "correct", meaning "that no mistakes about terms having a use with one another follow from its use". Mrs. Susan Haack (1967) has produced what she considers counter-examples to another rule, that for enforcing ambiguity, and R. Van Straaten has alleged that these examples are not well-formed and therefore are not counterexamples. He doubts "for strictly logical reasons" whether anyone *can* produce a counterexample. Since he does not give any such reasons, and since I find the foundations for Sommers's own derivations unsatisfactory, I offer apparent counter-examples of my own. One counter-example can be used to invalidate several of Sommers's important sense rules. This is so because they have a common logical structure. This logical structure I shall now display."

8. Greenberg, Robert S. 1972. "Individuals and the Theory of Predication." *The Journal of Philosophy* no. 69:435-448.

"As is known, Fred Sommers has provided rules of sense (*) which can be used to determine: (a) whether certain terms can occur together in a significant subject-predicate sentence, (b) whether things covered by certain terms belong to the same type of thing, and (c) whether certain terms of a theory must be construed as being ambiguous, if the theory is to be coherent. Problems such as these fall within the area of philosophy sometimes called *theory of predication*, *type theory*, or, more generally, *ontology*, and hence the purpose of a large part of Sommers' program is to provide methods for distinguishing and placing in a coherent structure what are generally called categories."

9. Griffin, Nicholas. 1977. "Do We Need Predication?" *Dialogue. Canadian Philosophical Review* no. 16:653-663.

"The paper is concerned with the standard distinction between the 'is' of identity and the 'is' of predication. It deals, in particular with attempts by Fred Sommers ("Journal of Philosophy", 1969) and Michael Lockwood ("Philosophical Review", 1975) to show that the distinction is ill-founded since identity statements are predications of singular terms. This proposal is criticized mainly on the grounds that the notion of a singular term depends upon identity and thus can't be used in a program to eliminate identity. An alternative means of removing the distinction between the 'is' of identity and the 'is' of predication, by eliminating predication in favour of relative identities using Geach's suggestion that "x" is "F" is equivalent to "x" is the same "F" as something, is briefly sketched."

12. Hacking, Ian. 2001. "Aristotelian Categories and Cognitive Domains." *Synthese* no. 126:473-515.

"This paper puts together an ancient and a recent approach to classificatory language, thought, and ontology. It includes on the one hand an interpretation of Aristotle's ten categories, with remarks on his first category, called (or translated as) substance in the *Categories* or What a thing is in the *Topics*. On the other hand is the idea of domain-specific cognitive abilities urged in contemporary developmental psychology. Each family of ideas can be used to understand the other. Neither the metaphysical nor the psychological approach is intrinsically more fundamental; they complement each other. The paper incidentally clarifies distinct uses of the word "category" in different disciplines, and also attempts to make explicit several notions of "domain". It also examines Aristotle's most exotic and least discussed categories, being-in-a-position (e.g., sitting) and having-(on) (e.g., armour). Finally the paper suggests a tentative connection between Fred Sommers' theory of types and Aristotle's first category."

13. Kasher, Asa. 1972. "Sommers' Concept of Natural Syntax." *Philosophical Studies (Ireland)* no. 20:139-143.

"It is shown that syntactic principles are not sufficient for the solution of semantic paradoxes. Light is shed on Sommers' conception of natural syntax in *On concepts of truth in natural languages* (1969), by showing that his solution is also semantic in nature."

16. Lockwood, Michael. 1975. "On Predicating Proper Names." *The Philosophical Review* no. 84:471-498.

"Mill's account of proper names presupposes -- contrary to current logical theory -- that in an identity sentence such as 'Cicero is Tully', 'is' has the same meaning as in sentences which are unquestionably of the 'S is P' form. The purpose of this article is to defend Mill's assumption and explore its implications. It is argued that Mill is inconsistent in holding both that, in the above sentence, 'Tully' is a genuine predicate and that proper names lack connotation. This tension may be removed, however, if we allow that proper names do connote, but that what they connote is merely the having of a certain identity."

18. Martin, Robert L. 1969. "Sommers on Denial and Negation." *Noûs* no. 3:219-226.

"Sommers' arguments in *Predicability* (1965) for a distinction between denial and negation (the former applying primarily to predicates, the latter to sentences) are criticized and found not to sustain the distinction. In response to his claim that the distinction permits a simple formal resolution of the predication paradoxes, I present a strengthened version of these paradoxes for which, apparently, the suggested resolution fails."

19. Massie, David. 1967. "Sommers' Tree Theory: A Reply to De Sousa." *The Journal of Philosophy* no. 64:185-193.

"In a recent article in this Journal Ronald Bon de Sousa attempts to criticize Fred Sommers' category theory, the "tree" theory, as described in "Types and Ontology." Sommers' paper is an important and brilliant contribution to formal linguistic analysis, and deserves critical attention. De Sousa, however, seems to have failed to understand it, in general and in detail; thus his remarks, which tend to be abusive in tone, are unilluminating and largely irrelevant. Since de Sousa may give the impression of having been as careful as he ought to have

been, he can easily be misleading on some elementary but essential points in Sommers' theory, and for that reason his comments call for an answer."

20. McCulloch, Gregory. 1984. "Frege, Sommers, Singular Reference." In *Frege: Tradition and Influence*, edited by Crispin, Wright, 110-125. Oxford: Blackwell.

"In his provocative recent book [*The logic of natural language*, 1982] Fred Sommers sets out to formulate a traditional term logic (hereafter TFL) that is a genuine and significant alternative to the Fregean type of logic (MPL) currently accepted as standard. (1) Broadly speaking, his procedure has two components. On the one hand, he tries to develop a logical syntax, based on the TFL model, that is roughly the equal of MPL in terms of expressive and inferential power. On the other, he engages in a sustained effort to show how such a logic would be free of certain logical and semantic commitments, allegedly typical of MPL, that are, according to Sommers, implausible or otherwise unsatisfactory.

In the present paper I do not question the extent of Sommers's success in the first task; nor do I try directly to defend MPL against his strictures. My concern is with one fundamental difference between the two logical frameworks as Sommers sees them. This supposed difference concerns expressions like proper names that appear to make straightforward singular reference to particular objects. Sommers argues at length that many of the significant differences alleged to hold between the two logics can be traced to the way that they handle such expressions. This contention he links to his claim that whereas the basic propositions of MPL are singular, those of TFL are general; and this in turn he links to his view that the two logics are based upon significantly different accounts of the first-order generality expressed by words like 'all' and 'some' (Sommers, Ch. 1-5, 11-12). I try to show that these claims are greatly exaggerated.

Even if one grants that Sommers succeeds in giving a novel, TFL-style account of first-order generality, it is a mistake to think, as Sommers does, that this novelty consists in an

interesting avoidance of commitment to the idea of singular reference. This is, furthermore, an entirely distinct issue from that of the semantic treatment of proper names. Sommers's claims gain a spurious' plausibility because of his failure to keep these distinct questions apart. And finally, anyway, we see that one's adoption of logical framework - TFL or MPL - does not materially affect one's options when dealing with proper names: both logics can accommodate any of the usual alternatives. If I am right in all this, the appearance of deep differences over singular reference just dissolves.

Sommers's book deserves careful and extended attention. Both in the effort to reinstate TFL as a worthwhile approach, and in the claim to have succeeded, Sommers finds himself in opposition to much received 'Fregean' opinion in logic, semantics, and the philosophy of language. Illumination is to be had from a piecemeal treatment of the many issues raised here. This paper is just one restricted contribution to that enterprise."

(1) 'MPL' and 'TFL' are Sommers's own abbreviations for 'Modern Predicate Logic' and 'Traditional Formal Logic' respectively. He attempts no precise definition of what a logic must be like if it is to count as MPL-type, but seems to have in mind logics that employ quantifier/variable notations in a more or less orthodox manner. Similarly, his use of 'logic' is quite flexible, and is used to apply not merely to a given calculus but to this plus the concepts, notions, and presuppositions that a standard semantic interpretation would employ. I follow him in this, although certain dangers in this are highlighted in §§ II and III.

21. Mendelsohn, Richard L. 1987. "Frege Two Senses of 'Is'." *Notre Dame Journal of Formal Logic* no. 28:139-160.

24. "It is widely believed that there are two senses of 'is', the 'is' of identity and the 'is' of predication, and that this distinction was clearly drawn by Frege in *On Concept and Object*, although it was anticipated by others, perhaps, e.g., by Plato in the *Sophist*. As opposed to this received view, I will argue that Frege had not successfully distinguished two senses of 'is',

indeed that his argument leads to precisely the opposite conclusion; on the other hand, the distinction Plato had supposedly drawn in the *Sophist*, which seems to rest on a semantics Frege was explicitly rejecting, is, given that semantic framework, viable.

Frege had introduced this distinction in order to buttress his view that proper names could not serve as genuine predicates: a proper name occupying ostensible predicate position could not be functioning as a predicate because the 'is' in such a statement would have to be the 'is' of identity, not the 'is' of predication.

I will argue that Frege had been mistaken on this point as well. More generally, I will argue that Frege's theoretical analysis of language is not, as he had thought, incompatible with proper names being allowed to play a genuinely predicative role.

My remarks are prompted by Michael Lockwood's stimulating article, *On Predicating Proper Names* (1975), which contains an extensive and detailed criticism of Frege's position."

22. Murphree, Wallace A. 1998. "Numerical Term Logic." *Notre Dame Journal of Formal Logic* no. 39:346-362.

"This paper is an attempt to show that my work to establish numerically flexible quantifiers for the syllogism can be aptly combined with the term logic advanced by Sommers, Englebretsen, and others."

23. Nelson, John D. 1964. "On Sommers' Reinstatement of Russell's Ontological Program." *The Philosophical Review* no. 73:517-521.

"In this discussion-paper I question four theses that I took Sommers to be advancing, among others, in *Types and ontology*: (1) that types are indifferent to predicate denial; (2) that a formal method of type discrimination can establish as correct a specific ontology; (3) that subjects of sentences can be located by certain described formal methods; and (4) that there must be one category that includes all others.

 28. Passell, Dan. 1969. "On Sommers' Logic of Sense and Nonsense." *Mind*:132-133.
 "Sommers' rule, R(U), for testing sense arguments, taken as an assertion about what makes sense, fails to state a necessary condition of what makes sense. Counterexamples to that assertion occur with terms taken from the same node of his ordinary language tree. For one example, the color terms, alabaster, blue, cream, dun, which obviously do make sense

together, cannot be classified as making sense together by the rule. This is because the condition required by the rule for determining that two terms make sense cannot be met for terms at the same node."

29. Peterson, Philip L. 1995. "Contraries and the Cubes and Disks of Opposition." *Metaphilosophy* no. 26:107-137.

"Prior, Sommers, and McIntosh hold that propositional contrariety is derivative, based on term contrariety. I argue that propositional contrariety is basic. In a proper Aristotelian square, one proposition is contrary to another if and only if the one properly entails the denial of the other.

Term contrariness produces a "cube" of opposition. Contrariety can be further elaborated on "bare" cubes and disks. Geach's analyses involving multiple quantifiers give no support for term-contrariness-as-basic, and there is little hope for developing H. W. B. Joseph's vague idea about "furtherest apart" on a quantitative scale."

30. Purdy, William C. 1992. "On the Question: 'Do We Need Identity?'" *Notre Dame Journal of Formal Logic* no. 33:593-603.

31. "This paper formalizes and extends Sommers' position on identity. This formalization is compared with MPL to define precisely the difference in expressive power. The formal language defined for this investigation is similar to the language of MPL (modern predicate logic). The similarity will not only facilitate comparison, but perhaps will also make this formal language more palatable to readers whose experience and/or predisposition favors MPL."

31. Reinhardt, L.R. 1965. "Dualism and Categories." *Proceedings of the Aristotelian Society* no. 66:71-92.

32. Richmond, Samuel A. 1971. "Sommers on Predicability." *The Journal of Philosophy* no. 68:138-142.

"Sommers has introduced a rule for enforcing ambiguity which indicates the conditions under which a term cannot univocally bridge a type difference. I argue that the theory of predication

from which the rule follows is either false or ambiguous in one of its crucial concepts. Sommers suggests the theory of predication may better set the bounds of metaphysics than the theory of knowledge. But the theory of predication itself needs to be justified by showing its epistemic utilities."

33. ———. 1975. "A Possible Empirical Violation of Sommers' Rule for Enforcing Ambiguity." *Philosophical Studies* no. 28:363-366.

"In an article entitled "Predicability," Fred Sommers has introduced a rule for enforcing ambiguity which indicates the logical conditions under which a predicate cannot univocally bridge a type difference. the rule places unacceptable a priori restrictions on future empirical discoveries.

The plausibility of the rule can be explained by the fact that violation of it in constructing empirical universal generalizations results in dualism and detracts from the unity of science.

Dualism exists when there are two sets of predicates such that members of each set enter into universally general statements only with members of the same set."

34. Routley, Richard. 1969. "Categories. Expressions or Things?" *Theoria* no. 35:215-238.

"Rival views on the composition of categories hold that categories are categories of things, that they are categories of expressions, or that they are both simultaneously. In view of the significance paradoxes-analogues of the modal paradoxes - here introduced, all these positions must be rejected, and two different sorts of meaninglessness distinguished. This distinction leads to the formulation of two distinct category theories, one apparently concerned with things, the other with descriptions. A case is made out for inclusive categories and against exclusive categories. Systematic ambiguity is attacked and shown to be tantamount to exclusiveness of categories. To allow for inclusive categories the usual notion of 'in the same category as' must be abandoned and replaced by a relative notion, except for certain sorts of categories - minimal

categories. A definition of 'in the same category as' is proposed for minimal categories; and some aspects of Ryle's theory and Sommers's theory are examined in the light of these results."

35. Sayward, Charles. 1976. "A Defense of Sommers." *Philosophical Studies* no. 29:343-347.

"Among the theses of Sommers' type theory are these: every individual belongs to some type; every category is a union of types. A recent criticism of Sommers is directed at these two theses. I argue that the criticism is mistaken."

36. ———. 1978. "Are There Infinitely Many Sorts of Things?" *Philosophia.Philosophical Quarterly of Israel* no. 8:17-30.

37. ———. 1981. "The Tree Theory and Isomorphism." *Analysis* no. 41:6-11.

"A main thesis of Fred Sommers' type theory, is that an isomorphism exists between any natural language and the categories discriminated by that language. Here I give an explanation of what this claim comes to. And then I argue that, so understood, the claim is incompatible with Zermelo-Fraenkel set theory. Finally, I argue against trying to salvage the isomorphism thesis by appealing to some other set theory."

38. Sayward, Charles, and Voss, Stephen H. 1972. "Absurdity and Spanning." *Philosophia.Philosophical Quarterly of Israel* no. 2:227-238.

"On the basis of observations J. J. C. Smart once made concerning the absurdity of sentences like 'the seat of the bed is hard', a plausible case can be made that there is little point to developing a theory of types, particularly one of the sort envisaged by Fred Sommers. The authors defend such theories against this objection by a partial elucidation of the distinctions between the concepts of spanning and predicability and between category mistakenness and absurdity in general. The argument suggests that further clarification of the concepts of spanning and category mistakenness should be sought in reflection upon the more familiar concepts of a sort of thing and a predicate category."

39. Shearson, W.A. 1977. "Speaking of Philosophy: A Reply to Paul Churchland." *Dialogue.Canadian Philosophical Review* no. 16:502-506.

"In his critique of George Englebretsen's *Speaking of persons* (1975), Paul Churchland has failed, on several accounts, to grasp the intent of Englebretsen's work. Most importantly, he has not seen that the main task there was to defend a particular theory of persons (videlicet attributism). Much of Churchland's confusion is shown to follow from his inability to connect Englebretsen's work with the logico-linguistic studies of F. Sommers on the one hand and the metaphysical studies of P. F. Strawson on the other."

40. Straaten, R.van. 1968. "Sommers' Rule and Equivocity." *Analysis* no. 29:58-61.
41. ———. 1971. "A Modification of Sommers' Rule." *Philosophical Studies* no. 22:16-20.
42. ———. 1971. "Sommers on Strawson's and Descartes' Ontology." *Mind* no. 80:148-149.
43. Suzman, Jonathan. 1972. "The Ordinary Language Lattice." *Mind* no. 81:434-436.

"F. Sommers ("Mind" 1959, "Philosophical Review" 1963) claims the predicates (monadic) of natural languages, if grouped by a relation u , or cosignificance, generate topological trees. if true, this would have wide philosophical significance; Sommers' ontology rests on this claim about trees. but it is false, in that the u -relation can be shown not to generate trees but lattices. if any natural languages do have the tree, rather than the lattice structure this would need empirical demonstration. this is proved with the help of two notions, that of the significance range of a term, and that of a constructible predicate true of all items in a terms significance range. it is also shown that u is in fact a vacuous tie, in that all terms are so related."

44. Swiggart, Peter. 1972. "The Limits of Statement Denial." *Mind* no. 81:437-442.

"This paper discusses Fred Sommers' distinction between statement negation and statement denial, as outlined in 'Predicability' and other papers. First I show that the formal nature of the distinction requires us to regard a given statement as having only a single denial. This point dissipates Sommers' proposed solution to the counterfactual problem, since that solution depends upon the existence of multiple denials of a given statement. Sommers' difficulty is traced to the assumption that an ordinary language sentence like 'S is unclean' can be recognized as a statement denial. But such recognition proves to be inherently ambiguous. Sommers' terminology can be an effective means of introducing the results of type analysis into standard logical notation, but strict and possibly intolerable limits must be placed upon its use in formulating basic type theory or as a help in solving traditional philosophical problems."

45. Szabolcsi, Lorne. 2008. *Numerical Term Logic*. Lewiston: Edwin Mellen Press.

Edited by George Englebretsen.

Contents: Preface by George Englebretsen I; Foreword by Fred Sommers V-XII; 1. Introduction 1; 2. Numerical Term Logic 11; 2.1 Logical Notation 11; 2.1.1. Rudiments of the Notational Extension 11; 2.1.2. Non-exceptional Occurrences of "At least" and "Fewer than" 16; 2.1.3. Exact Quantification 20;

2.1.4. Comparatives 22; 2.1.5. Fractional Quantities 24; 2.1.6. Subjective Natural Language Quantifiers 26; 2.2. Inference in NTL 2; 2.2.1. Quantifier Transformation 32; 2.2.2. Guaranteed Reference 35; 2.2.3. Existential Implication 39; 2.2.4. Distribution 42; 2.2.5. Mediate Logical Inference: Quantifier Addition 44; 2.2.6. Algebraic Inference 57; 2.3. Further Developments in NTL 67; 2.3.1. The Plurivocality of "Some" 67; 2.3.2. "Only" 68; 2.3.3. "Most" vs. "The Majority" 70; 2.3.4. Wild Quantity 72; 2.3.5. Definite Descriptions 74; 2.3.6. Subalternation 76; 3. Other Systems of Intermediate Quantification 81; 3.1. Bruce Thompson 82; 3.2. Philip Peterson 92; 3.3. Wallace Murphree 99; 3.4. A Note on

Generalized Quantifiers 101; 4. Conclusion 103; 5. Notes 105; 6. Bibliography 115; 7. Index 117-119.

"The ability to reason with numerically quantified propositions is of practical as well as theoretical importance. Lorne's Szabolcsi's valuable unpublished writings should be studied and edited for publication. His pioneering contributions to numerical logic deserve to be recognized and well-known. I know of no better method than his for dealing with numerical arguments." (Fred Sommers, p. XII).

D. M. (David Malet) Armstrong's Moderate Realism

Bibliography

Books

1. Armstrong, David Malet. 1978. *Universals and Scientific Realism*. Cambridge: Cambridge.

Volume One: Nominalism and Realism

Contents: Acknowledgments VI; Index VII-XI; Introduction XIII-XV; Part One: Preliminaries; 1. Predicates 1; Part Two: Theories of Universals; 2. Predicate Nominalism 11; 3. Concept Nominalism 25; 4. Class Nominalism 28; 5. Resemblance Nominalism 44; 6. Arguments for realism 58; 7. Transcendent universals 64; 8. Properties and relations as particulars 77; Part Three: Particulars; 9. Are particulars reducible to universals? 89; 10. The Lockean account of particulars 102; Particulars and universals 108; 12. A world-hypothesis 126; The argument of volume II 133; Glossary of terms and principles formulated 136; Works cited 141; Index to volume I 145.

Volume Two: A theory of Universals

The argument of volume I 1; Part Four: Predicates and universals; 13. Relations between predicates and universals 7; 14. Rejection of disjunctive and negative universals 19; 15. Acceptance of conjunctive universals 30; 16. The identification of universals 43; 17. Different semantic correlations between predicates and universals 53; Part Five: Properties and relations; 18. Properties 61; 19. Relations 75; Part six: The analysis of resemblance 95; 21. The resemblance of universals

(I) 101; 22. The resemblance of universals (II): a new account 116; Part Seven: Higher-order universals; 23. Higher-order properties 133; 24. Higher-order relations 148; In conclusion 167; Glossary of terms and principles formulated 169; Works cited 177; Index to volume I and II 183.

"It is argued in this work, first, that there are universals, both monadic and polyadic, that is, properties and relations, which exist independently of the classifying mind. Realism is thus accepted, Nominalism rejected. Second, it is argued that no monadic universal is found except as a property of some particular, and no polyadic universal except as a relation holding between particulars. Transcendent or Platonic Realism is thus rejected. Third, it is argued that what universals there are is not to be determined simply by considering what predicates can be applied to particulars. Instead, it is the task of total science, conceived of as total enquiry, to determine what universals there are. The view defended is therefore a scientific Realism about universals. It might also be called a posteriori Realism. The working out of a scientific Realism about universals is intended to be the special contribution of these volumes.

Contemporary philosophy recognizes two main lines of argument for the existence of objective universals. The first is, or is a descendant of, Plato's One over Many argument. Its premiss is that many different particulars can all have what appears to be the same nature. In the terms used by C. S. Peirce, different tokens may all be of the same type. The conclusion of the argument is simply that in general this appearance cannot be explained away, but must be accepted. There is such a thing as identity of nature.

I take this argument to be sound. But the argument is sometimes presented as an argument from genera words. It is asked how a general term can be applied to an indefinite multiplicity of particulars. It is answered that these particulars must be identical in some respect. There are two disadvantages in presenting the argument in this linguistic fashion. First, it obscures the fact that the same term may apply in virtue of

different natures of the different particulars. As a result, where Realism is embraced, it is likely to be a priori rather than scientific Realism. Second, presenting the argument linguistically encourages confusion with an unsound argument to universals from meaning.

This second argument moves from the existence of meaningful general words to the existence of universals which are the meanings of those words. Universals are postulated as the second term of the meaning relation. The argument from ideal cases, such as Plato's perfect circle, is perhaps a special case of this semantic argument to universals.

I regard this second line of argument as completely unsound. Furthermore, I believe that the identification of universals with meanings (connotations, intensions), which this argument presupposes, has been a 'disaster for the theory of universals. A thoroughgoing separation of the theory of universals from the theory of the semantics of general terms is in fact required. Only if we first develop a satisfactory theory of universals can we expect to develop fruitfully the further topic of the semantics of general terms. Philosophers have all too often tried to proceed in the opposite way.

In this first volume, *Nominalism and Realism*, I criticize at length and reject various versions of Nominalism, together with Platonic Realism. I also examine and reject the view that properties and relations are as particular as the objects which have properties and relations. I conclude that we must admit objective universals which, however, cannot exist independently of particulars. I go on to examine the notion of a particular and reject the view that we can give an account of particulars as "bundles of universals". The conclusion drawn is that particularity and universality, irreducible to each other, are both involved in all existence. I end the first book by sketching a world-hypothesis which admits nothing but particulars having (universal) properties and relations.

The position reached at that point, though contested by many, is, at least in general outline, familiar enough. But in the second volume a detailed attempt is made to work out a theory of

universals which is based upon natural science. In making this attempt, I enter relatively unexplored territory. For with the exception of a suggestive paper by Hilary Putnam (1970a) contemporary philosophers, at least, have largely ignored the possibility of developing a theory of objective universals, where the particular universals admitted are determined on the basis of scientific rather than semantic considerations. It might perhaps be argued that Plato in his later works, Aristotle and the Scholastic Realists were ahead of contemporary philosophy in this matter, although handicapped by the relative backwardness of the science and the scientific methodology of their day.

My contention is that, by accepting this a posteriori Realism, the theory of universals, arguably the central problem of ontology, can be placed on a securer and more intelligible foundation than anything previously available. In particular, such a doctrine makes possible the reconciliation of an empiricist epistemology, which I wish to retain, with ontological realism about universals.

Not all particulars are first-order particulars. Universals themselves fall under universals. That is to say, universals have certain properties and stand in certain relations to each other. In the final part of the second book an attempt is made to work out a theory of higher-order universals, but, again, one which is compatible with an empiricist epistemology. Of quite particular importance is the topic of relations between universals. For this topic may hold the key to an account of the nature of causation and of nomic necessity. By this means, it may prove possible to answer Hume without sacrificing Empiricism.

Finally, a word on the phrase "a posteriori Realism". The phrase may suggest that the theory advanced in this work is supported to be supported by a posteriori reasonings of the sort with which natural science has made us familiar. This is far from being the case. The reasoning will have the characteristically a priori flavour which philosophical reasonings, especially when they concern first philosophy, seem inevitably, if distressingly, to have. What is maintained is the

proposition that what universals there are is to be determined a posteriori. The status of this proposition is, however, a further question. It may have to be established, if it can be established, by a priori or relatively a priori reasoning." (Introduction to the First volume).

2. ———. 1989. *Universals. An Opinionated Introduction*. Boulder: Westview Press.

Contents: Preface XI-XII; 1. The problem 1; 2. Primitive natural classes 21; 3. Resemblance nominalism 39; 4. Particulars as bundles of universals 59; 5. Universals as attributes 75; 6. Tropes 113; 7. Summing up 135; References 141; Index 145.

"This book is intended to be intelligible to the advanced undergraduate student and should also be suitable for graduate seminars. However, I hope that it will also be of interest to professional philosophers, particularly those who are sympathetic to the project of an empirical metaphysics. Since the publication of my book *Universals and Scientific Realism* in 1978, although my views have remained the same in broad outline, I have become aware of various mistakes and omissions in what I said then. The present work, therefore, besides introducing the topic, tries to push the subject further ahead.

I now think that a particular type of moderate Nominalism, moderate because it admits properties and relations, but a Nominalism because it takes the properties and relations to be particulars rather than universals, can be developed as an important and quite plausible rival to a moderate Realism about universals. In the earlier book I gave such a Nominalism only brief consideration. By contrast, in this work a battle between Nominalists and Realists over the status of properties and relations becomes one main theme.

In general, I have largely confined myself to moderate Nominalisms and moderate Realisms. That host of contemporary philosophers who unreflectively substitute classes of particulars for properties and relations I take to be immoderate Nominalists. However, many of the arguments that I bring against the more moderate Natural Class theory are

also arguments against this orthodoxy. I would also classify Quine as an extreme Nominalist (although he himself would not, on the grounds that he recognizes classes and that these are "abstract" or "platonic" entities)." From the Preface.

"Brushing aside the uneconomical view that admits both tropes and universals, we have a choice in Trope theory between natural class and resemblance views. The same sort of consideration that favors resemblances rather than natural classes of "regular" particulars seems to me to favor a Trope theory with resemblance. And although it is orthodox to bundle the tropes, I doubt if they are really well suited to be the substance of the world. We do better, with Locke and C. B. Martin, to hold the trope view in a substance-attribute form.

Our final two contenders, then, I suggest, are a Universals theory and a Trope Resemblance theory, each held in a substance-attribute form. How do we adjudicate between these two?

The Trope theory in its resemblance and substance-attribute form seems to me to face two unpleasantnesses. The first is relatively minor. It is the possibility of swapping exactly resembling tropes, to which attention was drawn in Section IX of Chapter 6. It is a somewhat implausible 'possibility', and is excluded by the substitution of universals for tropes.

The second difficulty is more serious, I think. It is the fact that the features of resemblance, what we have called the Axioms of Resemblance, would be explained with the greatest naturalness, simplicity, and economy if resemblance of nature was always identity of nature, either partial or complete identity. The difficulty, it will be remembered, is that the Axioms of Resemblance can be derived from the properties of identity provided that it is allowed that resemblance can be analyzed in terms of identity, that is, in terms of universals (Chapter 5, Section X). A Resemblance theory must treat this as a mere metaphysical coincidence between the properties of resemblance and the properties of identity. It is a serious difficulty for any resemblance analysis that the irreducibility of resemblance is so implausible an irreducibility.

What of the difficulties faced by the Universals theory? It might be thought that a great difficulty lies in its strange primitive: the cross-categorical and fundamental tie or nexus of instantiation. The Resemblance theory has no such problem because its tie of resemblance is an internal relation, supervening upon the particularized natures of the resembling things.

I do not think that instantiation involves any special difficulty for the Universals theory. Barring the postulation of a special nontransferability for tropes, we have seen the need for states of affairs for all layer-cake theories, including those involving tropes. If tropes are the attributes of substances, which I have argued is the best view of the matter, then a fundamental tie or nexus is involved, that is, there will be states of affairs involving substances, which are particulars, having properties, and also substances standing in relation to each other. If the bundle conception is correct, then a bundling tie (compresence) is still involved, and relations hold between bundles. Instantiations are just states of affairs involving universals and seem to involve no more paradox or difficulty than states of affairs involving tropes.

Where I do see trouble for a Universals theory is the question of the resemblance of universals. Once universals are admitted, it must also be admitted that universals themselves can be ordered and grouped by resemblance relations. These relations, however, involve less than exact resemblance. (Two universals could not resemble exactly!)

The vital question, then, is whether this less than exact resemblance of universals is or is not analyzable. My idea is that it is analyzable, analyzable in terms of a partial, an incomplete, identity of constituents of the universals involved, where these constituents are themselves universals. (In a Trope Resemblance theory, it would be a matter of exact resemblance of some, but only some, constituents of the inexactly resembling tropes.)

If this analysis of the inexact resemblance of universals can be carried through, then the Universals theory is considerably

strengthened. But if it cannot be carried through, the theory is weakened, because the inexact resemblances will presumably have to be taken as unanalyzable primitives, strengthening the notion that exact resemblance is no more than the highest degree of this primitive.

So, a great deal turns on whether the analysis of the inexact resemblance of universals can be carried through. I think that it can be carried through, but it faces some formidable ontological and epistemological difficulties. A key question here is the nature of quantities. A quantity is for me a family of property universals bound together by inexact but systematic resemblances, but resemblances that involve identical constituents of the universals involved (see Armstrong - *Are quantities relations?* 1988). Here is an important area for further work." pp. 136-138.

3. ———. 1989. *A Combinatorialist Theory of Possibility*. Cambridge: Cambridge University Press.

Contents: Preface IX-XII; Part I: Non-naturalist theories of possibility. 1. The causal argument Part II: A combinatorial and naturalist account of possibility. 3; 2. Non-naturalist theories of possibility 14; 3. Possibility in a simple world 37; 4. Expanding and contracting the world 54; 5. Relative atoms 66; 6. Are there *de re* incompatibilities and necessities? 77; 7. Higher-order entities, negation and causation 87; 8. Supervenience 103; 9. Mathematics 119; 10. Final question: logic 138; Works cited 141; Appendix: Tractarian nominalism by Brian Skyrms 145; Index 153.

"What is put forward in this essay is a new version of the metaphysic of Logical Atomism. It is a Logical Atomism completely purged of semantic and epistemic atomism. The idea that one can reach the atoms by analysing meanings is utterly rejected. In general, it is not for philosophers to say what the fundamental constituents of the world are. That question is to be settled a posteriori. It is a question for total science.

The version of Logical Atomism put forward here even abstracts from the question of whether there are any atoms at

all at the bottom of the world. That too is a question to be decided a posteriori, if it can be decided at all. In Chapter 5 I argue that Logical Atomism can still be sustained even if we never get past merely relative atoms.

But if there may be no genuine atoms, why continue to speak of Logical! Atomism? I do so because, with a little qualification, the scheme presented cleaves to the fundamental idea that the states of affairs into which the world divides (Wittgenstein's and Russell's atomic facts) are logically independent of each other. Each one is, as I will say, distinct from every other.

This becomes the basis of what I think is a simple (and naturalistic) Combinatorial theory of possibility. In his article 'Tractarian Nominalism' (*) Brian Skyrms sketches a metaphysics of facts (states of affairs, as I put it), facts having as constituents individuals and universals (the latter divided into properties and relations). I had already argued for such a position in my book *Universals and Scientific Realism* (1978). What I had not noticed was what Skyrms pointed out: that this could become the basis for a theory of possibility. The present work is an attempt to develop Skyrms's insight. With his approval, and the permission of the D. Reidel Publishing Company, his article is reprinted at the end of this volume as an appendix." (From the Preface)

4. Armstrong, David Malet, Martin, Charles Burton, and Place, Ullin Thomas. 1996. *Dispositions. A Debate*. New York: Routledge.

Edited and with an introduction by Tim Crane.

Contents: List of authors VII-VIII; Part I. The Armstrong-Place debate; 1. D. M. Armstrong: Dispositions as categorical states 15; 2. U. T. Place: Dispositions as intentional states 19; 3. D. M. Armstrong: Place's and Armstrong's views compared and contrasted 33; 4. U. T. Place A conceptualist ontology 49; Part II. The Martin-Armstrong-Place debate; 5. C. B. Martin: Properties and dispositions 71; 6. D. M. Armstrong: Reply to Martin 88; U. T. Place: Structural properties: categorical,

dispositional or both? 105; 8. C. B. Martin: Replies to Armstrong and Place 126; D. M. Armstrong: Second reply to Martin 147; 10. U. T. Place: Conceptualism and the ontological independence of cause and effect 153; 11. C. B. Martin: Final replies to Place and Armstrong 163; Index 193.

"This book is about the nature of dispositional properties, or dispositions.

is hard to give an uncontroversial definition of the notion of a disposition, since its very definition is one of the matters under dispute. But we can make a start with the following preliminary definition: a disposition is a property (such as solubility, fragility, elasticity) whose instantiation entails that the thing which has the property would change, or bring about some change, under certain conditions. For instance, to say that some object is soluble is to say that it would dissolve if put in water, to say that something is fragile is to say that it would break if «or instance) dropped in suitable circumstances; to say that something is elastic is to say that it would stretch when pulled. The fragility elasticity) is a disposition; the breaking (dissolving, stretching is the manifestation of the disposition.

The contemporary philosophical controversy over dispositions is the descendant of earlier disputes - for example, Aristotle's view of actualities and potentialities, and Locke's view of secondary qualities as 'powers'. The recent interest in dispositions arose in two main areas of philosophy: the philosophy of science and the philosophy of mind. The interest in dispositions in the philosophy of science resulted from the logical empiricists' worries about unobservables - how could the whole of physics be expressed in terms of propositions about sense-experiences if physics requires attribution of dispositional qualities, which need have no manifestation in sense-experience?' The interest in dispositions in the philosophy of mind largely arose through behaviourist definitions of belief and other mental states, according to which belief is a disposition to act and/or to speak. Among the questions with which the philosophy of mind grappled were:

how should such dispositions be defined, and what explains the possession of such dispositions?

The three participants in the present Debate have all made substantial contributions to the philosophy of mind in the last fifty years. U.T. Place is well-known as one of the originators (with Herbert Feigl) of the mind-brain identity theory - and his work influenced other pioneers such as J.J.C. Smart. D.M. Armstrong was one of the first to develop in detail a causal theory of the mind. C.B. Martin had already been an early proponent of the causal theory of mind, and played a crucial role in the development of the philosophy of mind in Australia, which then spread throughout the rest of analytic philosophy's world. Part of Martin's role in influencing the shift from behaviourism to physicalism and functionalism was to insist on the importance of what came to be called the 'Truthmaker Principle': the principle that when a statement is true, there must be something (some fact or event or property) that makes it true?

Each of these three philosophers has developed a distinct conception of the nature of dispositions, conceptions which are central in their thought on mind, matter and causation. In this Introduction I shall give a brief guide to the difference between them. In order to do this I need to say something (not wholly impartial) about the recent background to the debate about dispositions, and a little about how to characterize dispositional and categorical properties." (From the Introduction by Tim Crane, pp. 1-2).

5. Armstrong, David Malet. 1997. *A World of State of Affairs*. Cambridge: Cambridge University Press.

Contents: Preface XI; -XIII; 1. Introduction 1; 2. Some preliminary doctrines 11; 3. Properties I 19; 4. Properties II 47; 5. Powers and dispositions 69; 6. Relations 85; 7. Particulars 95; 8. States of affairs 113; 9. Independence 139; 10. Modality 148; 11. Number 175; 12. Classes 185; 13. Totality states of affairs 196; 14. Singular causation 202; 15. Laws I 220; 16. Laws II 242; 17. The unity of the world 263; References 270; Index 277.

"During the past twenty years or so, I have been working on ontological questions. What are universals, laws of nature, dispositions and powers, possibilities and necessities, classes, numbers? The present essay tries to bring all these topics together in a unified metaphysical scheme, an ontology. As a result, there is a certain amount of recapitulation of earlier writing. But putting the pieces together turned out to be quite difficult. A good deal of further work was necessary. Many mistakes, as I now think of them, had to be corrected. So what follows is not a mere sum of past thinking." (From the Preface)

"The hypothesis of this work is that the world, all that there is, is a world of states of affairs. Others, Wittgenstein in particular, have said that the world is a world of facts and not a world of things. These theses are substantially the same, though differently expressed.

The general structure of states of affairs will be argued to be this. A state of affairs exists if and only if a particular (at a later point to be dubbed a *thin* particular) has a property or, instead, a relation holds between two or more particulars. Each state of affairs, and each constituent of each state of affairs, meaning by their constituents the particulars, properties, relations and, in the case of higher-order states of affairs, lower-order states of affairs, is a contingent existent. The properties and the relations are universals, not particulars. The relations are all external relations.

It is useful to admit *molecular* states of affairs. These, however, are mere conjunctions (never negations or disjunctions) of the original states of affairs. Molecular states of affairs constitute no ontological addition to their conjuncts. But in one special case, to be mentioned in a moment, they become very important.

For first-order states of affairs, that is, states of affairs that do not have states of affairs as constituents, the Tractarian thesis of Independence is somewhat speculatively, but nevertheless hopefully, advanced. No such state of affairs entails or excludes the existence of any other wholly distinct state of affairs. Given Independence, a rather simple and straightforward

Combinatorial theory of what possibilities there are, can be put forward. If Independence fails, things get more complicated.

The present theory is not biased towards Atomism nor is it biased against Atomism. An *epistemic* possibility that requires to be noted is the possibility that every (first-order) state of affairs is molecular, that is, analysable into a conjunction of states of affairs. (A simple if to a degree controversial example: *a'* being F may be equivalent to *a's* being G & *a'* being H, with $F=G \ \& \ H$. The pattern may be repeated for G and H, and so for ever.) Every first-order state of affairs may be a nest of first-order states of affairs: states of affairs all the way down. To allow for this epistemic possibility, a Combinatorial theory of what possibilities there are requires further elaboration." pp. 1-2.

6. ———. 2004. *Truth and Truthmakers*. Cambridge: Cambridge University Press.

Contents: Preface XI-XII; 1. An introduction to truthmakers 1; 2. The general theory of truthmaking 4; 3. Epistemology and methodology 26; 4. Properties, relations and states of affairs 39; 5. Negative truths 53; 6. General truths 68; 7. Truthmakers for modal truths, part 1: possibility 83; 8. Truthmakers for modal truths, part 2: necessity 95; 9. Numbers and classes 112; 10. Causes, laws and dispositions 125; 11. Time 145; References 151; Index 155.

"To postulate certain truthmakers for certain truths is to admit those truthmakers to one's ontology. The complete range of truthmakers admitted constitutes a metaphysics, which alerts us to the important point, stressed already but bearing much repetition, that the hunt for truthmakers is as controversial and difficult as the enterprise of metaphysics. I think that proceeding by looking for truthmakers is an illuminating and useful regimentation of the metaphysical enterprise, or at least the enterprise of a realist metaphysics. But it is no easy and automatic road to the truth in such matters.

But this raises the question of Quine, and the signalling of ontological commitment by what we are prepared to 'quantify over'. Why should we desert Quine's procedure for some other

method? The great advantage, as I see it, of the search for truthmakers is that it focuses us not merely on the metaphysical implications of the subject terms of propositions but also on their *predicates*. Quine has told us that the predicate gives us 'ideology' rather than ontology. (*) This saying is rather dark, but it is clear that, to some degree, he has stacked the ontological deck against predicates as opposed to subject terms. But when we look to truthmakers for truths, subject and predicate start as equals, and we can consider the ontological implications of both in an unbiased way.

The doing of ontological justice to the predicate leads us to consider whether we do not require at least selected properties and relations in our ontology. If properties and relations are admitted, we may think that some ontological connection between subjects and predicates is further required, and thus, perhaps, be led to postulate facts or states of affairs among our truthmakers. The propositional nature of truths will in any case push us in the same direction. The existence of negative truths and general truths raises the question whether negative and general facts are required as truthmakers. All these difficult metaphysical issues (which will receive discussion in chs. 5 and 6) tend to be swept under the carpet by correlating one's ontology with the subject term only of truths (what one takes to be truths).

Some may argue that what I see here as advantages of thinking in terms of truthmakers are actually disadvantages. The world is a world of things not of facts, it may be said, and so we do not want facts, and the nightmare of such entities as negative facts, in our ontology. This is an arguable position, of course, but, conceding it true for the sake of argument, it can still be accommodated by a doctrine of truthmakers. Let the world be a world of things. The fundamental truths (those that have unique minimal truthmakers) will then have the form 'X exists' and the Xs, whatever they may be, will be truthmakers for these truths." pp. 23-24

(*) Quine writes: 'In science all is tentative, all admits of revision . But ontology is, pending revision, more clearly in

hand than what may be called *ideology* - the question of admissible predicates' (Quine, *The way of paradox and other essay*, New York, Random House, 1966, p. 232).

Essays

1. ———. 1972. "Materialism. Properties and Predicates." *Monist* no. 56:163-176.

"How are contingent identifications ('heat is mean kinetic energy') possible? It is argued, first, that we require a realistic (but not Platonistic) theory of properties. second, that we must reject the common assumption that to each distinct predicate there corresponds its own peculiar property. Contingent identification occurs where two distinct predicates apply to the same object or objects in virtue of just one property of that object."

Bogusław Wolniewicz on the Formal Ontology of Situations

Introduction

"The theory presented below was developed in an effort to clarify the metaphysics of Wittgenstein's Tractatus. The result obtained, however, is not strictly the formal twin of his variant of Logical Atomism. but something more, general, of which the latter is just a special case. One might call it an ontology of situations. Some basic ideas of that ontology stem from Stanisław Wittgenstein's Tractatus, Oxford, 1968 and Suszko Ontology in the Tractatus of L. Wittgenstein - Notre Dame Journal of Formal Logic, 1968.

Let L be a classic propositional language. Propositions of L are supposed to have their semantic counterparts in the realm of possibility, or as Wittgenstein put it: in logical space. These counterparts are situations, and S is to be the totality of them. The situation described by a proposition a is S(a). With Meinong we call it the objective of a." (pp. 381-382)

From: Bogusław Wolniewicz, "A Formal Ontology of Situations", *Studia Logica* 41, 1982, pp. 381-413.

"Different ontologies adopt different notions of existence as basic. Aristotle's paradigm of existence is given by the equivalence:

(A) to be = to be a substance.

On the other hand, the paradigm of existence adopted in Wittgenstein's Tractatus is given by the parallel equivalence:

(W) to be = to be a fact.

Now, an Aristotelian substance is the denotation of an individual name, whereas a Wittgensteinian fact is the denotation of a true proposition. It seems therefore that the notions of existence derived from these two paradigms should be quite different, and one might readily expect that the metaphysical systems erected upon them will display wide structural discrepancies.

It turns out, however, that in spite of this basic difference there runs between these two systems a deep and striking parallelism. This parallelism is so close indeed that it makes possible the construction of a vocabulary which would transform characteristic propositions of Wittgenstein's ontology into Aristotelian ones, and conversely. To show in some detail the workings of that transformation will be the subject of this paper.

The vocabulary mentioned is based on the following four fundamental correlations:

Aristotle

- 1) primary substances (*substantiae primae*)
- 2) prime matter (*materia prima*)
- 3) form (*forma*)
- 4) self-subsistence of primary substances (*esse per se*)

Wittgenstein

- 1) atomic facts
- 2) objects
- 3) configuration
- 4) independence of atomic facts

Aristotle's ontology is an ontology of substances, Wittgenstein's ontology is an ontology of facts. But concerning the respective items of each of the pairs (1)-(4) both ontologies lay down conditions which in view of our vocabulary appear to be identical. To show this let us confront, to begin with, the items of pair (1): substances and facts.

(The interpretation of Aristotle adopted in this paper is the standard one, to be found in any competent textbook of the history of

philosophy. Therefore, with but one exception, no references to Aristotle's works will be given here.) Relatively to the system involved substances and facts are of the same ontological status. Aristotle's world is the totality of substances (*summa rerum*), Wittgenstein's world is the totality of facts (*die Gesamtheit der Tatsachen*). For Aristotle whatever exists in the basic sense of the word is a primary substance, for Wittgenstein - an atomic fact. Moreover, both ontologies are MODAL ones, allowing for different modes of being (*modi essendi*); and both take as basic the notion of 'contingent being' (*esse contingens*), opposed to necessary being on the one hand, and to the possibility of being on the other. Both substances and facts are entities which actually exist, but might have not existed. The equality of ontological status between substances and facts is corroborated by the circumstance that both are PARTICULARS, there being - as the saying goes - no multiplicity of entities which FALL UNDER them.

Substances and facts stand also in the same relation to the ontological categories of pairs (2) and (3). Both are always COMPOUND entities, a substance consisting of matter and form, and a fact consisting of objects and the way of their configuration. But in neither of the two systems is this compoundness to be understood literally as composition of physically separable parts or pieces. The compoundness (*compositio*) of a substance consists in its being formed stuff (*materia informata*), and the compoundness of a fact in its being a configuration of objects.

In view of correlation (4) we have also an equality of relation which a substance bears to other substances, and a fact to other facts. Self-subsistence is the characteristic attribute of primary substances: *substantia prima = ens per se*. If we take this to mean that each substance exists independently of the existence or non-existence of any other substance we get immediately the exact counterpart of Wittgenstein's principle of logical atomism stating the mutual independence of atomic facts. It should be noted that thus understood the attribute of self-subsistence or independence is a relative one, belonging to a substance - or to a fact - only in virtue of its relation to other substances - or facts.

From a Wittgensteinian point of view Aristotle's substances are not things, but hypostases of facts, and thus their names are not logically proper names, but name-like equivalents of propositions. (By that term we mean roughly either a noun clause of the form 'that p', or any symbol which might be regarded as a definitional abbreviation of such clause.) Surely, from the Aristotelian point of view it might be easily retorted here that just the opposite is the case: substances are not 'reified' facts, but on the contrary - facts are 'dereified' substances. Without passing judgement on these mutual objections let us note in passing that their symmetric character seems to be itself an additional manifestation of the parallelism discussed." (pp. 208-210, notes omitted)

From: Bogusław Wolniewicz, "A Parallelism Between Wittgensteinian and Aristotelian Ontologies", in: Robert S. Cohen and Marx Wartofsky (eds.), *Boston Studies in the Philosophy of Science*, Vol. IV, Dordrecht: Reidel 1969, pp. 208-217.

Wolniewicz on Wittgenstein's Tractatus

"The *Tractatus* is a masterpiece of rare power and ravishing beauty. Its content is a profound and highly coherent philosophy of language, based upon a radically new kind of metaphysics: the metaphysics of facts and situations. (Meinong, with his notion of the 'objective' of a proposition, apparently was moving in the same direction. But he never came near asking himself any of the two crucial questions: (1) When, if ever, are the objectives of different propositions identical? (2) What, if any, is the relation of the objective of a compound proposition to the objectives of its components?) Moreover, the *Tractatus* anticipated many of the later developments of logical semantics, especially those commencing around 1950 and connected with its algebraization. The kernel of its message may be put down as follows. The fundamental problem of the *Tractatus*, as of all philosophy, concerns the relationship of thought and reality. This relationship is mediated by language, and so it may be decomposed into the relative product of two relations: one between thought and language, the other between language and reality. Let us mark the latter by 'f', the former by '?'.

It has been maintained that according to the *Tractatus* the projective relation f between language and reality has to be an isomorphism. This, however, is not borne out by the text. To satisfy the conditions laid down by Wittgenstein it is enough for to be a *homomorphism*, and this already makes a lot of a difference. In the first place, we are confronted now with two delicate questions: (1) Which is the direction of that homomorphism: from language to reality, or the other way round? (2) Is it a homomorphism *onto*, or merely one *into*? Neither of these questions has a trivial answer in the context of the *Tractatus*.

We assume here that the relation f is a homomorphism on the language L onto the reality R , i.e., that $f: L \rightarrow R$. Thus reality is a homomorphic image of language. But language is the totality of propositions, and the reference of meaningful propositions are possible situations. Consequently, reality is not the world, but the logical space; i.e., it is not the totality of facts, but the totality of possibilities. Thus language is more capacious than the world, and the number of propositions is greater than even that of situations.

The simplest non-trivial homomorphism of that kind is the well-known Fregean one. Language is mapped under it onto the set of the two classic truth-values, and the corresponding two-element Boolean algebra is then the logical space. Thus for Frege there are just two possible situations: the True and the False. This is so because his only stipulation with regard to the reference of propositions is that *contradictory* propositions cannot have the same reference. In the *Tractatus*, however, it is stipulated further that logically *independent* propositions cannot have the same reference either. This move is the gist of its logical atomism, transforming the Fregean homomorphism $f: L \rightarrow \{1,0\}$ into the composition of two other ones: f' on L onto logical space, and f'' on logical space onto the set of truth-values. (1)

The aim of the *Tractatus* was to trace the boundaries of clear thought:

Philosophy... should trace the unthinkable from within by means of the thinkable. By presenting clearly what may be expressed it will point to the inexpressible. (2)

The positivistically-minded members of the Vienna Circle deemed to recognize in these words their own 'demarcation problem', together with their own hostility towards 'metaphysics' and their cult of 'science'. It was a monumental misunderstanding. To Wittgenstein the metaphysical is indeed the inexpressible, but this is not to mean that it is regarded as some kind of delusion or hoax. On the contrary, the hoax is the idea of a 'scientific philosophy'.

In the *Tractatus* the tracing of the boundaries of the inexpressible was to be accomplished at one stroke. Logical space R fills the realm of the expressible E completely, i.e., we have $E = R$. Consequently, the homomorphism f' is onto the expressible, and what is left, evidently, is only the inexpressible. This grandiose project, however, was soon to encounter grave technical difficulties, and then Wittgenstein simply dropped it. This was rash. Not all the difficulties were quite as insuperable as they might have seemed, and the *Tractatus* left room for manoeuvre. It might have been helpful, for instance, to weaken the homomorphism f' to one *into* the expressible. Then instead of the one language L we could consider a whole series of languages L_0, L_1, \dots , and a corresponding series of logical spaces R_0, R_1, \dots . The realm of the inexpressible would be approximated by the latter 'from within', starting from what is expressible in the language L_0 at hand. Certainly, the series of logical spaces need not be monotonic, and in advance there would be no telling whether what is inexpressible at a given stage L_1 is absolutely or only relatively so. Thus the final tracing of the boundaries of the inexpressible would recede to infinity, but for theory this could hardly count as an objection." (pp. 77-79)

Proceedings of the Second International Wittgenstein Symposium, 29th August to 4th September 1977, Kirchberg/Wechsel (Austria)*, edited by Leinfellner, Elisabeth, 174-176. Wien: Hölder-Pichler-Tempsky.
9. ———. 1978. "Situations as the Reference of Propositions." *Dialectics and Humanism* no. 5:171-182.

"The reference of propositions is determined for a class of languages to be called the "Wittgensteinian" ones. A meaningful proposition presents a possible situation. Every consistent conjunction of elementary propositions presents an elementary situation. The smallest elementary situations are the "Sachverhalte"; the greatest are possible worlds. The situation presented by a proposition is to be distinguished from that verifying it, but the greatest situation presented is identical

with the smallest verifying. The reference of compound propositions is then determined as a function of their components."

10. ———. 1978. "Objectives of Propositions." *Bulletin of the Section of Logic* no. 7:143-147.

"The paper sketches out a semantics for propositions based upon the Wittgensteinian notion of a possible situation. The objective of a proposition is defined as the smallest situation verifying it. Two propositions are assumed to have the same objective iff they are strictly equivalent. Formulas are given which determine the objectives of conjunction and disjunction as functions of the objectives of their components. finally a link with possible-world semantics is established."

11. ———. 1978. "Wittgenstein Und Der Positivismus." In *Wittgenstein, the Vienna Circle and Critical Rationalism. Proceedings of the Third International Wittgenstein Symposium, 13th to 19th August 1978, Kirchberg Am Wechsel (Austria)*, edited by Bergehel, Hal, Hübner, Adolf and Eckehart, Köhler, 75-77. Wien: Hölder-Pichler-Tempsky.
12. ———. 1978. "Les Situations Comme Corrélatés Semantiques Des Enoncés." *Studia Filozoficzne* no. 2:27-41.
13. ———. 1979. "A Wittgensteinian Semantics for Propositions." In *Intention and Intentionality. Essay in Honour of G. E. M. Anscombe*, edited by Diamond, Cora and Teichman, Jenny, 165-178. Ithaca: Cornell University Press.

"More than once Professor Anscombe has expressed doubt concerning the semantic efficacy of the idea of an 'elementary proposition' as conceived in the *Tractatus*. Wittgenstein himself eventually discarded it, together with the whole philosophy of language of which it had been an essential part. None the less the idea is still with us, and it seems to cover theoretical potentialities yet to be explored. This paper is a tentative move in that direction.

According to Professor Anscombe, (*) Wittgenstein's 'elementary propositions' may be characterized by the following five theses:

- (1) They are a class of mutually independent propositions.
- (2) They are essentially positive.
- (2) They are such that for each of them there are no two ways of being true or false, but only one.
- (4) They are such that there is in them no distinction between an internal and an external negation.
- (5) They are concatenations of names, which are absolutely simple signs.

We shall not investigate whether this is an adequate axiomatic for the notion under consideration. We suppose it is. In any case it is possible to modify it in one way or another, and for the resulting notion still to preserve a family resemblance with the original idea. One such modification is sketched out below."

- 14. ———. 1979. "Some Formal Properties of Objectives." *Bulletin of the Section of Logic* no. 8:16-20.
 "The objectives of propositions as defined in an earlier paper are shown here to form a distributive lattice."
- 15. ———. 1980. "On the Lattice of Elementary Situations." *Bulletin of the Section of Logic* no. 9:115-121.
- 16. ———. 1980. "On the Verifiers of Disjunction." *Bulletin of the Section of Logic* no. 9:57-59.
- 17. ———. 1981. "The Boolean Algebra of Objectives." *Bulletin of the Section of Logic* no. 10:17-23.
 "This concludes a series of papers constructing a semantics for propositional languages based on the notion of a possible "situation". Objectives of propositions are the situations described by them. The set of objectives is defined and shown to be a boolean algebra isomorphic to that formed by sets of possible worlds."
- 18. ———. 1982. "A Formal Ontology of Situations." *Studia Logica* no. 41:381-413.

"A generalized Wittgensteinian semantics for propositional languages is presented, based on a lattice of elementary

situations. Of these, maximal ones are possible worlds, constituting a logical space; minimal ones are logical atoms, partitioned into its dimensions. A verifier of a proposition is an elementary situation such that if real it makes true. The reference (or objective) of a proposition is a situation, which is the set of all its minimal verifiers. (Maximal ones constitute its locus.) Situations are shown to form a Boolean algebra, and the Boolean set algebra of loci is its representation. Wittgenstein's is a special case, admitting binary dimensions only."

"The scientific world-view is one of the fundamentals of our culture. It can be characterized in part by its specific system of values. A world-view is regarded as a scientific one if "truth" is one of its primary values, that is, as a value which is not a means, but an end in itself. Truth is served in particular by the two instrumental values of conceptual clarity and openness to critique. Their standing is (at present) low, for two reasons. (1) Unclear thinking not only promotes social idols; its consequences are also often difficult to see clearly and immediately. (2) In any case truth is of no interest (in a biological sense) to human beings; therefore, critique can at best be a socially tolerated activity. On the other hand, truth is not only a value, but also a force which in the long run cannot be held back; this fact gives some hope to adherents of the scientific world-view. "

33. ———. 1990. "Elzenberg's Logic of Values." In *Logic Counts*, edited by Ewa, Zarnecka-Bialy, 63-70. Dordrecht: Kluwe.

Reprinted in: *Logic and metaphysics* (1999) - pp. 286-292 (with the title: *Elzenberg's axiology*"

"1. Values are what our value-Judgements refer to, and the passing of Judgements is one of our vital activities, like sleeping and breathing. We constantly appraise things as good or bad, pretty or ugly, as noble or base, well-made or misshapen. No wonder that both the act of appraisal and that which it refers to - i.e. the real or spurious values - have been always the source of philosophical reflexion. In systematic form such reflexion is what we call *axiology*.

In Polish philosophy it was Henryk Elzenberg (1887-1967) who reflected upon matters of axiology most deeply and incisively.

(...)

3. Leibniz had said somewhere: "There are two mazes in which the human mind is most likely to get lost: one is the concept of continuity, the other is that of liberty". This admits of generalization: all concepts are mazes, *viz* mazes of logical relations between the propositions that involve them.

One such maze is the concept of 'value'. Possibly, it is even the same as one of the two mentioned by Leibniz, only entered - so to say - by another door. For it would be in full accord with Elzenberg's position - and with that of Kant too - to adopt the following characteristic: values are what controls the actions of free agents. Thus the concepts of value and of liberty should constitute one conceptual maze, or - which comes to the same - two mazes communicating with each other.

To get a survey of such logical maze the first thing is to fix the ontological category of the concept in question. Thus, in our case, we ask what kind of entities are those 'values' supposed to be. (Ontological categories are the most general classes of entities, the *summa genera*. A term even more general has to cover literally everything: like 'entity' or 'something'. For everything is an entity, just as everything is a something.)

Different ontologies admit different sets of categories. The categories most frequently referred to are those of 'objects', 'properties', and 'relations'; the more exotic ones are those of an 'event', a 'set', a 'function', or a 'situation'. One point, however, is of paramount importance: the categories admitted *In* one ontology have to be mutually disjoint". p. 63; 66.

"How is Wittgenstein's later philosophy related to his earlier one?"

Despite much discussion there is little clarity on that. So let us give it again some consideration.

(...)

Philosophy of language oscillates between the two poles of metaphysics and psychologism; (...) . The main representative of the former trend is Frege, and the *Tractatus* follows closely in his wake. The *Philosophical Investigations*, on the other hand, are the expression of a dramatic departure from Frege and towards psychologism. Language is now viewed by Wittgenstein not in its logical capacity as the medium of thought and the bearer of truth-value, but instrumentally as a means of communication. Its relation to reality fades out, and its connexion with feeling, thinking, and doing comes massively to the fore.

Psychologism and positivism go hand in hand. Metaphysics, though not condemned as a vice as in pure positivism, is viewed as a malaise to be cured. Thus Wittgenstein's later philosophy turns into a kind of psychotherapy, exerting itself to bring metaphysics to a stop. What for? This is never made clear, as if it were a matter of course. But it is not." (pp. 80-81)

41. ———. 2000. "Atoms in Semantic Frames." *Logica Trianguli* no. 4:69-86.

"Elaborating on Wittgenstein's ontology of facts, semantic frames are described axiomatically as based on the notion of an elementary situation being the verifier of a proposition. Conditions are investigated then for suchframes to be atomic, i.e. to have lattice-theoretic counterparts of his "Sachverhalte"."

42. ———. 2001. "Extending Atomistic Frames." *Logica Trianguli* no. 5.

"A "semantic frame" is bounded join-semilattice of *elementary situations*, with its maximal ideals to represent possible worlds and mapped into the complete sets of propositions determined by a given abstract logic (L, Cn). A frame is *Humean* if the elementary situations are separated by its possible worlds, and it is *atomistic* if the semilattice is so. One frame is the *extension* of another if the latter is an $\{0,1\}$ -subsemilattice of the former satisfying certain conditions discussed."

43. ———. 2001. "Tractatus 5.541 - 5.542." In *Satz Un Sachverhalt*, edited by Neumaier, Otto, 185-190. Sankt Augustin: Academia Verlag.

"In Wittgenstein's "Tractatus", thesis 5 is the Principle of Extensionality: all propositions are truth-functions of their clauses. This, however, has been often thrown into doubt. There are - it is said - compound propositions whose truth-value does not depend on that of their clauses. The usual example given are the so-called intensional contexts, like "John thinks that p", or "John says that p". And indeed, the truth-value of "p" is patently immaterial here to that of the whole proposition which it is part of.

Wittgenstein's retort are the following much discussed theses, adduced here in a translation of our own:

5.54 In the general propositional form, propositions occur in one another only as bases of truth-operations.

5.541 At first sight it seems that a proposition might occur in another also in a different way.

Particularly in certain propositional forms of psychology, like "A believes that p is the case", "A thinks p", etc.

For taken superficially, proposition p seems here to stand to the object A in some sort of relation.

(And in modern epistemology - Russell, Moore, etc. - these have actually been construed that way.)

5.542 However, "A believes that p", "A thinks p", "A says p" are clearly of the form "'p' says p"; and this is not correlating a fact with an object, but a correlation of facts by correlating their objects.

The objection is met here in two steps. Firstly, it is pointed out that a proposition of the form "John says that p" is actually of the form "'p' says that p". The idea is this: the proposition "John says that Jill has a cat" means: John produces the sentence "Jill has a cat", the latter saying by itself *that* Jill has a cat. In such a way propositions get independent of the persons producing them, and communicate some objective content. It is surely not by John's looks that we come to know about Jill's cat, but merely by his words. Whom they stem from, is irrelevant.

In his second step Wittgenstein follows Frege's interpretation of indirect speech, but with modifications. He points out that the formula " 'p' says that p " is equivalent to some compound proposition in which neither the proposition "p" as a syntactic unit, nor anything equivalent to it, does occur although there occur all the logically relevant constituents of "p" separately.

(...)

The distinction between abstract and concrete states of affairs is not drawn explicitly in the "Tractatus". But it fits well thesis 5.156, if we expand that thesis by a few words of comment, added here in brackets:

5.156(d) A proposition may well be an incomplete image of a particular (concrete) situation, but it is always *the* complete image (of an abstract one).

The circumstance that in 5.156 not "states of affairs", but "situations" are mentioned, is of no consequence in our context. We assume that states of affairs are just atomic situations, and so the distinction between "concrete" and "abstract" applies to both."

44. ——. 2003. "Extending Atomistic Frames: Part II." *Logica Trianguli* no. 6:69-88.

"The paper concludes an earlier one (*Logica Trianguli*, 5) on extensions of atomistic semantic frames. Three kinds of extension are considered: the adjunctive, the conjunctive, and the disjunctive one. Some theorems are proved on extending "Humean" frames, i.e. such that the elementary situations constituting their universa are separated by the maximally coherent sets of them ("realizations")."

Reinhardt Grossmann and the Ontology of Categories

Ontology, categories and the world

"Ontology, I said at the beginning, asks what the categories of the world are. What is a category? It is a kind of entity. What kind of kind? In answer to this question, we can only give examples. It is that sort of kind, as we have seen, that distinguishes between individuals, on the one hand, and properties on the other. It is that sort of kind, as we have noted, which obeys a certain kind of law, namely, categorial laws. But this reply does not really help much either. We must therefore rest content, as on so many other occasions, with examples rather than definitions. In these most fundamental matters of metaphysics, definitions are impossible." (p. 5)

"The world, I said earlier, is the ultimate object of ontological analysis. But this world must be distinguished from the physical universe. The universe is a complicated spatio-temporal structure. Facts, on the other hand, do not form such a structure. It follows, as Armstrong fails to realize, that a world consisting of facts cannot be identical with the universe. (D. M. Armstrong, *Universals and Scientific Realism*, 1978, vol. 1, pp. 126-135.) But if the world is not the same as the universe, to what category does it belong? There are a number of plausible answers. It may be said that the world is the totality of entities. Or it may be claimed that it is the totality of facts. (Compare L. Wittgenstein, *Tractatus Logico-philosophicus* 1961, p. 7.) If these answers imply that the world belongs to the category of class, then I think that they are wrong. But I must admit that I do not know how to argue for my view. I believe that the world is a fact; that it belongs to the category of fact. If this is the correct view, then we can distinguish between two levels of ontological analysis. On the

first level, the world can be analyzed into its constituent facts. On this level, we do not arrive at new categories, but discover the kinds of fact there are. We discover, in other words, the subcategories of the category fact. On the second level, we analyze facts which do not consist of further facts into their constituents. It is on this second level of analysis that we encounter the traditional categories of individual, property, relation, etc." (p. 8)

"Ontology asks what are the categories of the world. So far, I have tried to elucidate the crucial terms 'category' and 'world'. But I could have begun instead by saying that ontology attempts to categorize everything there is, and this alternative introduction would have led us earlier to a number of questions which we must now consider. There is an old and hallowed tradition, according to which being comes in many modes. One distinguishes, for example, between the existence of individual things and the mere subsistence of facts. Concrete things are said to exist, while abstract entities are held to subsist. But even though this view has been maintained by some of the recent philosophers I most admire -- by Bolzano, Frege, and Meinong, among others -- I do not think that it is correct. I do not believe that there are modes of being. Existence is the only kind of being there is. I shall later defend this belief. What is of primary interest to us right now is how the possibility of modes of being affects our conception of ontology. It seems to me clear that if there are modes of being, then it is the task of ontology to categorize all entities, irrespective of their particular modes of being. The field of ontology is as wide as the realm of being itself. But it is not any wider: What has no being cannot be categorized. What has no being cannot be the subject of ontology. Meinong, as we all know, would demur. According to him, there is an enterprise that deals, not only with existents and subsistents, but also with objects that have no being whatsoever; with objects like the golden mountain and the round square. And he claims that we are merely prejudiced if we exclude such objects from categorization. (A. Meinong, [*On the Theory of Objects*] 1904.) But Meinong's defense of a general theory of objects rests on an important assumption which I do not share. He maintains that objects without being may nevertheless have properties and stand in relations. He holds that the golden mountain is golden, that the round square is both round and square. Now, if it

were true that objects without being bristle with properties, then it would make sense to attempt to classify them, according to these properties. But if Meinong's assumption is mistaken, as I shall contend in a later chapter, then there simply can be no such classification; for one can only classify what has properties and stands in relations; what has, in short, attributes. My conviction that ontology cannot be extended beyond the realm of being thus rests on my rejection of the view that beingless objects can have attributes." (pp. 9-10)

Annotated Bibliography of Reinhardt Grossmann

Bibliography

A complete bibliography of the published writings of Reinhardt Grossmann and of the studies about his philosophy has been compiled by Javier Cumpa in the volume edited by him: *Studies in the Ontology of Reinhardt Grossmann* (2009), pp. 284-289; I give the list of the books and a selection of the most important articles.

Books

1. Grossmann, Reinhardt. 1965. *The Structure of Mind*. Madison: University of Wisconsin Press.

Contents: 1. Introspection. Inspection of phenomenal objects - Awareness of mental acts - Sensing and perceiving 3; 2. Mental Acts. The relational view - Nonexistent objects - Brentano's idealism 39; 3. Presentation and Judgment: Universals - Concepts - Frege's conceptualism - Abstraction 60; 4. Meaning. Mental contents - Intentional contexts - The behavioristic approach 104; 5. Intentionality. Possible particulars - Possible states of affairs - The intentional nexus 144; 6. Realism. Direct and indirect knowledge - Perceptual and phenomenal objects - Delusive perceptual situations 180; Index 238-248.

"This book avoids a number of traditional problems from the philosophy of mind. Emotions and volitions are hardly mentioned; and very little is said about imagination and memory. I am concerned in the main with only one topic: the realism-Idealism controversy. This concern explains why I limited the discussion to thought and perception. It also explains why at times I had to go rather deeply into the

problems of general ontology; for if my analysis is correct, the realism-idealism controversy arises from certain disagreements in general ontology.

Nor does this book deal with a number of currently fashionable topics. I say nothing on whether or not mental states are after all nothing but brain states. I do not discuss this point because I am convinced that there is nothing to be discussed. The correct answer to the question seems to me so obvious that I simply took it for granted in writing this book. The problem of our knowledge of other minds is of quite a different sort: it is, philosophically speaking, interesting and difficult. Since I do not discuss the problem, I may mention here that I consider all solutions in terms of so-called criteria for the application of expressions unsatisfactory. The one fashionable topic which I do discuss, though not under a separate heading and not in the movement's jargon, is the so-called private language argument. I am sure that the attentive reader can construct my position on this matter from the first chapter." (from the Preface).

Translated in Spanish as: *La estructura de la mente*. Barcelona, Labor, 1969.

2. ———. 1969. *Reflections on Frege's Philosophy*. Evanston: Northwestern University Press.

Contents: Editorial Foreword VII; Preface IX; Note XV-XVI; Chapter I. *Begriffsschrift*: Three Confusions 3. Act and Content 5; Subject and Predicate 13; Identity and Description 19; Function and Argument 23; Chapter II. *Grundlagen*: Two Distinctions 28; Ideas 29; Concepts 50; Objects 83; Reduction 108; Chapter III. *Sinn und Bedeutung*: A Solution 153; Identity 154; Truth 181; Chapter IV. Later Papers: Second Thoughts 224; About Sense and Reference 226; About Definitions 248; Index 255-261.

"I chose the title "Reflections on Frege's Philosophy" rather than, say, "An Outline of Frege's Philosophy" because I wanted to indicate that this book is not a systematic treatise on all or even most of Frege's views. I did not set out to write an exposition of Frege's philosophy, nor did I intend to provide a detailed commentary on his most important works.

My goal was rather modest in regard to Frege. I hoped to be able to discuss a few selected ontological problems within a very narrow setting. Frege's philosophy, as I found out, most conveniently provides such a setting. Not only does it center around the very questions which I wanted to take up, but it also deals with them in a manner which I find most congenial. Even though the ontological problems were foremost in my mind, however, I would be very pleased if my efforts contribute to a better understanding of Frege's philosophy as a whole.

(...)

It was clear to me from the beginning that Frege's views would have to be discussed with an eye on their gradual development. There are several definite stages in Frege's advancement, I believe, and his later views grow out of earlier ones. This conviction explains the structure of the present book. The first chapter is about the *Begriffsschrift*. I try to uncover the origins of the main themes of Frege's philosophy. These themes have their roots, I think, in three basic confusions: subjective and objective entities are not sharply distinguished; objects are not clearly separated from concepts; and identity is conceived of at times as a relation between signs, and at other times as a relation between entities. In the second chapter, the emphasis is on two cornerstones of Frege's mature philosophy, namely, his distinction between objective and subjective entities, and his notion of the difference between objects and concepts. But his attempt to reduce Arithmetic to logic raises the unsolved problem of identity. These topics are discussed against the background of the *Grundlagen*. Frege's philosophical development reaches a second peak with the three classical papers published in 1891 and 1892. These articles, especially "Über Sinn and Bedeutung," explain Frege's views on identity and truth. Both of these views rest on his distinction between sense and reference. The third chapter is about that distinction and its consequences. Frege's later published and unpublished manuscripts contain modifications, qualifications, and second thoughts about his earlier solutions. In Chapter Four I deal with some of these later ideas but this is rather an epilogue; the

real drama occurs in the second and third chapter." (from the Preface).

(...)

"If, in conclusion, we look back at Frege's system, we see that another of its main flaws has been eliminated. What remains as before is Frege's conviction that there are senses -- both senses of proper names and Thoughts. I have argued that a correct ontology contains states of affairs instead of Fregean senses. What descriptions represent -- as distinguished from what they describe -- are states of affairs, not senses. What sentences represent are states of affairs, not Thoughts. The sense-reference distinction, Frege's most original and most famous metaphysical innovation, must be rejected. Some metaphysical mistakes are so profound that generations of philosophers continue to discuss and learn from them. This is such a mistake." (p. 253).

3. ———. 1973. *Ontological Reduction*. Bloomington: Indiana University Press.

Contents: Preface 1; Introduction. A Principle of Acquaintance 3; Part One: Numbers and Quantifiers 29; Part Two: Properties and Classes 109; Part Three: Individuals and Structures 141; Conclusion: A List of Categories 177; Notes 191; Index 207-215.

"The structure of this book requires a brief explanation. The philosophical inquiry proceeds simultaneously, as it were, on three different levels. First and foremost, there is the problem of the nature of a (l)ogical reduction. What reduction devices and methods have been proposed? How does one go about showing that a given ontological kind can be reduced to another? What kinds of definitions are important from a strictly ontological point of view? These and similar questions arise in connection with the main topic of this book I shall contend that most kinds of definitions have no reductive power whatsoever. On the positive side, I maintain that there are only two ways of showing that what is alleged to be an ontological kind reduces in reality to another kind. First, it may be discovered that two expressions which apparently represent different entities or different kinds of entities refer in truth to

the very same entity or kind of entity. In most instances, one of the two expressions will then be an abbreviation of the other. Second, it may be discovered that a certain informative identity statement is true. In this case, either a description describes the same entity or kind of entity for which there is also a label, or two different descriptions describe the very same entity or kind of entity.

On the second level there are comments about the status and nature of a selected group of categories. Here the main topics are indicated by the five main parts of this book. The first part consists of some introductory remarks about the so-called principle of acquaintance. The second part deals with numbers and quantifiers in general. In the third part, the discussion turns to properties and classes. The fourth part is concerned with individuals and structures. The fifth part contains a summary of the most important results and a list of categories.

A discussion of the nature of ontological reduction has to be illustrated by examples. Numbers (and quantifiers in general), properties, classes, individuals, and structures are the five categories selected here as examples. In regard to numbers, it is argued (1) that they cannot be reduced to properties or classes, (2) that they form a subcategory of their own, and (3) that they belong to the main category of quantifiers. In regard to properties, the main contentions are (1) that there are no complex properties—that is, no properties represented by complex propositional forms—and (2) that there are properties which do not determine classes. Classes, I shall affirm, need not be determined by properties. The fourth section consists of Essays about four particular problems which arise because there are structures and, in particular, spatio-temporal structures.

On the third and last level of inquiry, an attempt is made to formulate a complete list of the main categories. But while the problem of ontological reduction is rather thoroughly discussed, and while there is also a fair amount of talk about particular categories, discussion of the hierarchy of categories is admittedly rather sketchy. Nevertheless, a glimpse at the

whole system of ontology seemed to me better than no glimpse at all.

Thus, with the three levels of inquiry in mind, you may think of this book in rather old-fashioned terms, as "A discussion of ontological reduction, with special reference to the status of selected categories and culminating in the outline of a list of categories". (from the Preface)

4. ———. 1974. *Meinong*. London: Routledge & Kegan Paul.

Contents: Preface IX-X; I. Individuals and Properties 1; II. Ideal and Real Relations 21; III. Ideas and Their Intentions 48; IV. Objects of Higher Order 57; V. Assumptions and Objectives 78; VI. Being and *Aussersein* 106; VII. Empirical Knowledge: Perception and Introspection 121; VIII. Relational Knowledge: The Theory of Entities 156; IX. The Apprehension of Objects 182; X. Modalities 199; Appendix I. Meinong's Ontology (by Meinong) 224; Appendix II. Meinong's Life and Work (by Meinong) 230; Notes 237; Index 255.

"This book on Meinong is primarily concerned with his arguments for the positions for which he is famous among some philosophers and infamous among others. But philosophical contentions carry little weight when they are viewed in isolation. Matters are too complex, too difficult, to be settled in an isolated way. Every argument must be evaluated against a background which includes a philosopher's other arguments and some of his basic assumptions or -- if you wish -- prejudices. I therefore discuss Meinong's arguments within the context in which they appear, but with an eye on his earlier positions as well as on his later changes of mind. There are at least two further reasons for adopting this particular approach in Meinong's case.

Findlay, in his classic study of Meinong's philosophy, compares him with G. E. Moore.⁽¹⁾ Although this comparison is apt, there is one respect in which Meinong differs greatly from Moore. Meinong's philosophy develops over the years from a sparse ontology into an ample one. Every new idea is built upon an old one; new problems arise in the wake of earlier solutions; certain questions are raised time and again, but their answers

are more and more refined. In short, there is a definite development, with a definite trend, definite stages, and a distinct final view.

I also wished to impress on the reader how misleading the prevalent view is that Meinong was a spendthrift metaphysician who delighted in multiplying entities continuously and needlessly. If one becomes aware of how Meinong's full ontology develops very slowly over many years from very austere beginnings, how he resists the temptation to solve a problem by admitting a new kind of entity, and how he gives in only after a whole series of arguments for the new kind of entity has accumulated, one will, hopefully, be less inclined in future to think of Meinong as the 'supreme entity multiplier in the history of philosophy'.(2)" (from the Preface).

(1) J. N. Findlay, *Meinong's Theory of Objects and Values*, 2nd ed. (Oxford, 1963), p. 348.

(2) This phrase is from Gilbert Ryle's article in the *Oxford Magazine* 26 October 1933.

5. ———. 1983. *The Categorical Structure of the World*. Bloomington: Indiana University Press.

For the Table of Contents, see the link at the end of the page.

"This book attempts to give a complete and accurate list of the categories of the world. In other words, it tries to bring Aristotle's *Categories* up-to-date.

My investigation into the categorical structure of the world was guided by two main ideas, one systematic, the other, historical in nature. The systematic idea is that most ontological disputes concern, all appearances to the contrary, not the existence of certain entities, but rather their nature. In each one of the chapters which deal with distinct categories, I have therefore discussed the main alternative categorizations of the kind of entity in question. Individual things, for example, have been classified either as particulars (as substances, in the traditional sense) or else as bundles of properties. For properties, too, there are two important views: they are categorized either as particulars (located in space and/or time) or as universals.

Numbers, to give a third example, have been conceived of as multitudes of units, or as properties of properties, or as classes of properties or of classes. In regard to these three kinds of entity, I come to the conclusions that individuals are particulars rather than bundles, that properties are universals rather than particulars, and that numbers are neither multitudes, nor properties, nor classes, but belong to an entirely different category of quantifier.

The historical idea is that until very recently, an Aristotelian ontology of substance and accident formed the basis of almost all philosophizing. Descartes, for example, is still a member of this tradition. However, in the 17th century there occurred a decisive break with that ontology. The notion of substance was attacked from the left by empiricists (Berkeley) and from the right by rationalists (Leibniz). As a result, a bundle view of individuals was widely accepted, and the Aristotelian distinction between essential and accidental properties was abandoned. But the acceptance of an ontology of bundles and properties raised a series of new questions. How do bundles of properties differ from mere classes? What role do relations play in the formation of bundles? What is the ontological status of relations? What kind of complex entity is a fact? And so on. The 19th century sees the final destruction of the Aristotelian ontology. Not just one, but several new categories appear on the ontological stage: relations, structures, classes, and facts. In this work, I try to take stock of these ontological innovations of the last hundred years or so.

The manuscript for my book was substantially finished several years ago. I mention this fact because it explains why I have not been able to do two things which I would like to do. Firstly, I would like to discuss in greater detail some of the important contributions to ontology which have recently been published. As it was, I could only insert brief references to the works of Armstrong, Butchvarov, Castañeda, Hochberg, and other philosophers. Secondly, I would now devote a separate chapter to negation, in order to emphasize that it is just as much a fundamental category of the world as, say, the category of property. I think that there are precisely eight categories (not

counting existence), namely, individuals, properties, relations, classes, structures, quantifiers, facts, and negation. On second thought, negation really deserves, not just a chapter of its own, but, like existence, a whole separate part; for it is clear that, like existence and unlike the categories, it is not a property. I shall have to write another book called "Negation and Existence!" (from the Preface).

6. ———. 1984. *Phenomenology and Existentialism: An Introduction*. London: Routledge & Kegan Paul.

Contents: Preface IX-X; Part I. The background. 1. Descartes: a new conception of the mind 1; 2. Brentano: the thesis of intentionality 29; 3. Kierkegaard: a different conception of man 68; Part II. Edmund Husserl: the problem of knowledge 77; 4. The distinction between particulars and universals 79; 5. Husserl's early views on numbers 89; 6. Husserl's distinction between essences and their existences 101; 7. Husserl's distinction between individuals and their aspects 115; 8. The phenomenological method 136; Part III. Martin Heidegger: the meaning of being 147; 9. Heidegger's project 149, 10. Modes of being 163; 11. The nature of existence 178; Part IV: Jean-Paul Sartre: the question for freedom 199; 12. The structure of the mind 201; 13. The origin of nothingness 226; 14. The pliancy of the past 251; Index 275-278.

"This book is based on lectures which I have given for the last ten years or so. This explains its style. Some other features, I think, require a little more explanation.

Different philosophers have quite different conceptions of what philosophy is all about. I am no exception, and my particular conception of philosophy has shaped my treatment of Husserl, Heidegger, and Sartre. In brief, I believe that all important philosophers—whether they know it or not and

whether they admit it or not—deal with certain traditional problems. There is a, sometimes hidden, continuity to philosophy.

No matter how revolutionary a philosophical movement may at first appear to be, and Phenomenology and Existentialism

certainly claimed to be revolutionary, a closer look reveals that the same old problems are merely discussed in a new way. I selected three such problems—the problem of knowledge, the problem of existence, and the problem of freedom—in order to provide some focus to the discussion, and because I believe that they were of major concern to Husserl, Heidegger, and Sartre, respectively.

But philosophical books are written, not only with a definite conception of philosophy in mind, but also from a particular point of philosophical view. My philosophical view is not easily described in contemporary terms. Although I was schooled in what is now called the 'analytic' tradition, I was also taught to appreciate Plato and Aristotle, Aquinas and Scotus, Descartes and Berkeley. I hope to show with this book that one so schooled can appreciate Heidegger and Sartre as well. It is surely silly to assume that only an Existentialist, say, can understand another Existentialist; as silly, I might add, as to believe that all Existentialists talk nonsense.

Finally, there is the fact that I argue, rather vehemently at times, for my own philosophical views. This will undoubtedly offend those who believe that an introductory text should present an unbiased picture. In defense of my polemical style, I can only plead that I find it very difficult to develop the dialectic of a particular problem -- the arguments and counter-arguments, the choices and limits -- without taking a definite stand myself. I assure the reader that I sound much more dogmatic than I am.

And I invite him to develop the arguments further than I have done, refuting my contentions in the process. This is the very stuff of which philosophy is made.

It goes without saying that Husserl, Heidegger, and Sartre have thought and written about things other than knowledge, existence and freedom. Just as it is obvious that there are other Phenomenologists and Existentialists. After all, this is merely an introduction to, not a survey of, Phenomenology and Existentialism. My main criticism of most of the introductions and anthologies in this field is that they contain bits and pieces

from numerous sources from Dostojewski to Marcel, without ever following up on any one topic, with the result that the student cannot possibly appreciate the complexity of the issues, or be impressed by the manner in which philosophical problems grow out of each other." (from the Preface)

Grossmann's Radical Empiricism (pp. I-IV) in: *Reprint Philosophy: Modern Classics of Analytical Philosophy Series*, Frankfurt, Ontos Verlag, 2006.

Contents: Preface VII-VIII; One: Knowledge of the External World: Perception 1; Two: Knowledge of Our Minds: Introspection 89; Three: Mathematical Knowledge: Perception Again 127; Bibliography 299; Index 304-311.

"In his commentary on *Kant's Critique of Pure Reason*, Vaihinger considers the four possible views which result if one combines the epistemological distinction between rationalism and empiricism with the ontological distinction between realism and idealism. He claims that until Kant, rationalism was always connected with realism, empiricism always with idealism. But Kant discovered a new combination: The marriage of rationalism with idealism. And then Vaihinger mentions in parentheses that the fourth possible combination, empiricism with realism, has always been considered to be impossible (see H. Vaihinger, *Kommentar zu Kants Kritik der reinen Vernunft*, vol. I, p. 52). It is this "impossible" view which I shall defend. That is why I called this book "The Fourth Way."

Empiricism means different things to different people. I have in mind the view that our knowledge of the external world rests entirely on perception, and that knowledge of our own minds is solely based on introspection. I hold that there is no special faculty of the mind, no Platonic "contemplation," no Cartesian "understanding," no Husserlian "eidetic intuition," by means of which we know external objects. My version of empiricism may be called "radical," for it insists, not only that we know the familiar objects around us by perception, but also that we know

numbers and other abstract entities by means of perception. I hold that the truths of arithmetic ultimately rest just as much on perception as the truths of physics.

It is in regard to this contention that my view differs most profoundly from other theories of knowledge. While many contemporary philosophers accept empiricism in regard to the "natural sciences," hardly anyone agrees with me that logic, set theory, and arithmetic are a matter of empirical knowledge. But empiricism cannot stand on one leg. An empiricism that claims exception for logic, set theory, and arithmetic is no empiricism at all. Arithmetic, in particular, is the touchstone for any serious attempt to defend empiricism. I shall therefore have to discuss arithmetic knowledge in great detail.

Realism, too, has many meanings. I mean the view that there are such perceptual objects as apples, that these things consist of smaller things like molecules, and that these in turn consist of even smaller objects like elementary particles (or of whatever else the physicist may discover). None of these things is mental. Nor do they depend for their existence or nature on there being minds. But my realism, too, is of a radical sort, for I also hold that there are sets and numbers, and that these things as well do not depend for their existence or nature on minds. Just as an empiricism in regard to science alone can be no more than a paltry evasion of the rationalist's challenge, so realism only in regard to ordinary perceptual objects can be nothing but a worthless response to the idealist's taunt. The realist's work is only half done after he has refuted Berkeley. That an apple is not a collection of ideas is fairly obvious. "That number is entirely the creature of the mind," however, seems to be an unshakable conviction of even the most realistic philosophers.

But even if we rid ourselves of this idealistic bias, even if we accept numbers and sets as part of the furniture of the world, there remains the formidable task of placing these entities somewhere in the hierarchy of categories. Granted that numbers are nonmental, to what category do they belong? Are they sets? Or are they perhaps properties of properties? This task, I believe, has been so futile up to now because the proper

category for numbers was simply not a part of standard ontologies. Philosophers have for generations tried in vain to squeeze numbers into one of the familiar and traditional categories. Until very recently, there was very little to choose from: Numbers had to be either individual things or else properties of individual things. For an idealist, they could only be either intuitions or concepts. A third possibility finally appeared with the reluctant acceptance of the category of set. But this acceptance posed a new challenge: How to reconcile the existence of sets with empiricism.

Vaihinger, as I said, claims that Kant discovered a new combination: the compatibility of rationalism with idealism. I do not think highly either of Kant's rationalism or of his idealism. But Kant discovered -- and proudly insisted on -- one crucial truth: arithmetic is necessary and yet synthetic. With this discovery, he challenged all empiricists as well as all rationalists. Empiricists have to explain how arithmetic can possibly be necessary; rationalists, how it can possibly be synthetic. This challenge, I believe, has not been met." (from the Preface)

8. ———. 1992. *The Existence of the World. An Introduction to Ontology*. New York: Routledge.

Contents: I. The Discovery of the World: Timeless Being 1; II. The Battle Over the World: Universals 14; III. The Structure of the World: The Categories 46; IV. The Substratum of the World: Existence 91; V. The Enigma of the World: Negation 120; Bibliography 134; Index 137-139.

"The nature of classification.

Ontology asks and tries to answer two related questions. What are the *categories* of the world? And what are the *laws* that govern these categories? In chemistry, for comparison, we search for the chemical elements and the laws of chemistry; in physics, for elementary particles and their laws. Categories are for ontology what these basic building blocks of the universe are for the natural sciences. But ontology is not a science among sciences. Its scope is vastly larger than that of any science. And its point of view is totally different from that of the

sciences. To see how ontology differs from science, we must first of all understand the notion of a category. Our first question therefore is: what is a category?

(...)

The *principle* of the classification of the elements, however, is the same as at Empedocles's time: *Things are distinguished from each other by means of the properties which they have*. Let us call this 'the principle of classification'.

(...)

Someone must have realized that the foundation of all classifications of individual things, namely, the distinction between these things and their properties, is itself a classification. But it is a classification, not of *individual things* - individual amounts of water or earth, or individual bits of gold or iron, or individual whales or carps - but of *entities* in general. It is a classification of *any kind* of existent. It divides up everything there is into two large groups of existents, namely, into individual things, on the one hand, and their properties, on the other. Every 'ordinary' classification rests on this most fundamental classification of things into individuals and their properties. In order to distinguish this classification from all others, we shall speak of a 'categorization'. *Entities*, we shall say, *are categorized*. The kinds of thing which the categorization distinguishes are then called 'categories'. We know that there are at least two categories, that is, two kinds of entity (existent), namely, *individual things* and *properties* of individual things." (pp. 1-3).

9. ——. 2009. *Phenomenological Realism Versus Scientific Realism. Reinhardt Grossmann - David M. Armstrong Metaphysical Correspondence*. Frankfurt: Ontos Verlag.

"We choose the title "Phenomenological Realism vs. Scientific Realism" because these two terms indicate what is common

and what is different in their respective metaphysical positions. The realism common to them involves the ontological acknowledgement of concrete as well as of abstract entities such as universals and numbers which are taken as independent of mind. The attributes "phenomenological" and "scientific" which differentiate between Armstrong and Grossmann refer to the way they support their ontological realism. Armstrong uses evidences of the natural sciences, Grossmann evidences of perception and introspection. The epistemological differences explain part of the disputes between Armstrong and Grossmann, e.g., over the simplicity of universals.

We have divided this work into four parts distributed in thirty two letters from 1976 until 1987, and three isolated commentaries on three works from 1984 until 1992. Thus, the structure of the book includes an important stretch of the intellectual development of both philosophers from the preparation of their cardinal works, Armstrong with "Universals and Scientific Realism" (Cambridge University Press, 1978) and Grossmann with "The Categorical Structure of the World" (Indiana University Press, 1983), until the publication of Grossmann's "The Existence of the World: An Introduction to Ontology" (Routledge, 1992) and Armstrong's "A Combinatorial Theory of Possibility" (Cambridge University Press, 1989)." (from the Introduction, p. 9)

10. Twardowski, Kazimierz. 1977. *On the Content and Object of Presentations. A Psychological Investigation*. The Hague: Martinus Nijhoff.

English translation and introduction (pp. VII-XXXIV) by Reinhardt Grossmann of: *Zur Lehre vom Inhalt und Gegenstand der Vorstellungen* (1894).

"Twardowski's little book - of which I here offer a translation - is one of the most remarkable works in the history of modern philosophy. It is concise, clear, and - in Findlay's words - "amazingly rich in ideas."(1)

It is therefore a paradigm of what some contemporary philosophers approvingly call "analytic philosophy." But

Twardowski's book is also of considerable historical significance. His views reflect Brentano's earlier position and thus shed some light on this stage of Brentano's philosophy. Furthermore, they form a link between this stage, on the one hand, and those two grandiose attempts to propagate rationalism in an age of science, on the other hand, which are known as Meinong's theory of entities and Husserl's phenomenology. Twardowski's views thus point to the future and introduce many of the problems which, through the influence of Meinong, Husserl, Russell, and Moore, have become standard fare in contemporary philosophy. In this introduction, I shall call attention to the close connection between some of Twardowski's main ideas and the corresponding thoughts of these four philosophers." (from the Introduction, p. 1)

A Selection of Papers

1. Grossmann, Reinhardt. 1960. "Acts and Relations in Brentano." *Analysis* no. 21:1-5.
2. ———. 1960. "Conceptualism." *Review of Metaphysics* no. 14:243-254.

Reprinted in: Edwin B. Allaire [and others], *Essays in Ontology*, The Hague, Martinus Nijhoff, 1963, pp. 40-49.

"There can be no doubt that one is acquainted in perception with red things rather than redness alone. Nor can there be any doubt that one can name things with which one is acquainted. Each of these two facts forms the commonsensical background for an ontological criterion. According to the first criterion, what exists is what can be presented in perception independently of other things. Call this the *independence-criterion*.⁽¹⁾ According to the second, what exists is what can be named. Call this the *naming-criterion*. (p. 40 of the reprint)

(...)

Let us ask, finally, what, if anything, the conceptualist has committed himself to with regard to the "existence" of concepts. It seems that he still has a number of alternatives.

First. The conceptualist could adopt the naming-criterion. Since concepts are named, they would then be said to exist along with the referents of "this" and "that."

Second. He could reject the naming-criterion and instead accept the independence-criterion. From the fact that concepts are named, it would then not follow that they exist. But notice that the independence-criterion was originally tailored to perception alone, not to thought. This shows that there is a third possibility.

Third. The conceptualist could introduce a new criterion of existence which replaces the old independence-criterion for perception. According to this new criterion, *what exists is what can be presented either in perception or in thought independently of other things.* To grasp that this is a real alternative, consider that according to many philosophers, although one cannot perceive red (or redness) in isolation, one can so think (of) it. If this be true, then upon the new criterion, concepts exist -- not because they are named, but because they can be thought (of) independently.

In the history of philosophy, conceptualism is closely linked with nominalism. More often than not, conceptualists held that concepts subsist rather than exist. Nor is this surprising. Remember the so-called localization-criterion: what exists is what is localized in space and time. This criterion and the conceptualist doctrine that one can in perception be presented only with a particular *this* are just two sides of the same coin. More precisely, the things that are localized upon the one criterion are often held to be exactly those with which one can be presented upon the other. (Time and space have been called "*Formen der Anschauung.*") This makes it plausible, to say the least, that the conceptualist, however unwittingly, may also be guided by the localization-criterion. If so, he will deny that concepts exist.

Comparing all three, realist, nominalist, and conceptualist, we note these similarities. All three admit that there are two ontological modes, namely, existents and subsistents. All three are forced to make this distinction because they accept one of several criteria, naming, independence, or localization, as the most significant criterion of existence. The conceptualist, however, stands with the nominalist when it comes to

separating existents from subsistents. To one who explicates different ontological uses of "exist" rather than adopting one himself, this is of little consequence. The deepest issue, I submit, is not whether universals are called "properties," or "concepts"; whether, perhaps, they are "parts" of something else; or whether, finally, they should be said to exist rather than merely being called subsistents. What then is this deepest issue? To state it, I avail myself of a metaphor I used a while ago. According to the conceptualist we have, as it were, two eyes; the eye of perception and the eye of the mind. With the latter we "see" the universal. This fundamental dualism both realist and nominalist reject." (pp. 48-49 of the reprint).

(1) For an excellent analysis of the independence-criterion and its importance for the realism- nominalism issue see Edwin B. Allaire, "Existence, Independence, and Universals," *The Philosophical Review*, 69,1960, 485-496 and also pp. 3-53 of this book.

3. ———. 1961. "Frege's Ontology." *Philosophical Review* no. 70:23-40.

Reprinted in: Edwin B. Allaire [and others], *Essays in Ontology*, The Hague, Martinus Nijhoff, 1963, pp. 106-120; reprinted also in: D. E. Klemke (ed.), *Essays on Frege*, Urbana, University of Illinois Press, 1974, pp. 79-98.

"Frege's system has two rather puzzling parts: (1) he insists on the sense-denotation distinction for names but makes no such distinction for concept words; (2) he describes concepts and concept words as being unsaturated. (1) raises the problem whether concept words either denote or express concepts. This problem has been discussed by W. Marshall Dummett.(a) (2) raises a number of different problems, for it led Frege to introduce so-called value ranges and concept correlates. These problems have been discussed by Peter Geach, R. S. Wells, and Gustav Bergmann.(b) Since both kinds of problems arise from Frege's notion of concept, it is plausible, as Bergmann tries to show, that they have their roots in a hidden nominalism. E. D. Klemke, however, has recently argued against Bergmann that Frege was clearly not a nominalist.(c)

In this paper I shall first suggest the structural reasons for Frege's insistence on (1) and (2). Then I shall make some comments about the issue whether or not Frege was a nominalist. But of course a complete discussion of Frege's philosophy must not be expected in this paper."

5. ———. 1962. "Sensory Intuition and the Dogma of Localization." *Inquiry* no. 5:238-251.

Reprinted in: Edwin B. Allaire [and others], *Essays in Ontology*, The Hague, Martinus Nijhoff, 1963, pp. 50-63.

"Conceptualism, like any other philosophical doctrine of comparable scope, has both ontological and epistemological aspects. Ontologically, however, conceptualism does not differ significantly from certain forms of nominalism.(1) At its root lies an epistemological thesis: All objects of sensory intuition are localized in space and time.(2) In this paper, I wish to

explore some of the consequences of this thesis. (p. 50 of the reprint).

(...)

To sum up. The problem of predication forces the conceptualist to part with the dogma of isolation and the dogma of localization. It forces him to admit that there is at least one way in which one is acquainted with things in connection rather than in isolation. And it forces him also to admit that there is at least one way in which one is acquainted with the localized together with the unlocalized. Being aware of these consequences, the conceptualist could retreat to a simplified form of conceptualism." (p. 61 of the reprint).

(1) I have discussed the ontological ramifications and possibilities of conceptualism elsewhere. See "Conceptualism," *The Review of Metaphysics*, 14,1960,243-54 and also pp. 40-49 of this book.

(2) I shall distinguish between sensory intuition and presentation as two distinct ways in which one might be acquainted with particular things and universals, respectively.

6. ———. 1963. "Particulars and Time." In *Essays in Ontology*, edited by Allaire, Edwin B., 30-39. The Hague: Martinus Nijhoff.

"Some philosophers agree that there is a connection between particularity and time: Particulars are in time; universals are not. However, they disagree among themselves about the precise nature of this connection. I wish to discuss some of the problems which give rise to their disagreement.

Perceptual objects are *continuants*. Phenomenal objects, e.g. *sensa*, mental acts, and the like, are *momentary* entities. A certain perceptual object A, being a continuant, may change its color from green to red and hence be green at one time and not green at another. Obviously, this situation cannot be described by the sentence 'A is green and A is not green.' The only satisfactory description introduces time in the form of moments: 'A is green at t₁ and A is not green at t₂'.(1) If one starts the philosophical analysis with continuants, one must

introduce moments in order to describe a changing thing. Put differently, a philosopher who starts out with continuants, commits himself to *absolute time*. But time is *relational*. It follows that one must start not with perceptual objects (continuants), but rather with phenomenal objects, that is, with momentary things.(2)

This argument for phenomenalism is not sound. The ontological analysis of *things* shows quite conclusively and on its own ground that (logically) proper names must name *particulars*, rather than things,(3) According to this analysis, a perceptual object A, say, a colored disk, consists of a particular a which exemplifies certain universals. The same holds for a so-called phenomenal object, say, a colored spot in a visual field. What we ordinarily call a (perceptual or phenomenal) thing, turns out to be a complex entity, only part of which is named by the proper name 'a'. Irregardless, therefore, of whether or not perceptual and phenomenal objects are continuants, philosophical analysis starts with neither. The argument could therefore not possibly establish that it must start with phenomenal rather than perceptual objects.⁴ Our criticism shows, though, that we need not consider the distinction between perceptual and phenomenal objects, in order to discuss the connection between particulars and time.

But even though it fails, the argument contains a very important point. It seems to prove conclusively that particulars must be momentary entities, if time is relational rather than absolute. To be momentary means in this connection to be changeless. Hence there is a connection between particularity and *change*: If time is relational, then particulars must be changeless. Yet, a perceptual or phenomenal object may change, even though it consists of nothing else but a particular which exemplifies certain universals. We confront here an apparent inconsistency which ontological analysis must resolve."

(1) Of course, time may be introduced through tenses. But this creates ontological problems of a different sort.

(2) Compare, for example, G. Bergmann: *Meaning and Existence* (Univ. of Wisconsin Press, Madison, 1960), pp. 182-188 and pp. 230-239.

(3) Compare Essays II [*Bare Particulars* by Edwin B. Allaire] and V [*Conceptualism* by R. Grossmann] of this book.

7. ———. 1963. "Common Names." In *Essays in Ontology*, edited by Allaire, Edwin B., 64-75. The Hague: Martinus Nijhoff.

"The doctrine of common names has a long history. It always finds proponents who think that it is a way out of the classical nominalistic difficulties. I wish to show that this doctrine does not even make sense when considered apart from the nominalism which it supposedly vindicates, and that it could be of no help to the nominalist, even if it made sense. (p. 64)

(...)

To sum up. Even if the common name doctrine were acceptable, it could be of no help to a nominalist. For, even if he could explain what it means for a word to name commonly, he cannot explain what there is in or about individual things that collects them under one common name. It is indeed one of the most curious facts in the history of philosophy that a certain type of nominalism should derive from the doctrine of common names. Perhaps the only explanation is that the spurious doctrine of particularized essences and the spurious doctrine of common names tended to reinforce each other." (pp. 74-75).

16. ———. 1984. "Non-Existent Objects Vs. Definite Descriptions." *Australasian Journal of Philosophy* no. 62:363-377.

"Some years ago, I published an article about Meinong's theory of objects. (1) I listed there four main theses of Meinong's view:

(1) The golden mountain (and other nonexistents) has no being at all.

(2) Nevertheless, it is a constituent of the fact that the golden mountain does not exist.

(3) Furthermore, it has such ordinary properties as being made from gold.

(4) Existence is not a constituent of any object.

And I argued in that paper that only thesis (1) is true. In particular, I insisted that (3), which I consider to be the most characteristic feature of Meinong's view, is false.

Since then, there have been quite a few discussions of Meinong's view. I would like, in response to some of these works, to reiterate my earlier criticism of Meinong. My purpose is threefold. Firstly, I would like to state once more my own view, which is a version of Russell's theory of definite descriptions, as clearly as possible. Secondly, I shall defend my past contention that the golden mountain is not golden against some recent objections. And thirdly and most importantly, I want to describe the dialectic of the philosophical problem as I perceive it. It seems to me to be an exasperating shortcoming of the discussion that most participants do not clearly state the basic options and their reasons for preferring some to others."

(1) 'Meinong's Doctrine of the *Aussersein* of the Pure Object', *Noûs*, 8 (1974, pp. 67-81. See also my *Meinong* (Routledge and Kegan Paul, London, 1974).

17. ———. 1995. "Frege's Fundamental Philosophical Mistakes." In *Logik Und Mathematik. Frege-Kolloquium Jena 1993*, edited by Ingolf, Max and Stelzner, Werner, 226-231. Berlin: de Gruyter.

"It is one of the most surprising features of Frege's philosophy that he, who correctly analyzed the structures of quantified states of affairs, insisted on treating definite description expressions ('the birthplace of Mozart') like names ('Salzburg') and names like definite description expressions.' I shall argue that Frege's original mistake leads to a string of further mistakes. It leads him to hold that names, like definite description expressions, have both a sense and a reference and, eventually, to the view that sentences name truth-values. In short, it results in his much admired sense-reference theory of meaning." (p. 226).

18. ———. 1995. "Thoughts, Objectives and States of Affairs." *Grazer Philosophische Studien* no. 49:163-169.

"The notion of state of affairs was introduced as the complexly signifiable in the Late Scholasticism and rediscovered by Logicians like Bolzano and Frege. While Bolzano and Frege were primarily interested in the nature of objective truths students of Brentano, among others Meinong, Twardowski and Husserl, developed similar concepts starting out with an interest in the nature of mental acts and judgement. Both Frege's and Meinong's conceptions face similar problems concerning complex referents which are diagnosed to stem from confusions of complexes of properties with complex properties."

"Seldom has a modern philosopher become as famous for a view which he does not hold as Alexius Meinong. One generally attributes to him the belief that there are, not just such ordinary things as mountains and relations, but even such things as the golden mountain and the round square. He is therefore often viewed as a spendthrift ontologist who delighted in multiplying entities continuously and needlessly. But this conception, I shall try to show, is mistaken. Anyone who has studied Meinong's philosophy carefully will come to the conclusion that he is not the 'supreme entity-multiplier in the history of philosophy' as Gilbert Ryle claims.(1)

But even though Meinong never embraced the rather extreme view that there are, in addition to existing things in space and time and subsisting things (ideal things) outside of space and time, also such things as the golden mountain, and even such contradictory things as the round square, he nevertheless insisted on another ontological principle not any less mistaken than what I just called the 'extreme' view. It is this insistence, and not his ontological inventory, which I consider to be Meinong's main mistake. I shall, therefore, first defend Meinong against the kind of accusation implied in Ryle's description of Meinong. And then I shall, secondly, show where Meinong really went wrong in his ontology." (p. 477)

The Ontological Realism of Panayot Butchvarov

Annotated bibliography

Books

1. Butchvarov, Panayot. 1966. *Resemblance and Identity. An Examination of the Problem of Universals*. Bloomington: Indiana University Press.

Contents: Preface IX-XIV; Introduction 3; 1. The nominalist theory 16, 2. The identity and the resemblance theories 56; 3. The relation of resemblance 101; 4. Generic identity 135; Conclusion 173; Bibliography 199; Index 205.

"The first task of this essay, therefore, is the development of a distinctive and philosophically useful notion of universal, and of a corresponding statement of the problem of universals as a separate philosophical issue. Its second task is the solution of the so-stated problem of universals. Roughly, I shall identify the notion of universal with that of universal quality, in a very wide sense of the word "quality" to be explained in section 1. And I shall offer an explanation of the notion of universal quality that does not depend on the employment of the technical philosophical terms "universal," "particular," or "abstract." I shall identify the problem of universals with the question whether there are universal qualities, i.e., whether the qualities of individual things are universal or particular, or, as I shall actually state it without the use of the terms "universal" and "particular," whether certain qualities of individual things should be described as being one and the same quality or distinct qualities related by a relation of resemblance. Other

questions concerning universals, I believe, are either consequences or under modifications of this primary problem, or else independent philosophical issues having no special relation to the puzzles concerning universals. That this is so will become evident, I hope, in the course of our inquiry, especially in sections 1, 2, 5, 13, 17, and 18. But I shall not engage in the historical and exegetic investigations necessary for an actual proof of this claim. My statement of the problem of universals, in particular the identification of the notion of universal with that of universal quality, accords well with important traditional conceptions, such as "the universal is common, since that is called universal which is such as to belong to more than one thing" (Aristotle), and "the universal is that which is in many and of many" (Albert the Great). But does it not fail to take account of the second part of the equally important traditional question "whether genera and species really exist or are bare notions only; and if they exist whether they are corporeal things, or incorporeal and rather separated, or whether they exist in things perceived by the senses and in relation to them," (Porphyry)? For it seems to exclude from consideration one of the major theories of universals: that "genera and species exist not in sensibles but in separation from sensibles," and that universals may exist even if they have no instances. Now if this theory amounts to the claim that qualities, whether particular or universal, need not be qualities of individual things, that the notions of genus and species can be explained independently of those of instantiation or participation, then indeed we need not consider it, since, in virtue of the very notions of quality, genus, and species, it is obviously false. But the theory need not be interpreted so crudely as to become obviously false. It can be interpreted as claiming that there is an enormous, categorial difference between individual things and universal qualities and that because of this difference the senses in which universal qualities can be said to exist and to be in space and time, and the senses in which individual things can be said to exist and to be in space and time are so different that one can assert the existence of a quality on the ground that it can have instances, even if in fact it has not. I shall consider this claim at the end of

the book. But the logically prior questions are, "What is a universal quality?" and "Are there universal qualities?" It is mainly to these questions that I shall address myself in this essay. In many ways the problem of universals is the paradigm of a philosophical problem. It bears virtually no resemblance to any issue of experimental science. It is supremely general, in the sense that it concerns a certain fact about all qualities, in any actual or possible world, in complete abstraction from circumstances and contexts. And it is neither overtly nor disguisedly a problem about philosophy, one which is of interest to philosophers only because of their self-consciousness about the status and possibility of their discipline. Perhaps this is why writers on the problem of universals are especially tempted to connect their inquiries with considerations about philosophical method. I have succumbed to this temptation, mainly in Chapter Three. In content, if not in style, this essay is intended to be metaphysical. Part of its purpose is to demonstrate, in the context of a specific philosophical topic, that at least one branch of philosophy is a legitimate cognitive discipline that has as its subject matter, not certain features of language or of mathematics, but the essential and most general characteristics of the world."

2. ———. 1970. *The Concept of Knowledge*. Evanston: Northwestern University Press.

Contents: Part One: Primary knowledge 3; Part Two: The objects of a priori knowledge 99; Part Three: Primary Perceptual knowledge 185; Part Four: Derivative knowledge 267; Index 321-325.

"Part One of this book attempts an account of the general concept of knowledge, especially as it is employed in what I shall call primary epistemic judgments, that is, judgments of the form "A knows that p" which would not typically be in need of justification by appeal to other epistemic judgments. (Epistemic judgments that are in need of such justification I shall call derivative, and I shall make a corresponding distinction between primary and derivative knowledge.) We shall find that this account leads to, indeed demands and at the

same time illuminates, the division of all knowledge into a priori and a posteriori. But unless then a detailed elucidation of this division is provided, the general account of the concept of knowledge would remain skeletal. There are two questions in particular that such an elucidation must answer. First, what are the objects of a priori knowledge? Second, what is the nature of primary a posteriori knowledge? Our account of the concept of knowledge, like most such accounts, requires that the object of knowledge be a certain truth or fact. But what, if anything, could be an a priori (or necessary) truth or fact? Our account, again in common with most, requires the distinction between primary and derivative knowledge. But can this distinction be made good with respect to our sense-perceptual knowledge of the "external" world of bodies, which is the paradigm and most extensive segment of a posteriori knowledge? That the answers to these questions are not at all settled should be obvious. Yet, unless it includes such answers, an account of the general concept of knowledge cannot be accepted as satisfactory. Part Two of this book will attempt to provide an answer to the first question, and Part Three an answer to the second.

The consideration of a posteriori knowledge in Part Three raises with particular urgency the question of the possibility and nature of derivative knowledge. This is not surprising. That question concerns chiefly derivative a posteriori knowledge, the nature of derivative a priori knowledge being largely the concern of formal logic and its possibility generally unquestioned. The crucial issue regarding derivative a posteriori knowledge is the legitimacy of nondemonstrative inference. In Part Four we return to our inquiry into the general concept of knowledge, but this time with special attention to the issue of nondemonstrative inference and to the nature of derivative knowledge in general, and provide further reasons in support of the chief thesis of Part One.

I shall not, however, discuss the usual philosophical problems about the validity of certain particular kinds of derivative knowledge (e.g., of the future, of bodies, of other minds). Each of these requires careful, detailed treatment in its own right; nothing is gained by sweeping proclamations or refutations of

skepticism. And since these problems constitute the familiar subject matter of the theory of knowledge, I offer here only an introduction to that branch of philosophy and not a theory of knowledge as such. Indeed, as is well known, the sort of theory of knowledge one proposes, and most of its tenets, are largely determined by the account one offers of the fundamental epistemic concepts. It is important, however, that such an account be given first and that it be uninfluenced by one's epistemological convictions. For, true or false, these convictions have philosophical value only insofar as they are justified, and their justification cannot be attempted without an account of the key concepts involved. Thus the reader may come to think that our inquiry leads to skepticism. In this, as I shall explain, he would be mistaken. But even if he were not, I would regard such a consequence as acceptable, as long as the rejection of skepticism is not itself grounded in investigations such as ours. Our respect for common sense must not be confused with the possession of a philosophical answer to skepticism. In philosophy, as in any other purely theoretical discipline, it is better to be wrong as the result of inquiry and argument than to be right as the result of mere conviction. The layman who takes the existence of an external world for granted may be right, and the philosophical skeptic whose inquiries lead him to deny the existence of an external world may be wrong. But the skeptic is the philosopher, and the layman is not." pp. 4-5

3. ———. 1979. *Being Qua Being. A Theory of Identity, Existence, and Predication*. Bloomington: Indiana University Press.

Contents: Acknowledgments IX; Introduction 1; 1. The apparent distinctness of Identicals 9; 2. Objects and entities 39; 3. Indiscernibility 64; 4. Existence 82; 5. essence 122; 6. Substances 154; 7. qualities 184; 8. Accidental connections 212; Appendix A. Relations 239; Appendix B. Idealism 248; Notes 256; Index 267.

"The inquiry into being qua being has been identified with metaphysics. But it would be better to use the term "metaphysics" more broadly, namely, for the branch of philosophy that has as its subject matter the nature of the world, or of reality, rather than the nature of our knowledge, or

of our language, or of our sciences about the world. We may then distinguish several levels of metaphysical inquiry. On the least fundamental level metaphysics is concerned with the most general description of the actual world, with the most general kinds of things there are and with the way they fit together. It asks such questions as whether God exists, whether there are both minds and bodies or only minds or only bodies, and if there are both minds and bodies, how they are related. On this level it is closely connected with epistemology, since the main philosophical difficulties such questions pose for us are epistemological in character.

On a more fundamental level, presupposed by the first, metaphysics inquires into the nature of all possible, or at least all conceivable, comprehensible worlds, and thus only indirectly into the nature of the actual world. Can there be a world that consists only of individuals and not also of properties and relations? Or a world that consists only of properties and relations? Can there be nonidentical but indiscernible things? Questions related to those on the previous level can now be asked in complete independence from the usual epistemological considerations. Can there be a world unless there is God? Can there be a world without bodies? Without minds? On this level metaphysics is closely connected with logic. (Immediately following his introduction of the notion of a science of being qua being Aristotle offers a defense of the laws of non-contradiction and excluded middle.) But this connection is no more limited to formal logic than the notion of necessary truth is limited to the truths of formal logic. The criterion of possibility on which it would rely can hardly be mere formal consistency; it must be conceivability or comprehensibility (not of propositions, but of what propositions purport to describe), for, whether we like it or not, we have no other general and ultimate criterion of possibility.

This is why, on this level, metaphysics is also connected with phenomenology, i.e., with the philosophical description of the most general character of the objects of consciousness qua objects of consciousness.

On the third and most fundamental level metaphysics is concerned with the concepts and principles on the basis of which the questions belonging to the other two levels, i.e., the questions about what things there are or at least there can be, must be answered. Instead of these questions, it asks, what is it for something to be in a world, or for something to be a world? It is on this level, I suggest, that metaphysics is best described as the inquiry into being qua being, or, we might also say, as protometaphysics. Any conception of a world presupposes the conception of what it is for something to exist in that world. Any conception of a thing presupposes the conception of what it is for it to be the subject of predication, both accidental and essential. Any conception of a thing presupposes the conception of what it is for it to be identifiable, not in the sense of being merely singled out but also in the sense of being singled out again or in a different way, of being recognized, of being the subject of a true informative identity judgment.

It follows that the concepts of existence, identity, essential predication, and accidental predication cannot be understood as standing for constituents of the world, presumably for certain properties or relations. They are the concepts in terms of which we must understand what it is for something to be in the world, what it is for something to have a property or be related to another thing, and what it is for something to be a property or a relation. Yet they apply to any possible world; indeed nothing would be a world were it not for their applicability to it. We may call such concepts, which apply without standing for anything, transcendental. The inquiry into being qua being, or protometaphysics, may then be called a transcendental inquiry.

Now the central thesis of this book is that the concepts of existence, identity, accidental predication, and essential predication are intimately related, and moreover that the concept of identity is basic and the other three are to be understood in terms of it. I shall argue that the four puzzles with which we began admit of a common solution, the key to which is to be found in a careful study of the second puzzle, that regarding identity. It is a solution based on a distinction

between what I shall call objects and entities. A similar, but not the same, distinction has often been made, most notably by Meinong but also by recent possible-worlds semanticists, in treatments of the first puzzle, that regarding existence. But there it rests on the proposition that there are things of which it is true that there are no such things, a proposition that, I suggest, cannot be made coherent, let alone plausible, except on the basis of considerations external to the topic of existence. A similar, but again not the same, distinction has also been made, e.g., by Carnap and Sellars, in treatments of an aspect of the second puzzle, namely, the seeming failure of the principle of the Indiscernibility of identicals in intentional and modal contexts; I have in mind the distinction between individuals and individual concepts. But if an individual concept is indeed a concept, or at all like a concept, then it is not the object of the propositional attitude, or the subject of the modal property, with respect to which the principle seems to fail, and therefore its relevance is obscure. If it is not really a concept, then how does it differ from the individual with which it is associated? Again, I believe that these questions can be answered only on the basis of considerations both far more general and much deeper than the seeming discernibility of identicals in intentional and modal contexts." pp. 3-5 (notes omitted).

4. ———. 1998. *Skepticism About the External World*. New York: Oxford University Press.

Contents: Introduction 3; 1. Direct realism 12; 2. The Adverbial theory 35; 3. The skeptic's argument 56; 4. A first answer to the skeptic 89; 5. Our concept of reality 111; 6. The untruth and the truth of skepticism 133; Notes 159; Index 179.

"We are now ready to attempt another answer to the skeptic, one based on the preceding considerations regarding the concept of reality. Can what I have called the particular (nonmodal epistemic) question, namely, Do we know or at least have evidence, in some particular perceptual situation, that what we perceive is a real material object? be given a nonskeptical answer, just as in chapter 4 I gave a non skeptical answer to the general (non-modal epistemic) question, namely, Do we know or at least have evidence that material objects

exist? If it can, then we would also have a second nonskeptical answer to the general question, since a nonskeptical answer to the particular question entails a nonskeptical answer to the general question, though not vice versa. Thus my argument in chapter 4 in favor of the latter would receive welcome supplementation. But, as we shall see, we would still need that argument at a crucial point in our search in this chapter for a complete nonskeptical answer to the particular question. The fact is that both answers are needed. There is no circularity here, since the argument in chapter 4 is independent of the argument to be offered in this chapter, It's just that the converse is not quite the case.

Clearly, the question whether a certain perceptual object exists, is real, cannot be answered unless an account of the concept of existence, reality, is offered, even though this fact has been generally ignored by recent Anglo-American philosophers of perception (in striking contrast with continental philosophers). I have already said why Russell's account in terms of the satisfaction of a propositional function is unacceptable; it presupposes a more fundamental concept of existence, which would allow us to decide what to count as admissible arguments of the function and what not to so count. And the familiar proposal that the reality of an object consists in its fitting in the spatiotemporal causal system of the world is conceptually circular; it presupposes the concept of reality, for of course the system in question must be a system of real objects, and the causal relations in it must also be real, rather than imaginary, if the "fitting in" is to be even relevant. For similar reasons, also conceptually circular is the Kantian-phenomenalist account, as I argued in chapter 5.

The failures of those accounts should not be surprising if the existence, the reality, of an object cannot be thought of as one of its properties, relational or nonrelational. It certainly is not observable, and we would be indulging in mere fantasy if we suppose that it is somehow hidden in or behind the object that exists. I have argued that we should think of existence as the indefinite identifiability of the object to which it is attributed, in the sense that there is an indefinite number of objects with each

of which it is identical. But their identity is not something in reality. Rather it is imposed on them by our decisions to apply the concept of identity, The same can be said about the concept of existence, reality, since it is to be understood in terms of the concept of identity. Both are transcendental concepts." pp. 133-134

Essays

1. ———. 1974. "The Limits of Ontological Analysis." In *The Ontological Turn. Studies in the Philosophy of Gustav Bergmann*, edited by Gram, Moltke and Klemke, Elmer, 3-37. Iowa City: University of Iowa Press.

2. ———. 1977. "Identity." *Midwest Studies in Philosophy* no. 2:70-89.

"A novel account is offered of the nature of informative identity statements. Special attention is accorded to the intimate connection between the concept of identity and the concept of existence, and to their fundamental role in any intelligible conceptual framework."

Reprinted in: Peter A. French, Theodore E. Uehling, Jr., Howard K. Wettstein (eds.) - *Contemporary perspectives in the philosophy of language* - Minneapolis, University of Minnesota Press, 1979

3. ———. 1981. "The Ontology of Philosophical Analysis." *Noûs* no. 15:3-14.

"The most striking fact about recent analytic philosophy has been its return to metaphysics. But it is characteristic of most recent analytic ontologies that they do not face the ontological issues directly, but rather consist in the search for definitions that would capture ordinary usage or in paraphrasing ordinary statements supposed to be ontologically problematic. Gustav Bergmann, whose recent work is reviewed here, is an exception. His recent ontology constitutes a genuine and unabashed turn to the things themselves. However, it involves excesses which seem due to insufficient attention to the peculiarities of the ontologically crucial concept of identity."

4. ———. 1986. "Our Robust Sense of Reality." *Grazer Philosophische Studien* no. 25/26:403-421.

"Anti-Meinongian philosophers, such as Russell, do not explain what they mean by existence when they deny that there are nonexistent objects - they just sense robustly. I argue that any plausible explanation of what they mean tends to undermine their view and to support the Meinongian view. But why are they so strongly convinced that they are right? I argue that the reason is to be found in the special character of the concept of existence, which has been insufficiently examined by anti-Meinongian as well as by Meinongian philosophers."

5. ———. 1988. "Russell's Views on Reality." *Grazer Philosophische Studien* no. 32:165-167.

"Russell's account of existence as satisfaction of a propositional function presupposes a more fundamental notion of existence, which we would employ in deciding what to allow as arguments satisfying a function, a notion he never elucidates. Jan Dejnožka has distinguished three ways Russell used the term "exists," one being the phenomenalist's, in which it refers to correlations of sense-data. I argue that this phenomenalist notion cannot be the one Russell needs, since he explicitly held that existence be understood broadly, so that, e.g., the nonexistence of God would not follow by definition."

The Conceptual Realism of Nino Cocchiarella

Introduction

I wish to thank Professor Cocchiarella for helping me to complete this bibliography.

"Research Profile: Cocchiarella proved the first completeness theorems in tense logic and second-order modal logic. He was the first to develop several second-order logics with nominalized predicates as abstract singular terms and then to use those systems in a consistent logical reconstruction of both Frege's and Russell's early logics and in the application of those reconstructions to the semantic analysis of natural language. This work also led to Cocchiarella's development of formal theories of predication and comparative formal ontology, including especially logical reconstructions of nominalism, conceptualism, logical realism, and the logic of natural kinds. Cocchiarella also showed how logical atomism is compatible with logical necessity as a modality, and that it is the only ontology in which logical necessity, as opposed to other kinds of modalities, makes sense. Cocchiarella's own preferred ontological framework is conceptual realism, which he has been formally developing for many years, and which contains a logic of both actualism and possibilism in terms of a distinction between concepts that entail concrete existence and those that do not. It also contains a logic of classes as many as plural objects, which is the basis of Cocchiarella's semantics for plurals and mass nouns in natural language, and in which the Leonard-Goodman calculus of individuals (and therefore Leśniewski's mereology as well) is reducible. Cocchiarella has also shown that Leśniewski's ontology, which is also called a logic of names, is reducible to his theory of

reference in conceptual realism, and that the medieval supposition theories of Ockham, Buridan, and other medieval logicians can be logically reconstructed in terms of this theory of reference. Cocchiarella is currently continuing his work on different subsystems of conceptual realism, including in particular a logic of events as truth-makers.

Teaching: Cocchiarella has taught introductory, intermediate, and advanced courses in logic, semantics, set theory and Montague Grammar, as well as seminars on some of the most recent areas of research in logic. He has placed an emphasis in his teaching on the logical analysis of natural language and the ontological interpretations of both scientific and mathematical language.

Vision Statement: Cocchiarella sees logic as a powerful tool for the analysis of our scientific theories and the structures that underlie natural language and our commonsense understanding of the world. The study of logical categories in particular provides an important way to study the semantic and ontological categories underlying our scientific and commonsense world views." (pp. 52-53)

From: Dov M. Gabbay, John Woods (eds.), *The International Directory of Logicians. Who's Who in Logic*, London: College Publications 2009.

Formal ontology

"Formal ontology is the result of combining the intuitive, informal method of classical ontology with the formal, mathematical method of modern symbolic logic, and ultimately identifying them as different aspects of one and the same science. That is, where the method of ontology is the intuitive study of the fundamental properties, modes, and aspects of being, or of entities in general, and the method of modern symbolic logic is the rigorous construction of formal, axiomatic systems, formal ontology, the result of combining these two methods, is the systematic, formal, axiomatic development of the logic of all forms and modes of being. As such, formal ontology is a science prior to all others in which particular forms, modes, or kinds of being are studied.

Logic can be distinguished from formal ontology, but only in the sense of logic as an uninterpreted calculus, i.e. as the method of constructing abstract formal systems subject to varying interpretations over varying domains. A formal system in which logical (or syncategorematic) constants can be distinguished from non-logical (or categorematic) constants and in which the axioms and rules are assumed to be logically valid is not an uninterpreted calculus, however, but a logistic system in which logic is a language with content in its own right. The defining characteristic of a logistic system is that it propounds a theory of logical form, which comprises both a pure logical grammar, i.e. a system of categories and rules for generating meaningful expressions, and a system of logical axioms and rules that determine the deductive relations between different sets of expressions of that grammar. The purely formal or non-descriptive content of the existence of any and all physically real individuals or of the natural properties and relations that such individuals might have in nature, is not independent of the different modes of being of such entities, and in fact presupposes such modes in its very articulation."

Edmund Husserl was among the first to characterize a logistic system in this way, and it was he who also first introduced the notion of a formal ontology. For Husserl, logic has both an apophantic (assertional) aspect, which he called formal apophantics (and which amounts to a theory of logical form as characterized above), and an ontological aspect, which he called formal ontology. The switch from a formal-apophantic attitude to an ontological one is achieved primarily through a process of nominalization, and the underlying unity of the two aspects is given through a 'Law of Denominative Equivalence', according to which the well-formed expressions of any given category may be transformed into corresponding nominal forms. It is in this way, for example, that propositional forms and their predicative components (as generated in the theory of logical forms) are transformed into nominal forms that stand for states of affairs and properties and relations, respectively. The 'categorical objectivities' or 'correlates' that originate from such 'denominative reductions' (or nominalizations) of the pure forms of apophantic logic are then claimed to make up the fundamental conceptual material of formal ontology (cf. *Logical Investigations*, Volume I,

§§67–8, *Ideas*, §119, and *Formal and Transcendental Logic*, Chapter 2, §25). The important connection of ontology with a logistic system is that the logico-grammatical distinctions made in the latter are based ultimately on a distinction between different modes of being, even if that distinction is initially described in terms of different modes of significance. More is required by way of comprehensive grasp, however, before a logistic system can be taken as a system of logic or a formal ontology in its fullest sense. In particular, such a logistic system must be rich enough to contain, when suitable non-logical constants, axioms, and meaning postulates (regarding such constants) are added to it, every scientific theory and the logical analysis of every meaningful declarative sentence of any natural language. In that case such a logistic system can be taken as a *lingua philosophica*, or what Leibniz also called a *characteristica universalis*, and as such it is also none other than a comprehensive system of formal ontology.

(...)

Beginning with Aristotle, the standard assumption in (pre-formal) ontology has been that being is not a genus, i.e. that being is multivalent, and that the principal method of ontology is categorial analysis. This raises the problem of how the different categories or modes of being fit together, and of whether one of the senses or modes of being is preeminent and the others somehow dependent on that sense or mode of being. The differential categorial analyses that have been proposed as a resolution of this problem have all turned in one way or another on a theory of predication, i.e. on how the different categories fit together in the nexus of predication, and they have differed from one another primarily on whether the analysis of the fundamental forms of predication is to be directed upon the structure of reality or the structure of thought. In formal ontology, the resolution of this problem involves the construction of a formal theory of predication. Aristotle's categorial analysis, for example, is directed upon the structure of reality and not upon the structure of thought, and the pre-eminent mode of being is that of concrete individual things (or primary substances). Predication, moreover, is explained in terms of two ontological configurations that together characterize the essence-accident distinction of Aristotle's ontology, viz. the relation between an individual and its species or genera on

the one hand, and the inherence of a universal in an individual on the other. Aristotle's moderate realism regarding species, genera, and universals is a form of natural realism and not of logical realism, and a formal theory of predication constructed as an Aristotelian formal ontology must respect that distinction as well as give an adequate representation of the two ontological configurations underlying the Aristotelian analysis of predication. In particular, such a theory must contain a logic of natural kinds and must impose the constraint of moderate realism that every natural property or relation is instantiated (i.e. that every natural property or relation exists only in rebus). This constraint leads to Aristotle's problem of the fixity of species (according to which members of a species cannot come to be except from earlier members of that species, and that therefore there can be no evolution of new species); but, given the modal category of natural necessity and possibility as part of a revised Aristotelian formal ontology of modal natural realism, this problem can be resolved by requiring of every natural property or relation not that it actually be instantiated (at any given time) but only that such an instantiation be within the realm of natural possibility. Such a formal ontology, needless to say, will contain a modal logic for natural necessity and possibility, as well as a logic of natural kinds that is to be described in terms of that modal logic. (Cf. Cocchiarella 1976.) Plato's ontology is also directed upon the structure of reality, but the pre-eminent mode of being in this framework is not that of concrete or sensible objects but of the Ideas. This leads to the problem of μέθεξις, or of how and in what sense concrete objects participate in Ideas, and also to the problem of χωρισμός, or of how and in what sense Ideas are 'things' or abstract individuals separate from the concrete individuals that participate in them. A Platonist theory of predication in contemporary formal ontology is the basis of logical realism (where it is assumed that a property or relation exists corresponding to each well-formed predicate expression of logical grammar, regardless of whether or not it is even logically possible that such a property or relation has an instance). When applied as a foundation for mathematics (as was Plato's own original intent), logical realism is also called ontological logicism. The best-known form of logical realism today is Bertrand Russell's theory of logical types, which Russell developed as a way to avoid his famous paradox of predication (upon which his paradox of

membership is based), a paradox not un-related to Plato's problem of χωρισμός. Whether and to what extent Russell's theory of logical types can satisfactorily resolve either of Plato's problems and be the basis of an adequate realist formal ontology is an issue that belongs to what we have called comparative formal ontology. (pp. 640-643)

(...)

Comparative formal ontology, as our remarks have indicated throughout, is the proper domain of many issues and disputes in metaphysics, epistemology, and the methodology of the deductive sciences. Just as the construction of a particular formal ontology lends clarity and precision to our informal categorial analyses and serves as a guide to our intuitions, so too comparative formal ontology can be developed so as to provide clear and precise criteria by which to judge the adequacy of a particular system of formal ontology and by which we might be guided in our comparison and evaluation of different proposals for such systems. It is only by constructing and comparing different formal ontologies that we can make a rational decision about which such system we should ourselves ultimately adopt, and that is a decision that can be made only in comparative formal ontology. (p. 647)

Mathematical logic as formal ontology

"Gödel has remarked that mathematical logic "has two quite different aspects. On the one hand, it is a section of Mathematics treating of classes, relations, combinations of symbols, etc., instead of numbers, functions, geometric figures, etc. On the other hand, it is a science prior to all others, which contains the ideas and principles underlying all sciences" (1) In the former case, mathematical logic is principally, though not only, a *calculus ratiocinator*. Under that aspect, beyond consistency, no special heed need be paid a formal system regarding the philosophical significance of its grammatical forms and the viability of the primitive concepts and assumptions expressed by means of these forms. In the latter case, however, it is quite otherwise. As a science prior to all others, Gödel's description

of mathematical logic is comparable to Aristotle's description of metaphysics. Only, as a science which is prior to all others, metaphysics, according to Aristotle, is therefore the science of the "modes" or "categories of being". Where the particular, specialized sciences, including mathematics, are concerned with but their own special "modes of being", metaphysics and now mathematical logic under its second aspect — or what we might instead call formal ontology — is concerned with the study and development of alternative formalizations regarding the systematic co-ordination of all the "modes" or "categories of being" under the most general laws. Usually, and perhaps most appropriately since this is where ontological commitment comes in, each "mode of being" within a particular formal ontology is represented by a type of bindable variable whose syntactical role is intended to reflect in some philosophically coherent way the ontological role of that "mode of being". Under this second aspect, mathematical logic, or formal ontology, is concerned with the adequacy of formal systems as alternative formulations of the deepest structural maps of reality.(2)

Viewed in this way, each feature of a proposed formal system is to be evaluated in terms of its purported philosophical significance, how well, for example, it functions as a proposed metaphysical map of reality. Different metaphysical schools, of course, will be interested in different ways of understanding a formal system as a map of reality. Conceptualists, for example, would view the grammar of a formal system together with its logistic behaviour as a proposed formal map of the structuring powers of human cognition, a proposed map, that is, of the structure of constructive cognitive processes of the human mind. Operations of the system must then be devised with limitations built into them that reflect in an appropriate manner the limitations of these same constructive powers of the mind. It is much in this sort of way that the constructivist attitude in the philosophy of mathematics must be understood. Realists, on the other hand, would construe the operations and elements of the formal map as having ontological significance independently of the constructive power of the human mind. Limitations built into the system, whether they apply to the notion of grammatical well-formedness or to the logistic behaviour of the ontological grammar, are evaluated then on grounds other than the nature of thought and

its inherent limitations. Some of the most obvious of such grounds for limitation pertain to the way the implicit metaphysical scheme underlying the system proposes to resolve the known antinomies.

Leibniz, as Gödel has pointed out, was one of the first expositors of this view of mathematical logic. Leibniz himself referred to such a formal system as a *characteristica universalis*. But it was not until Frege and Peano that any significant attempt at the construction of a formal ontology was made. Frege called his system a *Begriffsschrift*, indicating, as Gödel remarks, that “Frege was chiefly interested in the analysis of thought”.(3) Frege himself in a response to Schroder's criticisms of his *Begriffsschrift* stated “that, unlike Boole's, his logic is not a *calculus ratiocinator*, or not merely a *calculus ratiocinator*, but a *lingua characteristica*.(4)

Now this Fregean emphasis on concepts (*Begriffe*) and the nature of thought is significant. For although it would seem, because of this emphasis, that Frege is a conceptualist and that therefore his logic would reflect certain limitations in the nature of human concept formation, it turns out that Fregean concepts are real, objective entities of a “mode of being” which is independent of minds and the subjective ideas by means of which minds think. To be sure, Fregean concepts are not self-subsistent entities, but their ontological dependence is upon the individual objects “falling under” them and not, apparently, upon the nature of thought. Their ontological dependence consists only in their being “unsaturated”. They are nevertheless “real” entities in so far as Frege takes quantification over them as having ontological significance.(5) In this regard, Frege's ontology is realistic, though somehow it is also an analysis of thought.(6)

I shall not try to account here for this apparent ambiguity in the Fregean enterprise. I mention it in part because it is an ambiguity which Russell apparently shared (or perhaps even inherited from Frege) in the construction of his own formal ontology, the ramified theory of types, and which he never himself adequately resolved. As a formal embodiment of the Russell-Poincaré “vicious circle principle”, the ramified theory of types purports to represent a limitation in the powers of human concept formation, specifically a limitation regarding impredicative concept formation. Adjoining the axiom of

reducibility to this formal ontology, however, can be justified only by taking a realistic attitude, an attitude which Russell clearly accepted in at least some of his writings.(7) The two attitudes taken together: the attitude, on the one hand, that the limitations imposed on both the ontological grammar and the logical constructions based upon that grammar are dictated by one's conceptualist views regarding at least the "higher-order" portion of one's ontology; and the attitude, on the other hand, that the reality represented by one's ontological grammar and the operations on that grammar is independent of mind and the nature of thought; these two attitudes though apparently not formally inconsistent, seem not to result in a philosophically coherent formal ontology. It is within this sort of context that I understand Myhill's concluding remark that "the ramified *Principia* itself falls uncomfortably between these two positions, and apparently does not correspond to any coherent philosophy of mathematics..." (p. 27).

Let us note that where Myhill speaks to the question of a coherent philosophy of mathematics, I have referred instead to the problem of a philosophically coherent formal ontology. The distinction is minor or not depending on how broad one's criteria are for the coherence of a philosophy of mathematics. Certainly, since the problem of the nature of mathematical existence is an ontological problem par excellence, every philosophically coherent formal ontology must contain a coherent philosophy of mathematics.(9) Tolerance forbids, I would suppose, maintaining the converse." (pp. 29-32)

(2) cf. G. Bergmann, "Ontological Alternatives", in E. D. Klemke (ed.), *Essays on Frege*, Urbana, Ill., 1968, p. 148: "Logic without ontology is merely a calculus. A calculus acquires philosophical import only if its author claims that it is an ideal language

(*Begriffsschrift*), i.e. that it perspicuously reflects an adequate ontology.“

(3) Gödel, *op. cit.*

(4) J. van Heijenoort, “Logic as Calculus and Logic as Language”, *Synthese* 17, 3 (1967), p. 324.

(5) Bergmann, *op. cit.*, p. 135, construes Frege’s concepts as syncategorematic entities, but his only reason for this seems to be their ontological dependence on objects. We shall here understand a primitive symbol of a formal ontology to be a syncategorematic sign —and the entity, if any, it represents to be a syncategorematic entity — if it is not a substituend for (and the entity is not “indicated” by) any type of variable in the grammar of the system.

(6) cf. R. Grossman, “Frege’s Ontology”, in Klemke (ed.), *Essays on Frege*, for a discussion of this issue in regard to Frege’s ontology.

(7) For example, in his *Introduction to Mathematical Philosophy*, he says that “logic is concerned with the real world just as truly as zoology, though with its more abstract and general features” (p. 169). We might note that the realism implicit in the reducibility axiom is one in regard to classes and not properties (or, in Russell’s terminology, propositional functions). Indeed, Russell first referred to the axiom as “the axiom of classes”. What is peculiar about this is that Russell took his formal ontology to be a “no class” ontology.

(8) Most proposals regarding the construction of a philosophically coherent formal ontology are programmatic and fragmentary and do not purport to constitute a completed metaphysical system. The importance of formally constructing such partial or fragmentary ontologies is not at issue here. Nor is it being suggested that a fragmentary ontology which defers the question of mathematical existence is for that reason incoherent. Of course, if such a fragmentary ontology cannot be extended so as to contain a coherent account of the nature of mathematical existence, especially vis-à-vis that of concrete or physical existence, then it does indeed represent a philosophically incoherent ontology, even if only fragmentarily. For this reason, metaphysical programmes should not long defer the question of containing a coherent philosophy of mathematics.

Predication theory and the Problem of Universals

"Predication theory has been a subject of philosophical concern since at least the writings of Plato and Aristotle. It is in its way the locus of a number of philosophical issues both in metaphysics and epistemology, not the least of which is the problem of universals. The latter problem, sometimes all too simply put as the question of whether there are universals or not, is especially germane to the notion of predication since a theory of universals is at least in part a semantic theory of predication; and it is just to such a theory that we must turn in any philosophical investigation of the notion of predication. In doing so, however, we need not assume the truth or superiority of any one theory of universals over another. Indeed, an appropriate preliminary to any such assumption might well consist of a comparative analysis of some of the different formal theories of predication that can be semantically associated with these different theories of universals: for just as the latter provide a semantics for the former, it is only through the logical syntax of a formal theory of predication that the logical structure of a theory of universals can be rendered perspicuous. That, in any case, is the principal methodological assumption for the approach to the problem of universals we shall undertake in the present monograph where we will be more concerned with the construction and comparison of the abstract logical systems that may be associated with different theories of universals than with the metaphysical or epistemological issues for which they were originally designed. It is our hope and expectation, however, that these comparative formal analyses will be instrumental toward any philosophical decision as to whether to adopt a given theory of universals or not."

1. The problem of the predicable nature of universals

The original use of the term 'universal' goes back to Aristotle according to whom a universal is that which can be predicated of things (*De Interpretatione* 17 a 39). We shall retain the core of this notion throughout this essay and assume that whatever else it may be a universal has a predicable nature and that it is this predicable nature which is what constitutes its universality. Nothing follows from that assumption, however, regarding whether a universal is (1)

merely a predicate expression (nominalism) of some language or other; (2) a concept (conceptualism) in the sense of a socio-biologically based cognitive ability or capacity to identify, collect or classify, and characterize or relate things in various ways; or (3) a real property or relation existing independently of both language and the natural capacity humans have for thought and representation (realism). We propose to take each of these interpretations or theories of universals seriously in what follows at least to the extent that we are able to associate each with a formal theory of predication. Our particular concern in this regard, moreover, will be with the explanation each provides of the predicable nature of universals, i.e., of that in which the universality of universals consists. Our discussion and comparison of nominalism, conceptualism and realism, accordingly, will not deal with the variety of arguments that have been given for or against each of them, but with how each as a theory of universals may be semantically associated with a formal theory of predication. Our assumption here, as indicated above, is that insofar as such an associated formal theory of predication provides a logically perspicuous medium for the articulation of the predicable nature of universals as understood by the theory of universals in question, then to that extent the formal theory may itself be identified with the explanation which that theory of universals provides of the predicable nature of universals. It is in the sense of this assumption, moreover, that we understand a philosophical theory of predication to be a formal theory of predication together with its semantically associated theory of universals. (pp. 11-12)

From: Nino Cocchiarella, *Logical Investigations of Predication Theory and the Problem of Universals*, Napoli: Bibliopolis 1986.

Theories of universal: A) Nominalism

“Traditionally, there have been three general types of approach to the problem of universals: nominalism, conceptualism, and realism, with nominalism being the most restrictive. Some forms of nominalism, more-over, are even more restrictive in this regard than others. We shall not concern ourselves with these variations here, however, but shall identify (generic) nominalism with three general semantical theses instead. The first general thesis of nominalism is that

universals have only a formal mode of existence, i.e., that beyond the predicate expressions that occur or can occur in language there are no universals. Predicate expressions, in other words, do not designate any universals beyond themselves; and therefore predicate expressions are the only entities according to nominalism that have a predicable nature. For this reason, we shall occasionally refer to predicate expressions as nominalistic universals.

We do not dispute here, it will be noted, that there are universals. That is, the problem of universals as we understand it here is not the problem whether there are universals; for indeed all theories of universals acknowledge that there are at least nominalistic universals, though some will assert that there are other universals as well. The problem of universals, as we have already said, is the problem of providing a philosophically coherent explanation of the predicable nature of universals, i.e., of that in which their universality consists. And in nominalism, this problem concerns the sense in which predicate expressions may be predicated of individuals.

The second general thesis of nominalism is the thesis of extensionality, i.e., the thesis that, semantically, predicate expressions may make no finer distinction of content than can be generated by co-extensive predicate expressions; and therefore the thesis that co-extensive predicate expressions are to be interchangeable *salva veritate* in any applied formal theory of predication suitable for nominalism. This means in particular that only an extensional logic is appropriate to nominalism, a corollary of which is anti-essentialism, i.e., the thesis that no nominalistic universal is necessarily true of some of the things of which it may be predicated without being necessarily true of all. It is sometimes claimed, we should note, that only the latter thesis, or a suitable reconstruction of it, is really necessary to nominalism and that in fact a nominalistic formal theory of predication may contain a modal, and therefore non-extensional, logic after all. We shall evaluate, and reject, this claim at a later section of this chapter. For now, however, we simply assume that nominalism requires the stronger thesis of extensionality.

The third general thesis of nominalism is that there are only individuals (in the logical sense), i.e., that quantificational reference is univocal and applies only to the individual things of which our various predicate expressions may be said to be either true or false. Whether, in addition, all and only concrete particulars are individuals, as has been maintained in more traditional variants of nominalism, we shall leave unspecified. Certainly some contemporary variants of nominalism, such as that of Quine's, include, e.g., sets as part of their ontology; and no doubt others may include other types of abstract individuals as well.

The third general thesis, it should be noted, does not follow from the first. E.g., one may consistently maintain that there are no universals other than predicate expressions but that the latter in their logico-grammatical role as predicate expressions are unsaturated linguistic structures; and therefore that there is a mode of quantificational reference, viz., that to possible predicate expressions, which is not a form of quantificational reference to individuals. Nevertheless, while it is consistent to maintain this, i.e., to affirm the first and deny the third general thesis of nominalism, we remain unsure that the result can be developed into a philosophically coherent theory of universals. (1) We, in any case, shall not attempt to associate such a combination with any formal theory of predication here. (2) As is well-known, the theory of predication which is commonly associated with nominalism today is standard first-order predicate logic (with identity). Indeed, standard articulation of the predicable nature of universals as understood by the theory of universals in question. Thus the association of nominalism with standard first-order predicate logic is intended not only as a validation of nominalism's three general semantical theses but also as an explanatory or clarifying thesis to the effect that the predicable nature of nominalistic universals, i.e., of possible predicate expressions, is the logico-grammatical role they are represented as having in the logical forms of standard first-order predicate logic (with identity).

We are in almost complete agreement with this association of nominalism with standard first-order predicate logic (with identity). Our one reservation concerns the fact that the latter, strictly speaking, occurs properly only as the logical component of applied first-order theories. That is, except for the possible use of dummy

schema predicate letters, first-order predicate logic cannot be described as a pure formal theory of predication. Dummy schema predicate letters can of course be transformed into predicate variables and quantifiers can be applied to these, resulting thereby in a pure second-order theory of predication. Typically, however, this move has been seen as a violation of nominalism's first general thesis in that it would appear to commit us to universals other than predicate expressions themselves. The move to a second-order logic, in other words, exceeds the limits of nominalism insofar as predicate quantifiers may be given a referential interpretation.

Fortunately, however, there is another interpretation of predicate quantifiers which does not transcend nominalism and the ontological framework of standard first-order predicate logic (with identity). This is the non-referential or so-called substitutional interpretation of predicate quantifiers whereby the significance of such a quantifier in the context of an applied first-order theory is exhausted by the totality of its substituends, i.e., predicate expressions in the form of the open propositional forms of that theory, rather than by a reference to either real or conceptual universals existing independently of the language of the theory and supplemental to its domain of discourse. By utilizing substitutionally interpreted predicate quantifiers, nominalism can of course be developed as a pure second-order theory of predication.

There will, however, be certain constraints which such an interpretation of predicate quantifiers imposes upon the specification of nominalistic universals; and these constraints are in fact precisely those involved first-order predicate logic is typically taken by nominalists precisely as we are recommending any formal theory of predication should be taken: viz., as a logically perspicuous medium for the in the comprehension principle of standard predicative second-order logic. In this regard we agree with the growing consensus that standard predicative second-order logic is an appropriate medium for the representation of a nominalist theory of predication. (3)" (pp. 29-32)

Notes

(1) Cf. the theory of universals represented by the logically perspicuous language described by Wilfrid Sellars in "Naming and

Saying”, «Philosophy of Science», vol. 29, 1962, pp. 7-26. We believe this is really a conceptualist, and not a nominalist, theory of predication, however, albeit it is a form of conceptualism which is very close to nominalism.

(2) Cf. Cocchiarella, N., "Logical Atomism, Nominalism, and Modal Logic”, «Synthese», vol. 31, 1975, pp. 23-62, where such an attempt is made, but with doubtful success, as is suggested in the article itself.

(3) Cf. "A Plea for Substitutional Quantification”, by Charles Parson, «Journal of Philosophy», vol. LXVIII, no. 8, 1971, pp. 231-237.

Theories of universal: B) Conceptualism vs. Nominalism

"As cognitive capacities which may or may not be exercised on a given occasion, concepts are neither mental images nor ideas in the sense of particular mental occurrences. Concepts, in other words, and predicable concepts in particular, do not have an individual nature but are rather unsaturated cognitive structures whose realization or saturation in thought is what informs particular mental acts with a predicable nature.

Conceptualism, accordingly, rejects the third general thesis of nominalism, i.e., the thesis that there are only individuals, and therefore the sense in which there are concepts is not a restricted form of the sense in which there are individuals. Quantificational reference is not a univocal semantical notion in conceptualism, in other words, but is rather (at least) doubly aspected, depending on whether the reference is through the logico-grammatical role of a subject expression, and is therefore to individuals (in the logical sense), or whether it is through the role of an (n - place) predicate expression, and is therefore to (n -ary) concepts. (We shall also speak of «-ary concepts as *relational concepts* if $n > 1$.)

Conceptualism, of course, also rejects the first general thesis of nominalism, i.e., the thesis that there are no universals other than predicate χ expressions. Indeed, according to conceptualism, a

genuine predicate expression is precisely such only through having a concept as the semantic ground for its correct or incorrect application. This is not to say, on the other hand, that the possession of a concept will not come to be behaviorally equivalent to the possession of a linguistic ability to correctly apply a predicate expression having that concept as its semantic ground. Nor is it to deny that the possession of such a linguistic ability will naturally come to serve as a criterion for possession of the concept. Nevertheless, all questions of behavioral equivalence aside, being a criterion for the possession of a concept, according to conceptualism, is not the same as being that concept.

Despite their distinctness, however, concepts and predicate expressions do have analogous roles in their respective mediums, and to some ^ extent the development of concepts in the medium of thought is determined by the development of predicate expressions in the medium of language — just as the development of language is determined in part by the development of thought. In holistic conceptualism especially, as we shall see, impredicative concept-formation is a generalized capacity which is achieved only through the capacity for language, and in particular through the capacity to systematically use language for the expression of constructive or predicative concepts. In this regard, impredicative concept-formation is a mediated process, and language and the linguistic ability to use predicate expressions to express predicative concepts is the means used to master and direct such a process. Aside from this meditation, however, the laws of compositionality for systematic concept-formation in holistic conceptualism, and in particular the impredicative comprehension principle (CP) for predicable concepts, greatly exceed the principle of compositionality in nominalism, viz., the comprehension principle (CP!). In this regard, in other words, there can be no question of reducing or otherwise explaining only in terms of nominalistic universals the formal theory of predication we shall come to associate with holistic conceptualism. The prospects are better, no doubt, for a reduction of constructive conceptualism to nominalism; and indeed, in a sense, the formal theory of predication we shall associate with constructive conceptualism is contained in the formal theory determined by nominalism, viz., standard predicative second-order logic.

Nevertheless, whereas it is predicativity in the purely grammatical sense which is the basis of nominalism's formal theory of predication, it is predicativity in the logico-grammatical sense which is the basis of constructive conceptualism's formal theory of predication; for, as we shall see (in §2), it is only in this sense that we are to understand the closure conditions of the comprehension principle (CCP!) of constructive conceptualism's formal theory of predication. Unlike the situation in nominalism, in other words, where wffs that are predicative in the purely grammatical sense are ipso facto predicative in the logico-grammatical sense, in constructive conceptualism not all wffs (of an applied context) that are predicative in nominalism's purely grammatical sense need also be predicative in the logico-grammatical sense.

One of the consequences of this difference, as we shall see (in §3), is a corresponding difference in the notion of a possible {explicit} definition of a predicate constant. For whereas predicate constants are the paradigms of predicative expressions in nominalism, in constructive conceptualism not all predicate constants of an applied context need themselves be predicative, i.e., they need not all stand in that context for the value of a bound predicate variable. Thus, unlike the situation in nominalism, predicate constants can be definitionally introduced in an applied context of constructive conceptualism with definiens that are impredicative in either or both the purely grammatical and the logico-grammatical sense. That is, whereas such definitions can be proved to be both non-creative and eliminable in constructive conceptualism, they will be both creative and non-eliminable in nominalism, i.e., in standard predicative second-order logic.

These are not trivial or unimportant differences, needless to say, and they indicate the radically different philosophical perspectives involved in a conceptualist as opposed to a nominalist theory of predication. Differences not mentioned here, such as the reducibility or irreducibility of identity in an applied context (cf. §4), and the typical rejection of nominalism's second general thesis, i.e., the thesis of extensionality, only add to the picture of the important philosophical differences between nominalism and conceptualism. Their only point of real similarity in fact is their common denial — or commitment to denial — of there being anything at all like the so-

called logical modalities, since the same argument that proves the essential incompleteness of first-order modal logic described in Chapter I also proves the essential incompleteness of any higher order framework such as those we shall consider here (cf. §9)." (pp. 71-73)

From: Nino Cocchiarella, "*Logical Investigations of Predication Theory and the Problem of Universals*, Napoli: Bibliopolis 1986.

Theories of universal: C) Realism

“Realism, like conceptualism, goes beyond nominalism in positing the existence of universals other than predicate expressions. Unlike conceptualism, however, the existence of a real universal does not depend upon the existence of the intellect. That is, real universals exist independently of both language and the natural capacity humans have for thought and representation. In keeping with tradition, we shall refer to real universals as properties and relations.

Now the sense in which properties and relations are said to exist is not the same in all forms of realism. We assume, however, that despite their differences all forms of realism fall under two general and exclusive types which we shall call natural and logical realism, respectively. We agree of course that the differences between two variants of a given type may affect the sense in which each claims that there are real universals; but we maintain nevertheless that there is a common core of agreement between these variants which distinguishes them in a radical way from all variants of the other type. It is this agreement and distinction, respectively, which is the basis for our classification of realism into what we will call natural and logical realism.

In all variants of natural realism, for example, properties and relations are said to exist only within nature and that in particular they are integral components of the causal structure of the world. Such universals may exist independently of what is not determined by the causal structure of the world, and in that sense they may be said to exist independently of the world itself (considered as a whole); but, on the other hand, they cannot also exist independently of the causal structure of the world, and in that regard they cannot exist independently of all causal alternatives to the actual world

where the same laws of nature hold as hold in the actual world. Traditionally, these universals have been called material properties and relations; but this did not always mean that they were the properties and relations posited in one or another form of materialism — and in particular it did not mean that the only universals in question are physical properties and relations, i.e., the fundamental properties and relations posited in physics. The terminology rather harks back to a distinction between concepts which were said to have a material as opposed to a merely formal significance (as constructions of the intellect), which is only to say that it is a distinction between concepts to which such real universals correspond as opposed to those to which no such real universals correspond. We shall not adopt this terminology here ourselves however, since we wish not to suggest, even inadvertently, that natural realism is committed to one or another form of materialism. Materialism, to be sure, is committed to one or another variant of natural realism (to the extent that it admits properties and relations at all); but not all variants of natural realism, it must be emphasized, need be committed to materialism. What is assumed in natural realism as a general type is only that somehow nature contains within its causal matrix all the properties and relations there are, regardless of whether these properties and relations are those only of physics, or also of chemistry, or also of biology, or also of any other natural science whatsoever.

Now all variants of logical realism, it should be noted, take a completely opposite stand on this issue. That is, all variants of logical realism maintain that real properties and relations exist independently not only of what is not determined by the causal structure of the world but also of that causal structure itself — and, indeed, even of whether there is a world at all! Logically real universals, in other words, exist independently of all forms of concrete existence and the causal grounds for such. They do not exist independently of one another, to be sure, but that dependence obtains only in a timeless, transcendent realm of being which, according to all variants of logical realism, is in fact the semantico-ontological ground for the logical truths we express in thought and language — and it is for this reason, needless to say, that we refer to such a theory of universals as a variant of logical realism. Thus,

unlike the situation in natural realism, it is assumed in all variants of logical realism that there is a real universal corresponding to every fully applied wff $\varphi(x_1, \dots, x_n)$, including those which are logically determinate, i.e., those which are logically true or logically false of any individuals whatsoever.

Traditionally, because of their independent and transcendent mode of being, logically real universals have been called Platonic forms. However, because Platonism in general also assumes that universals are individuals, we shall avoid that label here, since there are also variants of logical realism (e.g. Gottlob Frege's) in which properties and relations are assumed to have only a predicable and not also an individual nature; i.e., variants in which logically real universals are in some sense only unsaturated structures.

It is not clear, incidentally, that natural realism can also allow for variants in which natural properties and relations have an individual as well as a predicable nature. In modal natural realism, for example, we argue that natural properties and relations can only be causally determinate unsaturated structures (the saturation of which results in the facts or states of affairs that obtain in the world). We believe a similar argument can be given with respect to the actual world alone, i.e., independently of modal considerations, if it is allowed that the same natural property or relation need have no instantiations at all during an interval of time between two or more of its instantiations. This argument, however, depends on temporal considerations (where moments, of time play the role of possible worlds) which we shall not go into here (since it requires a formulation of relativity theory as well); and for this reason we shall leave open the question whether all variants of natural realism are committed to natural properties and relations being only causally determinate unsaturated structures; i.e., whether in some variants of natural realism natural properties and relations have an individual as well as a predicable nature.

Finally, it should be noted that there are variants of both natural and logical realism which are committed to the thesis of extensionality as well as those which are committed to its denial and which we shall refer to here as modal natural and modal logical realism, respectively." (pp. 105-107)

1. Cocchiarella, Nino. 1966. *Tense Logic: A Study of Temporal Reference*.

Unpublished Ph.D. Dissertation, available at ProQuest Dissertation, reference number 6609326.

University of California - Los Angeles, January 7, 1966).
Committee in charge: Richard Montague, Charmain, Alfred Horn, Donald Kalish, Abraham Robinson, Robert Stockwell (VI, 251 pages).

N.B. *the unpublished Ph. D. thesis can be ordered to ProQuest Dissertation Express.*

Abstract: "This work is concerned with the logical analysis of topological or non-metrical temporal reference. The specific problem with which it successfully deals is a precise formalization of (first-order) quantificational tense logic wherein both an appropriate formal semantics is developed and a meta-mathematically consistent and complete axiomatization for that semantics given.

The formalization of quantificational tense logic herein presented adheres to all the canons of logical rigor by being carried out entirely as a definitional extension of (Zermelo-Fraenkel) set theory. Model-theoretical techniques are utilized in the semantics given and the notion of a history is formally developed as the tense-logical analogue of the notion of a model for standard first-order logic with identity. Corresponding to

the key semantical concept of satisfaction (and consequently of truth) in a model, by means of which the central standard notion of logical truth is defined, the notion of satisfaction (and consequently of truth) in a history at a given moment of that history is developed, from which development, in turn, the central notion of tense-logical truth is defined. An axiomatic characterization of derivability within tense logic, or t-derivability, is then presented and proved to be both consistent and complete, i.e., it is shown that an arbitrary tensed formula is tense-logically true if and only if it is t-derivable from zero premises, i.e., if and only if it is a theorem of the given axiomatic system.

Quantification within tense logic introduces issues in no manner confronted on the sentential level. Recognition is made that quantification over objects existing prior to the time of assertion is to be distinguished from quantification over objects existing at the time of assertion, both of which in turn are to be distinguished from quantifying over objects existing at the time of assertion. Such distinct kinds of quantification are readily distinguishable within tense logic by means of incorporation of what is here called the logic of actual and possible objects. Precise semantical and syntactical formalization of this double quantification is presented prior to its use within tense logic, and completeness theorems are given for both the full system, and the restricted logic of actual objects, the latter of which may separately be taken as a formalization of a logic which can accommodate denotationless names. These several kinds of quantificational logic lead to separate completeness theorems stated and established for tense logic, depending on the several kinds of quantificational bases possible for this logic."

Table of Contents: Preface 9; Introduction 11; Chapter 1. Nominalism 29; Chapter 2. Conceptualism 65; Chapter 3.

Realism 105; Chapter 4. On The Logic of Nominalized Predicates and Its Philosophical Interpretations 165; Chapter 5. Complex Predicates and The Lambda - Operator 215; Chapter 6. Two Fregean Semantics For Nominalized Complex Predicates 243-265.

"Beginning with Aristotle's notion of a universal as that which can be predicated of things, I provide in this monograph separate logical analyses of what nominalism, conceptualism and realism take to be the predicable nature of universals. My position throughout is that such an analysis proceeds through the construction of a formal theory of predication on the one hand and a logical semantics on the other. I adopt and apply in this regard the formal and semantical techniques of my former teachers Rudolf Carnap and Richard Montague.

One important way in which I differ from Carnap and Montague, however, is in our respective analyses of so-called "higher order" sentences - that is, sentences in which nominalized predicates, whether simple or complex, occur as the logico-grammatical subjects of other predicates. In this regard, whereas Carnap and Montague formulate and adopt one or another version of a theory of simple logical types as the framework within which to analyze such sentences, I formulate instead, relative to nominalism, conceptualism and realism, systems which do not require any grammatical type distinctions beyond those already found in standard second order predicate logic. All of the theories of predication formulated in this monograph, in other words, are second order theories, including those which contain a logic of nominalized predicates. Russell's paradox of predication, it turns out, can be resolved without resorting to a theory of types." (From the *Preface* p. 9)

4. ——. 1987. *Logical Studies in Early Analytic Philosophy*. Columbus: Ohio University Press.

Table of Contents: Preface XI-XII; Introduction 1; Chapter 1. The Development of the Theory of Logical Types and the Notion of a Logical Subject in Russell's Early Philosophy 19; Chapter 2. Frege, Russell, and Logicism: A Logical

Reconstruction 64; Chapter 3. Meinong Reconstructed versus Early Russell Reconstructed 119; Chapter 4. Frege's Double Correlation Thesis and Quine's Set Theories NF and ML 152; Chapter 5. Russell's Theory of Logical Types and the Atomistic Hierarchy of Sentences 193; Chapter 6. Logical Atomism and Modal Logic 222; Chapter 7. Logical Atomism, Nominalism, and Modal Logic 244; Index 285-293.

"The Essays collected here deal with the development of analytic philosophy in the first quarter of the twentieth century. In addition to providing a historical account of early analytic philosophy, these Essays also contain logical reconstructions of Frege's, Russell's, Meinong's, and Wittgenstein's views during the period in question. Several of these reconstructions can and have been used in the new logico-linguistic developments in pragmatics and intensional logic that make up the vanguard of contemporary analytic philosophy. Others, such as the interpretation of the logical modalities in logical atomism, or the determination of the objects of fiction and dreams in Meinong's theory of objects or Russell's early logic, provide a useful introduction, if not also a solution, to a number of problems confronting analytic philosophy today. Indeed, for that matter, all of the Essays collected here provide a useful propaedeutic to much of the research now going on in the study of logic and language.

A number of small changes have been made in all of the Essays reprinted here, mainly for stylistic purposes. Their histories are briefly indicated as follows. Chapter 1 first appeared in *Synthese*, vol. 45, no. 1 (September 1980):71–115, Copyright © 1980 by D. Reidel Publishing Company, Dordrecht, Holland. A somewhat longer version of chapter 2 first appeared in *Frege Synthesized*, L. Haaparanta and J. Hintikka (eds.), 1986, pp. 197-252, Copyright © 1986 by D. Reidel Publishing Company, Dordrecht, Holland. The present version was given as a lecture in a seminar on 13 March 1985, for the Bertrand Russell Editorial Project at McMaster University. Chapters 3 and 4 first appeared in *Journal of Philosophical Logic*, vol. 11, no. 2 (May, 1982): 183-214, and vol. 14, no. 1 (February 1985): 1-39, respectively, Copyright © 1982 by D. Reidei Publishing

- Company, Dordrecht, Holland. Chapter 3 was originally given as a lecture to the Société Belge de Logique et de Philosophie des Sciences, Brussels, in December 1981. Chapter 4 was my contribution to An Interdisciplinary Conference on Logic, Truth and Type Theory, given in memory of Alfred Tarski, 6-7 April 1984. Chapter 5 first appeared in *Essays in Bertrand Russell's Philosophy*, C. Wade Savage and C. Anthony Anderson (eds.), 1987, Copyright © by University of Minnesota Press, Minneapolis. Chapter 6 first appeared in *Philosophia, Philosophical Quarterly of Israel*, vol. 4, no. 1 (January 1974):41-66. It is reprinted here with the permission of the editor. Chapter 6 was given as a lecture to the Victoria Conference on Formal Ontology at the University of Victoria on 15 October 1972. Chapter 7 first appeared in *Synthese*, vol. 31, no. 1 (June 1975):23-62, Copyright © 1975 by D. Reidel Publishing Company, Dordrecht, Holland. It was originally given as a lecture to the University of North Carolina Fall Philosophy Colloquium in October 1973." (*Preface*, pp. XI-XII)

8. Medieval logic and conceptual realism 169; 9. On Geach against general reference 195; 10. Leśniewski's Ontology 215; 11. Plurals and the logic of classes as many 235; 12. The logic of natural kinds 273; Afterword on Truth-Makers 295; Bibliography 297; Index 307-316.

"The history of philosophy is replete with different metaphysical schemes of the ontological structure of the world.

These schemes have generally been described in informal, intuitive terms, and the arguments for and against them, including their consistency and adequacy as explanatory frameworks, have generally been given in even more informal terms. The goal of formal ontology is to correct for these deficiencies. By formally reconstructing an intuitive, informal ontological scheme as a formal ontology we can better determine the consistency and adequacy of that scheme; and then by comparing different reconstructed schemes with one another as formal ontologies we can better evaluate the arguments for and against them, and come to a decision as to which system it is best to adopt.

This book is divided into two parts. The first part is on formal ontology and how different informal ontological systems can be formally developed and compared with one another. An abstract set-theoretic framework, which we call comparative formal ontology, can be used for this purpose without assuming that set theory is itself a superseding ontological system. The second part of this book is on the formal construction and defense of a particular ontological scheme called conceptual realism. Conceptual realism is to be preferred to alternative formal ontologies for the reasons briefly described below, and for others as well that are given in more detail in various parts of the book. Conceptual realism, in other words, is put forward here as the best ontological system to adopt." (From the *Introduction*, p. XIII)

6. Cocchiarella, Nino, and Freund, Max A. 2008. *Modal Logic. An Introduction to its Syntax and Semantics*. New York: Oxford University Press.

Table of Contents: 1. Introduction 1; 2. The syntax of modal sentential calculi 15; 3. Matrix semantics 45; 4. Semantics for logical necessity 61; 5. Semantics for S 5 71; 6. Relational world systems 81; 7. Quantified modal logic 119; 8. The semantics of quantified modal logic 153; 9. Second-order modal logic 183; 10. Semantics of second-order modal logic 215; Afterword 253; Bibliography 257; Index 263-268.

"Modal logic is a theoretical field that is important not only in philosophy, where logic in general is commonly studied, but in mathematics, linguistics, and computer and information sciences as well. This book will be useful for students, researchers, and professionals in all of these and related disciplines. The only requirement is some familiarity with first-order logic and elementary set-theory.

The main outline of this book is a development of the logical syntax and semantics of modal logic in three stages of increasing logical complexity. The first stage is a comprehensive development of sentential modal logic, which is followed by a similarly comprehensive development of first-order modal predicate logic. The final stage is a development of second-order modal predicate logic. These stages are introduced gradually, with increasing difficulty at each stage. Most of the important results in modal logic are described and proved in each of their respective stages.

This book is based on a series of lectures given over a number of years at Indiana University by the first author. A draft of the book has also been used by the second author in Costa Rica and Mexico. The book is organized as follows.

We begin in chapter 1 with concatenation theory and the logistic method. By means of this theory and method we describe the construction of expressions, formal languages, and formal systems or calculi. Different modal calculi are then constructed in chapter 2. These cover all of the well-known systems, S1–S5, of Lewis and Langford's 1932 classic *Symbolic Logic*. As already indicated, these systems are constructed first on the level of sentential (or propositional) logic and then later in chapter 7 on the level of first-order predicate logic, where we distinguish the quantified modal logic of actualism from that of possibilism.

The systems are then extended yet again to the level of second-order modal predicate logic in chapter 9, where the notion of existence that is central to the actualism-possibilism distinction is given a deeper and finer-grained analysis in terms of

existence-entailing concepts, as opposed to concepts that do not entail existence." (From the *Introduction*, p. 1)

To appear in *Synthese*.

"Arthur N. Prior, in the Preface of *Past, Present and Future*, made clear his indebtedness to "the very lively tense-logicians of California for many discussions". Strangely, with a notable exception of Copeland (*Logic and reality: Essays on the legacy of Arthur Prior*, 1996), there is no extensive discussion of these scholars (as a group, if not a school) in the literature on the

history of tense logic. In this paper, I propose to study how Nino B. Cocchiarella, as one of the Californian tense-logicians, interacted with Prior in the late 1960s. By gathering clues from their correspondence available at Virtual Lab for Prior Studies, I will highlight some of the differences between their views on tense-logic, which might still have far-reaching philosophical implications. I will conclude with a sketch of how to study in what ways Prior and Cocchiarella influenced some other Californian tense-logicians."

"This article is a critical review of Cocchiarella's theory of reference. In conceptual realism, there are two central distinctions regarding reference: first, between active and deactivated use of referential expressions, and, second, between using referential expressions with and without existential presupposition. Cocchiarella's normative restrictions on the existential presuppositions of reference lead to postulating two fundamentally different kinds of objects in conceptual realism: realia or concrete objects, on the one hand, and abstract intensional objects or nonexistents, on the other. According to Cocchiarella, nonexistents can be referred to only without existential presuppositions. However, referring to nonexistents with existential presuppositions is an ordinary human practice. To account for this fact, Cocchiarella's normative theory of

reference should be supplemented by a descriptive account of referring."

Annotated bibliography of Nino Cocchiarella 1966-1977

Essays 1966-1977

1. Cocchiarella, Nino. 1966. "A Logic of Actual and Possible Objects." *Journal of Symbolic Logic* no. 31:688.

See note in 1966c.

2. ———. 1966. "A Completeness Theorem for Tense Logic." *Journal of Symbolic Logic* no. 31:689.

See note in 1966c.

3. ———. 1966. "Modality within Tense Logic." *Journal of Symbolic Logic* no. 31:690.

Note to the reprint of these three items in Karel Lambert (ed.) *Philosophical Applications of Free Logic*, New York: Oxford University Press 1991): " The abstracts are summaries of lectures given at the December, 1965 meetings of the Association for Symbolic Logic.

(A preliminary version of those lectures was given at UCLA in 1963, and a final version was given at UCLA in the spring of 1965 at a public lecture constituting the defense of my doctoral dissertation.)"

4. ———. 1968. "Some Remarks on Second Order Logic with Existence Attributes." *Noûs* no. 2:163-175.

"In *Past, Present and Future* A. N. Prior has suggested an approach towards the concept of existence where, following medieval logicians, we are to distinguish "between predicates (like 'is red', 'is hard', etc.) which entail existence, and

predicates (like 'is thought to be red, 'is thought of', etc.) which do not" (p. 161). Let us refer to attributes (including relational attributes) which are designated by the former kind of predicate as existence attributes, or for brevity, e-attributes. It is suggested then that "x exists" is to be defined as "there is some e-attribute which x possesses". A formalization of this (at least) second order logic of existence was recently brought about and reported on by the present author in [6]. The formalization was shown to be complete in the sense corresponding to the completeness of standard second order logic, i.e. in the sense which encompasses normal, non-standard as well standard models. (Cfr. A. Church, *Introduction to Mathematical Logic* (1956) - § 54). I should like in the present paper to discuss some of the philosophical issues involved in this formalization as well as some issues concerning the general notion of e-attribute." (p. 163)

5. ———. 1969. "A Substitution Free Axiom Set for Second Order Logic." *Notre Dame Journal of Formal Logic* no. 10:18-30.

"In what follows we present an adequate formulation of second order logic by means of an axiom set whose characterization does not require the notion of proper substitution either of a term for an individual variable or of a formula for a predicate variable. The axiom set is adequate in the sense of being equivalent to standard formulations of second order logic, e.g., that of Church [1]. It is clear and need not be shown here that every theorem of the present formulation is a theorem of the formulation given by Church. It of course will be shown here, however, that each of Church's axioms are theorems of the present system and that each of his primitive inference rules is either a primitive (and only modus ponens is taken as a primitive rule here) or a derived rule of the present system.

The importance of obtaining an axiomatic formulation such as herein described lies partly in the significance of reducing any axiom set to an equivalent one which involves fewer metalogical notions, especially such a one as proper substitution. However, of somewhat greater importance, it is highly desirable that we possess a formulation of both first and second order logic which can be extended without qualification

to such areas as tense, epistemic, deontic, modal and logics of the like. Now proper substitution especially has been the main obstacle to such unqualified extensions of standard logic, and we take it to be of no little significance that at least for first order logic (with identity) a substitution free axiomatic formulation has been provided. (1) The present system extends this earlier result to the level of second order logic. (2)

A second difficulty in unqualified extensions of standard logic concerns the form which Leibniz' law, i.e., the law regarding interchangeability salva veritate, is to take. Generally, in the extensions of standard logic to modal logic, this law has been formulated in an unqualified form applicable to all contexts, thereby lending credence to the questionable view that only "intensions" or the like can serve adequately as values of the variables for such systems. In the substitution free formulations of first order logic cited, however, Leibniz' law is axiomatically formulated only for atomic contexts, and the qualified form or forms the law takes for contexts involving non-standard formula operators is given in the statement of metatheorems. (3) But again, it is a far different matter having such qualifications stipulated in the form of metatheorems as opposed to having them built directly into the characterization of the logical axioms. As we have said, it is desirable that the standard logical axioms for either first or second order logic be so that axiomatic extensions of standard logic can be made without qualification.⁴ This desirable feature of the substitution free formulations of first order logic mentioned is retained in our present second order system." (pp. 18-19)

(1) Such a formulation is given by A. Tarski in [2] and developed by D. Kalish and R. Montague in [3]. The present author in [4] and [5] has also formulated a substitution free axiomatization of first order logic without "existential presuppositions."

(2) Of course, when extending either first or second order logic to tense, epistemic, deontic, or modal logic, qualifications in metatheorems regarding principles of proper substitution will be required. Nevertheless, it is a far different matter having

such qualifications stipulated in the form of metatheorems than it is having them built directly into the characterization of the logical axioms themselves.

(3) cf. [4], lemma 4.27 (p. 108) and the discussion on page 106. The objections against an unqualified, general version of Leibniz' principle (or interchangeability *salva veritate*) are applicable when certain special 'Opaque' contexts are involved, be they modal or otherwise. But all such contexts are—or should be when properly formalized—other than atomic, their "opacity" being generated within the scope of special formula operators. Atomic formulas, because they are atomic, will contain no occurrences of such operators and consequently will uphold par excellence the Leibnizian principle unqualifiedly."

"A. N. Prior in [9] has suggested an approach towards a second order logic of existence where, following medieval logicians, we distinguish "between predicates (like 'is red', 'is hard', etc.) which entail existence, and predicates (like 'is thought to be red', 'is thought of', etc.) which do not." (2) Let us refer to attributes (including relational attributes) which are designated by the former kind of predicate as existence attributes, or for brevity, e-attributes. It is suggested then that '*x exists' be

defined as 'there is some e-attribute which x possesses'. In what follows, this approach regarding the concept of existence is formalized semantically as well as syntactically, and a completeness theorem is established corresponding to the completeness (in a secondary sense, i.e., as including normal, nonstandard models) of standard second order logic (as formulated, for example, in Church [1])."

[For a more philosophical discussion of the present system, especially of the substitution free form of its axiom set, cf. *Some Remarks on Second Order Logic with Existence Attributes*].

"Recently, in [5], I formulated a second order logic of existence which centered around the distinction between those attributes that entail existence and those that do not. (1) The distinction provides

an especially apt explication of the concept of existence and is for this reason especially pertinent to pragmatics and intensional logic, encompassing as they do such areas as tense, epistemic, deontic and modal logic.(2) For example, apropos of tense logic some attributes, such as being red, being round, being hard, etc., cannot be possessed at a time except by objects existing at that time. Other attributes, especially relational attributes between objects whose "lifespans" need not overlap, such as being an ancestor of everyone (someone) now existing, being remembered by someone now existing, (3) etc., may very well be possessed by objects which no longer exist; others, e.g., being a future descendant of everyone (someone) now existing,

may be possessed by objects which have yet to exist. Still other attributes such as being believed to be a flying horse may be possessed by objects which never exist. Those attributes which entail existence (at the time of their possession) I shall call existence attributes, or for brevity, e-attributes. By a relational e-attribute I mean an attribute which entails existence with respect to each of its argument places.

In the present paper I shall discuss some of the motivation for distinguishing e-attributes from attributes in general. As indicated, this motivation depends essentially on the desire to use logistic systems in which we are allowed to recognize modes of being other than that of actual existence, e.g., such modes in tense logic as past and future existence, or, in the logic of belief, the mode of "intentional inexistence". As also indicated, the concept of existence is central to this discussion and I shall here examine informally its explication in terms of e-attributes. In a sequel to the present paper I shall present and discuss a formal analysis of this explication in the context of a semantics for standard second order logic, with quantification over e-attributes distinguished from quantification over attributes in general. The focal point of the formal discussion will be the issue of the logical priority of the notion of e-attribution over that of being an existing object, a priority which exemplifies that of the intensional over the extensional and which, for its clarification, requires some observations on the class-attribute distinction." (pp. 33-34)

(1) For a more philosophical discussion of the axiom set for this formalization, see [4]. I follow Carnap [1], p. 5, in using attribute' to comprehend both properties and relations (intension). Properties are 1-place or unary attributes and are designated by 1-place predicate expressions. Extending Carnap's terminology, propositions are understood to be designated by 0-place predicate expressions and are therefore construed as 0-place attributes (whose extensions are truth-values).

(2) Cf. R. M. Montague [9] and [10] for an elegant and philosophically stimulating formulation of pragmatics and

intensional logic. Montague's formulation of intensional logic, supplemented by the distinction between existence entailing and other kinds of attributes, is perhaps the most appropriate general logical framework to which the discussion and observations of the present paper lead.

(3) This example is given by R. M. Montague in [9] and [10].

"In what follows we present a second order formulation of S5 which is shown to be complete relative to a secondary sense of validity corresponding to that relative to which standard second order logic is known to be complete.(1) In our semantical metalanguage we consider various indexed sets of possible worlds and allow that not all objects existing in one indexed world need exist in another. However, as we have therefore confessed in the metalanguage our ontological commitment to all the objects that exist in one world or another, we acknowledge and formalize this confession in our object languages through allowing for quantification over *possibilia*.

Our means for distinguishing the existent from the mere possible is through a distinction between those attributes that entail existence (with respect to each of their argument places), referred to hereafter as e-attributes, and those attributes that do not.² Accordingly, we understand 'x exists' to mean 'There is some e-attribute which x possesses', thus rendering existence essentially impredicative. An alternative and equivalent route—but which we shall not follow here—is possible through taking existence as primitive in the form of quantification over existing objects and defining e-attributes as those attributes which necessarily are possessed only by existing objects." (p. 81)

"Russell's supposed paradox of predication has occasionally been cited as a source for lessons in ontology. So, for example, Grossmann in [6] has argued that one of the lessons of Russell's

paradox is that there are no complex properties. A recent re-evaluation of the supposed paradox, however, has led me to the conclusion that there is no paradox (cf. [3]). And of course where there is no paradox, there are no lessons of paradox.

There may, however, be lessons of non-paradox, especially if instead of contradiction what results is a highly instructive ontological oddity. In what follows I shall briefly review the considerations that led me to conclude that there is no paradox but instead only this ontological oddity with instructive lessons of its own, relative of course to the ontological framework within which it occurs. I shall then briefly consider several ways of responding to this oddity, where each response presupposes an alternative ontological framework relative to which the response accounts for the oddity by either showing it to rest on an ontological error, as with Grossmann's response, or by mitigating its effect through what purports to be a deeper or wider framework than the original one in which the oddity occurs." (p. 165)

Contributions to a seminar on ontology held under the auspices of the New York University Institute of Philosophy for the year 1970-1971.

"Russell's paradox has two forms or versions, one in regard to the class of all classes that are not members of themselves, the other in regard to "the predicate: to be a predicate that cannot be predicated of itself."(1) The first version is formulable in the ideography of Frege's *Grundgesetze der Arithmetik* and shows

this system to be inconsistent. The second version, however, is not formulable in this ideography, as Frege himself pointed out in his reply to Russell. (2) Nevertheless, it is essentially the second version of his paradox that leads Russell to avoid it (and others of its ilk) through his theory of types.

The first version is of course the relevant version with respect to any formulation of the theory of types in which membership in a class is the fundamental notion, that is, a formulation utilizing ' ε ' as a primitive binary predicate constant.(3) However, Russell's theory of types (even ignoring its ramification) is essentially concerned with the notion of predication, and only indirectly through the (philosophically questionable) interpretation of predication as the membership relation is the first version of his paradox relevant to this formulation.

Apparently, Russell saw his paradox as generating an aporetic situation in regard to two fundamental "notions," namely, the notion of membership (in a class) and the notion of predication (of an attribute).(4) In regard to the notion of membership, the application of Russell's paradox is not here brought into question. However, in regard to the notion of predication, the applicability of the reasoning grounding Russell's paradox will here be very much brought into question. Indeed, I shall claim that in this case the paradox fails.(5)" (pp. 133-135)

(2) "Letter to Russell," *ibid.*, p. 128.

(3) Cf. [5], p. 140 for a specific formulation of this kind of type theory.

(4) Gödel (cf. [6], p. 131f.) distinguishes these two forms of Russell's paradox by referring to them as the "extensional" and the "intensional" forms, respectively. For the purposes of the present paper, this distinction is preferable to Ramsey's different but better known distinction between "logical" and "semantical" paradoxes.

(5) With this failure of course goes a primary if not sole motivation for the simple theory of ontological types of third and higher order. The ontological scheme of second-order logic remains unaffected, having as it does a natural motivation of its own. Ramification also has its own motivation, and it may be appended to second-order logic (cf. [2], §58.) even though historically it was first appended to the simple theory of types.

"T*" is a logistic system¹ designed to represent the original ontological context behind Russell's paradox of predication. It encompasses standard second order logic, hereafter referred to as T, but goes beyond it by allowing predicate variables to occupy subject positions in its formulas.

Because of a violation of the restrictions imposed for the proper substitution of a formula for a predicate variable, Russell's argument fails in T*. Indeed, not only is T* consistent but it is also a conservative extension of T.

It has been suggested that one way of understanding this result is to construe occurrences of predicates in subject positions as referring, not to the properties which occurrences of the same predicates in predicate positions designate, but instead, to individual objects associated with these properties.⁴ Such a suggestion of course is reminiscent of Frege's ontology. And were it not that Frege is quite insistent in viewing predicates as

"unsaturated" expressions and therefore not qualified as substituends for subject positions which can be occupied only by "saturated" expressions, it might be tempting to construe T^* as representative of Frege's ontology. Be that as it may, the disproof of the principle that indiscernible properties are co-extensive, which is all that Russell's paradox comes to in T^* , is reinterpreted according to this suggestion so as to show merely a variant of Cantor's theorem. And that after all is rather appropriate, since Russell's argument for his supposed paradox is really but a variant of Cantor's argument for his theorem.

In what follows we formulate the suggestion semantically and show that although the semantics thus provided does not characterize T^* , it does characterize a certain rather interesting subsystem T^{**} of T^* supplemented by the extensionality principle that co-extensive properties are indiscernible.⁽⁵⁾ The supplemented system, $T^{**} + (\text{Ext}^*)$, no doubt appears bizarre from the point of view of the original ontological background represented by T^* —since in this ontology not all indiscernible properties are co-extensive whereas, according to the supplement, all co-extensive properties are indiscernible, thus suggesting co-extensiveness to be a stronger connection between properties than is the indiscernibility relation.

On the other hand, from the point of view of its quasi-Fregean semantics, the supplement seems rather natural—for according to this semantics the supplement amounts to the stipulation that the same individual object is to be associated with co-extensive properties. Fregean naturalness aside, it should perhaps be noted that the existence of a model-set-theoretic semantics characteristic for T^* —or of T^* supplemented with principles natural to the ontology of T^* —remains yet an open problem." (pp. 552-553)

(2) Cf. [2], §6.

(3) Ibid., §5. We should avoid using 'identical' in place of 'indiscernible' here. In [3], Meyer has shown that according to T^* there exists no relation which satisfies full substitutivity, and, accordingly, insofar as full substitutivity is taken to be a

necessary feature of identity, there is and can be no identity relation in the ontology of T^* .

(4) This suggestion is implicit, though only in a partial way, in the argument independently arrived at by Zorn and Meyer that T^* is a conservative extension of T . It is explicit in the type of model defined below as quasi-Fregean and first recommended to the author as characteristic of T^* by N. Belnap.

(5) It is easily seen from the proof in [2] that T^* is a conservative extension of T , that this extensionality principle is not a theorem of T^* —nor for that matter is its negation.

12. ———. 1974. "Formal Ontology and the Foundations of Mathematics." In *Bertrand Russell's Philosophy*, edited by Nakhnikian, George, 29-46. London: Duckworth.

"In his paper, 'The Undefinability of the Set of Natural Numbers in the Ramified *Principia*', [*] Myhill has shown that the general concept of a natural number or finite cardinal - general enough, that is, to yield the induction schema - is not definable in terms of ramified type theory in essentially its original form and without the axiom of reducibility. In my commentary I shall examine Myhill's concluding philosophical remarks within the context of general metaphysics or what below I call formal ontology. I shall especially be concerned with the sense in which ramified type theory (without the axiom of reducibility) purports to represent a constructive philosophy of mathematics. In addition, I shall sketch several forms of realism according to which the claim that "impredicativity is present in mathematics from the beginning" is true in an especially apt and interesting sense that goes beyond that intended by Myhill." (p. 29)

[*] In George Nakhnikian (ed.), *Bertrand Russell's Philosophy*, pp. 19-27.

13. ———. 1974. "Logical Atomism and Modal Logic." *Philosophia. Philosophical Quarterly of Israel* no. 4:41-66.

Reprinted as Chapter 6 in *Logical Studies in Early Analytic Philosophy*, pp. 222-243.

"Logical atomism has been construed as both a realist and a nominalist ontology. Despite their different ontological commitments, proponents of both types of atomism have tended to agree that modal operators for necessity and possibility, and thereby strict entailment too, are totally alien to the ontological grammar of logical atomism. The reason for this, apparently, is that any inclusion of modal operators in the ontological grammar of logical atomism, whether that grammar be of the nominalist or realist variants, would represent a commitment to internal properties and relations with material content. And in logical atomism, of course, all internal properties and relations, be they of objects or of situations, are formal and not material in nature. (Cf. Wittgenstein, *Tractatus Logico-Philosophicus*, ([TR]), 4.122).

However, to the contrary, we shall argue that not only are propositional connectives for logical necessity and possibility, and thereby strict entailment too, no more alien to the ontological grammar of logical atomism than are connectives for conjunction and disjunction, but, moreover, that the formal or internal properties and relations of objects and situations in the ontology cannot be adequately represented by the propositional forms of that grammar unless connectives for logical necessity and possibility are included (or definable by others so included) therein.

That is, we shall argue that connectives for logical necessity and possibility, together with their proper "logico-syntactical employment" ([TR], 3.327), represent formal, and not material, internal "properties," and, moreover, that these formal, internal "properties" are part of the ontology of logical atomism and cannot be adequately represented without the inclusion of such

connectives in the ontological grammar of any formal system purporting to represent that ontology.(1)

Our position and argument, incidentally, applies only to modal operators for logical necessity and possibility. All other modal operators, we agree, because they purport to represent internal “properties” or “relations” with real material content (e.g., causality, and even temporality via tense logic), are strictly prohibited within the metaphysical framework of logical atomism. “Superstition is nothing but belief in the causal nexus” ([TR], 5.1361). “The only necessity that exists is logical necessity” ([TR], 6.37).

Moreover, our concern here shall be with logical atomism as the metaphysical framework for a type of formal ontology. Our concern will not be with logical atomism as the framework for either a theory of meaning or a theory of knowledge. Accordingly, neither the Carnapian theory of *Protokolsätze* nor the Tractarian picture theory of meaning are essential to our present purely ontological considerations. We should note, however, that the Tractarian theory of elementary propositions as pictures contains both a theory of predication and a theory of meaning. It is the theory of predication that is an essential part of the ontology of logical atomism.

In the present chapter we shall limit our formal developments to the level of analysis dealing solely with propositional connectives. Our next chapter will deal with nominalist logical atomism where only individual variables are bindable but where atomism’s theory of predication enters the ontological grammar in a fundamental way. That chapter will also contain a description of several variants of realist logical atomism, one in which material properties and relations of objects are themselves objects, and another where material properties and relations of objects, though indicated by bound predicate variables (as in the first variant of realism), are not themselves objects (values of individual variables) but are nexuses or modes of configurations of objects (as they are in nominalism where they are not indicated by bound predicate variables).” (pp. 222-223 of the reprint)

15. ———. 1974. "A New Formulation of Predicative Second Order Logic." *Logique et Analyse* no. 65-66:61-87.

"In what follows, a predicative second order logic is formulated and shown to be complete with respect to the proposed model theoretic semantics. The logic differs in certain fundamental ways from the system formulated by Church in [1] § 58. The more important differences are noted and discussed throughout the present paper. A more specialized motivation for the new formulation is outlined in § 2.

In regard to the motivation for Church's formulation, this will be found in its natural extension to ramified type theory (without the axiom of reducibility). Within this larger framework, the theory of predication represented by such a formulation can be seen to be constructive: higher order entities are constructible from entities of lower order, with real, nonconstructed individuals as the entities of lowest order. Set theory, to whatever extent it is representable in the framework, appears in the ramified hierarchy only after propositional functions are allowed to be arguments of third and higher order predicates. To introduce sets as real, non-constructed individuals of lowest order would be antithetical to the framework's constructive theory of predication and in violation of its philosophical motivation."

(...)

"Essential to this proposal, however, is a view of the predicative/impredicative distinction radically different from that found in ramified type theory — and hence in Church's formulation of predicative second order logic. The latter framework (barring the axiom of reducibility) represents a constructive theory of predication that rules out all manner of

categorial content (indicated by bound predicate variables) or logistic efficacy for impredicative contexts. In the proposed, modified Fregean theory, however, impredicative contexts (wffs) are allowed to have logistic efficacy — and perhaps even categorial content if standard quantifiers ranging over all properties and relations are retained as well.

If, on the one hand, only quantifiers for predicatively specifiable properties and relations are allowed, then in this new formulation of predicative second order logic impredicative contexts — which in general will contain free (schematic) predicate variables or certain predicate constants — will be syncategorematic expressions, since they will not then be permissible substituends of generalized predicate variables. This does not mean that they must then be accorded null content. They may instead represent logical or formal content variant to what Frege calls second and third level "concepts".
(4)

This logical content would in effect be the basis of their logistic efficacy. (5)

If, on the other hand, these impredicative contexts are to be given categorial content by retaining standard quantifiers, then care must be made to distinguish these quantifiers from those ranging over only predicatively specifiable properties and relations. Both kinds of quantifiers will bind the same variables, but impredicative wffs will be permissible substituends only of variables bound by the one quantifier. (6)

They remain impermissible substituends of variables bound by the quantifiers for predicative properties and relations.

In the system to be formulated here we are concerned only with the first of the above alternatives, although once formulated it is easily extended to the richer framework. (7)" (pp. 61-64)

(4) We should distinguish at least two kinds of content that expressions of a formal system might have. The first is generally called descriptive, but historically has been called categorial, which we prefer here since even without (applied) descriptive constants the content is still indicated by bound

variables, (Hence our reference to categorial content.) The second is generally called logical or formal, or, traditionally, syncategorematic and is understood to be immanent to the logistic system in question. This latter content is usually said to be null or non-existent because it is not denoted or designated by corresponding constants, or, equivalently, because it is not indicated by any type of bound variable. (It may however be «indicated» in a secondary sense by free or schematic variables, and therefore also by constants that are substituends of these free or schematic variables.)

This rather standard view is untenable, however; for if the corresponding or associated expressions have logistic efficacy in the system, that fact can be accounted for only in terms of their representing content of some sort.

On the other hand, because of its immanency, this content need not be therefore accorded categorial existence, i.e., it need not be indicated by bound variables. Our point here, however, is that categorial existence is not the only philosophically viable notion of existence. In ramified type theory (without the axiom of reducibility), impredicativity has neither categorial nor syncategorial existence. In the new predicative second order logic, impredicativity has syncategorial but not categorial existence. In standard second order logic, impredicativity has categorial existence.

(5) A perspicuous representation of this logistic efficacy is the rule (S) of substitution of wffs for free (schematic) predicate variables or constants occurring in theorems. (Cf. 4 below for a description and derivation of (S).) This rule, though derivable in the predicative second order logic formulated here, is not derivable in Church formulation. Indeed, its addition there as a new rule results in standard, and not predicative, second order logic. This is not the case in the new formulation given here.

(6) The principle of universal instantiation, (UI), of wffs those containing as well as those not containing bound predicate variables — for a generalized predicate variable is now both formulabile and valid when the generalized predicate variable is bound by the standard quantifier. This principle implies the

weaker rule (S) and therefore contains, and goes beyond, the logistic efficacy of that rule. (7)" (pp. 61-64)

References

- [1] Church, A., *Introduction to Mathematical Logic*, Princeton University Press, 1956.
16. ———. 1975. "On the Primary and Secondary Semantics of Logical Necessity." *Journal of Philosophical Logic* no. 4:13-27.

"The semantical development of modal logic over the past fifteen years has incorporated a particular model-theoretic artifice which has received little or no critical attention. It is our contention that this artifice introduces, at least within conceptual frameworks typified by logical atomism, a subtle form of descriptive as opposed to merely formal content into the semantics of modal operators. This is particularly noteworthy at least for systems containing operators for the so-called logical modalities, e.g., logical necessity or possibility, or their cognate binary modality, strict implication; for, if any modal operators or connectives had ever been conceptually ordained to represent merely logical or formal operations with no material or descriptive content, it is such as these. Yet, as a result of this model-theoretic artifice, that is precisely what they fail to do.

Relative to a given non-empty universe of objects and a set of predicates of arbitrary (finite) addicity (representing the nexuses of atomic or basic states of affairs), the artifice in question concerns allowing modal operators to range (in their semantical clauses) over arbitrary non-empty subsets of the set of all the possible worlds (models) based upon the given universe of objects and the set of predicates in question. The intuitive and natural interpretation of modal operators for logical modalities, however, is that they range over all the possible worlds (models) of a logical space (as determined by a universe of objects and a set of predicate-nexuses) and not some arbitrary non-empty subset of that totality. The latter interpretation, by allowing the exclusion of some of the worlds (models) of a logical space, imports material conditions into the semantics of modal operators. This exclusion, however

appropriate for the representation of non-logical (e.g., causal or temporal) modalities, is quite inappropriate for the representation of what are purported to be merely formal or logical modalities.

This model-theoretic artifice of allowing the exclusion of some of the worlds (models) of a logical Space goes back to Kripke [5] where the notion of universal validity is used instead of the intuitive and primary notion of logical truth. Later semantical developments, by Kripke and others, retained the artifice and supplemented it with additional model-theoretic features, e.g., special accessibility relations between the non-excluded worlds, or semantical clauses allowing objectual quantifiers to range over arbitrary subsets of the universe of objects (thereby importing material content into the semantics of these operators as well). Such additions only deepened and supplemented the type and variability of the material content already induced by modal operators as a result of the artifice in its simplest form. And in that regard, however appropriate these additions may be for the representation of particular non-logical modalities, they only mark a further departure from the supposed purely formal content of operators for logical modalities. For this reason we shall ignore these later developments here and restrict our observations to some of the implications of the artifice in its original and simplest form. It should be kept in mind, however, that our discussion pertains only to operators for the so-called logical modalities." (pp. 13-14)

(...)

"Concluding remarks.

It is not our contention that we should eschew either the model-theoretic artifice of allowing modal operators to range over only some and not all of the worlds (models) of a given logical space or the related artifice of allowing («-place) predicate quantifiers to range over only some and not all of the sets (of «-tuples) of objects in the universe of that space. Indeed, we agree that such artifices are quite appropriate and may in fact be required for operators purportedly representing

non-logical modalities (e.g., temporal or causal modalities) or for quantifiers which purportedly range over attributes of a restricted form of content (e.g., perceptual content, or existence-entailing content where past- and future-existence are distinguished from present-existence).

It is our contention, however, that the employment of such an artifice is inappropriate in the semantics of what one considers to be a purely formal or syncategorematic sign. The fact that a secondary semantics which includes such an artifice yields a proof of completeness where the primary semantics showed incompleteness instead does not itself justify employment of the artifice. Rather, to adopt a secondary semantics for this sort of reason is, in our view, to already call into question the sense in which the sign is said to be syncategorematic or the sense in which the content purportedly represented is said to be of a purely formal nature. That of course may in the end be the appropriate question to raise in regard to all our so-called syncategorematic or logical constants. But to raise the question and to answer it adequately are two entirely different enterprises." (p. 28)

17. ———. 1975. "Second Order Theories of Predication: Old and New Foundations." *Noûs* no. 9:33-53.

"Second-order theories of predication are based on the assumption that a semantical or ontological interpretation of the forms of predication found in first-order languages will be philosophically adequate only if within the framework of the interpretation there exist entities corresponding to (some if not all of) the predicates occurring in these forms. These entities, depending on the theory in question, may or may not be projected as existing in reality independently of the structure of thought. For convenience, however, we shall refer to them in either case as properties when they are projected as corresponding to monadic predicates and as n-ary relations

when they are projected as corresponding to n-place predicates, for $n > 1$.

Now the nature of the correspondence in which properties and relations are purported to stand to predicates in second-order theories is such that it cannot be identified with or reduced to the relation of denotation between singular terms, e.g., individual constants or variables, and the individuals or objects which they are understood to denote. In some second-order theories it cannot be understood as a relation at all, though in others it will (properly) include the singular-term denotation relation (in the sense that properties and relations can also be denoted therein by singular terms) while still going beyond it in ways that are peculiar to predicates. For this reason, quantification over the theoretically projected or posited properties and relations is primarily effected through quantified predicate variables and not, as it were, through a form of restricted quantification over one or another kind of individual. Informally, we say that properties and relations have in this regard a *predicative nature*, though in some theories they may have a *nominative* nature as well.

In what follows we shall be concerned, though somewhat unevenly, with this distinction between second-order theories in which properties and relations have only a predicative nature as opposed to those in which they are purported to have a nominative nature as well. The two general types of second-order theory we have in mind, then, are distinguished according to (1) whether the nature of the correspondence between predicates on the one hand and properties and relations on the other is to (properly) include the singular-term denotation relation so that predicates, within the framework of the theory, are allowable substituends of individual variables; or (2) whether the purported mode of being of properties and relations is strictly of a predicative nature which excludes their being arguments or logical subjects of predication in any sense which is logically similar to that in which individuals in general are. In the first type of theory, properties and relations are themselves individuals, i.e., have a nominative as well as a predicative nature, whereas in the second the categories or

modes of being purportedly indicated by quantified predicate and individual variables are ontologically disjoint. Following Frege, we shall speak of properties and relations as *unsaturated* entities when they are projected entities of a theory of the latter sort." (pp. 33-34)

18. ———. 1975. "Logical Atomism, Nominalism, and Modal Logic." *Synthese* no. 31:23-62.

Reprinted as Chapter 7 in *Logical Studies in Early Analytic Philosophy*, pp. 244-275.

"Logical atomism, through its theory of logical form, provides one of the most coherent formal ontologies in the history of philosophy. It is a coherence which, whether we agree with the ontology or not, renders the framework important and useful as a paradigm by which to compare and better evaluate the coherence of alternative systems based upon alternative theories of logical form and especially alternative theories of predication.

As the basis of a formal ontology, logical atomism, aside from the differences between its realist and nominalist variants, specifies not only a 'deep structure' ontological grammar within which all analysis must ultimately be resolved, but determines as well a logistic for that grammar. Both together constitute the formal ontology and serve to indicate how logical atomism views the fundamental structure of reality. Thus, for example, the grammar serves to indicate the formal as well as the material categories of being acknowledged by the ontology, while the logistic, by regulating the proper 'logico-syntactical employment' ([TR], 3.327) of the expressions of that grammar serves to indicate not only the logical 'scaffolding of the world' ([TR], 6.124) but supplements the grammar in its presentation of the ontological structure of reality.

The distinction between logical scaffolding and ontological structure is fundamental to atomism and pertains to a distinction between material and formal content that grammar alone is insufficient to represent. It is a distinction that any proposed formalization of logical atomism must account for (through the Doctrine of Showing) in order to be an adequate

formal representative of that ontology. It is a distinction, however, or so it will be argued here, that cannot be made without the introduction of modal operators for logical necessity and possibility.

The argument for this last claim was already given in chapter 6, but it was there restricted to the level of logical analysis dealing solely with propositional connectives."

(...)

"In what follows we shall be concerned with the problematic extension of these results to the level of analysis involving quantifiers for objects as concrete particulars along with some means for expressing their self-identity and mutual difference. On this level, logical atomism's theory of predication enters our considerations in a fundamental way. For according to that theory, only elementary predications represent or 'picture' a structure with material content, and that content is in all cases external to the constituents of the structure. Such a structure is an atomic situation (*Sachlage*) and the externality of its content to its constituents consists in both it and its complement being logically possible. The difficulty here is that since objects are quantified over, they are part of the world and therefore contribute to the ontological content of the world (cf. [TR] 5.5561); and in that regard their self-identity and mutual difference or nonidentity, and thereby their total number, would prima facie seem to involve material content. Yet, in atomism, an object's self-identity or nonidentity with any other object is not an external condition of that object, (3) and, as a consequence of the dependence of logical space on reality, it is logically impossible for the totality of objects, no less the number of that totality, to differ from world to world. In other words, in logical atomism, if not in other ontologies, identity and difference, as well as objectual quantification, are formal and not material aspects of reality. Here already we begin to see the paradigmatic role of logical atomism, for in most other systems identity and difference, as well as objectual quantification, are also said to be formal in content, though

propositions regarding that content are not also said to be either logically necessary or logically impossible.

Because our considerations will be restricted to quantifying over objects as concrete particulars and not, for example, over material properties and relations as well, the variant of logical atomism we shall discuss here is nominalistic. Several realist alternatives are sketched in order to highlight the significant theses and/or difficulties of nominalism, though it should be noted that not all forms of nominalism need agree with the special ontological theses of nominalist logical atomism.

Finally, it should also be noted that our concern in this chapter is with an adequate formal representation of the ontology of logical atomism and not with its theory of thought, meaning, or philosophy of language. We wish to leave open how these might or must be developed with respect to the system constructed here, especially with regard to how they might or must pertain to the question of its logistic completeness." (pp. 244-247 of the reprint)

(1) The convention adopted here is to use scare-quotes when speaking of what connectives represent as 'properties' or 'relations'. This is done to mark a special philosophical use which is convenient in our informal discussion but which strictly speaking is ontologically misleading. A similar convention applies throughout when we refer to existence (being-the-case) and nonexistence (being-not-the-case) as material 'properties' of atomic situations.

(3) That is, an object's self-identity or nonidentity with any other object is invariant through all the possible worlds of a logical space containing that object. We must distinguish this ontological invariance from the varying semantical relation of denotation (*Bedeutung*) between an object and a (non-Tractarian) name or definite description of that object. The former must be accounted for within the formal ontology, the latter only within its applications.

19. ———. 1975. "A Second Order Logic of Variable-Binding Operators." *Reports on Mathematical Logic* no. 5:13-18.

"It is well-known that Frege distinguished between first- and second-level concepts or functions. First-level concepts he associated with properties and relations between objects. These concepts Frege characterized as functions which assigned truth-values (the true or the false) to (n-tuples of) object(s) (1). An (n-tuple of) object(s) was said to fall under such a concept if it was assigned the true by that concept. In his *Begriffsschrift* these concepts were indicated by predicate variables.

Second-level concepts or functions, on the other hand, correspond to variable binding operators, e.g., the universal quantifier or, as in Frege's later development of the *Begriffsschrift*, the course-of-values abstraction operator. The latter assigns to a monadic concept the class which is its extension while the former assigns a truth-value. Second-level concepts, i.e., second-level functions corresponding to variable-binding operators of the quantifier type, accordingly, can be associated with properties or relations between properties and relations of objects in a sense analogous to (but also different from) that in which first-level concepts are associated with properties or relations between objects. In Frege's terminology, while an (w-tuple of) object(s) is said to fall under a first-level concept, the latter is said to fall within, not under, a second-level concept if it is assigned the true by that concept.

Third-level concepts corresponding to quantifiers binding predicate variables were also introduced into the *Begriffsschrift*, but Frege seems to have had some doubts regarding their ontological or objective significance. Indeed, Frege's attitude toward third-level concepts seems in general to resemble the nominalists' attitude toward second-level concepts, viz., that they are merely formal or syncategorematic concepts which are immanent to the *Begriffsschrift* and correspond to nothing objective in reality.

The objectivity of first- and second-level concepts, however, was said by Frege to be “founded deep in the nature of things” (2). These concepts, in other words, have an objective and not merely a formal or syncategorematic content according to Frege. Accordingly, from the point of view of rendering one’s ontological commitments explicit by means of appropriate quantifiers, this indicates that in a framework such as the *Begriffsschrift* we should allow not only for third-level quantifiers binding predicate-variables (having first-level concepts as their values), as Frege explicitly did allow, but also for fourth-level quantifiers binding second-level quantifier variables (having second-level concepts as their values), as Frege only implicitly allowed. This he did in effect by allowing free or schematic occurrences of second-level quantifier variables (as affixed to schematic individual variables).”

(...)

"Finally, we should perhaps point out that not all second-level concepts need be quantifier concepts. E.g., Frege himself took the “property” of being a property of the number 2 to be a second-level concept ([4], p. 75), and no doubt he intended there to be such a second-level concept corresponding to each and every object. In the present system we remain faithful to Frege’s intentions. Indeed, by (CP-2), it is valid here that for each object x there exists a second-level concept within which fall all and only those first-level concepts under which x falls.

Our approach to the semantics of variable-binding formula operators differs in this regard from that of Mostowski [8], Thomason and Johnson [9], and Issel [5], [6], [7], all of whom, aside from restricting their considerations to first order languages (and, generally, to 1-ary 1-place quantifiers), interpret such operators as designating “quantities” of first-level concepts, i.e., they restrict their considerations to quantifier concepts.

The present system includes these sorts of second-level concepts but goes beyond them to include others as well. However, since the ‘quantifier’ terminology is simpler and more convenient than referring to variable-binding formula

operators, we shall hereafter conflate the latter with the former and speak only of “quantifiers”, though of course now quantifiers do not in all cases represent “quantities” (6).” (pp. 13-15)

(1) Frege apparently allowed only for binary relations. We extend his framework to include n-ary relations for arbitrary finite $n \geq 2$. In addition, we refer to all these relations as (n-ary) concepts. (Frege referred only to properties as concepts.)

(2) *Function and Concept*, p. 41 of [3].

(6) So-called branched quantifiers represent second-level concepts that are somewhat anomalous to quantifier concepts in general, i.e., to “quantities”. It is well-known, however, that the semantic content of these quantifiers is representable in second order logic, and, accordingly, these concepts too are included among those represented in the system formulated below.

"A minimal second order modal logic of natural kinds is formulated. Concepts are distinguished from properties and relations in the conceptual-logistic background of the logic through a distinction between free and bound predicate variables. Not all concepts (as indicated by free predicate variables) need have a property or relation corresponding to them (as values of bound predicate variables). Issues pertaining to identity and existence as impredicative concepts are examined and an analysis of mass terms as nominalized predicates for kinds of stuff is proposed. The minimal logic is extendible through a *summum genus*, an *infima species* or a partition principle for natural kinds."

"A standard objection to quantified modal logic is that it breeds such reptiles of the mind as Aristotelian essentialism, "the doctrine that some of the attributes of a thing (quite independently of the language in which the thing is referred to, if at all) may be essential to the thing, and others accidental" ([5], p. 173f.). This objection has been criticized on one front by pointing out that none of the standard systems of quantified modal logic commit us to more than the meaningfulness of the non-trivial versions of the doctrine and that indeed we can, if we so choose, actually deny such versions in these systems (cf. [4]). A more heroic response, however, accepts these versions of the doctrine, at least when properly stated, and finds quantified modal logic the appropriate medium for its

formulation. In what follows I shall attempt to formulate one such response, at least for the purpose of clarifying the general sort of logistic framework it presupposes if not also for exposing some of the more fascinating serpents that breed therein." (p. 202)

(...)

"Concluding Remarks. The above are only some of the more obvious principles that come to mind in the development and application of a logic of natural kinds. My objection to including them within the minimal system is based solely upon the rather strong sense of independence from the structure of thought (and therefore of "logic") which I assume natural kinds to have. Of course, in certain restricted contexts or for specialized applications these principles, and perhaps others as well, may be fully justified and used accordingly.

There are of course other developments and applications which I have not touched upon at all in this paper, e.g., the analysis of causal counterfactuals as based upon natural kinds or of a comparative similarity relation between individuals in terms of the natural kinds they share, etc. Our interests in these sorts of developments or applications should, it is hoped, vindicate at least to some extent the ontology of natural kinds as causal or nomological essences. In any case, such reptiles of the mind as these are taken to be by some philosophers seem hardly poisonous or deadly at all.

Finally, there is the sort of application suggested in section 4 for extending the logic of natural kinds to include nominalized predicates so as to provide a general analysis of the logic and ontology of mass terms. I have only hinted throughout this essay at how this richer framework might be developed, and though I do have some further suggestions which I have not gone into here, it is hoped that perhaps others will also take up the clarion call to defend this rather fascinating serpent of the mind." Abstract: "There are different ways in which we might investigate and represent the successive stages of the development of our common-sense and scientific conceptual frameworks. Jean Piaget's "fundamental hypothesis" regarding this development is that there is a parallelism between the progress made in the logical and rational organization of knowledge and the corresponding formative psychological processes" ([9], p.13). Piaget's approach has been a general inquiry into our formative psychological processes, a type of inquiry that requires us "to take psychology seriously" (*ibid.*, p.9). There is an alternative for philosophical logicians, however. For while it is not within our expertise to investigate formative psychological processes, we can nevertheless contribute to the study and representation of "the logical and rational organization of knowledge" through the construction of theories of logical form that are characteristic of at least some of the more important stages in the development of our common-sense and scientific frameworks. We adopt the methodology of such a construction in this paper where our primary concern will be the logical structure of our referential devices for quantifying, identifying and classifying things.

We will be concerned in particular with how this structure is to bear upon the problem of cross-world and cross-time re-identification."

"Investigations into the logical structure underlying ordinary language and our common-sense framework have tended to

support the hypothesis that there are different stages of conceptual development and that while the structures elaborated at a later stage are in general not explicitly definable or reducible to those at the earlier they nevertheless presuppose them as conceptually prior bases for their own construction and elaboration— even when the conceptually prior structures are somehow eliminated or completely reconstructed at the later stages. This applies, moreover, not just to the conceptual structures underlying our common-sense framework but to those underlying the development of logic, mathematics and the different sciences as well.

Jean Piaget, for example, as a result of his investigations into genetic epistemology has found that our knowledge of logico-mathematical structures is obtained through a process of “constructive” or “reflective” abstraction that proceeds through a hierarchy of successive stages at which the structures acquired at a previous stage are reconstructed before they are integrated into the new structures elaborated at later stages (cp. [10], p.159). But, as Piaget has also shown, it is not just in logic and mathematics that cognitive activity develops through successive stages of progressive structuration; for the development of intelligence and knowledge in general, whether as represented in our common-sense or our scientific framework, proceeds in essentially the same way. Indeed, the construction of our scientific framework on the basis of our common-sense framework is itself a prime example not only of how conceptual structures acquired at a previous stage are completely reconstructed before they are integrated into those elaborated at a later stage but also of how the later structures, though built upon the earlier, cannot be reduced to or defined in terms of them (cf. Sellars [11]).

Now there are different ways in which we might investigate and represent the successive stages of the development of our commonsense conceptual framework. E.g., because of his “fundamental hypothesis” that there is a parallelism between the progress made in the logical and rational organization of knowledge and the corresponding formative psychological processes” ([9], p.13), Piaget’s approach has been a general

inquiry into our formative psychological processes. The first principle of genetic epistemology, according to Piaget, is “to take psychology seriously” (ibid., p. 9).

There is an alternative for philosophical logicians, however. For while it is not within our expertise to investigate our formative psychological processes, we can nevertheless contribute to the study and representation of “the logical and rational organization of knowledge” through the construction of theories of logical form that are characteristic of at least some of the more important stages in the development of our common-sense and scientific frameworks.

One thing in particular that the construction of such a theory would help explain is the sense in which the operations and coordinations of concepts that characterize a given stage of conceptual involvement constitute a self-sufficient structured whole which purports to have limits beyond which there is nothing for thought. It would also help explain how the formalization of these operations and the clarification of their limits can be the basis for new and more elaborate operations whose structuration transcends those same limits and leads to a new stage of conceptual involvement.

It is this methodology that we shall adopt in what follows where our primary concern will be the logical structure of our referential devices for quantifying, identifying and classifying things. We shall particularly be concerned with how this structure is to bear upon the problem of cross-world and cross-time re-identification.” (pp. 439-441)

Annotated bibliography of Nino Cocchiarella 1978-1992

Essays 1978-1992

1. Cocchiarella, Nino. 1978. "On the Logic of Nominalized Predicates and Its Philosophical Interpretations." *Erkenntnis* no. 13:339-369.

Errata, *Erkenntnis*, 14, 103-104, pp. 103-104.

"Predicate nominalizations are transformations of predicates and predicate phrases into nouns or noun phrases. Thus, e.g., 'pious' is transformed into 'piety', 'wise' into 'wisdom', 'triangular' into 'triangularity', and 'human' into 'humanity'. We call these types of derivative nouns abstract singular terms. Some relational predicates are also transformed into abstract singular terms: e.g., 'identity' for 'is identical with' and 'indiscernibility' for 'is indiscernible from'.

There are other forms which predicate nominalizations take as well. E.g., the noun phrase 'the concept Horse', especially as used by Frege, amounts to a nominalization of the predicate 'horse', and others of a related sort are 'the property red' and 'the relation of being taller than'. These nominalizations have stylistic variations, e.g., 'redness' or 'red' simpliciter (when used as a singular term rather than as a predicate) and 'the taller-than relation' or simply 'being taller than'.

There are no doubt a number of distinctions relevant to linguistics that should be drawn between these different types of nominalizations. We, however, shall not pursue them here but shall concern ourselves instead with the more formal question of a logic of nominalized predicates in the context of

some of its philosophical interpretations. We shall assume in this regard that the occurrences of nominalized predicates in ordinary discourse for which the logic is designed are all singular terms in the modern sense, i.e., that they purport to have singular reference in the same sense in which proper names and (unreduced) definite descriptions are said to have such reference." (p. 339)

2. ———. 1979. "The Theory of Homogeneous Simple Types as a Second Order Logic." *Notre Dame Journal of Formal Logic* no. 3:505-524.

"In its original form the theory of simple types, hereafter called ST, is a theory of predication and not, or at least not primarily, a theory of membership. With that original form in mind we construct in this paper a second order counterpart of ST which we call ST*. We briefly compare ST* with an alternative extension of second order logic, viz., the author's system T*(*) of [1], which was proposed as characterizing the original (and yet consistent!) logistic background of Russell's paradox of predication.

In [2], the author showed the completeness of T**, plus an extensionality axiom (Ext*), relative to a Fregean interpretation of subject-position occurrences of predicates, viz., that such occurrences of predicates denote individuals correlated with the properties (or "classes") designated by predicate-position occurrences of the same predicates. It is observed here that when the semantical Fregean frames characterized satisfy ST*'s stratified comprehension principle instead of T**'s general comprehension principle, then the same Fregean interpretation yields a completeness theorem for monadic ST* + (Ext*) as well. It has been found convenient, on the other hand, to consider (monadic) ST as a theory of membership rather than a theory of predication when axioms of extensionality are

included in its characterization. So considered, Quine proposed his system NF as a first order counterpart of ST, though of course, as is well-known, NF far exceeds ST in deductive powers. We show here per contra that while (monadic) ST* + (Ext*) is motivated in its construction along lines followed by

Quine in the construction of his first order counterpart NF, viz., the reduction of ST's metatheoretic feature of typical ambiguity to a stratified comprehension principle, our system, unlike NF, is equiconsistent with ST. This, along with the fact that the non-abstract individuals (or "urelements") of ST are retained unmodified in ST*, indicates that ST*, as a theory of predication, is to be preferred to NF, as a theory of membership, in the interpretation which each gives to STPs metatheoretic feature of typical ambiguity. We show in addition that if to (monadic) ST* +(Ext*) we add the assumption that whatever is a value of an individual variable is also (or, on the Fregean interpretation, is correlated with) a value of a (monadic) predicate variable, i.e., the assumption that every individual is a "class", then the resulting system is equiconsistent with NF. We refer to monadic ST* +(Ext*) as NFU* and show that it contains Jensen's system NFU as well." (pp. 505-506)

3. ———. 1980. "Nominalism and Conceptualism as Predicative Second Order Theories of Predication." *Notre Dame Journal of Formal Logic* no. 21:481-500.

"There appears to be a growing consensus, even if not unanimity, that standard predicative second-order logic is the appropriate logical medium for the representation of a nominalist theory of predication. We agree that this is indeed the case and formulate in this paper a model-theoretic approach which justifies that claim. (1) Because it is model-theoretic, our approach differs from the truth-value semantics approach of Leblanc and Weaver. (2) Amongst other reasons, we prefer our model-theoretic approach so as to accommodate those nominalists for whom the assumption that there are

potentially as many names as there are individuals is not acceptable.

The models involved in our semantics, moreover, are precisely the same models as are already involved in standard first-order logic. Assignments of values (drawn from the domain of a given model) to the individual variables are extended, however, to what, relative to a given first-order language, we call *nominalistic assignments* to the n -place predicate variables (for each positive integer n) these assign first-order formulas (wffs) of the language in question, relative to the free occurrences of n distinct individual variables occurring in those wffs, to the H -place predicate variables. The satisfaction by such an assignment of a second-order wff in a model is then defined by a double recursion on the logical structure of the wff and on the number of nested predicate quantifiers occurring therein.

It is natural of course that a first-order wff, relative to n individual variables occurring therein as argument indicators, should be understood as representing an n -place predicate expression of the language in question; and in fact in an applied first-order theory based upon that language such a first order wff would constitute the definiens of a possible definition for an n -place predicate constant not already belonging to that language or occurring in that theory. Potentially, of course, there are infinitely many predicate constants that might be introduced into a first-order theory in this way; and it is just over such a potential infinity, and no more, that our predicate quantifiers, nominalistically interpreted, are understood to range when we turn to the predicative second-order counterpart of a given first-order theory.

Finally, in order to better understand the implicit background of our nominalistic semantics, we include in a final section of this paper a brief comparison of nominalism, as represented by standard predicative second-order logic, with a closely related form of conceptualism, represented by a certain nonstandard predicative second-order logic formulated by the author in an earlier paper." (pp. 481-482)

(1) For the consensus view, see Parsons [9], For the dissenting view, at least in regard to the extension of predicative second-order logic to ramified type theory, see Church [2].

It is possible of course that Church intends his demurral to apply only after predicates are ramified and allowed to occur as subjects of higher-order predicates. If so, then we believe that his demurral may have some merit (see Note 10).

(2) For reasons indicated in Note 10, we suspect that ramification may presuppose a linguistic capacity for introducing predicates that exceeds the proper limits of a nominalist theory of predication. Such a capacity does not exceed the limits of a closely related form of conceptualism (briefly discussed in Section 6) which may be represented by the nonstandard predicative second-order logic formulated in [3].

Reprinted as Chapter 1 in *Logical Studies in Early Analytic Philosophy*, pp. 19-63.

"The development of the theory of logical types in Russell's early philosophy proceeds along a difficult and rather involuted path; and even the final product, the theory as adumbrated in [*Principia Mathematica* = PM], remains unclear in its syntax and problematic in its semantics. Indeed, one might well be left with the impression that Russell himself, in the end, remained

unsure of which parts of the different views he had held along the way are finally to be adopted.

In what follows, we shall attempt to describe and explain the development of Russell's early views, at least to the extent to which they are available in published form today, from the perspective of the development in those views of the notion of a logical subject. It is the development of this notion in Russell's early philosophy, we believe, that holds the key to many of the problems confronting Russell in the development of his theory of logical types and that led to the various, and sometimes conflicting, proposals that he made along the way.

It should be noted, however, that in referring to the development of the theory of logical types in Russell's early philosophy we have in mind only the views developed by Russell up to, but not subsequent to, the 1910–13 publication of the first edition of [PM]. The subsequent views developed by Russell from 1913–25, that is, between the first and second editions of [PM], and summarized to some extent in his introduction (and added appendices) to the second edition, constitute Russell's version of logical atomism. Except for some concluding remarks in the final section of this chapter, we delay our discussion of those views until chapter 5." (pp. 19-20 of the reprint)

5. ———. 1981. "Richard Montague and the Logical Analysis of Language." In *Contemporary Philosophy: A New Survey. Vol. 2: Philosophy of Language*, edited by Fløistad, Guttorm, 113-155. The Hague: Martinus Nijhoff.

"Richard Montague was an exceptionally gifted logician who made important contributions in every field of inquiry upon which he wrote. His professional career was not only marked with brilliance and insight but it has become a classic example of the changing and developing philosophical views of logicians in general, especially during the 1960s and 70s, in regard to the form and content of natural language. We shall, in what follows, attempt to characterize the general pattern of that development, at least to the extent that it is exemplified in the articles Montague wrote during the period in question.

The articles to which we shall especially direct our attention are: 'Pragmatics' [1]; 'Pragmatics and Intensional Logic' [2]; 'On the Nature of Certain Philosophical Entities' [3]; 'English as a Formal Language' [4]; 'Universal Grammar' [5]; and 'The Proper Treatment of Quantification in Ordinary English' [7].

Needless to say, but many of the ideas and insights developed in these papers Montague shared with other philosophers and logicians, some of whom were his own students at the times in question. Montague himself was meticulous in crediting others where credit was due, but for convenience we shall avoid duplicating such references here." (p. 113)

(...)

"Concluding Remarks

There are many other important features of Montague's grammar for English and of his translation of English by means of that grammar into intensional logic that we cannot go into here. The highly intensional nature of his semantics, for example, provides not only a more direct analysis of the opacity of intensional verbs but also a more direct analysis of the opacity of infinitive phrases as well. And then there is his treatment of relative clauses and of attributive adjectives, which we have not touched upon at all.

In closing then, it will no doubt have crossed the reader's mind that there may be some irony in the fact that Montague began his philosophical career as an extensionalist who took set theory as the proper theoretical framework for philosophy and as a formal-language philosopher who viewed the formalization of ordinary language as either impossible or extremely laborious, and in any case as certainly not philosophically rewarding. For the fact is that Montague has made important and philosophically innovative contributions toward a fully formalized syntax and semantics for natural language and that the semantics in question is most perspicuously described in terms of an intensional logic that transcends set theory and that in effect constitutes a new theoretical framework for

philosophy. If this is not a revolution, it is at least a form of progress in the logical analysis of language." (p. 155)

Reprinted as Chapter 3 in *Logical Studies in Early Analytic Philosophy*, pp. 119-151.

"Contemporary philosophy is in a rut, according to Terence Parsons in his recent book *Nonexistent Objects*, ([NO]), and it is one that stems from the (post-1905) work of Bertrand Russell. The main characteristic of this "Russellian rut" ([NO],

1) is strict adherence to the thesis that being, or being something, amounts to being something that exists—or equivalently that ‘there is’ is to be equated with ‘there exists’ ([NO], 6). This view is now so well entrenched, according to Parsons, that it is a main stay of what he also calls the orthodox tradition.

Now the orthodox view is in a rut, according to Parsons, “because it’s a view in which most of us are so entrenched that it’s hard to see over the edges” ([NO], 1). Naturally, if we want “to look over the edge and see how things might be different” ([NO], 8), as any objective seeker of truth would, then “we need to encounter an actual theory about nonexistent objects” (ibid.). It is the construction and presentation of such a theory that is Parsons’s concern in *Nonexistent Objects*.

(...)

"Now we do not object to Parsons’s choice of Meinong’s theory here, nor for that matter to his elegant reconstruction and presentation of that theory. We do think, however, that a more balanced recognition of Russell’s overall view is called for and that perhaps the best way to make the Meinongian notion of a concrete object understandable to the orthodox tradition is to compare it with the general Russellian notion of a concrete individual, i.e., the Russellian notion of an individual that can exist but which might in fact not exist. Indeed, on the basis of the analysis and comparison we shall give here, it is our position that the Meinongian notion of a concrete object, at least as reconstructed by Parsons, is parasitic upon, though in a beneficent way, the Russellian notion of a concrete individual, existent or otherwise." "The trouble with modal logic, according to its critics, is quantification into modal contexts - i.e. *de re* modality. For on the basis of such quantification, it is claimed, essentialism ensues, and perhaps a bloated universe of *possibilia* as well. The essentialism is avoidable, these critics will agree, but only by turning to a Platonic realm of individual concepts whose existence is no less dubious or problematic than mere *possibilia*. Moreover, basing one's semantics on individual concepts, it is claimed, would in effect render all identity statements containing only proper names either necessarily true or necessarily false - i.e. there would then be no contingent identity statements containing only proper names.

None of these claims is true quite as it stands, however; and in what follows we shall attempt to separate the chaff from the grain by examining the semantics of (first-order) quantified modal logic in the context of different philosophical theories. Beginning with the primary semantics of logical necessity and the philosophical context of logical atomism, for example, we will see that essentialism not only does not ensue but is actually rejected in that context by the validation of the modal thesis of

anti-essentialism, and that in consequence all *de re* modalities are reducible to *de dicto* modalities.

(...)

Besides the Platonic view of intensionality, on the other hand, there is also a socio-biologically based conceptualist view according to which concepts are not independently existing Platonic forms but cognitive capacities or related structures of the human mind whose realization in thought is what informs a mental act with a predicable or referential nature. This view, it will be seen, provides an account in which there can be contingent identity statements, but not such as to depend on the coincidence of individual concepts in the platonic sense. Such a conceptualist view will also provide a philosophical foundation for quantified tense logic and paradigmatic analyses thereby of metaphysical modalities in terms of time and causation. The problem of the objective significance of the secondary semantics for the analyzed modalities, in other words, is completely resolved on the basis of the nature of time, local or cosmic. The related problem of a possible ontological commitment to *possibilia*, moreover, is in that case only the problem of how conceptualism can account for direct references to past or future objects." (pp. 235-236)

8. ———. 1985. "Two Lambda-Extensions of the Theory of Homogeneous Simple Types as a Second Order Logic." *Notre Dame Journal of Formal Logic* no. 26:377-407.

Contents:

0. Introduction 377; 1. HST* revisited 379; 2. An improved axiom set for HST* 380; 3. The grammar of HST* with lambda-abstracts 383; 4. The system lambda-HST* 384; 5. The system HST*lambda 386; 6. An extensional Fregean semantics for nominalized predicates 390; 7. The relative consistency of HST*-lambda + (Ext*) to lambda-HST* + (Ext*) 393; 8. An intensional Fregean semantics for nominalized predicates 395; 9. Identity versus indiscernibility in HST*-lambda 402; Notes 406; References 407.

Abstract: "Two second order logics with lambda-abstracts are formulated as counterparts to the theory of homogeneous simple types. Predicates can be nominalized and occur as abstract singular terms in these logics so that self-predication is meaningful in general and, in certain special cases, even provable. Extensional and intensional Fregean semantics in which nominalized predicates are assigned individuals as concept-correlates are formulated and the extensional and intensional versions of these logics are shown to be complete with respect to their corresponding semantics. The logics are also shown to be consistent relative to weak Zermelo set theory."

"In the theory of simple logical types as originally conceived, it is meaningless for one predicate expression to occur in one of the subject or argument positions of another unless the latter is assigned a higher logical type than the former within the grammar of the object language; and therefore it is meaningless in particular for any predicate expression to apply to itself, i.e., to occur in one of its own subject positions. Russell's paradox of predication is thereby avoided, of course, but the price is high, for the resulting theory is not an accurate representation of the role of predicates in natural language where predicate expressions can apply not only to the nominalizations of other predicates but to their own nominalizations as well -- and without regard at all for the notion of a logical type. In the theory of logical types as a second-order logic, on the other hand, predicate expressions are typed within the grammar of the object language only in the way they are typed in standard second-order logic, i.e., only with respect to their degree or number of subject positions, and they are allowed otherwise to meaningfully occur in the subject or argument positions of other predicates, and of themselves as well, without regard to the notion of a logical type. Russell's paradox of predication can be avoided, it turns out, not by resorting to the notion of a logical type as a part of the grammar of the object language but rather only as a part of the metalinguistic description of the conditions under which properties and relations are to be posited by means of the grammar of the object language. The

difference is crucial, needless to say, since it allows for a more accurate representation of the role of predicates and predication in natural language. The resulting theory is not, to be sure, a second-order logic in the "standard" sense used today (though it does contain the latter), but it is a second-order logic in the traditional or pre-type-theoretical sense in which quantifier expressions are allowed to reach into both subject and predicate positions without obliterating the logical and conceptually important distinctions between the two." (pp. 377-378)

9. ———. 1985. "Frege's Double Correlation Thesis and Quine's Set Theories NF and ML." *Journal of Philosophical Logic* no. 14:1-39.

Reprinted as Chapter 4 in *Logical Studies in Early Analytic Philosophy*, pp. 152-192.

"There are two fundamentally different notions of a class, which, following tradition, we might call the mathematical and the logical notions, respectively. The logical notion is essentially the notion of a class as the extension of a concept, and, following Frege, we shall assume that a class in this sense "simply has its being in the concept, not in the objects which belong to it" (Frege, [PW], 183)—regardless of whether or not concepts themselves differ, as Frege assumed, "only so far as their extensions are different" (ibid., 118). The mathematical notion of a class, on the other hand, is essentially the notion of a class as composed of its members, i.e., of a class that has its being in the objects that belong to it. This notion of a class, we claim, is none other than the iterative concept of set—or at least that is what it comes to upon analysis. Note that although what accounts for the being of a class under the one notion is not the same as what accounts for the being of a class under the other, nevertheless the axiom of extensionality applies equally to both notions. This means that the axiom of extensionality does not of itself account for the being of a class. (1)

Of course the logical notion of a class, especially as developed in Frege's form of logicism, is usually thought to be bankrupt as a result of Russell's paradox. This assessment, however, is

erroneous. In particular, in “Frege, Russell, and Logicism: A Logical Reconstruction,” ([FRL]), I have explained how Frege’s view of classes in the logical sense can be reconstructed without paradox by modifying in either of two ways what I there referred to as Frege’s double correlation thesis. The two systems that result from these modifications, it turns out, have certain structural similarities with Quine’s two set theories NF and ML, especially when the latter are themselves modified so as to include urelements other than the empty set. This is significant because both NF and ML are commonly said to “lack a motivation” (cf. Boolos’s “The Iterative Concept of Set” ([ICS]), 219). But that is because as theories of sets in the sense of classes that are composed of their members, which is really the only sense to which Quine is willing to commit himself, both NF and ML are incompatible with the iterative concept of set. As theories of classes in the logical sense, however, and in particular of the classes that Frege took to be the correlates of concepts, both NF and ML can be given a very natural motivation, especially when modified to include urelements. In what follows we shall defend this motivation by examining the structural similarities in question.” (pp. 152-153 of the reprint)

(1) In an intensional language, the mathematical notion of a class might well assume a stronger axiom of extensionality, viz. one in which classes that are composed of their members are necessarily identical when they have the same members. Such an axiom would not in general hold for classes in the logical sense, since co-extensive concepts are not in general necessarily co-extensive. (It would of course hold for those classes in the logical sense that are the extensions of “rigid” concepts, i.e., concepts that have the same extension in every possible world.)

Reprinted as Chapter 2 in *Logical Studies in Early Analytic Philosophy*, pp. 64-118.

"Logicism by the end of the nineteenth century was a philosophical doctrine whose time had come, and it is Gottlob Frege to whom we owe its arrival. "Often," Frege once wrote, "it is only after immense intellectual effort, which may have continued over centuries, that humanity at last succeeds in achieving knowledge of a concept in its pure form, in stripping off the irrelevant accretions which veil it from the eyes of the mind" (Frege, *The Foundations of Arithmetic*, [Fd], xix). Prior to Frege logicism was just such a concept whose pure form was obscured by irrelevant accretions; and in his life's work it was Frege who first presented this concept to humanity in its pure form and developed it as a doctrine of the first rank.

That form, unfortunately, has become obscured once again. For today, as we approach the end of the twentieth century, logicism, as a philosophical doctrine, is said to be dead, and even worse, to be impossible. Frege's logicism, or the specific presentation he gave of it in *Die Grundgesetze der Arithmetik*, ([Gg]), fell to Russell's paradox, and, we are told, it cannot be resurrected. Russell's own subsequent form of logicism presented in [PM], moreover, in effect gives up the doctrine; for in overcoming his paradox, Russell was unable to reduce classical mathematics to logic without making at least two assumptions that are not logically true; namely, his assumption of the axiom of reducibility and his assumption of an axiom of infinity regarding the existence of infinitely many concrete or nonabstract individuals.

Contrary to popular opinion, however, logicism is not dead beyond redemption; that is, if logicism is dead, then it can be easily resurrected. This is not to say that as philosophical doctrines go logicism is true, but only that it can be logically

reconstructed and defended or advocated in essentially the same philosophical context in which it was originally formulated. This is true especially of Frege's form of logicism, as we shall see, and in fact, by turning to his correspondence with Russell and his discussion of Russell's paradox, we are able to formulate not only one but two alternative reconstructions of his form of logicism, both of which are consistent (relative to weak Zermelo set theory).

In regard to Russell's form of logicism, on the other hand, our resurrection will not apply directly to the form he adopted in [PM] but rather to the form he was implicitly advocating in his correspondence with Frege shortly after the completion of [POM]. In this regard, though we shall have occasion to refer to certain features of his later form of logicism, especially in our concluding section where a counterpart to the axiom of reducibility comes into the picture, it is Russell's early form of logicism that we shall reconstruct and be concerned with here.

Though Frege's and Russell's early form of logicism are not the same, incidentally, they are closely related; and one of our goals will be to reconstruct or resurrect these forms with their similarity in mind. In particular, it is our contention that both are to be reconstructed as second order predicate logics in which nominalized predicates are allowed to occur as abstract singular terms. Their important differences, as we shall see, will then consist in the sort of object each takes nominalized predicates to denote and in whether the theory of predication upon which the laws of logic are to be based is to be extensional or intensional." (pp. 64-65 of the reprint)

11. ———. 1986. "Conceptualism, Ramified Logic, and Nominalized Predicates." *Topoi. An International Review of Philosophy* no. 5:75-87.

"The problem of universals as the problem of what predicates stand for in meaningful assertions is discussed in contemporary philosophy mainly in terms of the opposing theories of nominalism and logical realism. Conceptualism, when it is mentioned, is usually identified with intuitionism, which is not a theory of predication but a theory of the activity of constructing proofs in mathematics. Both intuitionism and conceptualism are concerned with the notion of a mental construction, to be sure, and both maintain that there can only be a potentially infinite number of such constructions. But whereas the focus of concern in intuitionism is with the construction of proofs, in conceptualism our concern is with the construction of concepts. This difference sets the two frameworks apart and in pursuit of different goals, and in fact it is not at all clear how the notion of a mental construction in the one framework is related to that in the other. This is especially true insofar as mathematical objects, according to intuitionism, are nothing but mental constructions, whereas in conceptualism concepts are anything but objects. In any case, whatever the relation between the two, our concern in this paper is with conceptualism as a philosophical theory of predication and not with intuitionism as a philosophy of mathematics.

Now conceptualism differs from nominalism insofar as it posits universals, namely, concepts, as the semantic grounds for the correct or incorrect application of predicate expressions. Conceptualism differs from logical realism, on the other hand, insofar as the universals it posits are not assumed to exist independently of the human capacity for thought and representation. Concepts, in other words, are neither predicate expressions nor independently real properties and relations. But then, at least for the kind of conceptualism we have in mind here, neither are they mental images or ideas in the sense of

particular mental occurrences. That is, concepts are not objects (saturated individuals) but are rather cognitive capacities, or cognitive structures otherwise based upon such capacities, to identify and classify or characterize and relate objects in various ways. Concepts, in other words, are intersubjectively realizable cognitive abilities which may be exercised by different persons at the same time as well as by the same person at different times. And it is for this reason that we speak of concepts as objective universals, even though they are not independently real properties and relations.

As cognitive structures, however, concepts in the sense intended here are not Fregean concepts (which for Frege are independently real unsaturated functions from objects to truth values). But they may be modeled by the latter (assuming that there are Fregean concepts to begin with) -especially since as cognitive capacities which need not be exercised at any given time (or even ever for that matter), concepts in the sense intended here also have an unsaturated nature corresponding to, albeit different from, the unsaturated nature of Fregean concepts. Thus, in particular, the saturation (or exercise) of a concept in the sense intended here results not in a truth value but a mental act, and, if overtly expressed, a speech act as well. The un-saturatedness of a concept consists in this regard in its non-occurrent or purely dispositional status as a cognitive capacity, and it is the exercise (or saturation) of this capacity as a cognitive structure which informs particular mental acts with a predicable nature (or with a referential nature in the case of concepts corresponding to quantifier expressions)." 14. ———. 1988. "Predication Versus Membership in the Distinction between Logic as Language and Logic as Calculus." *Synthese* no. 75:37-72.

Contents: 0. Introduction; 1. The problem with a set-theoretic semantics of natural language; 2. Intensional logic as a new theoretical framework for philosophy; 3. The incompleteness of intensional logic when based on membership; 4. Predication versus membership in type theory; 5. Second order predicate logic with nominalized predicates; 6. A set theoretic semantics with predication as fundamental; 7. Concluding remarks.

"There are two major doctrines regarding the nature of logic today. The first is the view of logic as the laws of valid inference, or logic as calculus. This view began with Aristotle's theory of the syllogism, or syllogistic logic, and in time evolved first into Boole's algebra of logic and then into quantificational logic. On this view, logic is an abstract calculus capable of various interpretations over domains of varying cardinality. Because these interpretations are given in terms of a set-theoretic semantics where one can vary the universe at will and consider the effect this, has on the validity of formulas, this view is sometimes described as the set-theoretic approach to logic (see van Heijenoort ["Logic as Language and Logic as Calculus", *Synthese* 17,] 1967, p. 327).

The second view of logic does not eschew set-theoretic semantics, it should be noted, and it may in fact utilize such a semantics as a guide in the determination of validity. But to use such a semantics as a guide, on this view, is not the same as to take that semantics as an essential characterization of validity. Indeed, unlike the view of logic as calculus, this view of logic rejects the claim that a set-theoretic definition of validity has anything other than an extrinsic significance that may be exploited for certain purposes (such as proving a completeness theorem). Instead, on this view, logic has content in its own right and validity is determined by what are called the laws of logic, which may be stated either as principles or as rules. Because one of the goals of this view is a specification of the basic laws of logic from which the others may be derived, this view is sometimes called the axiomatic approach to logic." (p. 37)

(...)

"Concluding Remarks. The account we have given here of the view of logic as language should not be taken as a rejection of the set-theoretical approach or as defense of the metaphysics of possibilist logical realism. Rather, our view is that there are really two types of conceptual framework corresponding to our two doctrines of the nature of logic. The first type of framework is based on membership in the sense of the iterative concept of set; although extensionality is its most natural context (since sets have their being in their members), it may nevertheless be extended to include intensional contexts by way of a theory of senses (as in Montague's sense-denotation intensional logic). The second type of framework is based on predication, and in particular developments it is associated with one or another theory of universals. Extensionality is not the most natural context in this theory, but where it does hold and extensions are posited, the extensions are classes in the logical and not in the mathematical sense.

Russell's paradox, as we have explained, has no real bearing on set-formation in a theory of membership based on the iterative concept of set, but it does bear directly on concept-formation or the positing of universals in a theory based on predication. As a result, our second type of framework has usually been thought to be incoherent or philosophically bankrupt, leaving us with the set-theoretical approach as, the only viable alternative. This is why so much of analytic philosophy in the 20th Century has been dominated by the set-theoretical approach. Set theory, after all, does seem to serve the purposes of a *mathesis universalis*.

What is adequate as a *mathesis universalis*, however, need not also therefore be adequate as a *lingua philosophica* or *characteristica universalis*. In particular, the set-theoretic approach does not seem to provide a philosophically satisfying semantics for natural language; this is because it is predication and not membership that is fundamental to natural language. An adequate semantics for natural language, in other words, seems to demand a conceptual framework based on predication and not on membership.

(...)

We do not maintain, accordingly, that we should give up the set-theoretic approach, especially when dealing with the philosophy and foundations of mathematics, or that only a theory of predication associated with possibilist logical realism will provide an adequate semantics for natural language. In both cases we may find a principle of tolerance, if not outright pluralism, the more appropriate attitude to take." (pp. 69-70)

"Predication has been a central, if not the central, issue in philosophy since at least the time of Plato and Aristotle. Different theories of predication have in fact been the basis of a number of philosophical controversies in both metaphysics and epistemology, not the least of which is the problem of universals. In what follows we shall be concerned with what traditionally have been the three most important types of theories of universals. namely, nominalism, conceptualism, and realism, and with the theories of predication which these theories might be said to determine or characterize.

Though each of these three types of theories of universals may be said to have many variants, we shall ignore their differences here to the extent that they do not characterize different

theories of predication. This will apply especially to nominalism where but one formal theory of predication is involved. In both conceptualism and realism, however, the different variants of each type do not all agree and form two distinct subtypes each with its own theory of predication. For this reason we shall distinguish between a constructive and a holistic form of conceptualism on the one hand, and a logical and a natural realism on the other. Constructive conceptualism, as we shall see, has affinities with nominalism with which it is sometimes confused, and holistic conceptualism has affinities with logical realism with which it is also sometimes confused. Both forms of conceptualism may assume some form of natural realism as their causal ground; and natural realism in turn must presuppose some form of conceptualism as its background theory of predication. Both forms of realism may be further divided into their essentialist and non-essentialist variants (and in logical realism even a form of anti-essentialism), and though an essentialist logical realism is sometimes confused with Aristotelian essentialism, the latter is really a form of natural realism with natural kinds as the only essential properties objects can have." (pp. 253-254)

16. ———. 1989. "Russell's Theory of Logical Types and the Atomistic Hierarchy of Sentences." In *Rereading Russell: Essays on Bertrand Russell's Metaphysics and Epistemology*, edited by Savage, C.Wade and Anderson, C.Anthony, 41-62. Minneapolis: University of Minnesota Press.

Reprinted as Chapter 5 in *Logical Studies in Early Analytic Philosophy*, pp. 193-221.

"Russell's philosophical views underwent a number of changes throughout his life, and it is not always well-appreciated that views he held at one time came later to be rejected; nor, similarly, that views he rejected at one time came later to be accepted. It is not well-known, for example, that the theory of logical types Russell described in his later or post-[PM] philosophy is not the same as the theory originally described in [PM] in 1910-13; nor that some of the more important applications that Russell made of the theory at the earlier time cannot be validated or even significantly made in the

framework of his later theory. What is somewhat surprising, however, is that Russell himself seems not to have realized that he was describing a new theory of logical types in his later philosophy, and that as a result of the change some of his earlier logical constructions, including especially his construction of the different kinds of numbers, were no longer available to him.

In the original framework, for example, propositional functions are independently real properties and relations that can themselves have properties and relations of a higher order/type, and all talk of classes, and thereby ultimately of numbers, can be reduced to extensional talk of properties and relations as “single entities,” or what Russell in [POM] had called “logical subjects.” The Platonic reality of classes and numbers was replaced in this way by a more fundamental Platonic reality of propositional functions as properties and relations. In Russell's later philosophy, however, “a propositional function is nothing but an expression. It does not, by itself, represent anything. But it can form part of a sentence which does say something, true or false” (Russell, *My Philosophical Development*, ([MPD]), 69). Surprisingly, Russell even insists that this was what he meant by a propositional function in [PM]. “Whitehead and I thought of a propositional function as an expression containing an undetermined variable and becoming an ordinary sentence as soon as a value is assigned to the variable: ‘x is human’, for example, becomes an ordinary sentence as soon as we substitute a proper name for V. In this view . . . the propositional function is a method of making a bundle of such sentences” ([MPD], 124). Russell does realize that some sort of change has come about, however, for he admits, “I no longer think that the laws of logic are laws of things; on the contrary, I now regard them as purely linguistic” (ibid., 102).

(...)

Now it is not whether [PM] can sustain a nominalistic interpretation that is our concern in this essay, as we have said, but rather how it is that Russell came to be committed in his

later philosophy to the atomistic hierarchy and the nominalistic interpretation of propositional functions as expressions generated in a ramified second order hierarchy of languages based on the atomistic hierarchy. We shall pursue this question by beginning with a discussion of the difference between Russell's 1908 theory of types and that presented in [PM] in 1910. This will be followed by a brief summary of the ontology that Russell took to be implicit in [PM], and that he described in various publications between 1910 and 1913. The central notion in this initial discussion is what Russell in his early philosophy called the notion of a logical subject, or equivalently that of a "term" or "single entity". (In [PM], this notion was redescribed as the systematically ambiguous notion of an "object.") As explained in chapter 1 this notion provides the key to the various problems that led Russell in his early philosophy to the development of his different theories of types, including that presented in [PM]. This remains true, moreover, even when we turn to Russell's later philosophy, i.e., to his post-[PM] views, only then it is described as the notion of what can and cannot be named in a logically perfect language. The ontology of these later views is what Russell called logical atomism, and it is this ontology that determines what Russell described as the atomistic hierarchy of sentences. In other words, it is the notion of what can and cannot be named in the atomistic hierarchy that explains how Russell, however unwittingly, came to replace his earlier theory of logical types by the theory underlying the atomistic hierarchy of sentences as the basis of a logically perfect language." (pp. 193-195 of the reprint)

"0. Introduction

Linguists and philosophers are sometimes at odds in the semantical analysis of language. This is because linguists tend to assume that language must be semantically analyzed in terms of mental constructs, whereas philosophers tend to assume that only a platonic realm of intensional entities will suffice. The problem for the linguist in this conflict is how to explain the apparent realist posits we seem to be committed to in our use of language, and in particular in our use of infinitives, gerunds and other forms of nominalized predicates. The problem for the philosopher is the old and familiar one of how we can have knowledge of independently real abstract entities if all knowledge must ultimately be grounded in psychological states and processes. In the case of numbers, for example, this is the problem of how mathematical knowledge is possible. In the case of the intensional entities assumed in the semantical analysis of language, it is the problem of how knowledge of even our own native language is possible, and in particular of how we can think and talk to one another in all the ways that language makes possible.

I believe that the most natural framework in which this conflict is to be resolved and which is to serve as the semantical basis of natural language is an intensional logic that is based upon a conceptual analysis of predication in which what a predicate stands for in its role as a predicate is distinguished from what its nominalization denotes in its role as a singular term. Predicates in such a framework stand for concepts as cognitive

capacities to characterize and relate objects in various ways, i.e. for dispositional cognitive structures that do not themselves have an individual nature, and which therefore cannot be the objects denoted by predicate nominalizations as abstract singular terms. The objects purportedly denoted by nominalized predicates, on the other hand, are intensional entities, e.g. properties and relations (and propositions in the case of zero-place predicates), which have their own abstract form of individuality, which, though real, is posited only through the concepts that predicates stand for in their role as predicates. That is, intensional objects are represented in this logic as concept-correlates, where the correlation is based on a logical projection of the content of the concepts whose correlates they are.

(...)

Before proceeding, however, there is an important distinction regarding the notion of a logical form that needs to be made when joining conceptualism and realism in this way. This is that logical forms can be perspicuous in either of two senses, one stronger than the other. The first is the usual sense that applies to all theories of logical form, conceptualist or otherwise; namely, that logical forms are perspicuous in the way they specify the truth conditions of assertions in terms of the recursive operations of logical syntax. In this sense, fully applied logical forms are said to be semantic structures in their own right. In the second and stronger sense, logical forms may be perspicuous not only in the way they specify the truth conditions of an assertion, but in the way they specify the cognitive structure of that assertion as well. To be perspicuous in this sense, a logical form must provide an appropriate representation of both the referential and the predicable concepts that underlie an assertion.

Our basic hypothesis in this regard will be that every basic assertion is the result of applying just one referential concept and one predicable concept, and that such an applied predicable concept is always fully intensionalized (in a sense to be explained). This will place certain constraints on the

conditions for when a complex predicate expression is perspicuous in the stronger sense — such as that a referential expression can occur in such a predicate expression only in its nominalized form. (A similar constraint will also apply to a defining or restricting relative clause of a referential expression.) In the cases where a relational predicable concept is applied, the assumption that there is still but one referential concept involved leads to the notion of a conjunctive referential concept, a notion that requires the introduction in intensional logic of special quantifiers that bind more than one individual variable. Except for briefly noting the need for their development, we shall not deal with conjunctive quantifiers in this essay." (pp. 15-16)

18. ———. 1991. "Conceptualism." In *Handbook of Metaphysics and Ontology*, edited by Smith, Barry and Burkhardt, Hans, 168-174. Munich: Philosophia Verlag.

Conceptualism is one of the three types of theories regarding the nature of universals described by Porphyry in his introduction to Aristotle's *Categories*. The other two are nominalism and realism. Because a universal, according to Aristotle, is that which can be predicated of things (*De Int.* 17a39), the difference between these three types of theories lies in what it is that each takes to be predicable of things. In this regard we should distinguish predication in language from predication in thought, and both from predication in reality, where there is no presumption that one kind of predication precludes the others.

All three types of theories agree that there is predication in language, in particular that predicates can be predicated of things in the sense of being true or false of them. Nominalism goes further in maintaining that only predicates can be predicated of things, that is, that there are no universals other than the predicate expressions of some language or other. Conceptualism opposes nominalism in this regard and maintains that predicates can be true or false of things only because they stand for concepts, where concepts are the universals that are the basis of predication in thought. Realism also opposes nominalism in maintaining that there are real

universals, viz. properties and relations, that are the basis of predication in reality." (p. 168)

(...)

"Conceptualism is by no means a monolithic theory, but has many forms, some more restrictive than others, depending on the mechanisms assumed as the basis for concept-formation. None of these forms, in themselves, precludes being combined with a realist theory, whether Aristotelian (as in conceptual natural realism) or Platonist (as in conceptual intensional realism), or both. Some conceptualists, such as Sellars, have made it a point to disassociate conceptualism from any form of realism regarding abstract entities, but that disassociation has nothing to do with conceptualism as a theory about the nature of predication in thought. Conceptualism's shift in emphasis from metaphysics to psychology, in other words, while important in determining what kind of theory is needed to explain predication in thought, should not be taken as justifying a restrictive form of conceptualism that precludes both a natural and an intensional realism." (p. 174)

19. ———. 1991. "Logic V: Higher Order Logics." In *Handbook of Metaphysics and Ontology*, edited by Smith, Barry and Burkhardt, Hans, 466-470. Munich: Philosophia Verlag.

"Higher-order logic goes beyond first-order logic in allowing quantifiers to reach into the predicate as well as the subject positions of the logical forms it generates. A second feature, usually excluded in standard formulations of second-order logic, allows nominalized forms of predicate expressions (simple or complex) to occur in its logical forms as abstract singular terms. (E.g., 'Socrates is wise', in symbols $W(s)$, contains 'is wise' as a predicate, whereas 'Wisdom is a virtue', in symbols $V(W)$, contains 'wisdom' as a nominalized form of that predicate. 'Being a property is a property', in symbols $P(P)$, or with λ -abstracts, $P\lambda xP(x)$, where $\lambda xP(x)$ is read 'to be an x such that x is a property', contains both the predicate 'is a property' and a nominalized form of that predicate, viz. 'being a property'. Frege's well-known example, 'The concept Horse is

not a concept', contains 'the concept Horse' as a nominalized form of the predicate phrase 'is a horse'.)" (p. 466)

20. ———. 1991. "Ontology, Fomal." In *Handbook of Metaphysics and Ontology*, edited by Smith, Barry and Burkhardt, Hans, 640-647. Munich: Philosophia Verlag.

"Formal ontology is the result of combining the intuitive, informal method of classical ontology with the formal, mathematical method of modern symbolic logic, and ultimately identifying them as different aspects of one and the same science. That is, where the method of ontology is the intuitive study of the fundamental properties, modes, and aspects of being, or of entities in general, and the method of modern symbolic logic is the rigorous construction of formal, axiomatic systems, formal ontology, the result of combining these two methods, is the systematic, formal, axiomatic development of the logic of all forms and modes of being. As such, formal ontology is a science prior to all others in which particular forms, modes, or kinds of being are studied." (p. 641)

21. ———. 1991. "Russell, Bertrand." In *Handbook of Metaphysics and Ontology*, edited by Smith, Barry and Burkhardt, Hans, 796-798. Munich: Philosophia Verlag.

"Russell held a number of different metaphysical positions throughout his career, with the idea of logic as a logically perfect language being a common theme that ran through each.

(...)

"A fundamental notion of Russell's logical realism, sometimes also called ontological logicism, was that of a propositional function, the extension of which Russell took to be a class as many. Initially, as part of his response to the problem of the One and the Many, Russell had assumed that each propositional function was a single and separate entity over and above the many propositions that were its values, and, similarly, that to each class as many there corresponded a class as one. Upon discovering his paradox, Russell maintained that we must distinguish a class as many from a class as one, and that a class as one might not exist corresponding to a class as

many. He also concluded that a propositional function cannot survive analysis after all, but 'lives' only in the propositions that are its values, i.e. that propositional functions are nonentities."

(...)

"As a result of arguments given by Ludwig Wittgenstein in 1913, Russell, from 1914 on, gave up the Platonistic view that properties and relations could be logical subjects. Predicates were still taken as standing for properties and relations, but only in their role as predicates; i.e., nominalized predicates were no longer allowed as abstract singular terms in Russell's new version of his logically perfect language. Only particulars could be named in Russell's new metaphysical theory, which he called logical atomism, but which, unlike his earlier 1910-13 theory, is a form of natural realism, and not of logical realism, since now the only real properties and relations of his ontology are the simple material properties and relations that are the components of the atomic facts that make up the world. Complex properties and relations in this framework are simply propositional functions, which, along with propositions, are now merely linguistic expressions. (Russell remained unaware that as a result of the change in his metaphysical views from logical to natural realism his original theory of types was restricted to the much weaker sub-theory of ramified second-order logic, and that he could no longer carry through his logicist programme. This reinforced the confusion of nominalists into thinking that Russell's earlier theory of types could be given a nominalistic interpretation, since such an interpretation is possible for ramified second-order logic.)" (pp. 797-798)

22. ———. 1991. "Quantification, Time and Necessity." In *Philosophical Applications of Free Logic*, edited by Lambert, Karel, 242-256. New York: Oxford University Press.

Contents: 0. Introduction; 1. A Logic a Actual and Possible Objects; 2. A Completeness Theorem for Tense Logic; 3. Modality Within Tense Logic; 4. Some Observations on Quantifiers in Modal and Tense Logic; 5. Concluding Remarks.

Abstract: "A logic of actual and possible objects is formulated in which "existence" and "being", as second-level concepts represented by first-order (objectual) quantifiers, are distinguished. A free logic of actual objects is then distinguished as a subsystem of the logic of actual and possible object. Several complete first-order tense logics are then formulated in which temporal versions of possibilism and actualism are characterized in terms of the free logic of actual objects and the wide logic of actual and possible objects. It is then shown how a number of different modal logics can be interpreted within quantified tense logic, with the latter providing a paradigmatic framework in which to distinguish the interplay between quantifiers, tenses and modal operators and within which we can formulate different temporal versions of actualism and possibilism."

"The fundamental assumption of a logic of actual and possible objects is that the concept of existence is not the same as the concept of being. Thus, even though necessarily whatever exists has being, it is not necessary in such a logic that whatever has being exists; that is, it can be the case that there be something that does not exist. No occult doctrine is needed to explain the distinction between existence and being, for an obvious explanation is already at hand in a framework of tense logic in which being encompasses past, present, and future objects (or even just past and present objects) while existence encompasses only those objects that presently exist. We can interpret modality in such a framework, in other words, whereby it can be true to say that some things do not exist. Indeed, as indicated in Section 3, infinitely many different modal logics can be interpreted in the framework of tense logic. In this regard, we maintain, tense logic provides a paradigmatic framework in which possibilism (i.e., the view that existence is not the same as being, and that therefore there can be some things that do not exist) can be given a logically perspicuous representation.

Tense logic also provides a paradigmatic framework for actualism as the view that is opposed to possibilism; that is, the view that denies that the concept of existence is different from

the concept of being. Indeed, as we understand it here, actualism does not deny that there can be names that have had denotations in the past but that are now denotationless, and hence that the statement that some things do not exist can be true in a semantic metalinguistic sense (as a statement about the denotations, or lack of denotations, of singular terms). What is needed, according to actualism, is not that we should distinguish the concept of existence from the concept of being, but only that we should modify the way that the concept of existence (being) is represented in standard first-order predicate logic (with identity). A first-order logic of existence should allow for the possibility that some of our singular terms might fail to denote an existent object, which, according to actualism, is only to say that those singular terms are denotationless rather than what they denote are objects (beings) that do not exist. Such a logic for actualism amounts to what nowadays is called free logic." (pp. 242-243)

23. ———. 1992. "Conceptual Realism Versus Quine on Classes and Higher-Order Logic." *Synthese* no. 90:379-436.

Contents: 0. Introduction; 1. Predication versus Membership; 2. Old versus New Foundations; 3. Concepts versus ultimate Classes; 4. Frege versus Quine on Higher-Order Logic; 5. Conceptualism versus Nominalism as Formal Theories of predication; 6. Conceptualism Ramified versus Nominalism Ramified; 7. Constructive Conceptual Realism versus Quine's view of Conceptualism as a Ramified Theory of Classes; 8. Holistic Conceptual Realism versus Quine's Class Platonism.

Abstract: "The problematic features of Quine's 'set' theories NF and ML are a result of his replacing the higher-order predicate logic of type theory by a first-order logic of membership, and can be resolved by returning to a second-order logic of predication with nominalized predicates as abstract singular terms. We adopt a modified Fregean position called conceptual realism in which the concepts (unsaturated cognitive structures) that predicates stand for are distinguished from the extensions (or intensions) that their nominalizations denote as singular terms. We argue against Quine's view that predicate quantifiers can be given a referential interpretation only if the

entities predicates stand for on such an interpretation are the same as the classes (assuming extensionality) that nominalized predicates denote as singular terms. Quine's alternative of giving predicate quantifiers only a substitutional interpretation is compared with a constructive version of conceptual realism, which with a logic of nominalized predicates is compared with Quine's description of conceptualism as a ramified theory of classes. We argue against Quine's implicit assumption that conceptualism cannot account for impredicative concept-formation and compare holistic conceptual realism with Quine's class Platonism."

"According to Quine, in one of his later works, the pioneers in modern logic, such as Frege and Russell, overestimated the kinship between membership and predication and in that way came to view set theory as logic (Quine 1970, p. 65). Such a claim, we maintain, is both false and misleading. Frege and Russell did assume a logical kinship between predication and membership, but what they meant by membership was membership in a class as the extension of a concept (where a concept is a predicable entity, i.e., a universal in the traditional sense) and not membership in a set. Sets, unlike classes, as we have said, have their being in their members, and in that regard there need be no kinship at all between predication and membership in a set. Classes in the logical sense, on the other hand, have their being in the concepts whose extensions they are, which means that any theory of membership in a class presupposes a superseding theory of predication. (3) Frege and Russell did not view set theory as logic, but they each did develop a theory

of classes and they each did so based on a superseding higher-order theory of predication." (p. 382)

24. ——. 1992. "Cantor's Power-Set Theorem Versus Frege's Double-Correlation Thesis." *History and Philosophy of Logic* no. 13:179-201.

Abstract: "Frege's thesis that second-level concepts can be correlated with first-level concepts and that the latter can be correlated with their value-ranges is in direct conflict with

Cantor's power-set theorem, which is a necessary part of the iterative, but not of the logical, concept of class. Two consistent second-order logics with nominalised predicates as abstract singular terms are described in which Frege's thesis and the logical notion of a class are defended and Cantor's theorem is rejected. Cantor's theorem is not incompatible with the logical notion of class, however. Two alternative similar kinds of logics are also described in which Cantor's theorem and the logical notion of a class are retained and Frege's thesis is rejected."

"There is another problem with Russell's solution, however, in addition to that of the relativisation of classes to each logical type. This problem has to do with the fact that the particular theory of types that Russell adopted is a theory of ramified types, which, unlike the theory of simple types, is based on a constructive (i.e. 'predicative') comprehension principle. Such a constructive approach is not without merit, but it does affect the logical notion of a class in a fundamental way. In particular, because of the kind of constructive constraints imposed by the theory on the comprehension principle, Cantor's theorem, which involves objects of different types, cannot be proved in such a framework (cf. Quine 1963, 265). That is not objectionable in itself, but it does not get at the root of the matter of the real conflict between Cantor's power-set theorem and the logical notion of class as represented by an impredicative comprehension principle.

An impredicative comprehension principle is provable in the theory of simple types. But in this framework, as in the theory of ramified types as well, Russell's paradox cannot even be stated (because of the grammatical constraints on the conditions of well-formedness), which means that the description of the class upon which Russell's paradox is based is meaningless. Thus, not only must the universal class be relativised and duplicated, potentially, infinitely many times in order to avoid Russell's paradox on this approach, but the paradox must itself be ruled as meaningless. The theory of types, whether simple or ramified, is not really a solution of the problem so much as a way of avoiding it altogether.

There is another way in which we can preserve our logical intuitions and not give up the logical notion of a class in favor of the mathematical (i.e. in favor of set theory), and yet in which not only is Cantor's theorem formulable but so is Russell's paradox—though, of course, the latter will no longer be provable. Indeed, there is not just one such way, but at least two (both of which themselves have two alternatives). On the first, it is not the logical notion of a class that must be rejected as the way of resolving Russell's paradox, but Cantor's theorem instead. This rejection is not ad hoc or arbitrary on this approach, but is based on a more general principle, which we refer to as Frege's double-correlation thesis. It is this approach that we shall turn to first. On the second and alternative approach, which we shall turn to later, the trouble lies in neither Cantor's theorem nor in the assumption that there is a universal class (both of which can be retained without contradiction on this approach), but rather in how the logic of identity is to be applied in certain contexts. On this approach, the claim that a contradiction results by combining Cantor's theorem with the assumption that the universal class exists is not a 'truism' after all but is outright false."

Annotated bibliography of Nino Cocchiarella 1993-2019

Essays 1993-2019

1. Cocchiarella, Nino. 1993. "On Classes and Higher-Order Logic: A Critique of W.V.O. Quine." *Philosophy and the History of Science. A Taiwanese Journal* no. 2:23-50.

Abstract: "The problematic features of Quine's set theories NF and ML result from compressing the higher-order predicate logic of type theory into a first-order logic of membership, and can be resolved by turning to a second-order predicate logic with nominalized predicates as abstract singular terms. A modified Fregean position, called conceptual realism, is described in which the concepts (unsaturated cognitive structures) that predicates stand for are distinguished from the extensions (or intensions) that their nominalizations denote as abstract singular terms. Quine's view that conceptualism cannot account for impredicative concept-formation is rejected, and a holistic conceptual realism is compared with Quine's class Platonism."

2. ——. 1995. "Knowledge Representation in Conceptual Realism." *International Journal of Human-Computer Studies* no. 43:697-721.

"Knowledge representation in Artificial Intelligence (AI) involves more than the representation of a large number of facts or beliefs regarding a given domain, i.e. more than a mere listing of those facts or beliefs as data structures. It may involve, for example, an account of the way the properties and relations that are known or believed to hold of the objects in

that domain are organized into a theoretical whole - such as the way different branches of mathematics, or of physics and chemistry, or of biology and psychology, etc., are organized, and even the way different parts of our commonsense knowledge or beliefs about the world can be organized. But different theoretical accounts will apply to different domains, and one of the questions that arises here is whether or not there are categorial principles of representation and organization that apply across all domains regardless of the specific nature of the objects in those domains. If there are such principles, then they can serve as a basis for a general framework of knowledge representation independently of its application to particular domains. In what follows I will give a brief outline of some of the categorial structures of conceptual realism as a formal ontology. It is this system that I propose we adopt as the basis of a categorial framework for knowledge representation." (p. 697)

(...)

" Concluding remarks. We have given here only an overview or sketch of conceptual realism as a formal ontology, i.e. as a theory of logical form having both conceptual and ontological categories - but in which the latter are represented in terms of the former. The categories of natural kinds and of natural properties and relations, for example, are represented in terms of the categories of sortals and predicable concepts, respectively, and the category of abstract objects is represented in terms of the process of conceptual nominalization (reification) as a subcategory of objects. Not all of these categories or parts of this formal ontology will be relevant in every domain of knowledge representation, but each is relevant at least to some domains and is needed in a comprehensive framework for knowledge representation. In those domains where certain categorial distinctions are not needed - such as that between predicative and impredicative concepts, or that between predicable concepts and natural properties and relations, or between sortal concepts and natural kinds, etc. - we can simply ignore or delete the logical forms in question. What must remain as the core of the system is the intensional

logic around which all of the other categories are built - namely, the second-order predicate logic with nominalized predicates as abstract singular terms that we call HST*-lambda. It is this core, I believe, that can serve as a universal standard by which to evaluate other representational systems." (p. 721)

3. ———. 1996. "Conceptual Realism as a Formal Ontology." In *Formal Ontology*, edited by Poli, Roberto and Simons, Peter, 27-60. Dordrecht: Kluwer.

Contents: 1. Introduction; 2. Substitutional versus Ontological Interpretations of Quantifiers; 3. The Importance of the Notion of Unsaturatedness in Formal Ontology; 4. Referential and Predicable Concepts Versus Immanent Objects of Reference; 5. Conceptual Natural Realism and the Analogy of Being Between Natural and Intelligible Universals; 6. Conceptual Natural Realism and Aristotelian Essentialism; 7. Conceptual Intensional Realism versus Conceptual Platonism and the Logic of Nominalized Predicates

8. Concluding Remarks.

Abstract: "Conceptualism *simpliciter*, whether constructive or holistic, provides an account of predication only in thought and language, and represents in that regard only a truncated formal ontology. But conceptualism can be extended to an Aristotelian conceptual natural realism in which natural properties and relations (and natural kinds as well) can be analogically posited corresponding to some of our concepts, thereby providing an account of predication in the space-time causal Order as well. In addition, through a pattern of reflexive abstraction corresponding to the process of nominalization in language (and in which abstract objects are hypostatized corresponding to our concepts as unsaturated cognitive structures), conceptualism can also be extended to a conceptual Platonism or intensional realism that can provide an account of both the intensional objects of fiction and the extensional objects of mathematics. Conceptual realism is thus shown to be a paradigm formal ontology in which the distinctions between abstract reality, natural reality, and thought and language are properly represented, and in which the traditional opposition

between Platonism and Aristotelianism is finally overcome by properly locating their different functions, and the way each should be represented, in formal ontology."

"Concluding Remarks. As this informal sketch indicates, conceptual realism, by which we mean conceptual natural realism and conceptual intensional realism together, provides the basis of a general conceptual-ontological framework, within which, beginning with thought and language, a comprehensive formal ontology can be developed. Not only does conceptual realism explain how, in naturalistic terms, predication in thought and language is possible, but, in addition, it provides a theory of the nature of predication in reality through an analogical theory of properties and relations. In this way, conceptual realism can be developed into a reconstructed version of Aristotelian realism, including a version of Aristotelian essentialism. In addition, through the process of nominalization, which corresponds to a reflexive abstraction in which we attempt to represent our concepts as if they were objects, conceptualism can be developed into a conceptual intensional realism that can provide an account not only of the abstract reality of numbers and other mathematical objects, but of the intensional objects of fiction and stories of all kinds, both true and false, and including those stories that we systematically develop into theories about the world. In this way, conceptual realism provides a framework not only for the conceptual and natural order, but for the mathematical and intensional order as well. Also, in this way, conceptual realism is able to reconcile and provide a unified account both of Platonism and Aristotelian realism, including Aristotelian essentialism - and it does so by showing how the ontological categories, or modes of being, of each of these ontologies can be explained in terms a conceptualist theory of predication and its analogical extensions." (p. 60)

4. ——. 1997. "Formally Oriented Work in the Philosophy of Language." In *Routledge History of Philosophy. Vol. X - The Philosophy of Meaning, Knowledge and Value in the 20th Century*, edited by Canfield, John, 39-75. New York: Routledge.

Contents: 1. The notion of a *Characteristica Universalis* as a philosophical language; 2. The notion of a logically perfect language as a regulating ideal; 3. The theory of logical types; 4. Radical empiricism and the logical construction of the world; 5. The logical empiricist theory of meaning; 6. Semiotic and the trinity of syntax, semantics and pragmatics; 7. Pragmatics from a logical point of view; 8. Intensional logic; 9. Universal Montague grammar; 10. Speech-act theory and the return to pragmatics.

Abstract: "One of the perennial issues in philosophy is the nature of the various relationships between language and reality, language and thought, and language and knowledge. Part of this issue is the question of the kind of methodology that is to be brought to bear on the study of these relationships. The methodology that we shall discuss here is based on a formally oriented approach to the philosophy of language, and specifically on the notion of a logically ideal language as the basis of a theory of meaning and a theory of knowledge."

5. ———. 1997. "Conceptual Realism as a Theory of Logical Form." *Revue Internationale de Philosophie*:175-199.

"The central notion in the philosophy of logic is the notion of a logical form, and the central issue is which theory of logical form best represents our scientific (including our mathematical) and commonsense understanding of the world. Here, by a theory of logical

form, we mean not only a logical grammar in the sense of a system of formation rules characterizing the well-formed expressions of the theory, but also a logical calculus characterizing what is valid (i.e., provable or derivable) in the theory. The representational role of the logical forms of such a theory consists in the fact that they are perspicuous in the way they specify the truth conditions, and thereby the validity, of formulas in terms of the recursive operations of logical syntax. In conceptualism we also require that logical forms be perspicuous in the way they represent the cognitive structure of our speech and mental acts, including in particular the referential and predicable concepts underlying those acts.

The purpose of a theory of logical form, accordingly, is that it is to serve as a general semantical framework by which we can represent in a logically perspicuous way our commonsense and scientific understanding of the world, including our understanding of ourselves

and the cognitive structure of our speech and mental acts. So understood, the logical forms of such a theory are taken to be semantic structures in their own right, relative to which the words, phrases, and (declarative) sentences of a (fragment of) natural language, or of a scientific or mathematical theory, are to be represented and interpreted. The process by which the expressions of a natural language or scientific theory are represented and interpreted in such a theory — relative to the aims, purposes and pragmatic considerations regarding a given context or domain of discourse — amounts to a logical analysis of those expressions. (A different group of aims, purposes, etc., might give a finer- or a coarser-grained analysis of the domain.)

Ideally, where the syntax of a target language or theory has been recursively characterized, such an analysis can be given in terms of a precisely characterized theory of translation (1). Usually, however, the analysis is given informally.

In what follows I will briefly describe and attempt to motivate some (but not all) aspects of a theory of logical form that I associate with the philosophical system I call conceptual realism. The realism involved here is really of two types, one a natural realism (amounting to a modern form of Aristotelian essentialism) and the other an intensional realism (amounting to a modern, but also mitigated, form of Platonism). The core of the theory is a second-order logic in which predicate expressions (both simple and complex) can be nominalized and treated as abstract singular terms (in the sense of being substituends of individual variables). In this respect the core is really a form of conceptual intensional realism, which is the only part of the system we will discuss here (2)." (pp. 175-176)

(1) See Montague (1969) for a description of such a theory of translation (for Montague's type-theoretical intensional logic).

(2) See Cocchiarella (1996), §§ 5-6, for a description of conceptual natural realism as a modern form of Aristotelian Essentialism.

6. ———. 1998. "Property Theory." In *Routledge Encyclopedia of Philosophy - Vol. 7*, edited by Craig, Edward, 761-767. New York: Routledge.

Abstract: "Traditionally, a property theory is a theory of abstract entities that can be predicated of things. A theory of properties in this sense is a theory of predication -just as a theory of classes or sets is a theory of membership. In a formal theory of predication, properties are taken to correspond to some (or all) one-place predicate expressions. In addition to properties, it is usually assumed that there are n-ary relations that correspond to some (or all) n-place predicate expressions (for $n > 2$). A theory of properties is then also a theory of relations.

In this entry we shall use the traditional labels 'realism' and 'conceptualism' as a convenient way to classify theories. In natural realism, where properties and relations are the physical, or natural, causal structures involved in the laws of nature, properties and relations correspond to only some predicate expressions, whereas in logical realism properties and relations are generally assumed to correspond to all predicate expressions.

Not all theories of predication take properties and relations to be the universals that predicates stand for in their role as predicates. The universals of conceptualism, for example, are unsaturated concepts in the sense of cognitive capacities that are exercised (saturated) in thought and speech. Properties and

relations in the sense of intensional Platonic objects may still correspond to predicate expressions, as they do in conceptual intensional realism, but only indirectly as the intensional contents of the concepts that predicates stand for in their role as predicates. In that case, instead of properties and relations being what predicates stand for directly, they are what nominalized predicates denote as abstract singular terms. It is in this way that concepts - such as those that the predicate phrases 'is wise', 'is triangular' and 'is identical with' stand for - are distinguished from the properties and relations that are their intensional contents - such as those that are denoted by the abstract singular terms 'wisdom', 'triangularity' and 'identity, respectively. Once properties are represented by abstract singular terms, concepts can be predicated of them, and, in particular, a concept can be predicated of the property that is its intensional content. For example, the concept represented by 'is a property' can be predicated of the property denoted by the abstract noun phrase 'being a property', so that 'being a property is a property' (or, 'The property of being a property is a property') becomes well-formed. In this way, however, we are confronted with Russell's paradox of (the property of) being a non-self-predicable property, which is the intensional content of the concept represented by 'is a non-self-predicable property'. That is, the property of being a non-self-predicable property both falls and does not fall under the concept of being a non-self-predicable property (and therefore both falls and does not fall under the concept of being self-predicable)." (p. 761)

7. ———. 1998. "The Theory of Types (Simple and Ramified)." In *Routledge Encyclopedia of Philosophy - Vol. 9*, edited by Craig, Edward, 359-362. New York: Routledge.

Abstract: "The theory of types was first described by Bertrand Russell in 1908. He was seeking a logical theory that could serve as a framework for mathematics and, in particular, a theory that would avoid the so-called 'vicious-circle' antinomies, such as his own paradox of the property of those properties that are not properties of themselves - or, similarly, of the class of those classes that are not members of themselves.

Such paradoxes can be thought of as resulting when logical distinctions are not made between different types of entities and, in particular, between different types of properties and relations that might be predicated of entities, such as the distinction between concrete objects and their properties, and the properties of those properties, and so on. In 'ramified' type theory, the hierarchy of properties and relations is, as it were, two-dimensional, where properties and relations are distinguished first by their order, and then by their level within each order. In 'simple' type theory properties and relations are distinguished only by their orders." (p. 359)

8. ———. 1998. "Reference in Conceptual Realism." *Synthese* no. 114:169-202.

Contents: 1. The core of Conceptual Intensional Realism; 2. Referential concepts, simple and complex; 3. Geach's negation and complex predicate arguments; 4. Active versus deactivated referential concepts; 5. Deactivation and Geach's arguments; 6. Relative pronouns and referential concepts; 7. Relative pronouns as referential expressions; 8. Concluding remarks.

Abstract: "A conceptual theory of the referential and predicable concepts used in basic speech and mental acts is described in which singular and general, complex and simple, and pronominal and non-pronominal, referential concepts are given a uniform account. The theory includes an intensional realism in which the intensional contents of predicable and referential concepts are represented through nominalized forms of the predicate and quantifier phrases that stand for those concepts. A central part of the theory distinguishes between active and deactivated referential concepts, where the latter are represented by nominalized quantifier phrases that occur as parts of complex predicates. Peter Geach's arguments against theories of general reference in "Reference and Generality" are used as a foil to test the adequacy of the theory. Geach's arguments are shown to either beg the question of general as opposed to singular reference or to be inapplicable because of the distinction between active and deactivated referential concepts."

"Concluding Remarks. We do not claim that the theory of relative pronouns as referential expressions proposed in Section 7 is unproblematic, it should be noted. If it should turn out that it cannot be sustained, then we still have the theory proposed in Section 6, where relative pronouns are taken as anaphoric proxies for non-pronominal referential expressions. In other words, whether the proposal of Section 7 is sustained or not, we maintain that Geach's arguments against complex names and general reference do not work against the kind of conceptualist theory we have presented here.

We also do not claim to have proved that our conceptualist theory of reference resolves all problems about reference, but only that it has passed an initial test of adequacy as far as Geach's arguments in (Geach Reference and Generality third edition, 1980) are concerned. It is our view that a conceptualist theory is what is needed to account for reference and predication in our speech and mental acts, and that only a theory of the referential and predicable concepts that underlie the basic forms of such acts will suffice. Such a theory, we maintain, must provide a uniform account of general as well as singular reference, and, in terms of the referential and predicable concepts involved in a speech or mental act, it must distinguish the logical forms that represent the cognitive structure of that act from the logical forms that only represent its truth conditions. That, in any case, is the kind of conceptualist theory we have attempted to describe and defend here." (p. 198)

10. ———. 2000. "Russell's Paradox of the Totality of Propositions." *Nordic Journal of Philosophical Logic* no. 5:25-37.

Abstract: "Russell's "new contradiction" about "the totality of propositions" has been connected with a number of modal paradoxes. M. Oksanen has recently shown how these modal

paradoxes are resolved in the set theory NFU. Russell's paradox of the totality of propositions was left unexplained, however. We reconstruct Russell's argument and explain how it is resolved in two intensional logics that are equiconsistent with NFU. We also show how different notions of possible worlds are represented in these intensional logics."

"In Appendix B of his 1903 *Principles of Mathematics* (PoM), Russell described a "new contradiction" about "the totality of propositions" that his "doctrine of types" (as described in Appendix B) was unable to avoid. (1)

In recent years this "new contradiction" has been connected with a number of modal paradoxes, some purporting to show that there cannot be a totality of true propositions, (2) or that even the idea of quantifying over the totality of propositions leads to contradiction. (3) A number of these claims have been discussed recently by Mika Oksanen and shown to be spurious relative to the set theory known as NFU. (4) In other words, if NFU is used instead of ZF as the semantical metalanguage for modal logic, the various "paradoxes" about the totality of propositions (usually construed as the totality of sets of possible worlds) can be seen to fail (generally because of the existence of a universal set and the failure of the general form of Cantor's power-set theorem in NFU). It is not clear, however, how Russell's own paradox about the totality of propositions is resolved on this analysis, and although Oksanen quoted Russell's description of the paradox in detail, he did not show how it is explained in NFU after his resolution of the other related modal paradoxes; in fact, it is not at all clear how this might be done in NFU.

One reason why Russell's argument is difficult to reconstruct in NFU is that it is based on the logic of propositions, and implicitly in that regard on a theory of predication rather than a theory of membership. A more appropriate medium for the resolution of these paradoxes, in other words, would be a formal theory of predication that is a counterpart to NFU.

Fortunately, there are two such theories, λ HST* and HST* λ , that are equiconsistent with NFU and that share with it many of

the features that make it a useful framework within which to resolve a number of paradoxes, modal or otherwise. (5)" (pp. 25-26)

11. ———. 2001. "A Logical Reconstruction of Medieval Terminist Logic in Conceptual Realism." *Logical Analysis and History of Philosophy* no. 4:35-72.

Abstract: "The framework of conceptual realism provides a logically ideal language within which to reconstruct the medieval terminist logic of the 14th century. The terminist notion of a concept, which shifted from Ockham's early view of a concept as an intentional object (the *fitcum* theory) to his later view of a concept as a mental act (the *intellectio* theory), is reconstructed in this framework in terms of the idea of concepts as unsaturated cognitive structures. Intentional objects (*ficta*) are not rejected but are reconstructed as the objetified intensional contents of concepts. Their reconstruction as intensional objects is an essential part of the theory of predication of conceptual realism. It is by means of this theory that we are able to explain how the identity theory of the copula, which was basic to terminist logic, applies to categorical propositions. Reference in conceptual realism is not the same as supposition in terminist logic. Nevertheless, the various "modes" of personal supposition of terminist logic can be explained and justified in terms of this conceptualist theory of reference."

"Conclusion. The framework of conceptual realism provides a logically ideal language within which to reconstruct the medieval terminist logic of the 14th century. The terminist notion of a concept, which shifted from Ockham's early view of a concept as an intentional object (the *fictum* theory) to his later view of a concept as a mental act (the *intellectio* theory), is reconstructed in this framework in terms of the notion of a concept as an unsaturated cognitive structure. Referential and predicable concepts in particular are unsaturated cognitive structures that mutually saturate each other in mental acts,

analogous to the way that quantifier phrases and predicate expressions mutually saturate each other in language. Intentional objects (*ficta*) are not rejected but are reconstructed as the objectified intensional contents of concepts, i.e., as intentional objects obtained through the process of nominalization — and in that sense as products of the evolution of language and thought. Their reconstruction as intensional objects is an essential part of the theory of predication of conceptual realism. In particular, the truth conditions determined by predicable concepts based on relations — including the relation the copula stands for — are characterized in part in terms of these objectified intensional contents. It is by means of this conceptualist theory of predication that we are able to explain how the identity theory of the copula, which was basic to terminist logic, applies to categorical propositions.

Reference in conceptual realism, based on the exercise and mutual saturation of referential and predicable concepts, is not the same as supposition in terminist logic. Nevertheless, the various “modes” or types of personal supposition are accounted for in a natural and intuitive way in terms of the theory of reference of conceptual realism. Ockham’s application of merely confused supposition to common names occurring within the scope of an intensional verb is rejected, as it should be, but its rejection is grounded on the notion of a deactivated referential concept—a deactification that, because of the intensionality of the context in question, cannot be “activated,” the way it can be in extensional contexts.” (p. 71)

12. ———. 2001. "Logic and Ontology." *Axiomathes. An International Journal in Ontology and Cognitive Systems* no. 12:127-150.

Contents: 1. Logic as Language versus Logic as Calculus; 2. Predication versus Membership; 3. The vagaries of Nominalism; 4. The Vindication (Almost) of Logical Realism; 5. Conceptualism Without a Transcendental Subject; 6. Conceptual Natural realism and the Analogy of being Between Natural and Conceptual Universals; 7. Conceptual Intensional Realism; 8. Concluding Remarks.

Abstract: "A brief review of the historical relation between logic and ontology and of the opposition between the views of logic as language and logic as calculus is given. We argue that predication is more fundamental than membership and that different theories of

predication are based on different theories of universals, the three most important being nominalism, conceptualism, and realism. These theories can be formulated as formal ontologies, each with its own logic, and compared with one another in terms of their respective explanatory powers. After a brief survey of such a comparison, we argue that an extended form of conceptual realism provides the most coherent formal ontology and, as such, can be used to defend the view of logic as language."

"Concluding Remarks: Despite our extended discussion and defense of conceptual realism, the fact remains that this is a formal ontology that can be described and compared with other formal ontologies in the set-theoretic framework of comparative formal ontology. Set theory, as we have said, provides a convenient mathematical medium in which both the syntax and an extrinsic semantics of different formal ontologies can be formulated, which then can be compared and contrasted with one another in their logical and descriptive powers. This is the real insight behind the view of logic as calculus. But membership is at best a pale shadow of predication, which underlies thought, language and the different categories of reality. Set theory is not itself an adequate framework for general ontology, in other words, unless based on a theory of predication (as in Quine's nominalist-platonism). Only a formal theory of predication based on a theory of universals can be the basis of a general ontology. This is the real insight behind the view of logic as language. But there are alternative theories of universals, and therefore alternative formal theories of predication, each with its own logic and theory of logical form. A rational choice can be made only by formulating and comparing these alternatives in comparative formal ontology, a program that can best be carried out in set theory. Among the various alternatives that have been formulated and investigated

over the years, the choice we have made here, for the reasons given, is what we have briefly described above as conceptual realism, which includes both a conceptual natural realism and a conceptual intensional realism. Others may make a different choice. As Rudolf Carnap once said: "Everyone is at liberty to build up his own logic, i.e. his own form of language, as he wishes." But then, at least in the construction of a formal ontology, we all have an obligation to defend our choice and to give reasons why we think one system is better than another. In this regard, we do not accept Carnap's additional injunction that in logic, there are no morals." (pp. 145-146)

13. ———. 2001. "A Conceptualist Interpretation of Leśniewski's Ontology." *History and Philosophy of Logic* no. 22:29-43.

Contents: 1. Introduction 29; 2. Leśniewski's Ontology as a First-Order Theory 29; 3. The Logic of Names in Conceptual Realism 31; 4. A Conceptualist Interpretation of Leśniewski's System 35; 5. Reduction of Leśniewski's Theory of Definitions 39; 6. Consistency and Decidability 40; References 43.

Abstract: "A first-order formulation of Leśniewski's ontology is formulated and shown to be interpretable within a free first-order logic of identity extended to include nominal quantification over proper and common-name concepts. The latter theory is then shown to be interpretable in monadic second-order predicate logic, which shows that the first-order part of Leśniewski's ontology is decidable."

"Introduction. One of the important applications of Leśniewski's system of ontology, sometimes also called *the logic of (proper and common) names*, (1) has been as a logistic framework that can be used in the reconstruction of medieval terminist logic. (2) This is especially so because the basic relation of Leśniewski's system, singular inclusion, amounts to a version of the two-name theory of the copula. (3) An alternative reconstruction of medieval terminist logic can also be given within the logistic framework of conceptual

realism, however.(4) This system is preferable in part because, unlike Leśniewski's ontology, it is not committed to an extensional framework, which is important in the logical analysis of the tensed and modal modification (ampliation) of the terms (names) of medieval logic. (5) It is also possible, as we show below, to reduce or reconstruct Leśniewski's ontology within the logistic framework of conceptual realism."

(1) See, e.g. Lejewski 1958, p. 152, Slupecki 1955 and Iwanuś 1973.

(2) See, e.g. Henry 1972.

(3) Singular inclusion, as represented by e in the formula ' $a e b$ ', read as ' a is b ', was the only undefined constant of Leśniewski's original system of ontology. The system could also be based either on partial, weak or strong inclusion as the only primitive as well. See Lejewski 1958, pp. 154-156.

(4) See Cocchiarella 2001. For an account of conceptual realism as a formal ontology see Cocchiarella 1996.

(5) One might, of course, add tense and modal operators to Leśniewski's ontology, even though he himself was against such a move.

14. ———. 2002. "On the Logic of Classes as Many." *Studia Logica* no. 70:303-338.

Abstract: "The notion of a "class as many" was central to Bertrand Russell's early form of logicism in his 1903 *Foundations of Mathematics*. There is no empty class in this sense, and the singleton of an urelement (or atom in our reconstruction) is identical with that urelement. Also, classes with more than one member are merely pluralities— or what are sometimes called "plural objects"— and cannot as such be themselves members of classes. Russell did not formally develop this notion of a class but used it only informally. In what follows, we give a formal, logical reconstruction of the logic of classes as many as pluralities (or plural objects) within a fragment of the framework of conceptual realism. We also take groups to be classes as many with two or more members and show how groups provide a semantics for plural quantifier phrases."

"There is a notion of a class that has been ignored by most, but not all, philosophers. (4) This is the notion of a "class as many," as described, e.g., by Bertrand Russell in his 1903 *Principles of Mathematics*. (5) A class in this sense is the extension of a common count noun, i.e., the extension of what traditionally has been called a common name. (6) The three important features of this notion are, first, that a vacuous common name, i.e., a common name that names nothing, has no extension, which is not the same as having an

empty class as its extension. Thus, according to Russell, "there is no such thing as the null class, though there are null class-concepts," i.e., commonname concepts that have no extension. (7) Secondly, the extension of a common name that names just one thing (in the sense of an urelement) is just that one thing. In other words, unlike the singleton sets of set theory, which

are not identical with their single member, the class that is the extension of a common name that names just one thing (urelement) is none other than that one thing."

(...)

"We believe that this notion of a class, or of a group, can be usefully developed as part of the broader framework of conceptual realism that we have described elsewhere. (11)" (pp. 304-305)

(4) See, e.g., Simons 1982 for one proposed formulation of this notion. Simons's formulation is different from the one we give here. Simons doubts that there can be "an exact logic for the quantificatory uses" of common names, which is what the present system is

based on. Also, whereas the present system relies on only one type of "objectual" variable (having both "atoms" and classes as many as values), Simons has three: one for "individuals," another for "pluralities," and a third for "neutrals." There are a number of other

differences as well, but we will not go into them here.

(5) See Russell 1903, chapter VI. Russell's view in this book precedes his later no-classes doctrine.

(6) Strictly speaking, Russell distinguishes between a common name, e.g., 'man', and its plural form, 'men', and then takes the latter to denote the class as many of men (§67). We do not distinguish common names from their plural forms here, and we describe the class as many simply as the extension of the common name (and the concept it stands for).

15. ———. 2002. "Logical Necessity Based on Carnap's Criterion of Adequacy." *Korean Journal of Logic* no. 5:1-21.

Abstract: "A semantics for logical necessity, based on Carnap's criterion of adequacy, is given with respect to the ontology of logical atomism. A calculus for sentential (propositional) modal logic is described and shown to be complete with respect to this semantics. The semantics is then modified in terms of a restricted notion of 'all possible worlds' in the interpretation of necessity and shown to yield a completeness theorem for the modal logic S5. Such a restricted notion introduces material content into the meaning of necessity so that, in addition to atomic facts, there are "modal facts" that distinguish one world from another."

"...in what follows we will construct a semantics for logical necessity based on Rudolf Carnap's criterion of adequacy and the metaphysical framework of logical atomism, a semantics, we maintain, that provides a clear and precise account of the connection between logical truth and logical necessity— at least with respect to this kind of metaphysical framework. (4)" (p. 2)

(4) There are reasons to think that no other sort of metaphysical framework can succeed in adequately explaining the connection between logical truth and logical necessity. This is not to say, however, that other frameworks cannot account for notions of necessity other than logical necessity.

16. ———. 2003. "Conceptual Realism and the Nexus of Predication." *Metalogicon* no. 16:45-70.

Abstract: "The nexus of predication is accounted for in different ways in different theories of universals. We briefly review the

account given in nominalism, logical realism (modern Platonism), and natural realism. Our main goal is to describe the account given in a modern form of conceptualism extended to include a theory of intensional objects as the contents of our predicable and referential concepts."

"Introduction. A universal, according to Aristotle, is what can be predicated of things. (1) But what exactly do we mean in saying that a universal can be predicated of things? How, or in what way, do universals function in the nexus of predication?

In the history of philosophy, there are three major types of theories that deal with the problem of universals and that purport to answer these questions: (2)

(1) Nominalism: According to this theory there are no universals, and there is predication only in language; that is, only predicates can be predicated of things, and the only nexus of predication is the linguistic nexus between subject and predicate expressions.

(2) Realism: There are real universals, i.e., universals in reality, that are predicated of things, and the function of predication in language is to represent predication in reality. Different versions of realism explain the nexus of predication in reality in different ways.

(3) Conceptualism: There are conceptual universals, e.g., predicable concepts, that underlie predication in thought, and the nexus of predication in thought underlies the nexus of predication in language.

All three theories agree that there is predication in language though each has a different account of how that kind of predication is possible and what it represents. The theory we will describe here in some detail is a modern form of conceptualism.

Unlike traditional conceptualism (e.g., British empiricism), the conceptualism we describe here is not based on a theory of "ideas" (*Vorstellungen*), and it includes an intensional realism

based on an evolutionary account of concept-formation. In this paper, our main

purpose is to describe the conceptualist account of the nexus of predication.

Before turning to conceptualism, we will make some brief observations about nominalism and realism and our methodology." (pp. 45-46)

(1) *De Interpretatione*, 17 a 39.

2 These three theories were first described by Porphyry in his [*Isagoge* or] *Introduction to Aristotle's Categories*.

17. ——. 2005. "Denoting Concepts, Reference, and the Logic of Names, Classes as Many, Groups and Plurals." *Linguistics and Philosophy* no. 28:135-179.

Abstract: "Bertrand Russell introduced several novel ideas in his 1903 *Principles of Mathematics* that he later gave up and never went back to in his subsequent work. Two of these are the related notions of denoting concepts and classes as many. In this paper we reconstruct each of these notions in the framework of conceptual realism and connect them through a logic of names that encompasses both proper and common names, and among the latter complex as well as simple common names. Names, proper or common, and simple or complex, occur as parts of quantifier phrases, which in conceptual realism stand for referential concepts, i.e., cognitive capacities that inform our speech and mental acts with a referential nature and account for the intentionality, or directedness, of those acts. In Russell's theory, quantifier phrases express denoting concepts (which do not include proper names). In conceptual realism, names, as well as predicates, can be nominalized and allowed to occur as "singular terms", i.e., as arguments of predicates. Occurring as a singular term, a name denotes, if it denotes at all, a class as many, where, as in Russell's theory, a class as many of one object is identical with that one object, and a class as many of more than one object is a plurality, i.e., a plural object that we call a group. Also, as in Russell's theory, there is no empty class

as many. When nominalized, proper names function as "singular terms" just the way they do in so-called free logic. Leśniewski's ontology, which is also called a logic of names can be completely interpreted within this conceptualist framework, and the well-known oddities of Leśniewski's system are shown not to be odd at all when his system is so interpreted. Finally, we show how the pluralities, or groups, of the logic of classes as many can be used as the semantic basis of plural reference and predication. We explain in this way Russell's "fundamental doctrine upon which all rests," i.e., "the doctrine that the subject of a proposition may be plural, and that such plural subjects are what is meant by classes [as many] which have more than one term" (*Principles of Mathematics*], p. 517)."

"Bertrand Russell introduced several novel ideas in his 1903 *Principles of Mathematics* [PoM] that he later gave up and never went back to in his subsequent work. Two of these are the related notions of denoting concepts and classes as many. Russell explicitly rejected denoting concepts in his 1905 paper, "On Denoting". Although his reasons for doing so are still a matter of some debate, they depend in part on his assumption that all concepts, including denoting concepts, are objects and can be denoted as such. (1) Classes of any kind were later eliminated as part of Russell's "no-classes" doctrine, according to which all mention of classes was to be contextually analyzed in terms of reference to either propositions, as in Russell's 1905 substitution theory, or propositional functions as in *Principia Mathematica* [PM]. The problem with classes, as Russell and Whitehead described it in [PM], is that "if there is such an object as a class, it must be in some sense one object. Yet it is only of classes that many can be predicated. Hence, if we admit classes as objects, we must suppose that the same object can be both one and many, which seems impossible" (p. 72).

Both notions are worthy of reconsideration, however, even if only in a somewhat different, alternative form in a conceptualist framework that Russell did not himself adopt. In such a framework, which we will briefly describe here, Russell's assumption that all concepts are objects will be rejected in favor of a conceptualist counterpart to Frege's notion of

- unsaturatedness, and we will reconsider the idea of a class as many somehow being both one and many." (pp. 135-136)
18. ———. 2008. "Infinity in Ontology and Mind." *Axiomathes. An International Journal in Ontology and Cognitive Systems* no. 18:1-24.

Abstract: "Two fundamental categories of any ontology are the category of objects and the category of universals. We discuss the question whether either of these categories can be infinite or not. In the category of objects, the subcategory of physical objects is examined within the context of different cosmological theories regarding the different kinds of fundamental objects in the universe.

objects are discussed in terms of sets and the intensional objects of conceptual realism. The category of universals is discussed in terms of the three major theories of universals: nominalism, realism, and conceptualism. The finitude of mind pertains only to conceptualism. We consider the question of whether or not this finitude precludes impredicative concept formation. An explication of potential infinity, especially as applied to concepts and expressions, is given. We also briefly discuss a logic of plural objects, or groups of single objects (individuals), which is based on Bertrand Russell's (1903, *The Principles of Mathematics*, 2nd edn. (1938). Norton & Co, NY) notion of a class as many. The universal class as many does not exist in this logic if there are two or more single objects; but the issue is undecided if there is just one individual. We note that adding plural objects (groups) to an ontology with a countable infinity of individuals (single objects) does not generate an uncountable infinity of classes as many."

"Introduction.

Ontology, as originally described by Aristotle, is the study of being qua being, where being is not univocal but is divided into different categories. The two most fundamental categories are those of universals and objects respectively. Here, by a universal, and again we follow Aristotle, we mean that which can be predicated of things.¹ Predication, of course, is what connects universals with objects. One important aspect of the

role, or significance, of infinity in ontology, accordingly, is whether or not either of these categories, i.e., the category of objects or the category of universals, is, or can be, infinite. How infinity applies to mind in this regard is the question of whether or not there are, or can be, infinitely many concepts as intelligible universals, and whether or not the finitude of the human mind places limitations on the concepts that can be constructed.

The methodology of ontology, which, as we have said, is divided into different categories, is the analysis of those categories and the laws connecting them with one another, including in particular the nature of predication. The clearest and most precise way to analyze these categories is through the development of what is known as formal ontology, where the logico-grammatical forms and principles of a logistic system are formulated for the purpose of representing the different categories and the laws connecting them.² A formal ontology in which ontological and logical categories are combined in a unified framework will then amount to a comprehensive deductive framework that is prior to all others in both logical and ontological structure. By proving the consistency of such a logistic system we can thereby show that the intuitive ontological framework associated with it is consistent as well.

One important role of infinity in ontology, accordingly, can be understood as the determination of whether or not any of the categories of being, and in particular the categories of objects and universals, are, or can be, infinite as part of such a formal framework. In what follows we will consider some possible answers to this question." (p. 2)

19. ———. 2009. "Mass Nouns in a Logic of Classes as Many." *Journal of Philosophical Logic* no. 38:343-361.

Abstract: "A semantic analysis of mass nouns is given in terms of a logic of classes as many. In previous work it was shown that plural reference and predication for count nouns can be interpreted within this logic of classes as many in terms of the subclasses of the classes that are the extensions of those count nouns. A brief review of that account of plurals is given here and it is then shown how the same kind of interpretation can also be given for mass nouns."

"Why is the semantics of mass nouns so problematic? One reason, apparently, is that unlike count nouns, which have determinate extensions, mass nouns have extensions that in some cases are said to be indeterminate. The objects in the extension of a count noun are unproblematic because those objects are generally discrete and well-delineated, and hence can be individuated. The objects in the extension of a mass noun, especially mass nouns for different kinds of stuff, are said to be "diffuse" and indeterminate, on the other hand, because there are often an indefinite number of ways to refer them separately as well as together as wholes. (1)

A number of proposals have been made and criticized about the extensions of mass nouns. (2) We will not review those proposals and criticisms here but instead will present a proposal of our own based on what has been called "the simplest plan" of all. (3) We will defend this "plan" in terms of a logical framework designed to represent a form of conceptualism in which the logical forms that represent the cognitive structure of our speech and mental acts are distinguished from the logical forms that represent the truth conditions and deductive relations of those acts." (pp. 343-344)

20. ———. 2009. "Reply to Gregory Landini's Review of *Formal Ontology and Conceptual Realism*." *Axiomathes. An International Journal in Ontology and Cognitive Systems*:143-153.

"1. Some Initial Ontological Distinctions.

In our discussion of Greg Landini's review, we should distinguish how the logical systems $LHST^*$ and HST^*l that I have developed are to be understood in my reconstructions of Gottlob Frege's and Bertrand Russell's *Principles of mathematics* (1903) ontologies as opposed to how HST^*l is understood as a (proper) part of my ontology of conceptual realism. Both of these systems are type-free second-order predicate logics that allow predicate expressions (complex or simple) and formulas (propositional forms) to be nominalized and occur in formulas as abstract singular terms.(1)

The main logical difference between these systems, as Landini notes, is that whereas $LHST^*$ contains standard first-order logic (with identity) as a proper part, the system HST^*l is free of existential presuppositions regarding singular terms, including nominalized predicates as abstract singular terms, which is essential to any argument for Russell's paradox of predication. In particular, nominalization of the Russell predicate that is not predicable of itself turns out to be denotationless in HST^*l as an abstract singular term.

The main ontological difference between Russell's and Frege's ontologies is that one is intensional and the other is extensional. Russell's (1903) ontology is based on predication as the ontological nexus of propositions, whereas Frege's is based on predication as a function from properties and relations to truth values. (2) In conceptual realism, predication is based on the mutual saturation of referential and predicable concepts as unsaturated complementary cognitive structures, the result being a speech or mental act. (3)

In Russell's ontology, a nominalized predicate denotes, as an abstract singular term, the very same property or relation (intension) that the predicate stands for in its role as a predicate. In Frege's ontology, a nominalized predicate denotes the extension (value range, *Wertverläufe*) of the concept or relation (*qua* function from objects to truth values) that the predicate stands for in predicate position; and in conceptual realism, a nominalized predicate denotes the intension of the concept (*qua* cognitive structure) that the predicate stands for in its role as a predicate. Because what a predicate stands for and what its nominalization denotes are not the same type of entity in either Frege's ontology or my conceptual realism, the fact that a nominalized predicate, on pain of contradiction, might fail to denote as an abstract singular term does not affect the objective reality of what that predicate stands for in its role as a predicate.

That is why the system *HST**l** can be used in a reconstruction of Frege's ontology as well as in my conceptual realism. The system *lHST** will also suffice for a reconstruction of Frege's ontology, but a free first-order predicate logic is essential to my analysis of plurals and mass nouns in terms of the logic of classes as many developed in my book, which means that only *HST**l** is appropriate for conceptual realism.

On the other hand, for a reconstruction of Russell's ontology, where nominalized predicates denote the same property or relation they stand for in their role as predicates, only the system *lHST** is appropriate. That is, because it is the same entity involved in both roles in Russell's ontology, we cannot in

that framework both affirm the being of what a predicate stands for in its role as a predicate, and also deny that being in the nominalization of the predicate as an abstract singular term." (p. 143)

(1) There is of course a type distinction between object terms and predicates in these systems; but unlike the situation in type theory there is no hierarchy of predicates of different types.

(2) Frege's *Begriffe* are really *Eigenschaften*, and in our present context where we want to distinguish concepts as cognitive capacities from Frege's *Begriffe*, it is better to speak of his *Begriffe* as properties instead.

(3) We assume in this discussion a distinction between predication in language, predication in our speech and mental acts, and predication as the nexus of propositions or of states of affairs, or, in Frege's case, as functional application.

21. ———. 2009. "Reply to Andriy Vasylychenko's Review of *Formal Ontology and Conceptual Realism*." *Axiomathes. An International Journal in Ontology and Cognitive Systems*:167-178.

"Andriy Vasylychenko makes the interesting observation that our references are frequently emotionally charged. A comprehensive theory of reference, Vasylychenko suggests, should include an account of this phenomenon. We agree.

Indeed, as we will see, the theory of reference in conceptual realism can be used to explain an important feature of our emotional states when we read a novel, or watch a play, a movie, or even when viewing a painting. This feature, which in aesthetics is called *psychical distance*, is connected in part with the difference between active and deactivated reference in conceptual realism. We will take up that issue at the end this reply.

There is, however, an important misunderstanding in Vasylychenko's review of how the notion of existential presupposition applies -- or, as he claims, fails to apply -- to fictional objects and more generally to the abstract intensional objects of conceptual realism. We will discuss this latter issue

first, and then turn to the issue of our emotional states and psychical distance when reading fiction or watching a play or a film, and perhaps even when having an aesthetic experience in general." (p. 167)

23. ———. 2010. "Actualism versus Possibilism in Formal Ontology." In *Theory and Applications of Ontology. Vol. 1: Philosophical Perspectives*, edited by Poli, Roberto and Seibt, Johanna, 105-118. Dordrecht: Springer.

"Comparative formal ontology is the study of how different informal ontologies can be formalized and compared with one another in their overall adequacy as explanatory frameworks. One important criterion of adequacy of course is consistency, a condition that can be satisfied only by formalization. Formalization also makes explicit the commitments of an ontology.

There are other important criteria of adequacy as well, however, in addition to consistency and transparency of ontological commitment. One major such criterion is that a formal ontology must explain and provide an ontological ground for the distinction between being and existence, or, if the distinction is rejected, an adequate account of why it is rejected. Put simply, the problem is: Can there be things that do not exist? Or is being the same as existence? Different formal ontologies will answer these questions in different ways.

The simplest account of the distinction between being and existence is that between actualism and possibilism, where by existence we mean physical existence, i.e., existence as some type of physical object; and by being we mean possible physical existence, i.e., physical existence in some possible world. According to possibilism, there are objects that do not now exist but could exist in the physical universe, and hence being is

not the same as existence. In actualism being is the same as existence.

Possibilism: There are objects (i.e., objects that have being or) that possibly exist but that do not in fact exist.

Therefore: Existence \neq Being.

Actualism: Everything that is (has being) exists.

Therefore: Existence = Being.

Now the implicit understanding in formal ontology of both possibilism and actualism is that the objects that the quantifier phrases in these statements range over are values of the variables bound by the first-order quantifiers \forall and \exists (for the universal and existential quantifiers, respectively), and hence that what has being (on the level of objects) is a value of the (object) variables bound by these quantifiers. In other words, to be (an object, or thing) in both actualism and possibilism is to be a value of the bound object variables of first-order logic. This means that in possibilism, where being is not the same as existence, existence must be represented either by different quantifiers or by a predicate, e.g., $E!$, which is the predicate usually chosen for this purpose.

Another criterion of adequacy for a formal ontology is that it must explain the ontological grounds, or nature, of modality, i.e., of such modal notions as necessity and possibility, and in particular the meaning of possible physical existence. If the modalities in question are strictly formal, on the other hand, as is the case with logical necessity and possibility, then it must explain the basis of that formality.

This criterion cannot be satisfied by a set-theoretic semantics alone, especially one that allows for arbitrary sets of possible worlds (models) and so-called accessibility relations between those worlds. Such a semantics may be useful for showing the consistency of a modal logic, or perhaps even as a guide to our intuitions in showing its completeness; but it does not of itself provide an ontological ground for modality, or, in the case of

logical modalities, explain why those modalities are strictly formal.

We restrict our considerations here to how physical existence, both actual and possible, is represented in a formal ontology. This does not mean that the formal ontologies considered here cannot be extended so as to include an account of how abstract objects might be represented as well, if allowed at all." (pp. 105-106)

24. ———. 2010. "Predication in Conceptual Realism." *Axiomathes* no. 20:1-21.

Abstract: "Conceptual realism begins with a conceptualist theory of the nexus of predication in our speech and mental acts, a theory that explains the unity of those acts in terms of their referential and predicable aspects. This theory also contains as an integral part an intensional realism based on predicate nominalization and a reflexive abstraction in which the intensional contents of our concepts are "object"-ified, and by which an analysis of predication with intensional verbs can be given. Through a second nominalization of the common names that are part of conceptual realism's theory of reference (*via* quantifier phrases), the theory also accounts for both plural reference and predication and mass noun reference and predication. Finally, a separate nexus of predication based on natural kinds and the natural properties and relations nomologically related to those natural kinds, is also an integral part of the framework of conceptual realism."

25. ———. 2013. "Representing Intentional Objects in Conceptual Realism." *Humana.Mente* no. 25:1-24.

Special number edited by Laura Mari (Scuola Normale Superiore of Pisa) and Michele Paolini Paoletti (University of Macerata): *Meinong Strikes Again. Return to Impossible Objects 100 Years Later*.

Abstract: "In this paper we explain how the intentional objects of our mental states can be represented by the intensional objects of conceptual realism. We first briefly examine and show how Brentano's actualist theory of judgment and his

notion of an immanent object have a clear and natural representation in our conceptualist logic of names. We then briefly critically examine Meinong's theory of objects before turning finally to our own representation of intentional objects in terms of the intensional objects of conceptual realism. We conclude by explaining why existence-entailing concepts are so basic to our commonsense framework and how these concepts and their intensions can be used to model Meinong's ontology."

26. ——. 2015. "Two Views of the Logic of Plurals and a Reduction of One to the Other." *Studia Logica* no. 103:757-780.

Abstract: "There are different views of the logic of plurals that are now in circulation, two of which we will compare in this paper. One of these is based on a two-place relation of *being among*, as in 'Peter is among the juveniles arrested'. This approach seems to be the one that is discussed the most in philosophical journals today. The other is based on Bertrand Russell's early notion of a class as many, by which is meant not a class as one, i.e., as a single entity, but merely a plurality of things. It was this notion that Russell used to explain plurals in his 1903 *Principles of Mathematics*; and it was this notion that I was able to develop as a consistent system that contains not only a logic of plurals but also a logic of mass nouns as well.

We compare these two logics here and then show that the logic of the *Among* relation is reducible to the logic of classes as many."

"There are different views of the logic of plurals that are now in circulation. (1)

One of these is based on a two-place relation of being among, as in 'Peter is among the juveniles arrested'. This approach seems to be the one that is discussed the most in philosophical journals today. The other is based on Bertrand Russell's early notion of a class as many, by which is meant not a class as one, i.e., as a single entity, but a mere plurality of things. It was this notion that I developed in 2002 as a provably consistent system that contains not only a logic of plurals but also a logic of mass nouns as well. (2) It also contains, as we show in this paper, the plural logic based on the Among relation. We will first compare

these two logics here and then show that the logic of the *Among* relation in Linnebo [2004] is reducible to the logic of classes as many.

We will first briefly discuss the plural logic based on the *Among* relation as described by Linnebo. Then we will briefly explain the basics of the logic of classes as many, and finally we will show how the logic of the *Among* relation is reducible to the logic of classes as many." (p. 757)

27. ———. 2016. "On Predication, A Conceptualist View." In *Philosophy and Logic of Predication*, edited by Stalmaszczyk, Piotr, 53-92. Bern: Peter Lang.

Abstract: "Predication, as the nexus between a subject and a predicate expression, is the basis of the unity of a speech act, including speech acts in the plural and speech acts that involve mass nouns. A speech act, of course, is an overt expression of a mental act, e.g., a judgment; and therefore the unity of a speech act such as an assertion is really the unity of the judgment that underlies that act. Such a mental act, and therefore the speech act as well, has a unity based on how the referential and predicable roles of the subject and predicate expressions combine and function together respectively. What we propose here is to explain this unity of predication in terms of a conceptualist theory of logical forms that we claim underlies at least some important aspects of thought and natural language. Our conceptualist logic also contains an account of the medieval identity (two-name) theory of the copula, as well as an account of plural and mass noun reference and predication, the truth conditions of which are based on a logic of plurals and mass nouns."

28. ———. 2017. *Epistemological Ontology and Logical Form in Russell's Logical Atomism*.

Not yet published.

Preprint available on [academia.edu](https://www.academia.edu).

Abstract: "Logical analysis, according to Bertrand Russell, leads to and ends with logical atomism, an ontology of atomic facts that is epistemologically founded on sense-data, which Russell claimed are mind-independent physical objects. We first explain how Russell's 1914–1918 epistemological version of logical atomism is to be understood, and then, because constructing logical forms is a fundamental part of the process of logical analysis, we briefly look at what has happened to Russell's type theory in this ontology. We then turn to the problem of explaining how the logical forms of Russell's new logic can explain both the forms of atomic facts and yet also the

sentences of natural language. The main problem is to explain the logical forms for belief and desire sentences and how those forms correspond to the logical forms of the facts of logical atomism."

Abstract: "Logical analysis, according to Bertrand Russell, leads to and ends with logical atomism, an ontology of atomic facts that is epistemologically founded on sense-data, which Russell claimed are mind-independent physical objects. We first explain how Russell's 1914-1918 epistemological version of logical atomism is to be understood, and then, because constructing logical forms is a fundamental part of the process of logical analysis, we briefly look at what has happened to Russell's type theory in this ontology. We then turn to the problem of explaining whether or not the logical forms of Russell's new logic can explain both the forms of atomic facts and yet also the sentences of natural language, especially those about beliefs. The main problem is to explain the logical forms for belief and desire sentences and how those forms do not correspond to the logical forms of the facts of logical atomism."

30. ———. 2018. A Modal-Ontological Argument and Leibniz's View of Possible Worlds.

Unpublished paper, available on this site.

Abstract: "We critically discuss an ontological argument that purports to prove not only that God, or a God-like being, exists, but in addition that God's existence is necessary. This requires turning to a modal logic, S5 in particular, in which the argument is presented. We explain why the argument fails. We then attempt a second version in which one of its premises is strengthened. That attempt also fails because of its use of the Carnap-Barcan formula in a context in which that formula is not valid. A third is presented as well using the proper name 'God' as a singular term, but it too fails for the same reason, though in a later section we show how this last argument can be

validated under a re-interpretation of the quantifiers of the background logic. In our later sections, we explain what is wrong

with the original first premise as a representation of what Leibniz meant by the consistency of God's existence, specifically as God's existence in a possible world. Possible worlds exist only as ideas in God's mind, and the consistency of God's existence cannot be God's existence in a possible world. Realism regarding possible worlds must be rejected. Only our world is real, the result of an ontological act of creation. We also explain in a related matter why according to Leibniz, Boethius, Aquinas and other medieval philosophers, God's omniscience does not imply fatalism."

31. ———. 2019. Can an AI System Think? Functionalism and the Nature of Mentality.

Unpublished paper, available on this site.

Abstract: "In this paper we consider the philosophical question of whether or not an AI system can think and be self-conscious. We note that in order to take this question seriously, we must reject metaphysical dualism. Then, because Functionalism gives an affirmative answer to our question, we turn to an account of Functionalism as a philosophical theory of the mind and the nature of thought. The basic assumption of Functionalism is that mentality consists essentially of functionality, and that as functional states and processes, mental states and processes can be structurally duplicated in the functionality of the electronic hardware of a suitably programmed AI system. According to Functionalism's basic assumption, structural duplication can be achieved if a functional isomorphism can be achieved between such an AI system and the human mind. We also describe three kinds or levels of self-consciousness and discuss the claim that all three levels can in principle be achieved in an AI system. The first kind, which all animals with a central nervous system have, is expressed in an animal's self-regarding behavior. The second is based on self-reference and reflexive abstraction on the content of thought. This is done in language by means of

nominalization where a predicate or declarative sentence is transformed into an abstract noun that denotes the content of that predicate or sentence. The third is based on a double reflexive abstraction on the intentional content of the self by means of a double nominalization. The first nominalization is a transformation of the referential use of the personal pronoun 'I' into a second order predicate true of all and only the properties of the self. The second is a nominalization of that second-order predicate into an abstract noun that denotes the intentional content of the self. In Functionalism, the goal is to achieve a functional isomorphism between the mental states and processes of humans and the electronic states of a suitably programmed AI. Given Functionalism's assumption that the essential nature of mentality is its functionality, such a functional isomorphism would suffice, according to Functionalism, for an AI system to be structurally duplicating, and not merely simulating, the mental states and processes that humans have. And hence an AI system can think and be self-conscious, according to Functionalism, in just the way that humans can."

Richard Sylvan [*born Richard Routley*] on Nonexistent Objects

Introduction

"On the June 16th, 1996, Richard Sylvan died of a sudden and unexpected heart attack. His death, at the relatively young age of 60, robbed Australasia of one of its greatest philosophers, arguably the most original that it has ever produced.

Richard was born Francis Richard Routley at Levin, New Zealand, on 13 December, 1935. He changed his name to Sylvan -- much to the confusion of a number of people -- when he remarried in 1983. After studying at the Victoria University of Wellington, he took a job at the University of Sydney, in Australia, where he lived for the rest of his life. He had several other jobs in Australia, including one at the University of New England, where, with Len Goddard, he trained a generation of Australian logicians. In 1971, he took up a position at the Australian National University, in Canberra, where he worked until his untimely death.

Richard was a most unusual person -- by any standards. He would rise at dawn, write philosophy till lunch, then pursue his hobbies, like building houses or tending the forests that he owned, till the sun went down, when he would open a bottle of wine and relax. To those who did not know him well, he could appear blunt, aggressive, and he could certainly be a difficult person for university administrators to get on with. But those who got to know Richard well knew that he was a shy, caring, and warm person. For this he was loved by his many friends and students (not disjoint collections). One day, a biography will be written; but this is not it.

Richard made major contributions to many areas of philosophy: relevant and paraconsistent logic, Meinongianism and metaphysics, environmental ethics, to name but the most important. To others, these might seem a rather disparate collection, but for Richard they were all part of one seamless whole; solutions to (and the generation of) many philosophical problems presupposed particular solutions in areas others viewed as far a field. Many philosophical areas, he thought, suffer from the narrow scope of their authors' concerns.

Another of Richard's philosophical trademarks-in fact, perhaps the major one-was taking up grossly unpopular views and defending them doggedly. If relatively few people were ultimately persuaded by him, all had to admit that the views were not as silly and easily disposed of as they had hitherto thought." (p. 1)

From: Dominic Hyde & Graham Priest, "Editors' Introduction" to: *Sociative Logic and Their Applications*, Aldershot: Ashgate 2000.

"Richard Sylvan (né Routley) was undoubtedly one of Australasia's most wide-ranging and systematic philosophers. The astonishing breadth of his philosophical work includes writings on logic, metaphysics, philosophy of language, epistemology, environmental philosophy, social philosophy, political philosophy, ethics, philosophy of science. philosophy of mind and computation theory. A major reason for this intellectual diversity was his view that 'received logical theory and mainstream philosophical thinking involve ... fundamentally mistaken assumptions'(1) These mistaken assumptions were, in fact, seen as so fundamental that nothing less than 'logical revolution' and the abandonment of 'the main philosophical positions of our times' was called for. 'The same mistaken philosophical moves ... appear over and over again in different philosophical arenas ... in metaphysics, in epistemology, in the philosophy of science, ... in ethics. in political theory, and elsewhere, in each case with serious philosophical costs.' (2) This view, coupled with Sylvan's desire to set things straight, led him to work in all these areas and more. His usual method of work was to rise at dawn and write until lunch. This philosophical writing (decipherable to only a select few until typed by one such) amounted to a considerable body of work. By my reckoning at the time of his death in June 1996 he had published as sole author, joint author or

editor, 10 books, 16 booklets and nearly 200 articles in academic philosophy -- as well as numerous unpublished articles and articles contributing to general intellectual debate on social policy and environmental matters. In addition to the wide-ranging nature of this profile outpouring of philosophy, Sylvan's work was also distinctive in character. As noted, he thought that mainstream philosophical thinking was doomed to failure and the theories he argued for were accordingly unorthodox and often highly innovative. (3) Moreover he took the view that philosophy ought to strive for uniformity in its resolution of problems.

'Virtually every philosophical problem has a range of potential resolutions. A coherent philosophy selects and develops its resolutions uniformly, with connected solutions for related problems, not a different sort of solution for every (sort of) problem. (4)

Accordingly, his work is characterized by the attempt to develop and apply these unorthodox theories in a wide range of contexts. Thus his work represents a broad, uniform and unorthodox approach to philosophical problems. Though making a contribution to philosophy (and intellectual life more broadly) well beyond his writings in logic and metaphysics, a survey of Sylvan's work will show that the majority of it concentrates directly on issues in these two areas, and where it does not hear directly on them it typically presents them as having central underlying import. One reason, of course, was his acceptance of the idea of the centrality of logic to philosophy (see Routley 1980, iii) and one has only to look at the Essays gathered together in Sylvan (2000) to see just how seriously he took this idea. (...). However he was also keen to emphasize the importance of metaphysics to all reaches of philosophy and, with the possibilities opened up by research in non-classical logic, substantial developments in metaphysics were there to pursue and pursue them he did." (pp. 181-182)

Notes

Routley's Noneism

" Noneism was created by Richard Routley. According to him the universe is a realm that comprises nonexistent objects. In this universe are included, beside real objects, sets that are contradictory or even absurd, and objects that we can think about, or imagine, but that are beyond the limits of reality. For instance, propositions like "the Squond is square" and "the Squond is round", in which Squond is an object that is square and round, are quite legitimate. Of course the Squond does not exist but - and this is the important point - it can be thought. Examples of less aggressive insolence, are more than abundant. For instance "the fairy Wandolina is very gentle" or "Zeus is the most powerful of the Olympian gods" are expressions fully understandable. The noneist system complies the three conditions to be metaphysical theory.

1. It encompasses the whole world, physical and mental,
2. it offers explications of meaning, and explanations of facts, and

3. it is not empirically corroborable.

That it contains objects with certain properties that are described by unverifiable propositions, is essential in a noneist universe. We have just shown two of them. This unverifiability is quite different from the one we find in physical theories. In these theories, when a new fact is discovered, its corresponding proposition must be deduced from the premises that are valid in the system. (*) This means that it must be explained, and to explain a proposition P, means that P must be logically deduced from previous theorems of the system (every axiom is a theorem). (**) This deduction is ordinarily done utilizing classical logic. Some physicists pretend that the only way to deduce quantum propositions, is by means of a "quantum logic". But this is a farfetched methodology, because the reasons they expose to justify their claim, are based on the fact that the De Morgan laws are not valid. But these laws are invalid, because they are identified with the addition of certain states that have nothing to do with logic.

I dare to qualify noneism as a metaphysical theory, because it complies with conditions 1, 2, and 3. That it complies with the first, is evident. Condition 2 is also complied with because noneist theory explains many facts. For instance, how is it possible that a child of five or six years, understands perfectly well a fairy tale. The only explanation of this miraculous fact is that, as the tale advances, the child is apprehending objects that do not exist. This apprehension must not be confounded with imaginative objects. The objects the child imagines do not exist, but they are viewed as subject dependable. On the other hand, the objects we apprehend listening to the story are not subject dependent. The child does not invent them, he (or she) sees the images that the story is suggesting. Different children can "see" different images, but the images that a child has will have a certain structure, and the structure will be the same for all children (and, of course, for all adults). Moreover, if a child "sees" that color C_i is adjacent to color C_k , the other child will "see" other colors D_i and D_k but in the same order, that is D_i and D_k , will be adjacent.

The third condition is also complied by the system: non-verifiability with respect to sensory objects, and this non-verifiability is absolute.

It is assured by definition. We qualify it as "metaphysical", applying a frequent procedure in pure mathematics. If we define a complicated concept having definite properties, say, {A, B, C, D}, then, on behalf of easiness, we devise another concept that includes the first one, but has a note E, (there can be more than one) present in {A, B, C, D, E}. A classical example is the concept of zero. We can develop set theory without employing it. But as the theory advances, it becomes frightfully complicated." (pp. 33-35)

Notes

(*) The word "system" is used in its usual meaning. This meaning is quite different from the way it is employed in physics, in which it means an object.

(**) We say "axioms" because, in mathematical physics, the propositions from which all others must be deduced, play the role of axioms. With the exception of constructive mathematics, some axioms of geometry (for instance, the axioms of "betweenness", and finite set theory, all the axioms are hypothetical propositions. The truth probability of a theory increases through corroborations of its explanations, or through the verification of its predictions.

Annotated bibliography of the logical works of Richard Sylvan [*né* Routley] (1960-1977)

Bibliography

N. B. *In 1983 Richard Routley changed his name to Richard Sylvan and Val Routley changed his name to Val Plumwood.*

1. Routley, Richard, and Gunderson, K. 1960. "Mr. Rescher's Reformulation of the Ontological Proof." *Australasian Journal of Philosophy* no. 38:246-252.

"In the midst of revived philosophical interest in theological issues, we wish to record our objections to one recent attempt at reformulating the ontological proof for the existence of God. x In trying to navigate around what he calls the three "traditional objections" to the proof viz.: (1) that it "rests upon an explicit definition per genus et differentiam" which in turn "depends upon the thesis that existence has the status of a predicate", (2) that it invokes "the procedure of defining into existence", and (3) that if

the "proof were logically sound, its theological serviceability would be insignificant"--Mr. Rescher, we believe, runs aground on the following criticisms."(p. 246)

(1) "The Ontological Proof Revisited", this Journal, August, 1959.

2. Routley, Richard. 1963. "Review of *Abstract Sets and Finite Ordinals*, by G. B. Keene." *Australasian Journal of Philosophy* no. 41:279-284.

3. ———. 1965. "What Numbers Are." *Logique et Analyse* no. 8:196-208.

Abstract: "Cardinal numbers are non-distributive properties of certain manifolds. This thesis, the P-C thesis, though often (in effect) proposed, does not seem to have been fully worked out, and has in fact been subject to repeated attacks. Recently the thesis that numbers properties of classes has been criticised by Professor Benacerraf (*). My main aim here is to elaborate the initially plausible P-C thesis and to defend it against criticisms."

(*) In his stimulating article 'What numbers could not be', *Philosophical Review* LXXIV (1945), 47-73.

4. ———. 1966. "On a Significance Theory." *Australasian Journal of Philosophy* no. 44:172-209.

"Not all declarative sentences are statement-capable. A declarative sentence P is *statement-capable* in context c if and only if P yields a statement in c. Given that all statements are either true or false, P is statement-capable in c if and only if P is *truth-valued* in c., i.e., yields a truth or falsehood in c." (p. 172)

(...)

"Motivation for developing a significance theory arises from several connected sources: firstly, from the role of significance in the solution of a whole range of philosophical paradoxes and puzzles; secondly, from the fact that philosophers repeatedly appeal to significance considerations and principles; and thirdly, from the fact that many idiolects, both ordinary and technical, distinguish some sentences as non-significant and satisfy some significance principles. The importance of the first source is illustrated by the role significance and category theories have played in epistemology and particularly in the philosophy of mind. With respect to the second source, a significance logic has a similar role to play in assessing the correctness of philosophical arguments and moves as Aristotelian and classical logic have had. Given the

third source, a significance theory is a vital ingredient in attempts to further formalise discourse, and to take further

account of both everyday and technical usage." (p. 177)

5. ———. 1966. "Some Things Do Not Exist." *Notre Dame Journal of Formal Logic* no. 7:251-276.

"The main objects of this paper are to suggest a definition of 'exists', to propose solutions to difficulties raised within restricted predicate logic with identity by failures of existential presuppositions of purportedly referring expressions such as individual constants and definite descriptions, to develop within a semantical system R^* , with the syntax of a restricted applied predicate calculus, the logic of 'exists', and to unify within $=R^*$, i.e. R^* with identity, several hitherto distinct logical theories, to construct theories of definite descriptions, and to criticize certain widely accepted criteria for the ontological commitment of a theory. The logical developments in this paper are limited almost entirely to those that can be carried out in a first-order predicate logic with identity but without modal or intensional functors." (p. 251)

6. Routley, Richard, and Goddard, Lenn. 1966. "Use, Mention and Quotation." *Australasian Journal of Philosophy* no. 44:1-49.

"It is the thesis of this paper that an extensive revision of those ways of talking about expressions which are usually recognized by logicians is of paramount importance if we are to escape the absurd conclusions and purely technical restrictions which arise from a confusion of the kinds of distinctions which it is often necessary to make both in logical and non-logical contexts. We propose, therefore, to consider in detail the commonly recognized distinction between types and tokens, and secondly between use and mention, in order both to emphasize the deficiencies of the standard account and to indicate the steps which are required for the development of a special and systematic vocabulary for talking about linguistic expressions. It is necessary, however, for the purposes of exposition before new conventions are introduced

to adopt the ordinary practice of using single quotes to indicate the fact that a linguistic expression is being mentioned, and double quotes to indicate reported speech (and other *quasi-mentionings*);

sometimes, too we set off an expression which is to be mentioned on a line by itself." (p. 2)

7. Routley, Richard, and Montgomery, Hugh. 1966. "Contingency and Non-Contingency Bases for Normal Modal Logic." *Logique et Analyse* no. 9:318-328.

"Contingency and non-contingency bases for modal logics provide direct bases for various logical investigations of philosophical interest. For example: for logics of causation and causal implication, for certain theories of entailment, for syllogistic systems with only contingent propositions, and for theories of future contingents. Furthermore by taking contingency as primitive various new extensions of weak modal logics - extensions which include systems S6-S8 and provide interpretations of philosophical interest for these neglected systems - are suggested. Contingency and non-contingency bases are also of some formal interest; for instance S5 has a very simple and elegant formulation in terms of non-contingency. In this paper we present contingency and non-contingency bases for familiar normal modal logics, specifically for T, S4 and S5." (p. 318)

8. Routley, Richard. 1968. "Decision Procedures and Semantics for C1, E1 and SO.5." *Logique et Analyse* no. 11:468-471.
9. ———. 1968. "The Decidability and Semantical Incompleteness of Lemmon's System SO.5." *Logique et Analyse* no. 12:413-421.

"Two decision procedures are given for the modal system SO.5, a Gentzen style decision procedure and a von Wright-Anderson type decision procedure. The second procedure leads easily, as Cresswell has indicated in [2] using Kripke semantics, to a completeness result for SO.5. However under the intended interpretation for SO.5 proposed by Lemmon in [6] and [7] and adopted by Cresswell, namely that the necessity connective is interpreted as 'it is tautologous (by truth-table) that', the system is incomplete. To complete the system under the intended interpretation conventionalistic theses like $\nabla \Box p$ (contingently necessarily p) must be added to SO.5. But this augmented SO.5 is under its intended interpretation a formalised metalogic of classical sentential logic {see [7]}.

Hence the (usual) metalogic of classical sentential logic is conventionalistic about modality. (p. 413)

10. Routley, Richard, and Montgomeery, Hugh. 1968. "Non-Contingency Axioms for S4 and S5." *Logique et Analyse* no. 11:422-424.

"In [3] some contingency and non-contingency bases were developed for normal modal logics. Some of the axioms presented there for extending T to S4 and S5 are sufficiently strong to give these latter systems when added to the non-normal system S3." (p. 422)

12. Routley, Richard, and Montgomery, Hugh. 1968. "On Systems Containing Aristotle's Thesis." *Journal of Symbolic Logic* no. 33:82-96.

"Apart from merits or defects of P_{A1} however, its existence demonstrates the feasibility of a new approach to the logic of propositions involving the principle of subjunctive contrariety. We thus have good reason to investigate the effect this principle, and a concept of conditionality compatible with it, might exert if introduced into standard quantification theory, into set theory, into modal logic and into epistemology and the philosophy of science." R. B. Angell(1)

"Introduction. The thesis $p \rightarrow q \rightarrow \sim (p \rightarrow \sim q)$, Angell's *principle of subjunctive contrariety*, here called *Boethius' thesis*(2) or *Boethius*, has as a consequence *Aristotle's thesis*(2) $\sim (\sim p \rightarrow p)$. The effect of *Boethius* or even of *Aristotle* alone, in quite weak sentential logics, is sufficient to cast serious doubt both on the merit of proceeding in the directions Angell suggests and on the value of connexive logics.(3) To show this we examine the consequences of adding to a basic system Z1

which we describe as *strong normal implication*, the axiom *Aristotle*. This augmented system Z1a is inconsistent with a number of principles of implication which it is very difficult to reject on semantic grounds. Further semantic problems arise when Z1a is augmented by *Fact* to give Z1b, and when Z1b is augmented by *Antilogism* and *Mat Taut* to give Z1c or by *Boethius* to give Z1d. As these five systems are all sublogics of both Angell's P_{A1} , and McCall's CC1 (see [6]) the consequent interpretational problems for P_{A1} , and CC1 are immediate. In the *Analytica priora* (57b-3 f) Aristotle argues that ... it is impossible that the same thing should be necessitated by the being and by the not-being of the same thing".

Fact $p \rightarrow q \rightarrow . p . r \rightarrow q . r$ Principle of the factor

Antil $p.q \rightarrow r \rightarrow . p . \sim r \rightarrow \sim q$ Antilogism.

Mat Taut $p \supset p . p$ Material tautology.

13. ———. 1968. "Modal Reduction Axioms in Extensions of S1." *Logique et Analyse* no. 11:492-501.

"Modal logics are commonly formulated with a primitive necessity or possibility operator, though often they may equally well have non-contingency or contingency as the sole modal primitive, necessity and possibility being introduced by definition (1). Examples of normal modal logics with such bases are given in [2], and similar foundations can easily be constructed for the weaker classical systems such as S1, S2 and S3. One attraction of these formulations is that non-contingency extension axioms often provide very simple and illuminating relationships between different modal systems,

and another is that iterated modalities are seen from a different aspect (2)." (p. 492)

(1) Sufficient conditions for this to be possible are that SSE is derivable and that $p.(\Box p \vee \Box \sim p) = \Box p$ is provable. Example of systems for which these conditions fail are SO.5. S1°. S2°.

(2) By an 'iterated modality' we mean a sequence of zero or more symbols each of which is either a negation symbol or a primitive monadic modal symbol.

14. Routley, Richard. 1969. "The Need for Nonsense." *Australasian Journal of Philosophy* no. 47:367-383.

"It is important to have a distinct category of nonsense into which to bundle grammatical indicative sentences which do not express truths or falsehoods.

For, on the one hand, a high redefinition of 'grammar' which brings nonsignificant sentences out as ungrammatical, not only eliminates the valuable distinction between sentences with textbook grammatical defects and nonsignificant sentences; it also makes the quite unwarranted assumption that all non-significance is recursively generated non-significance. But not all nonsense is obvious, or recursive nonsense. Still more damaging, nonsignificant sentences, unlike seriously ungrammatical sentences, can figure in valid arguments and can occur as unquoted components of grammatical sentences. Yet, on the other hand, theories which eschew non-significance as a further sentence-value beyond truth and falsehood are not only bound to be less comprehensive than, and mere special cases of significance theories (see [15]); they are in fact inadequate to deal with the logical and linguistic data--linguistic data which the grammatical theory does acknowledge--which significance theories are designed to handle. (For a sketch of some of the relevant data, see [15], p. 177)." (p. 367)

(...)

"Significance logics are richer than classical logic; for they include all theses of classical logic for suitably restricted significant sentences; but even the fundamental predicate 'S' of significance theory cannot be explicitly defined in classical predicate logic. Now where two theories are not equivalent theories there are two cases to consider. Either the theories cover (roughly) the same data and one or the other contains false or defective sentences.

Then the one that does is false or defective, and the other, if true, is to that extent preferable. Or both theories are true. Then they must cover different fields and so are not distinguishable through simplicity; in particular one theory may be more comprehensive than the other, so overriding simplicity.

Simplicity then is not an adequate ground for deciding against significance theories." (p. 383)

15. ———. 1969. "A Simple Natural Deduction System." *Logique et Analyse* no. 12:129-152.

"A natural deduction system ND is introduced and proofs in it illustrated. This system is much simpler and more flexible than familiar natural deduction systems: it avoids completely such complicating devices as subscripting, flagging, ordering of variables, and distinctions of several sorts of variables or parameters. Furthermore proofs are valid line by line. ND is presented as a formal system. It still needs emphasizing that natural deduction systems can be made just as formal as Hilbert-type systems. The precise conditions on substitution - quite important for natural deduction but often suppressed - are made explicit in the rules of ND." (p. 129)

16. ———. 1969. "Existence and Identity in Quantified Modal Logics." *Notre Dame Journal of Formal Logic* no. 10:113-149.

"The aim of this paper is to present a way in which philosophical objections to the development of a combined quantification and modal logic based on S5 can be overcome. In more detail, the objectives are to show that S5 is immune to criticisms directed at those theorems which distinguish it from S4 and T; that problematic theorems(1) of modalised predicate logic like the Barcan formulae $[\Diamond(\exists x) f(x) \supset (\exists x) \Diamond f(x)]$ and $[\Diamond(\exists t) g(x, t) \supset (\exists t) \Diamond g(x, t)]$ can be appropriately qualified once existence is explicitly treated; that puzzles over identity can be escaped by a more elaborate treatment of identity than the standard treatment; and that difficulties associated with quantification into modal sentence contexts can be cleared away given these treatments of existence and identity. A combination of these moves suffice, so it will be argued, to meet standard objections, most forcefully presented by Quine(2), to quantified modal logics. Admittedly a full elaboration of these moves calls for some sentence/statement distinction, some analytic/synthetic (or necessary/contingent) distinction, and some sense/designation (or connotation/denotation) distinction: but although, consequently, it is not to be expected that a combination of these moves will satisfy Quine, they may satisfy some who have been disturbed by the objections Quine raises." (p. 113)

17. Routley, Richard, and Montgomeery, Hugh. 1969. "Modalities in a Sequence of Normal Noncontingency Modal Systems." *Logique et Analyse* no. 12:225-227.

"Some properties of sequences of systems lying between T and S4, and T and S5, having added axioms of the form $\Box^n p \supset \Box^{n+1} p$ have been investigated in [4] and elsewhere (1). These systems have infinitely many modalities for $n > 1$. Here we consider an analogous sequence of noncontingency based systems, the i -th member of the sequence being denoted by T_{Δ}^i where i is any positive integer. The primitive basis of T_{Δ}^i is given by adding the axiom $\Delta^i p$ (where ' Δ^i ' denotes i iterations of the noncontingency modal connective ' Δ ', and ' $\Delta^0 p$ ' denotes ' p ') to either $S1_{\Delta}$ (see [3]) or to one of the noncontingency based formulations of T given in [2]. The equivalence of these bases follows from Theorem 5. of [3]. The first member of this sequence, T_{Δ}^1 , is deductively equivalent to the Trivial System, the second, T_{Δ}^2 , to S5, and the remaining members of the infinite sequence lie between S5 and T. Each system T_{Δ}^i has $2(i + 1)$ distinct modalities" (p. 225)

"Is significance a matter of things or of descriptions of things?"

That is to say, is it the couplings of certain individuals and certain properties or relations that are properly said to be significant or non-significant, or is it the couplings of descriptions and predicates?

A common answer is that it is either or both, or that it doesn't matter which we say. For it is assumed that to any non-significant coupling of an individual and a property there corresponds a nonsignificant

coupling of expressions, and vice versa. This isomorphism thesis(1) can be stated more generally as follows: there is a one-one correspondence between things-relations couplings and description-predicate couplings preserving significance.

Another answer to the main question is that significance is a matter of things and their relations, and not really a question of description at all. There is a strong temptation, supported by tradition and by some ordinary speech, to adopt such a thing or essentialist thesis of significance, to say that significance is concerned with things irrespective of how they are referred to or even whether they are referred to, and that, furthermore, things fall into logical kinds or categories as they do into natural kinds." (p. 215)

(...)

"The distinction between significance and absurdity resolves the initial puzzles, which arose from incompatible ways of looking at significance. Category theories based on both significance and absurdity are viable. Because, however, one theory is not the isomorphic image of the other the isomorphism thesis is false; and since the theories cannot be confused without disastrous consequences, it does matter what we say." (p. 238)

(1) An isomorphism thesis is stated explicitly by F. Sommers 'Types and Ontology' *Philosophical Review*, vol. 72 (1963), pp. 327-363; e.g. pp. 350-1: 'linguistic structures and ontological structures are isomorphic'.

19. ———. 1969. "A Fallacy of Modality." *Noûs* no. 3:129-153.

"The ancient principle of distributivity of necessity (DN for short), that necessary propositions only entail necessary propositions, has acquired an upstart companion, the distributivity of contingency (DC), which threatens to borrow some plausibility from DN; violations of these principles are sometimes lumped together as "fallacies of modality". The DC principle, according to which contingent statements only entail contingent statements, has played a specially important role in the discussion of entailment; and in particular it has taken a central part in Anderson and Belnap's important theory of entailment E. The DC principle has also had a major part in attacks on linguistic theories of logical necessity. We contend, however, that the principle and minor modifications of it, are false. We argue that the principle provides an example of a strong false thesis drawing its plausibility from its association with a weak but trivial counterpart which cannot however perform the task of the strong principle. We also explain in detail why no version of the principle can fulfill the role for which it is needed in E.

It is our contention that the real fallacy concerning DC is that of taking violations of DC as fallacious. For DC itself is a modal fallacy." (pp. 129-130, a note omitted)

20. Routley, Richard. 1970. "Non-Existence Does Not Exist." *Notre Dame Journal of Formal Logic* no. 11:289-320.

"The main aims of this paper are to explain criteria for the identity of individuals, to compare various criteria for the existence of properties and for the existence of propositions, and to present certain theses concerning the existence and identity of individuals, of propositions, and of properties.

Several other topics are, however, treated incidentally; for example an extended sentential logic designed to take care of certain semantical paradoxes and truth-value gaps by allowing for statement-incapable sentences is sketched.

In order to attack in a formal way the question of the existence of properties and relations and to formalise widely employed criteria for the existence of attributes, i.e. of properties and relations, an extended predicate calculus must first be

introduced. As a first move it is valuable to determine how much can be done in the simplest and most accessible of higher order functional calculi, viz. second-order functional calculus. Now this logic has to be so designed that it can express such propositions as "Some properties do not exist" and "All properties, whether possible or impossible,... (e.g. exist)". At first this suggests that a system like R^* , which allows for quantification over all possible individual items, be extended to second order.(1)" (p. 289)

(1) The system R^* is presented in R. Routley, "Some things do not exist," *Notre Dame Journal of Formal Logic*, Vol. 7 (1966), pp. 251-276.

21. ———. 1970. "Decision Procedures and Semantics for Feys's System S_2^0 and Surrounding Systems." *Zeitschrift für mathematische Logik und Grundlagen der Mathematik* no. 16:165-174.

"The systems investigated in detail are Feys system S_2^0 (of [3]), S_2^e , S_2 , C_2 and E_2 . The same methods as are used in studying these systems extend to a much larger class of modal logics; some extensions are outlined in section IV. For the systems studied three decisions are provided; in section I by Gentzen methods; in section II by extended truth-table methods; and in section III, as a corollary to completeness results, by the finite model property." (p. 165)

22. ———. 1970. "Extensions of Makinson's Completeness Theorems in Modal Logic." *Zeitschrift für mathematische Logik und Grundlagen der Mathematik* no. 16:239-256.

"Completeness theorems are derived, using the maximal consistent set construction, for a large class of sentential modal logics. The paper extends MAKINSON's[1]method (of [6]) to systems based on the modal logic C_2 (cf LEMMON[4]), on the system C_2^a (of FEYS[1]), on system C_2^n for each n , and on the weak system C_1 (of LEMMON[3]) and $S_{0.5}$ ". The systems

considered include, among others, all systems treated in MAKINSON[6], all modal systems treated in LEMMON[4] and [5], various systems introduced in [7], all E systems, all C systems, D1 and D2, S0.5, S2^o, S2^e, S3^o, S3^e, S4^o, T*, Parry's system S3 + $\Box \Diamond \Box A \rightarrow \Box A$, S3.5, S6, S7, S8 and S8.5. (For details of many of these systems see FEYS [1].)

The methods are readily extended to various other systems, e.g. to the conventionalist systems of [7] and, as is well-known, to extensions of S4, and they can be extended to quantified modal logics. For certain systems considered the completeness results are combined with a solution of the decision problem by the finite model property." (p. 239)

- "The standard semantics for quantification logics have serious limitations; they are more complicated than they need be and more set theoretical than they should be. In support of this evaluation alternative simpler and less set-theoretical

semantics are provided for quantification and free quantification logics both without and with identity, and for second-order significance logic. These semantics, domainless semantics, are defended against objections as to their intelligibility and satisfactoriness, and appropriate consistency and completeness theorems are proved in order to show the comparative adequacy of the semantics. Domainless semantics, by assigning values en bloc to atomic wff, eliminates the otiose notion of a domain of interpretation and n-place relations on this domain of entities, and thereby eliminates the associated correspondance theory of truth which is built into the reference selections and truth evaluations of standard semantics. It does this without introducing names in the style of, what is similar, the substitution interpretation of quantifiers, and so it avoids legitimate objections that have been made to substitution semantics (1)."

"No modal logic so far presented adequately represents radical conventionalism. Yet conventionalism about modalities is a very pervasive doctrine. In this paper we make a start on filling this serious gap in the

literature.

Radical conventionalism is distinguished by the thesis:

(R). *All assertions of modalities are contingent.*

(...)

Radical conventionalism is inconsistent with *all* Lewis modal logics, as we shall show. It does not follow, however, that

radical conventionalism is, as has often been assumed, inconsistent. One of our main aims is to exhibit a class of consistent modal logics in which thesis (R) is satisfied. This is a major step towards showing that radical conventionalism is a consistent doctrine.

We distinguish radical conventionalism from two other main positions regarding modality which have also been called conventionalisms. For radical conventionalism has frequently been confused with these other

doctrines, to the detriment of each position since each pair of positions entails mutually inconsistent principles." (p. 131)

Abstract: "In the first part of this paper, we developed a semantics for the system R of relevant implication, which is the non-modal part of Anderson-Belnap style systems of

entailment. In the present paper, which we have endeavored so far as possible to render self-contained, we add an S4-style theory of necessity, getting the system NR of [1]. This enables us to introduce an entailment connective on the definition. (1) $A \Rightarrow B =_{df} N(A \rightarrow B)$, where \rightarrow , is relevant implication, and accordingly to adapt the semantics for relevant logics developed in [2] to a theory of entailment proper.' We note that although the question whether the NR-theory of entailment coincides exactly with that of E remains open, both the results of [1] and the motivation provided for the pure theory of entailment in [3] suffice to settle it for all practical purposes - every motivating condition ever put forth for E is satisfied in NR, and in all known cases of interest involving formulas built up from entailment and the truth-functions, E and NR coincide exactly with respect to provability. Indeed, although we should like very much to see the remaining open question definitively solved, we hazard here the guess that if E and NR should happen to diverge on some formula, it will be E which turns out thereby to be semantically deficient; we do not think that will happen. In any event, we present with confidence the present results as the semantics for Anderson-Belnap style entailment." (p 53, a note omitted)

"In [1] and [2], we developed Kripke-style semantical postulates for the system R of relevant implication and the system NR of relevant implication with modality. The latter suffices for a theory of entailment as well, though we left the

question open in [2] whether that theory is precisely the Anderson-Belnap system E of entailment. The time has come to extend our semantical methods to other systems of relevant logic besides the system R. We shall do so in two stages. The present paper deals only with positive systems of entailment, since these may be handled quite simply along previous lines; complications arising from negation are put off until the sequel. We do not consider quantified entailment logics explicitly, though quantifiers may be handled in the style of [1] (or differently, if the reader prefers). Accordingly, we present here a semantical analysis of the Anderson-Belnap systems R_+ of positive relevant implication, E_+ of positive entailment, and T_+ of positive ticket entailment; by ringing the changes on the axiomatizations of these particular systems, we include as well related relevant logics; there is, on our approach, a natural minimal one, which we can call B_+ ." 30. ———. 1972. "Algebraic Analysis of Entailment I." *Logique et Analyse* no. 15:407-428.

"In [1]-[4], the authors have developed a semantical analysis of Ackermann-Anderson-Belnap style systems of entailment similar to the well-known analyses of Lewis style strict implication due to Kripke, Hintikka, Lemmon, and others. The present paper uses these semantic insights - in particular those of [3] - to develop a general algebraic analysis of entailment logics. Such an analysis has already been furnished by Dunn in [5] for the system R of relevant implication, who interpreted the system R in a certain class of partially ordered algebraic structures, namely the DeMorgan monoids (1). A similar analysis, as we report, will do for entailment logics generally. This present analysis, as it remarkably turns out, is strongly reminiscent of the very differently motivated connections

drawn between the theory of combinators and certain theorems of intuitionist logic by H. B. Curry in [6] and [7]. The present paper will analyze chiefly negation-free entailment logics, which are the most natural algebraically; some remarks, however, will be inserted to show where the enterprise tends when negation too is added. Our key algebraic notion will be that of an Ackermann groupoid, defined below, which serves to explicate algebraically the minimal relevant logic B^+ of [3] and which comes on the addition of postulates to explicate also more familiar relevant, modal, and intuitionist logics, such as T^+ , E^+ , R^+ , $S4^+$, and the intuitionist sentential calculus J ." (p. 407)

(1) The theory of residuation, on which Dunn's and the present work rests, was developed by Ward and Dilworth; cf. [7] for references.

"We concentrate on first degree semantics because this sharpens and simplifies the choice among rival systems. For different systems may have a common first degree theory. In particular a large class of strict implication systems (including all Lewis systems) have the same first degree; and the system FD coincides with the f.d. theory of the system E of Anderson and Belnap (presented in [1] and [2]) and also of a number of rival entailment systems both included in, including, and only intersecting E (see [11]). Thus the divergence of entailment from strict implication, and from other implications such as connexive implication,

is already clear at the first degree. Most of the traditional and current disputes come up and can be settled at the first degree level, for example, disputes about the paradoxes and their effects, and as to the adequacy of principles such as Disjunctive Syllogism. Thus choice of a first degree system already fixes in large measure one's position on entailment. Furthermore, for a number of important notions the higher degree structure is either peripheral, as with inclusion of logical content, or, as with causal sufficiency, not well defined.

Finally the first degree has much simpler semantics than the full systems; it is not complicated by questions as to which setups or structures implications are in or what relations hold between set-ups, which determine the fate of higher degree laws." (pp. 335-336)

"In spite of the central role which the concept of significance has played in recent philosophy, very little has been done to produce a general theory in terms of which the various claims can be evaluated. Both Russell and Ryle go some way towards the development of particular significance theories which they then apply to the examination of philosophical theses, and Russell's theory of types is expressed partly in terms of formal criteria. But the two theories, though similar, are inconsistent with each other, and each is seriously incomplete. Both depend crucially on the acceptance of intuitive and unstated principles.

It is our purpose to develop a general formal theory of significance in terms of which significance claims, and arguments by means of which they are made, can be assessed. Thus we aim, eventually, to provide a logic, not previously developed, for much of modern philosophy.

This aim might be challenged in one of three ways. First, even though it is accepted that some sentences are nonsignificant, it might be thought that there is no need of a special logic to take account of them since the ordinary principles of classical two-valued logic can be applied to arguments in which they occur. Secondly, it might be said, given that there is a need for a special logic, the peculiar features of nonsignificant sentences make its development impossible. Thirdly, it has sometimes

been suggested, nonsignificance can be wholly explained in terms of other well-understood concepts: in particular, it can either be identified with the ungrammatical, in which case nonsignificant sentences should be excluded from all arguments and the only logic which is necessary is the classical two-valued logic over significant sentences; or it can be identified with the necessarily false, and in this case significance claims and arguments can be handled within classical modal logic.

Consider the first objection. The point of and need for a general formal theory of significance can be justified on general grounds by appealing to the usual reasons for underpinning philosophical investigations by logical studies: namely the clarity and systematisation which result, and the fact that the philosophical theory can be tested for consistency and is generally more readily assessed and open to falsification. But it can also be justified on special grounds since, without it, the assessment of particular significance theories, if not impossible, is at best intuitive. Unless general principles are formulated and justified, it remains obscure which critical arguments are valid within and against a particular theory. Thus, without some systematisation of significance principles, many philosophical arguments, such as those of Ryle and Strawson on the philosophy of mind, are impossible to assess.

As one example of the need to make explicit the principles which are assumed, and the need to evaluate them, consider Russell's assumption, which is nowhere justified, that the paradox argument evaporates and the conclusion no longer follows once it has been shown that the premisses are meaningless. This amounts to saying, in general, that a nonsignificant sentence has no implications. But if this is so, then Ryle's *reductio ad absurdum* technique, and Wittgenstein's declared aim, seem to be illogical. For here, the intention is to show that a given sentence is nonsignificant because it has implications which are nonsignificant. But if it is indeed nonsignificant, then it was so before the actual implications were drawn, and in terms of Russell's principle it cannot have these implications because it has none at all.

In order to resolve problems such as this, it is necessary to construct associated significance logics for particular theories of significance and to ask whether there is an internal inconsistency in either theory, whether there are general principles incompatible with either or both, and whether there is a general theory which can consistently include both. It may be, for example, that the apparent incompatibility of Russell's principle and Ryle's is not real. This would be so if they were adopting different implication connectives; in this case, both principles could consistently appear in the same general theory.

None of these questions can be settled using only a classical two-valued logic, however, since what is in issue is just which relations hold between truth-valued sentences, on the one hand, and nonsignificant sentences, on the other. Similarly, it is inadmissible to evaluate positivist criteria of significance using principles of two-valued logic alone since, given that some sentences are nonsignificant, such a logic cannot hold generally. But the mere recognition that at least a three-valued logic is necessary is of itself inadequate. For unless the *relevant* three-valued logic is specified, the criteria are still not fully assessable." (pp. 5-7)

34. Routley, Richard, and Brady, Ross. 1973. "Don't Care was Made to Care." *Australasian Journal of Philosophy* no. 51:211-225.

"We believe that the deep structure of natural languages, and hence of the languages in which philosophical problems are characteristically formulated, will have to be based on an enriched significance logic which has a third value -- nonsense or non-significance -- and not on a classical two-valued logic which only has truth and falsity as its values. Such logics will be required not just in providing a semantics for natural language but also, for what is even more important, in the assessment of informal reasoning and in determining the scope of valid argument. But our view that there is a need for nonsense as a value has been challenged, most recently by Haack(1) who thinks that a variation on Quine's position can be sustained, that central examples of non-significant sentences are 'Don't Cares' which can be brought within the scope of classical logic by some fairly arbitrary assignments of truth-values to them.

Though we shall concentrate on Haack's case against nonsense as a further value, our criticism has more than merely local interest, for many of the defective moves that Haack makes in defence of classical logic have wide currency." (p. 211)

35. Routley, Richard, and Meyer, Robert K. 1973. "Classical Relevant Logics I." *Studia Logica* no. 32:51-68.

"In a number of papers, the authors have offered semantic and algebraic analyses of the relevant logics of Ackermann, Anderson, and Belnap, and of logics akin thereto. The most interesting of these logics, in our opinion, are the Anderson-Belnap system R, which we analyzed in [1], and our own system B, studied in [5] and [6]. These are respectively the strongest and the weakest relevant logics, others being intermediate. Now one of the chief features of the relevant logics -- indeed, the chief feature on the motivational lines of [7], [8], and [1] -- lies in their blocking the so-called paradoxes of material and strict implication. The paradox which has drawn the most ink, particularly in Meyer's remarks, is the old saw that from a contradiction anything follows: i.e.,

(1) $A \ \& \ \neg A \rightarrow B$.

One would have thought, accordingly, that addition of (1), with other classical negation principles, to positive relevant logics would result in their breakdown, just as intuitionist logic fails to accommodate, on pain of breakdown, (1) together with excluded middle. Like so many things one would have thought, this is false. In fact, on a semantical analysis akin to that of [1] and [5] but in certain respect more natural as regards negation, the positive insights emerge unscathed. The purpose of this paper is to present that semantics and the *classical relevant logics* to which it gives rise. Arising out of this analysis are new algebraic insights as well; classical relevant logics are Boolean and so the algebras of these logics -- sufficing in particular for the positive parts of the relevant logics studied to date and in

distinction to the algebras developed by Dunn in [9] and by us in [6] -- are just Boolean algebras with an additional binary operation. Indeed, as we show, we may limit our considerations to *set algebras* -- i.e., algebras whose domain is the power set of some set. This leads to considerable simplification of some outstanding problems for positive relevant logics -- in particular, for the long-open decision question for R^+ -- and we suggest lines along which we believe a successful solution of this question can be obtained." (p. 51)

"Word that Anderson & Belnap had made a logic without semantics leaked out. Some thought it wondrous and rejoiced, that the One True Logic should make its appearance among us in the Form of Pure Syntax, unencumbered by all that set-theoretical garbage. Others said that relevant logics were Mere Syntax. Surveying the situation Routley, and quite independently Urquhart, found an explication of the key

concept of relevant implication. Building on Routley [1972] , and with a little help from our friends - Dunn and Urquhart in particular, with thanks also due to Anderson, Belnap, V. Routley, and Woodruff - we use these insights to present here a formal semantics for the system R of relevant implication, and to provide it with proofs of consistency and completeness relative to that semantics." (pp. 199-200)

(...)

"Our introductory remarks conclude with the observation that, as a result of this paper and of Urquhart's [1972] related work, the relevant logics now have a formal semantics; but relating such a semantics to the informal claim that a system of logic has captured one's intuitions is ever a matter of private judgment, and that judgment we leave, as his rightful due, to the reader." (p. 204)

"The purpose of this paper is to exhibit a simple, undecidable sentential calculus in the ANDERSON-BELNAP family of relevant logics. We call this system Q^+ . We use the semantical methods of [1] and [3] to show that if Q^+ is decidable then the word problem for semigroups is solvable, contradicting POST's [2] and establishing our main result. Q^+ , we add, is not our favorite sentential logic, but it is closely

related to the viable ANDERSON-BELNAP system R of relevant implication. Accordingly we believe to it be the best approximation yet to HARROP's request in [4] for a philosophically interesting undecidable sentential logic." (p. 389)

38. Routley, Richard, and Routley, Val. 1973. "Ryle's *Reductio ad Absurdum* Argument." *Australasian Journal of Philosophy* no. 51:125-138.

"According to Gilbert Ryle (in his *Collected Papers*) a certain sort of *reductio ad absurdum* argument, distinct from Euclid's argument, has a central place in philosophical argument. This *reductio ad absurdum* argument is applied in the following way: if it can be shown that an apparently meaningful thesis, such as that the mind is in the body, implies indisputable cases of absurdity, then the thesis itself is absurd (nonsense). Thus the argument is of the form: If q follows from p and q is absurd then p is absurd,

i.e., using some symbols,

if $p \supset q$ and $\neg Sq$ then $\neg Sp$ (1)

Throughout $p \supset q$ reads '(that) p entails (that) q ' and $\neg Sq$ reads '(that) q is not significant (is absurd)'. But the notation may alternatively (by trading 'that' in for quasi-quotes) be read metalinguistically.

(...)

We want to argue here that there are grave difficulties in maintaining the correctness of the *reductio* argument (1), but that, fortunately for the project in *The Concept of Mind*, it is doubtful that the arguments used

- there are in fact of this form or have to depend for their correctness on the correctness of (1). Once again the case for a special philosophical argument appears to fall down." (p. 125)
39. ———. 1973. "Rehabilitating Meinong's Theory of Objects." *Revue Internationale de Philosophie* no. 27:224-254.

"Meinong's theory of objects makes an important contribution to the logical theory and semantics of that large and indispensable part of discourse which is intensional. Despite this, his theory has been, and continues to be, the target for a barrage of supposedly devastating criticism and ridicule, which is without much parallel in modern philosophy, so that even to mention Meinong's theory gives rise to amusement, and practically any theory can be condemned by being associated with Meinong (e.g. 'shades of Meinong!' Ryle [1] p. 234; 'Meinong's jungle of subsistence,' 'the horrors of Meinong's jungle' [2] pp. 12, 32, 'the unspeakable Meinong', James cited in [3], p. 187. The effects of this have not merely been an historical injustice to a courageous and original thinker; it has also had the effect of blocking off, or at least inordinately delaying, a whole avenue of research, especially of non existential logic and of alternatives to the entrenched Russellian theory and its modern variations and simplifications. For the fact is that many of the more general objections which are supposed to destroy Meinong's theory would, if correct, be equally effective against non-existential logic, with which Meinong's theory shares important features. Our project of considering these objections has then wider importance than just that of clearing Meinong's name and rehabilitating his theory. In this paper we want to defend Meinong's theory of objects, or rather a modern logical reconstruction of a substantial part of it, against some of the common general objections which are taken to have completely discredited it. (Thus, e.g. Ryle [4]: '*Gegenstandstheorie* itself is dead, buried and not going to be resurrected'). We shall argue that these criticisms do not stand up to examination, and that it is not Meinong but his critics who are involved in a naive and mistaken theory of meaning, the Reference Theory." (p. 224)

40. ———. 1973. "Ideal Objects on a Meinongian Theory of Universals." In *Proceedings of the XVth World Congress of Philosophy Varna; 17th to 22nd September, 1973, Varna, Bulgaria. Vol. 5*, 581-584. Sofia: Sofia Press.

"The rejection of the Ontological Assumption (hereafter OA), according to which one cannot make true statement about what does not exist, together with the further step of admitting that non entities, i.e. items which do not exist, have determinate properties, makes it possible for a theory of items, such as Meinong's theory of objects, to avoid the standard positions on universal and many of their difficulties.

(...)

The rejection of the OA does not give a Meinongian position a merely terminological advantage or claim to novelty, nor does the position differ merely terminologically from Platonism (as the official positions are inclined to claim). The distinction is not merely terminological because the question of what exists is not completely uncontrolled by conditions: one cannot say what one likes about what exists. For to exist is to be in the actual world, and the logical properties of entities are controlled by those of the actual world. Hence these conditions which derive from the logical features of the actual world: - *first*, what exists is consistent; *second*, what exists is complete or determinate; and *third*, what exists is unqualifiedly assumptible, e.g. if the x which fs exists then the x which fs does

f. In short, in the case of an entity we do not require further guarantees about the suitability of its description: the guarantee is provided by its existence." (p. 581)

(...)

"Terms like 'the Triangle' and 'triangularity', and also mass terms, are irregular subjects. Accordingly there is nothing to be lost and much to be gained by admitting such subjects within the formal framework of quantification logic (see [3]). But once such subjects are admitted, and the domain of items in the semantical frame correspondingly widened, it is decidedly preferable to switch to a quantified significance logic to cope with the very large class of non significant sentences that result in typical applications of the logic. Then special postulates, each as part of (F), governing the new universal terms can be adjoined, but their exact form has still to be worked or argued out. Likewise a semantical rule for form terms, non trivial enough to verify the admissible half of requirement (F) (though not its converse, except under appropriately restricted conditions) remains, so far as we know, an open problem." (p. 584)

"Professor Bernard Williams' arguments that "fatal difficulties beset the account of Meinongian 'pure objects'" ([1]), p. 55; my rearrangement) are, I try to show, simply invalid: the main argument effectively distributes a universal quantifier across a disjunction." (p. 131)

(...)

"Meinong's theory of incomplete objects is a going enterprise; but it has yet to be shown so far as I can see, if it can be shown

at all, that statements about Universals can always be eliminated, preserving relevant properties, in favour of hypothetical statements about 'ordinary' objects.

All we have been offered by those who would eliminate 'systematically misleading' statements about Universals (e.g. Ryle [3]) are sample eliminations, which however exemplify schemes such as (Q), which break down if applied generally. And it would appear to be an outcome of Ackermann's demonstration of the unsolvability of the elimination problem for second-order predicate logic (see [4], p. 304) that a general elimination of polyadic Universals in the proposed style is impossible." (p. 135)

"The purpose of this note is to extend the simplifications of [1] to the system R of relevant implication analyzed semantically in [2]. In [1], it was established that the system R +, which is the negation-free fragment of R, could be furnished with a negation \neg more classical in most respects than the preferred negation — of [3].

This was rather astonishing, since an important motivating condition on relevant logics had been absence of the classical paradoxes of implication (1). It turned out, however, that one

could have the most objectionable of the paradoxes anyway, namely $A \& \neg A \rightarrow B$ and $A \rightarrow B \vee \neg B$, without the least interference with the positive ideas." (p. 182)

(1) Other scholars, notably Urquhart and Gabbay, have thought independently about classical negation in relevant logics. But [1], so far as we know, contained the first demonstration that the system $R +$ does not collapse under the admission of such negation." (p.183)

45. ———. 1974. "E is a Conservative Extension of E_i ." *Philosophia* no. 4:223-249.

"The purpose of the present note is to solve the most recalcitrant of the conservative extension questions presented by Anderson for E in [1], by showing that E is a conservative extension of the system E_i , formulated as in [2]. The proof proceeds by reducing this question to the analogous question for the system NR introduced by the first author [Meyer](1) I in [3] and which was studied by us semantically in [4]. By showing that NR is a conservative extension of an appropriate system NR_i , we complete the proof. The result is of interest, as was noted in [1], in that E_i is under more firm control than E, having been Gentzenized and furnished with a decision procedure in [2].(2) The method of proof, too, is of some interest, the most important part of the argument (in II below) lying in the replacement of truth-functional $\&$, \vee with their intensional analogues $-$, $+$ in adapting the characterization of [4] of theory and of prime theory in an appropriate completeness proof. One concludes that the point of view of [4], and of related papers, is

less dependent on properties of $\&$, \vee - in particular, their general lattice properties - than one might have thought. Hopefully this will yield further insight into the semantics of E, which though in a sense completed in [6] and [7], remains too formally cluttered to be completely satisfactory.(3)." (p. 223)

(1) Bacon had the idea earlier, and independently. In principle it's due to Anderson and Belnap. And accordingly to Ackermann. And accordingly ... to Adam.

(2) We suppose, too, that E_i and NR_i have appropriate finite model properties on the present semantics, given the result of [10] that R_i has the finite model property.

For E and NR and R, on the other hand, these questions are open.

(3) In contrast, e.g., to R.

"Many intensional logicians have not abandoned, as unrealisable, the dream of something like Leibniz's *characteristica universalis*, of an almost universal logical language, with simple components, and with a

precise and acceptable semantics, within which the whole of (English) discourse can be expressed, and whose semantics provides theories of truth, consequence and meaning for the discourse expressed. Admittedly things did seem rather desperate when, after the initial successes of the pioneering days of Wittgenstein's *Tractatus Logico-Philosophicus* and Carnap's *The Logical Syntax of Language* had faded, it was shown that the theories of these texts fail at point after point. However, most of the objections which were taken as winning the day against these theories - for example the inability of the theories to cope at all adequately with intensional discourse, with context dependence, with non-significance and other discourse failures - are now seen to rest on the paucity of the logical, and especially semantical, equipment then available, not in inherent limits to logic and semantical analysis.(1) make the dream a little more real then, both the logical syntax and the semantical framework will have to be much enriched.(2)

Realising the dream involves however a very ambitious program. We don't pretend to know whether it can be brought off, or how exactly.

But we do believe that if the program is to stand a chance of succeeding its logical theory will have to include enrichments like those we go on to discuss. These enrichments in turn however lead to many new problems, several of them

philosophical (and the regress in philosophical problems set up by technical solutions to earlier philosophical problems may well be vicious). We opt, in later sections of the paper, to concentrate on one important set of these problems, one which has a special bearing on the shape the grand semantics should take, the general admission of descriptions into intensional discourse, and of a choice descriptor in particular." (p. 291)

(1) This point is elaborated in [1], Chapter 4.

(2) Ideally these developments would be carried out in combination since, as Montague has emphasized (e.g. [2] p. 212), 'there will often be many ways of syntactically generating a given set of sentences, but only a few of them have semantic relevance'. Ideally - but there is a danger, in the current rudimentary state of semantical and context theory, that important notions, as well as discourse that cannot be properly digested by the theory, will be inadequately or roughly treated, if investigated at all.

"It is a vogue idea that semantical analyses of natural languages such as English can be accomplished within the framework of a λ -categorical or type-theoretical language,(1) or of a language which can be included in such a λ -categorical language (e.g. Montague [7], Lewis [6], Parsons [8], Tichy [17], Cresswell[3]).

The leading assumption are (1) that the surface structure or grammar of a given language can be transformed, or translated, by a series of reductions into a canonical form, commonly called 'deep structure', which is appropriately λ -categorical or as a special case thereof, categorical), and (2) that the semantic, which it is enough of course to furnish for the deep structure, is (some complication of) a two-valued possible worlds semantics. The assumed procedure is exhibited in a rudimentary way in the pedagogical practice of transforming English arguments into quantified modal logic as a preliminary to assessing validity, etc." (p. 327)

"Much fresh light is cast on traditional metaphysical proposals, and on associated philosophical programmes designed to indicate or explain these proposals, by recent rapid advances in the areas of discourse which succumb to semantical analysis. Indeed, through semantical analysis various pervasive metaphysical proposals--which lie behind and thus propel modern philosophical programmes--can be conclusively demonstrated in appropriately qualified form, and the strength, limitations, and inadequacies of the more traditional forms can be revealed." (p. 187)

(...)

"The main thesis to be argued on this point is simply that *many philosophically influential reductive positions, when generously construed, furnish semantical analyses whose correctness can be demonstratively*

established. In short, the *wide* reductions, taken as semantic analyses, are necessarily true, and thus reconcilable with transcendental positions.

Where this is so the reductions furnished are not paradoxical, or wrong, but demonstrably correct, and not trivial, though sometimes virtually platitudinous. So results the promised synthesis.

What has generally happened, however, is that the reductions adopted are intended to work with a narrower reduction base which fits in with some cherished programme, such as empiricism. Under this contraction

of the base, the reductions cease to be demonstrable, and succumb to formal counter-examples and their more familiar intuitive analogues; and it is under these narrow construals that the reductions are paradoxical in Wisdom's sense.[*] But one important reason why the reductions are so appealing, a reason which Wisdom neglects, is that they rely on widened, correct, versions of the reductions where further situations are admitted into the analysis." 55. ———. 1976. "The Durability of Impossible Objects." *Inquiry* no. 19:247-250.

See the Reply by Karel Lambert (pp. 251-253).

"Meinong's theory of impossible objects, though an enduring contribution to semantics, has been subject to much misrepresentation and to repeated criticism, much of it based on Russell's criticism of the theory. Lambert, in an unusually sympathetic discussion of Meinong's theory argues that:

Russell's well-known argument fails. However, it is possible to augment Russell's argument against Meinong with sound Russellian principles in such a way that it presents at least a strong inclining reason against

Meinong's theory of impossible objects.(1)

The object of this note is to show that Lambert's 'augmentation of Russell's argument to show that there are at any rate no impossible objects' (p. 310) fails, and fails for essentially the reasons that Russell's well-known argument fails." (p. 247)

56. Routley, Richard, and Meyer, Robert K. 1976. "Dialectical Logic, Classical Logic and the Consistency of the World." *Studies in Soviet Thought* no. 16:1-25.

Italian Translation: "Logica Dialettica, Logica Classica e Non-Contraddittorietà del Mondo", in Diego Marconi (a cura di), *La formalizzazione della dialettica*, Torino: Rosenberg & Sellier 1979, pp. 324-353.

"Dialectical logic, especially Soviet logic, has customarily received sharp and summary treatment at the hands of Western critics.

(...)

To date classical logic - which is Western mainstream logic - has been strongly on the offensive in the ideological logical warfare between East and West, with many supporters in fact among the Soviets, and dialectical logic has been very much on the defensive. The object of this paper is to try to upset this ideological power structure by furnishing dialectical logic with the framework at least of a viable semantics, and at the same time to shatter the imperviousness of mainstream Western logic, and thereby to assist the cause of that newer, less orthodox and so far minor, logical theory - relevance logic.

It will emerge that the differences between the orthodox Western and Soviet positions cannot be satisfactorily represented as logic, or formal or classical logic, on the one side, and anti-logic or the rejection of formal logic on the other; each position can furnish viable, equally formal, but competing logical theories, and the differences between these positions will come down to philosophical differences about such highly debatable and empirically untestable matters as the consistency of the world." (p. 1)

57. ———. 1976. "Every Sentential Logic has a Two-Valued Worlds Semantics." *Logique et Analyse* no. 19:345-365.

"No one anywhere will design a sentential logic without a quite familiar kind of semantics, and no one can now scorn any such logic just because it lacks a semantics. For just as every

sentential logic has a characteristic Lindenbaum algebra, so, and less trivially, every such logic has a bivalent relational (and also an operational) semantics." (p. 345)

(...)

"But even if the models the method generates are sometimes skew, or even inconsistent, the method promises a big payoff not only in logic, but also for linguistics and philosophy. This payoff will be increased still further when the methods are extended to logics and languages far richer than sentential ones, as they can be (see [8]). Indeed the method presented below already suffices for all zero-order logics under a truth-valued interpretation; but for an objectual semantics further features have to be included in the models (see [10]). We conjecture that every logic has a two-valued worlds semantics ; but there remain some conspicuous problems in the way of proving such a result, e.g. the problem of characterising logics and logical languages generally. The logical payoff comes through the theories and results semantical analyses of logics and languages open up, for example, theories of truth, reference, meaning and consequence, and, less generally, results such as compactness, separation and decidability. The philosophical and linguistic pay-off derives from this logical payoff: it is that any area of language that can be supplied with an exact logical syntax and set of principles can automatically be furnished with an extensional semantics, and so provided with associated logical theories of truth, meaning, consequence and so on. If, for example, the theory of propositional attitudes or notions such as belief or perception have a logic, or a structure, then they have a worlds semantics." (p. 347)

Journal of Formal Logic no. 17:44-58.

"Algebraic techniques are used to show that Feys' system $S2^\circ$ (cf. [1]) and certain necessitated extensions of $S2^\circ$, such as Lewis' systems $S2$ and $S3$, have the finite model property, and accordingly are decidable.

Representation theorems are then used to establish set-theoretical semantics for the modal systems studied. Where the results obtained are not new they improve on earlier results (such as those of Lemmon in [3]) in two respects; first they provide direct algebraic treatments of the systems, and second they furnish better semantical results (see the discussion of theorem J for $S2$). The techniques used however follow those of McKinsey (in [4]) and Lemmon (in [2] and [3]). Since it is now known that these techniques do not work for all necessitated extensions of $S2^\circ$, a somewhat piecemeal approach is inevitable. Weak results are also obtained for Feys' system SI° and Lewis' system SI (for details of these systems see [1])." (p. 44)

"It is one thing to give a general theory of or semantics for truth, or even for truth and significance, and thereby provide for the main ingredients of a full theory of referential (or denotation style) notions. It is quite another, so it is commonly enough claimed (following Quine [1]), to characterise any of the

notions of the full theory of meaning - synonymy, sense, entailment, and so forth. The extent to which this popular dogma - one of the newer dogmas of empiricism - is correct, is an issue even within empiricist semantics." (p. 33)

(...)

"Because intensional discourse has to be encompassed in the theory of truth, the general semantical framework of a satisfactory theory has to include worlds far beyond the actual, or the like. But in including these - especially impossible worlds, which are essential for example, for the semantical analysis of propositional attitudes such as belief (see [14]) - it far exceeds what is empirically admissible. By including these worlds, however, the *full* theory of truth offers a framework for definitions of central intensional notions, such as meaning: but a less extensive modelling, with worlds restricted to the actual or to those of modal logics, would *not* suffice." (p. 36)

60. ——. 1977. "Welding Semantics for Weak Strict Modal Logics into the General Framework of Modal Logic Semantics." *Zeitschrift für mathematische Logik und Grundlagen der Mathematik* no. 23:497-510.

"Weak strict modal logics, strict modal logics which are weaker than systems which contain the rule of necessitation (that where A is a theorem so is its necessitation, $\Box A$), form an important, but somewhat neglected and under-rated, class of modal logics. They have, however, attractive semantics which form an integral part of general semantics for modal logics. A sentential *modal* logic is a system which includes as well as classical sentential logic SL -taken to hold at *every* world-at least one oneplace non-truth-functional connective, \Box say.

Semantics for sentential modal logics are a special case of the universal semantics of [4], with the rules for classical connectives reducing to classical evaluation rules (such as Iii) and Iiii) below). With just one further modelling condition, a natural semantics for weak strict modal systems emerges. Semantics for such systems are, of course, far from uniquely determined." p. 497)

"Philosophers of modern logic have cherished no project more dearly than that of extensional reduction. Despite occasional protests that this project was ill-conceived from the start, or that it fails to account for important areas of experience and thought, the extensionalist mills have been grinding away anyhow. Their grinding has brought with it a number of important technical successes, replete with philosophical claims that light has finally been shed on areas hitherto buried in incomprehensible darkness.

There has, frankly, always been something self-serving about these claims. A man who understands no language but French will find nothing comprehensible until it has been translated into French. This does not mean, surely, that Shakespeare reads better in French than in English. It means rather that those who are unwilling to make the effort to comprehend Shakespeare in his native linguistic habitat will have to make do with what can be preserved of him in a foreign language.

Nevertheless, the fruits of the project have been impressive. Nor is there any doubt that some areas?e.g., Lewis-style modal logics?have been rendered, if not necessarily more intelligible, at least simpler and closer to what one took to be an underlying philosophical motivation?e.g., by Kripke-style possible world analysis.

So, in short, it seems good to us to have another look at the entire program of extensional reduction. We shall ask in particular whether successful extensional reduction should be taken as a touchstone of good semantical analysis. Relevant to this question will be certain technical results to be newly presented here." (p. 355)

Annotated bibliography of the logical works of Richard Sylvan [*né* Routley] (1978-1988)

Bibliography

1. Routley, Richard. 1978. "Semantics for Connexive Logics I." *Studia Logica* no. 37:393-412.

"According to the third view in the ancient debate on the nature of conditionals,[*] a sound conditional requires a connexion between antecedent and consequent. Both material implication (the first ancient view} and

strict implication (the second ancient view) were rejected by the third view as satisfactory accounts of the conditional relation because they deliver conditionals such as those of the paradoxes of implication which

are unsound, presumably on the ground that they fail to meet the requirement of connexion. We do not know what conditionals were said to meet this requirement, other than Identity, $A \rightarrow A$ (a principle that was explicitly rejected under the fourth ancient view).

The third ancient view has reappeared in the modern debate as to the nature of entailment, implication and conditionality, where the connexion requirement is commonly imposed as a requirement of meaning

or content connexion between antecedent and consequent of valid implications. This requirement coincides with the broad requirement of relevance: for if antecedent and consequent enjoy a meaning connexion then they are relevant in meaning

to one another, and if they are relevant in meaning to one another then they have through the relevance relation a connexion in meaning." (p. 393)

(...)

"Although the semantical analysis resolves many problems concerning connexive logics and provides new means of attacking other problems, it leaves many problems - perhaps too many - open." (p. 410)

2. ———. 1978. "An Inadequacy in Kripke-Semantics for Intuitionistic Quantificational Logic." *Bulletin of the Section of Logic* no. 7:61-67.

"The semantics for intuitionistic quantificational logic, that have come to be known as Kripke-semantics (see, e.g., [2], p. 246) after the influential presentation of Kripke [1], turn out to be unsound. Since a large body of theory concerning intuitionistic logics and mathematics is now based on these semantics the matter is of more than merely local significance.

Although the points made apply equally against many other presentations of Kripke-semantics for intuitionist logic (e.g. those of Thomason [3], Aczel [4], Gabbay [5] and elsewhere), it is convenient to focus on Kripke [1], and to borrow his terminology and notation. Kripke in turn adopts (see [1], p. 93) the formulation of intuitionistic predicate logic of Kleene [6], and it is advantageous to follow suit. It is worth noting that Kleene's formulation allows both for free variables and for constants (and so also do the formulations adopted by some others: e.g. Thomason [3], p. 1 and Aczel [4], p. 2)." (p. 61)

"In his original presentation of The System of Strict Implication ([1], chapter V) Lewis considers a 'partial system contained in Strict Implication' to which he believes some interest attaches.

If our aim be to create a workable calculus of deductive inference, we shall need to retain the relation of logical product,

$p \& q$, but material implication, $p \supset q$, and probably also material sum, $p \vee q$, may be rejected as not sufficiently useful to be worth complicating the system with. The ideas of possibility and impossibility also are unnecessary complications. Such a system may be called the Calculus of Ordinary Inference ([1], p. 318; with modern notation for connectives." (p. 4)

"Systems in the vicinity of the *P* systems, first formulated by Arruda and da Costa [1] (1) are logically important, for several reasons. Firstly, it is evident that a naive set theory with an unrestricted comprehension axiom, designed with certain of these systems as underlying logic, will prove to be a non-trivial though inconsistent theory (2). Thus, as remarked in effect in [1], these systems offer important initial bases on which to endeavour to erect mathematically adequate paraconsistent set theories." (p. 301)

(1) Da Costa's use of *P* systems, and also of other systems than his *C* systems, was quite unfairly neglected in [8], where it was suggested that da Costa, though having the fine vision of a general theory of inconsistent or (as they are now called) paraconsistent systems, had concentrated on much too narrow a range of systems.

But a theory of sufficient generality of paraconsistent systems -- as distinct from the investigation of just a few systems of the class -- has yet to be worked out.

(2) Inconsistency is readily established by paradox arguments, e.g. by the standard argument for the Russell paradox. The intuitive argument which makes non-triviality evident is as

follows: - - It is known from [2] that an extensional comprehension axiom can be added to quantified \mathbf{P} systems without trivialising them, that is one can non-trivially adjoin a comprehension axiom limited only by the requirement that set determining wff contain but extensional connectives and quantifiers, i.e. in this context, contain no occurrences of the implicational connective \rightarrow . But, as the semantics will show in the case of appropriate \mathbf{P} systems such as \mathbf{BH} , no reduction of nested implication can be effected in these \mathbf{P} systems; thus even if implicational connectives should occur in set determining wff they cannot be utilised, they are effectively locked away in the set determining wff. Hence, intuitively at least, an unrestricted comprehension axiom can be added to appropriate \mathbf{P} systems without trivializing them.

A proper demonstration of the non-triviality of naive set theory based on appropriate \mathbf{P} systems can, it appears, be obtained enlarging on the persistence methods of [2], by adding world by world variation to the modelling that establishes the non-triviality of extensional dialectical set theory. Such a proof is made easier by the simplicity, surprising in view of [3], of the semantics for appropriate \mathbf{P} systems. Da Costa and

Arruda have apparently devised a different demonstration of the non-triviality of \mathbf{P} with unrestricted comprehension.

9. Routley, Richard. 1979. "The Theory of Objects as Commonsense." *Grazer Philosophische Studien* no. 9:1-22.

"It is beginning to be appreciated that the Meinong of the mainstream philosophical literature is a mythological figure, that Meinong's philosophy has in fact been presented in an unfair fashion (perhaps even by largely sympathetic expositors such as Findlay [2]), and that the theory of objects in particular has been either widely misunderstood or else deliberately misrepresented. What has not been much appreciated is that Meinong's theory of objects represents an important alternative to standard (Russellian) logical theory.(1) Whereas the entrenched theory is both reductionist and logico-empiricist in spirit, the alternative is nonreductionist, antiverificationist, and commonsense. Since the theory of objects has often - there are, however, important exceptions - been taken to be the very antithesis of commonsense, there is some explaining to be done. The problems are compounded by the fact that it is not at all easy to say what commonsense amounts to, and even more difficult to show that a philosophical theory is a commonsense one." (p. 1)

(1) There need be no apology for calling modern, standard, orthodox, "nondeviant", "classical" logic 'Russellian'. The orthodox logic of the textbooks consists essentially of variations and improvements (or sometimes the reverse) on the logical theory devised in large measure by Russell, building on the work of Peano and others, and worked out in collaboration with Whitehead in *Principia Mathematica* [5]. Certainly there have been important additions by Hilbert, Wittgenstein, Tarski, Gentzen and others but these do not affect the general claim. In these terms influential modern logical theories, such as those of Quine

[15], are but variations on a theme of Russell's. And they share the reductionist empiricist assumptions of Russell's logical theory.

11. ———. 1979. "Dialectical Logic, Semantics, and Metamathematics." *Erkenntnis* no. 14:301-331.

"As with the thesis that God exists, so with the Consistency Hypothesis that the world is consistent, there are three main positions that can be taken; namely, a theistic or classical position which accepts the hypothesis, an agnostic or relevant position which suspends judgement, and an atheistic or dialectical position which rejects the hypothesis. (1) Here the world is Wittgenstein's world, the real or actual world of intensional semantics, that is the class T of all truths, and the Consistency Hypothesis, CH, is the thesis that T is simply consistent, that it contains no contradictory pairs of the form A and $\sim A$, where $\sim A$ is the negation of A. T, whether consistent or not, by no means exhausts the class of statements; for it is an empirical truth that the world is not trivial, that not all statements are true. Neither relevantly nor dialectically, however, does inconsistency lead to triviality; to assume, as classically, that it does is to assume the matter at issue, for the assumption is tantamount to CH (as [1]) explains)." (p. 301)

(...)

"The remainder of this paper endeavours to contribute something further to the discernment of such a dialectical theory, to circumscribing its underlying static logic and furnishing its semantics, to establishing its

adequacy, and to outlining certain of its applications in mathematical and foundational studies." (pp. 302-303)

(1) 1 Whereas in [1] adoption of the relevant position was argued for as the rational course of action, in [3] and [11] the dialectical position is defended. The case for the shift from the agnosticism of 1973-1974 to atheism is explained in [3]. [1] and [11] are desirable background reading for the present paper.

12. ———. 1979. "Alternative Semantics for Quantified First Degree Relevant Logic." *Studia Logica* no. 38:211-231.

Abstract: "A system **FDQ** of first degree entailment with quantification, extending classical quantification logic **Q** by an entailment connective, is axiomatised, and the choice of axioms defended and also, from another viewpoint, criticized. The system proves to be the equivalent to the first degree part of the quantified entailment system **EQ** studied by Anderson and Belnap; accordingly the semantics furnished are alternative to those provided for the first degree of **EQ** by Belnap. a worlds semantics for **FDQ** is presented, and the soundness and completeness of **FDQ** proved, the main work of the paper going into the proof of completeness. The adequacy result is applied to yield, as well as the usual corollaries, weak relevance of **FDQ** and the fact that **FDQ** is the common first degree of a wide variety of (constant domain) quantified relevant logics. Finally much unfinished business at the first degree is discussed."

13. ———. 1979. "The Semantical Structure of Fictional Discourse." *Poetics* no. 8:3-30.

"An attempt is made to account for the evident truths supplied by fictional discourse, and to vindicate the ordinary naive theory of fictions, within the single framework of universal semantics and the theory of objects. The theory offered is an elaboration of a contextual theory (which tints easily into universal semantics) according to which the context supplies base-shifting functions which alter the world where truth is assessed. The elaboration consists, firstly, of expansion of the theory of contexts to meet various objections, and, secondly, of deployment of the theory of objects to account for truths concerning fictional objects in non-fictional contexts (as regards the second, various options open on the contextual theory are sketched; but an important option the author now prefers is omitted).

An account is given of fiction and its distinctive semantical features. A work of fiction is regarded as portraying part of a world, so a work of fiction is semantically like a theory. Since there is little restriction on the worlds of fiction, any modal theory of fiction is bound to be inadequate; there is in fact no general uniform logic of fiction. (This corresponds to the unrestricted imagination thesis, fundamental to a comprehensive theory of fiction, to the effect that there are no restrictions on what is imaginable.) Also criticised and rejected are other theories of fiction such as elliptical and dimensional theories.

Not only the statements of fiction but the objects of fiction are considered. The worst logical difficulties concerning the objects of fiction are resolved, so it is argued, by adopting a neutral quantificational framework and by sharply qualifying the Leibniz identity principle.

That the same object, e.g. London, occurs in a given fictional world as in the actual world is a matter of qualified author say so; transworld identity is *here* stipulative. The final points concern the incompleteness and fictionality of the theory developed." (p. 3)

14. Routley, Richard, and Griffin, Nicholas. 1979. "Towards a Logic of Relative Identity." *Logique et Analyse* no. 22:65-83.

"Identity statements in natural language come in two syntactic varieties. Some are of the form '*a* is the same as *b*' or '*a* is identical with *b*' and may be symbolized, after the manner of classical identity theory, as ' $a = b$ '. These will be called absolute identity statements. Others have the form '*a* is the same Φ as *b*' where ' Φ ' is some general noun. Statements of this form will be called relative identity statements and will be formalized (following Wiggins [1], p. 2) as ' $a =_{\Phi} b$ '. In such statements ' Φ ' is called the covering concept of the identity statement." (p. 65)

(...)

"Two theses are of central concern in considering relative identity. The first is the claim (R) that two items may be the same with respect to one general noun but distinct with respect to another; the second is the claim (D) that absolute identity statements are semantically incomplete." (p. 66)

(...)

"In this paper we propose (roughly in order of increasing plausibility) a variety of logics for relative identity theories of the first and second types, that is, theories with both (D) and (R) and theories with (R) but not (D). In doing this we refute two claims about relative identity which have gained currency: firstly, the claim made by Nelson [1] and Ayers [1] that identity theories in which (R) is satisfiable are incoherent; secondly, the claim, implied by Wiggins [1], p. 27, that (R) entails (D). In the case of each theory proposed, the satisfiability of (R) can be demonstrated by adding to the theory appropriate constants which can be used to form an example of (R)." (p. 67)

15. Routley, Richard, Meyer, Robert K., and Dunn, Jon Michael. 1979. "Curry's Paradox." *Analysis* no. 39:124-128.

"In short, the conclusion of our examination of Curry's paradox is discouraging in the extreme for the hopeful naive set theorist. One sought to avoid the problems posed by Russell by weakening logic, in order to save the abstraction principle. We were willing to give up the usual aversion to contradiction. We faced with equanimity the sacrifice of the deduction theorem. To continue with the project, a minimal, decent respect even for *modus ponens* must be given up as well.

We have always held that, in these permissive days, no rule is sacrosanct--except *modus ponens*. And one may, of course, still cleave to the *rule* of *modus ponens* without the *modus ponens* axiom; indeed, Routley

has conjectured that a naive set theory based on a very weak relevant logic is absolutely consistent. One might look for other escapes, too; e.g., the role of the ' \leftrightarrow ' in the abstraction principle above might be

reexamined. But the conclusion is none the less clear; unless we are prepared to give up a great deal of logic--not only of classical logic but of intuitionist and even relevant logic as well--a naive set theory is

untenable." (p. 128)

16. Routley, Richard, and Routley, Val. 1979. "The (Logical) Importance of not Existing." *Dialogue* no. 18:129-165.

"An adequate theory of meaning and truth is semantically important. Such a theory necessarily includes in its analysis nonentities, items that do not exist. So what is semantically, and hence logically, important is bound to include nonentities. In virtue of the modifier 'semantically', the first premiss is analytic (what is semantically important may not be important), and it is comparatively uncontroversial. By contrast the second premise of the syllogism, which we want to stick to,

is decidedly controversial. So too is the thesis (advanced in [2] and [3] and in Chisholm [15]) - which implies the inadequacy of classical logical theories - that there are a great many natural language statements, statements an adequate theory should be able to treat of, which cannot be analysed logically, and semantically, without the equivalent of an appeal to nonentities. Defence of the thesis has been somewhat piecemeal, taking the form that all the theories so far offered which try to dispense with nonentities break down or run into insuperable difficulties, difficulties which are readily surmounted given appropriate talk about nonentities. In what follows we shall outline more general sorts of argument for the thesis, designed to show that no theory which dispenses with nonentities as objects of discourse can do justice to the data.

The thesis of the inadequacy of classical logical theory, basically one of Meinong's theses expanded and dressed up in more modern attire, has not exactly won widespread acclaim, but it has gained some notoriety and has encountered much opposition.

Much of what follows is an attempt to counter some of that opposition; to reinforce the claim that classical theories break down irreparably over the analysis of intensional discourse concerning nonentities; to meet the objection that objectual semantics for Meinongian-style theories of objects have themselves serious flaws; to refute the view that Meinongian theories have no philosophical advantages, only drawbacks; and to show, by way of illustration of the importance of nonentities in solving traditional philosophical problems, how the theory of objects, and only such a theory, can resolve many problems in epistemology, problems in fact generated by the classical theory." (pp. 129-130)

"A fundamental error is seldom expelled from philosophy by a single victory. It retreats slowly, defends every inch of ground, and often, after it has been driven from the open country, retains a footing in some remote fastness (Mill *A system of logic*, pp. 73-4).

The fundamental philosophical error, common to empiricism and idealism and materialism and incorporated in orthodox (classical) logic, is the Reference Theory and its elaborations. It is this theory (according to which truth and meaning are functions just of reference), and its damaging consequences, such as the Theory of Ideas (as Reid explained it), that noneism - in effect, the theory of objects - aims to combat and supplant. But like Wittgenstein (in *Philosophical Investigations*, and unlike Mill, noneists expect no victories against such a pervasive and treacherous enemy as the Reference Theory. Though noneists take it for granted that 'Truth is on their side', and reason too, the evidence that 'Truth and reason will out' is exceedingly disappointing. Nor do they expect the enemy to vanish, even from open country: fundamental error will no doubt persist, to the detriment of philosophy, and of every theoretical and practical subject it touches. For there is great resistance to changing the framework (to amending the paradigm); so there is an attempt to handle everything within the prevailing philosophical frame. There is no need, it is thought, to change the framework, all problems can eventually be solved within the basic referential scheme - at worst by some concessions (1) which absorb some nonreferential fragments, and thereby decrease both the level of dissatisfaction with the going frame, and the prospects for perception of its real character.

The faith that the Reference Theory (and its forms such as extensionalism and empiricism) will find a way out of its impasses, a way to deal adequately with nonexistence and intensionality, is like the faith that technology will find *a way* to deal with social problems, especially with all the problems it creates (the faith is deeply embedded in the Technocratic

Ideology). As with the Technocratic Ideology so with the Reference Theory, the Great Breakthrough which will resolve these problems, (patently) not soluble within the technological or referential framework, is always just around the corner, no matter how discouraging the record of failures in the past. The problems, difficulties, and failings of the Theory are not recognised as reasons for rejecting it and adopting a different theoretical-and ideological framework, but are presented as 'challenges', which further work and technology will doubtless find a way to resolve. And as with Technocracy the 'solution' of a problem in one area is liable to create a rash of new problems in other areas (e.g. increasing energy supply at the expense of increased pollution, forest destruction, etc.), which can, however, for a time at least, be conveniently overlooked in the presentation of the 'solution' as yet another triumph for the theory and its ideology. That is, the procedure is to trade in one problem for another, and hope that nobody notices.

The basic failings of the Reference Theory are at the logical level. The Reference Theory yields classical logic, and directly only classical.

An example of theoretical cooption is the (somewhat grudging) toleration of lower grades of modality and intensionality - which can however be referentially accounted for, more or less.

The basic failings of the Reference Theory at the logical level.

The Reference Theory yields classical logic, and directly only classical logic: in this sense classical logic is the logic of the Reference Theory. An important group of elaborations of the Reference Theory correspond in the same way to logics in the Fregean mode. Accordingly with the breakdown of the Reference Theory and its elaborations all these logics fail; and so, as with the breakdown of modern energy supplies, substantial adjustment and reconstruction is required. In fact no less than the effects of a logical revolution are called for (see *Relevant logics and their rivals*), though the aim of these essays is to achieve such results in a more evolutionary way, to take advantage of the classical superstructure, to build the new logic in part on what there is. The logical areas where change

and improved treatment are especially, and desperately, needed are these:

nonexistence and impossibility;

intensionality;

conditionality, implication and deducibility;

significance; and context.

It is on the first two overlapping areas, the very shabby treatment of which is a direct outcome of the Reference Theory, that the essays which follow concentrate. (The remaining areas - which are, as will become quite evident, far from independent - are treated, still in a preliminary way, in two companion volumes to this work, *Relevant logics and their rivals* and *The logic of significance and context*, and in other essays.) When the Reference Theory and its elaborations (such as Multiple Reference Theories) are abandoned the role of logic changes - its importance need not however diminish." (Preface, I)

(1) An example of theoretical cooption is the (somewhat grudging) toleration of lower grades of modality and intensionality - which can however be referentially accounted for, more or less.

18. ———. 1980. "Problems and Solutions in the Semantics of Quantified Relevant Logics. I." In *Mathematical Logic in Latin America: Proceedings of the IV Latin American Symposium on Mathematical Logic held in Santiago, December 1978*, edited by Arruda, Ayda Ignez, Newton da Costa, Carneiro Affonso and Chaqui, Rolando Basim da, 305-340. Amsterdam: North-Holland.

Abstract: "The main problem investigated is the adequacy of constant domain relational world semantics for quantified relevant logics. The problem is solved, though in a disagreeably circuitous way, for many weaker relevant logics, and an outline of how the solution may be extended to stronger logics such as RQ is given.

Alternative necessity and intensional conjunction style rules for the evaluation of quantifiers are studied and shown to simply

force the main problems above with the usual (extensional conjunction style) quantifier- rule to reappear, unmitigated, at alternative outlets. Finally some philosophical problems allegedly engendered by constant domain world semantics are examined briefly: it is argued that the "problems" are no problems."

19. ———. 1980. "The Choice of Logical Foundations: Non-Classical Choices and the Ultralogical Choice." *Studia Logica* no. 39:77-98.

Abstract: "A multiple factor model for choice of best objective (which generalises on the modellings of optimisation theory, and so enables the unification of much decision theory) is developed. Essentially the recipe is to maximize a given function of expected values of the factors subject to a set of constraining relations on the factors and to overriding constraints (the constraining relations are not restricted to certain relations of equality and inequality). The model, which was designed to apply in environmental decision-making situations, has an important role in value theory and in the theory of choice of theories, and it specialises to the matter of choice of logical foundations.

It is argued by way of a series of actual examples that the limited quantifiability or nonquantifiability of the factors does not count against realistic applicability of the model. The factors and constraints in the special case of best choice of logical foundations (for the full range of logical purposes) are sketched and discussed. Important factors are those of scope and applicability to the data. other nonnegligible factors

are such pragmatic factors as simplicity, economy, power, intelligibility, fruitfulness.

In addition to constraints between the factors there is a major overriding constraint, namely that of conformity to the facts.

The theoretical model is applied. First a criticism of other accounts of choice, especially pragmatism, and consistency criteria, is mounted. It is then argued, applying the account of best choice of logical foundations for discourse (including

philosophical discourse) that has emerged, and making heavy use of factual constraints, that the choice to make is not a choice of classical logic, not a choice of some extension of

classical logic, but choice of a paraconsistent logic, and among such essentially nonclassical logics, of an ultralogic, i.e. of a relevant inexistentia highly intensional logic."

Abstract: "The paper seeks a perfectly general argument regarding the noncontingent limits to any (human or non-human) knowledge. After expressing disappointment with the history of philosophy on this score, an argument is grounded in Fitch's proof, [*] which demonstrates the unknowability of some truths. The necessity of this unknowability is then defended by arguing for the necessity of Fitch's premise—viz., there this is in fact some ignorance."

"Consider some thing, *d* say, that does not exist, for example *d* is Meinong's round square. Then what does not exist is in this case *d*; but it in no way follows from "*d* is non-existent" that "*d* exists". Such nonentities as *d* need have no being in any sense. It is basically because whatness and thinghood have been illicitly restricted to what exists or has being, that a puzzle seems to have arisen: for certainly we contradict ourselves if we say that what has being does not have being. There is no contradiction however in saying that what is a thing or object, e.g. *d*, may have no being in any sense; and this dissolves what Quine nicknames *Plato's beard*, without using or blunting, Occam's razor. For Occam's razor to remain sharp requires only that entities not be multiplied beyond necessity; but no multiplication of entities has been made, no bloating of the universe (of what exists) has occurred. Indeed the theory of objects enables a very substantial reduction in what is said to exist, so that what is said to exist can coincide with what really does exist, namely only certain individual objects now located in space.(4) But, more to the point, Occam's razor embodies various muddles of the very sort that it is important to remove. In particular, Occam's dictum that entities [or differently, objects] should not be multiplied beyond necessity supposes that it is in our power to increase or decrease the number of entities [or objects]: but of course in *that* sense - as opposed to the destruction or creation of objects by one's activity - it is not. What we can increase or decrease is not what exists but what we *say* exists, what we (choose to) *talk about*, and what our theories commit us to in one way or another. So the dictum, and a use like Quine's of it, confuses what exists with what we (choose to) talk about or what we, or our theories, *say* exists - a confusion that runs through into recent criteria for ontological commitment, themes of ontological relativity, and programs for ontological reduction." (pp. 152-153)

(4) It was Meinong's thesis that any existing object has a more or less definite location in space and time. It is a corollary that abstract objects do not exist (see further [2], chapter 9).

"This volume is primarily a logical and semantical investigation of an extensive class of zero-order intensional logics, i.e. of intensional logics which do not include variable binding devices such as abstraction operators, descriptors, quantifiers or their equivalents. The effect of adding variable binding devices will have to be reserved for another volume. Many of the philosophical investigations and issues which are presupposed by or arise from this predominantly formal study will, we still hope, appear in yet other publications (e.g. *Beyond the Possible*, long in preparation). The separation of these matters is admittedly deplorable (whether the proposed multiplication of book-entities is also deplorable will be left for readers to decide). The exclusion of quantifiers and descriptors deprives

the logics of some of their interest and usefulness in the analysis of natural languages and philosophical and other argumentation, and the partial exclusion of intimately connected and motivating philosophical issues is artificial and weakens the case for such a detailed study of particular intensional logics. However this volume is evidently long enough already.

Relevant and irrelevant logics. We focus on those intensional logics that, satisfying weak relevance principles, have become known as relevant logics. The class of sentential logics that satisfy weak principles of relevance is however wide and includes many logics which are, in principle, rivals to the position(s) we shall be advancing.

We want it to emerge with stark clarity, however, that our main concern is not really relevance at all - the appropriate sort of relevance is a byproduct of any good implication relation, which comes out in the wash. Only one weak necessary condition for relevance features in what follows: that is all'. A study of relevance, of the sorts of relevance, of sufficient conditions for relevance, ... - all these matters are philosophically interesting, and some of them are important, especially for the logics of evidence and probability - but they are not our present concern. For this reason the name 'relevant logics', or 'relevance logic', is not entirely satisfactory - perhaps even, to lodge a much stronger claim, unfortunate - since the name tends to suggest, wrongly, that relevance is of the essence, instead of being a peripheral concern. Nonetheless the name has a point, and it is a little late to change it.

What our concern is with is implication and its varieties, and in particular with genuine implication in the sense that amounts to total sufficiency. Thus our concern is, in the first place, with sufficiency, or, as it is otherwise equivalently put in the logical case, with complete logical dependence, with total inclusion of logical content, and so on. Implication is not confined however to logical implication or deducibility; we are very much interested in having our systems apply to other sorts of sufficiency, physical or law-like sufficiency in particular, and to

provide the bases, in enthymematic ways, for analyses of partial sufficiency, for instance for insufficiency conditionals - for conditionals, for example, which are obtained from genuine sufficiency conditionals by suppression of true or necessary antecedents (or, symmetrically, of false or impossible consequents). This will take us back through the usual logics of the textbooks, to intuitionistic logic and modal logics, and, in the extreme case, to classical two-valued logic. (p. X)

26. Routley, Richard, and Plumwood, Val. 1982. "Negation and Contradiction in Wittgenstein." In *Sprache und Ontologie. Akten des 6. internationalen Wittgenstein Symposiums 23. bis 30. August 1981, Kirchberg/Wechsel (Österreich)*, edited by Leinfellner, Werner, Kraemer, Eric and Schank, Jeffrey, 471-474. Wien: Verlag Holder-Pichler-Tempsky.

"In the earlier work, especially the *Tractatus*, the classical explosion model of negation is adopted; negation is represented as total exclusion. There has, of course, to be more to the account of negation than this. In particular, logical constants such as negation, since they would otherwise raise serious difficulties for the picture theory of meaning, call for special treatment, which they obtain through the theory of math-functions. Negation is simply such a classical function; nothing in reality corresponds to it." (p. 471)

(...)

"A cancellation view, incompatible with the classical model of the *Tractatus*, is infiltrated in subsequent work. A cancellation picture is already deployed in transitional work, e.g. 'the rules of Euclidean geometry don't contradict one another, i.e. no rule occurs which cancels out an earlier one (p and $\sim p$), , ,' (*PG*, p. 345). It is a cancellation picture, where contradictions have no content and say nothing (and so are useless), that lies behind Wittgenstein's assumption that one should not draw any conclusions from a contradiction (*LFM*, p. 220), or better, that a way should be found of not proceeding from a contradiction (*LFM*, p. 223).¹⁰ Furthermore, many of the pictures and images of negation Wittgenstein later considers are of a cancellation type or can be adjusted to fit a cancellation model.

Although Wittgenstein repeatedly alludes to such images, at the same time he depreciates them (e.g. all attempts to explain why a contradiction “won't work” are spurious, *LFM*, p. xviii): they are all said to convert to no more than substitution of one symbolism for 'another. Even so, such things can have an explanatory and modelling role. Wittgenstein suggests not, because all that is offered is symbolism and figure, so the question of 'how one is going to use it?' (*LFM*, p. 181) remains, since any picture can be used in several ways. He goes on to advance the even more dubious description theme that 'anything which we give and conceive to be an explanation of why a contradiction does not work is always just another way of saying that we do not want it to work' (*LFM*, p. 187).

The assumption that contradictions don't, or won't, work and associated themes, e.g. that contradictions are useless, and associated images, e.g. the jamming picture (*LFM*, p. 178–9, ascribed to Moore, p. 190), are 'all connexivist in cast. With a contradiction, as when the cogs join, nothing emerges, 'we cannot do anything with it' (*LFM*, p. 191). It is from the same cancellation model that the no-content thesis, which jamming depicts, derives, that contradictions do not say anything, a thesis also equivalently (but misleadingly) expressed in 'contradictions don't make sense'.

The cancellation view can be included in the relevant synthesis by appeal to abnormal worlds or language-games, games where contradictions do stop proceedings, and where $A \ \& \ \sim A$ may have no content. But in assuming, as he often appears to, that games are restricted to those that are classical (effectively, in P) or those that are of a cancellation type (in a subclass of W-K), Wittgenstein much too drastically delimits the games, or worlds, needed in giving a full account of negation. And in assuming that abnormal cancellationtype games are characteristic—'that we exclude the contradiction and don't normally give it a meaning is characteristic of our whole use of language' (*LFM*, p. 179)—Wittgenstein goes curiously astray. Commonly we do not treat contradictions in this way. We reason on the basis of them (e.g. in reductio arguments), we act on the basis of inconsistent information (cf. the general who

acts, and succeeds, on the basis of contradictory reports, *LFM*, p. 105), and we exploit paradoxes when we can." (p. 474)

27. ——. 1982. "The Inadequacy of the Actual and the Real: Beyond Empiricism, Idealism and Mysticism." In *Sprache und Ontologie. Akten des 6. internationalen Wittgenstein Symposiums 23. bis 30. August 1981, Kirchberg/Wechsel (Österreich)*, edited by Leinfellner, Werner, Kraemer, Eric and Schank, Jeffrey, 49-67. Wien: Verlag Holder-Pichler-Tempsky.

"In contrast to empiricism the historical alternatives of (traditional) rationalism, Meinongian rationalism, mysticism and idealism are alike in their rejection of what we have selected as the most important characterising thesis of empiricism, that the world can be adequately accounted for or explained just in terms of what exists, in terms of the actual (referential) world *G*.

Meinongian rationalism has a modern logical expression in noneism, the theory of items elaborated elsewhere (especially in Routley (1979)). The core theses of noneism include the following:—Every (significant) singular term signifies an object, i.e. (in earlier terminology) is about an object. Everything whatsoever—whether it is possible or not, complete or not, paradoxical or not, thinkable or not—is an object. Most objects do not exist, in any way at all, or have any form of being (or other ontological status) at all. Nonexistent objects, nonentities, are constituted in one way or another, and have more or less determinate natures. An object, whether it exists or not, has those properties which characterise it, e.g. the object which *f*s does *f*, where *f* is a characterising property. But existence, and many other properties (especially "higher-order" properties) are not characterising properties.(8)

Additional theses, presupposed in and of some importance for what follows are these: Universals are objects which do not exist (hence also they are something). Objects are not reducible

to entities; for instance, nonexistent objects are not in some way constructs from what does exist, and discourse about nonentities is not translatable, without residue, into discourse about entities.(9) Running in tandem with this is a nonreductionist theme (with something of the ring of the later Wittgenstein): Nonentities are mostly perfectly in order as they are, without reduction. With intensionality as with nonexistence, noneism is committed to commonsense theses (again of a later Wittgenstein cast): Very many intensional statements are perfectly in order as they are, without reductive analysis, and are about the objects they appear to be about. For example, 'Bacon looked for Atlantis' is about Bacon and Atlantis. There is just one object sought, Atlantis; there is no need to try to resolve the statement into one concerning concepts, or complex set-theoretic constructs, or such like; whether or not Atlantis ever existed.

The foregoing themes lead naturally (once the semantical theory is introduced) to further theses,(10) theses that go to the heart of philosophy (as many have seen it), theses stating conditions on the truth and explanation of things in the world: the truth conditions for the factual world T , and also for its actual subworld G , involve nonentities, essentially. This thesis, that truth depends on nonexistence, derives in part from the earlier theme that there are irreducible truths about what does not exist. Further, the explanation of what exists, and so of the actual world G , involves essential appeal to what does not exist, to other worlds beyond G . It is themes like these that render noneism a transcendental position,(11) and align it with idealism.

Contrary to empiricism, then, we do need to go beyond the factual world and to consider possible and impossible worlds, and beyond entities of the factual world to consider a wide range of other objects, including impossible and merely possible ones. In particular, according to noneism, we cannot adequately understand or explain the actual world, its entities and its phenomena, without going beyond to other worlds, without adverting, in essential ways, to the non-actual. *The*

actual is not sufficient, on its own, to account either for truth or for explanation." (pp. 51-52)

(8) The emerging big theory, noneism, is a kind of amalgam of Meinong with the later Wittgenstein; so however strange the combination may seem, it can claim a good Austrian ancestry.

(9) While a semantical analysis of discourse about nonentities can be given, e.g. through a universal semantics (cf. Routley (1979), 1.24), in terms of what Platonists are pleased to call 'entities', the objects involved in the analysis do not exist.

(10) So far only nonepistemic themes have been assembled. For subsequent comparisons, especially with ways of knowing and interworld access of idealism, mysticism, primitivism, etc., it will however be important to introduce epistemic and limitative theses.

(11) In the standard sense of 'transcendental', of being other-worldly, necessary for (the explanation of) experience, and not reducible to it.

"Medieval logicians have a great deal to teach their modern descendants.(1)

They discussed issues that are of contemporary importance with an ingenuity and sophistication lost till this century. We will illustrate this by considering an argument produced by a medieval logician, fated to become known as 'Pseudo-Scotus'. It was rescued from oblivion by Bocheński in 1938 and has been commented on more recently, particularly by Benson Mates and Stephen Read.(2) However, a good deal more can be learnt from Scotus' argument as we will show. Specifically we will formulate separate lessons in Sections 2, 4 and 6." (p. 189)

29. Routley, Richard, Routley, Val, Meyer, Robert K., and Martin, E.P. 1982. "On the Philosophical Bases of Relevant Logic Semantics." *Journal of Non-Classical Logic* no. 1:71-105.

"Criticisms of semantics for relevant logics, Commonly enough encountered in discussion, are beginning to appear in print. For example, such criticism has come from Scott who asserts, without any supporting argument, that 'the recent semantical interpretations [of relevance logics] have as yet no adequate philosophical justification' (74, p. 154). A rather similar criticism 'of model-theoretical interpretations of existing

relevant logics' is implied by Hintikka (81, p. 80). Analogous criticisms are part of Lewis's recent attack on relevant and paraconsistent logics (in 82). But the bulkiest "case", which includes most of the criticisms commonly indicated, has been presented by Copeland:

And the Routley-Meyer semantics, it will be urged, fails to satisfy those requirements which distinguish an illuminating and philosophically significant semantics from a merely formal model theory (Copeland 400)

Although Copeland reiterates this now familiar claim, that the Routley Meyer semantics for relevant logic is a mere formal model theory as distinct from "a semantics" (see also pp. 406, 408, 412), like others he

omits to specify the requirements upon 'an illuminating and philosophically significant semantics': so urging does not give way to arguing in any rigorous way for the theme (thus too the promise of his short title 'When a semantics is not a semantics' is never fulfilled). Furthermore, the supporting considerations offered for the theme are based, like several of the incidental remarks concerning relevant logics, upon faulty but often unstated assumptions and mistaken data. Although the unfavourable conclusions are stated clearly enough, the structure of the argument by which they are reached is often decidedly unclear, and indeed the case relies upon obscurity and lack of precision. Consequently meeting this often nebulous set of objections requires proceeding beyond what is directly stated to examination of what the case requires if the considerations actually presented are to show anything damaging against relevant semantics in the way declared." (p. 71)

32. Routley, Richard, and Meyer, Robert K. 1983. "Relevant Logics and their Semantics Remain Viable and Undamaged by Lewis's Equivocation Charge." *Topoi* no. 2:205-216.

"Is relevant logic but a logic for equivocators? Such Lewis's provocatively entitled 'Logic for equivocators', directed against relevant logic, certainly seems to imply. But the ambiguity interpretation which he proposes he is unable to get to work for relevant logic, so he falls back on the first degree implication (fde) parts(4) of the irrelevant logics *LP* and *RM*: in these "we have two logics for ambiguous sentences

- and lo, they are partly relevant" (p. 439). Not only is Lewis well off the relevant target(5) ; but the argument for the conclusion that relevant or cryptorelevant logics are logics of ambiguity, or, for equivocators, is a decidedly poor one. For what we are offered are three-valued interpretations of fde *LP* and *RM* through the values: true osd only, i.e. true on all its disambiguations; false osd only, i.e.

false on all its disambiguations; and both true osd and false osd, i.e. true on some disambiguations and false on others (pp. 438-9). The Lewis interpretation is evidently a simple variation on the truth-valued interpretation obtained by, in effect, omitting 'osd', an interpretation - the intended interpretation

for *LP* and *RM3* -- which Lewis tries to rule out as "not making sense". (p. 206)

(4) There is a logical howler running systematically through Lewis's paper. He has 'first degree' where he should have 'fde', unless nonstandard names are adopted. But as 'first degree' is nowhere explained, it must be assumed to have its standard sense. It follows, e.g., from what Lewis asserts that the first degree part of *E* has a four-valued semantics (see p. 433). This is false.

Since everything in the discussion that follows is restricted to the first degree, talk of 'relevant logic' in the singular is (perfectly) in order.

(5) And *Io*, also, they axe substantially irrelevant. While *RM* has long been associated with the relevant enterprise, though not as an acceptable explication of the key notions under investigation, *LP* has not, and, at the time of design and development of *LP*, Priest explicitly disassociated himself from the relevant enterprise.

36. Routley, Richard. 1984. "The American Plan Completed: Alternative Classical-Style Semantics Without Stars, for Relevant and Paraconsistent Logics." *Studia Logica* no. 43:131-158.

Abstract: "American-plan semantics with 4 values $1, 0, \{1, 0\} \{ \}$, interpretable as True, False, Both and Neither, are furnished for a range of logics, including relevant affixing systems. The evaluation rules for extensional connectives take a classical form: in particular, those for negation assume the form $1 \varepsilon t (\sim A, a)$ iff $0 \varepsilon t A, a$ and $0 \varepsilon t (\sim A, a)$ iff $1 \varepsilon t (A, a)$, so eliminating the star function $*$, on which much

criticism of relevant logic semantics has focussed. The cost of these classical features is a further relation (or operation), required in evaluating falsity assignments of implication formulae.

Two styles of 4 valued relational semantics are developed; firstly a semantics using notions of double truth and double validity for basic relevant system **B** and some extensions of it; and secondly, since the first semantics makes heavy weather of validating negation principles such as Contraposition, a reduced semantics using more complex implication M rules for relevant system **C** and various of its extensions.

To deal satisfactorily with elite systems **R**, **E** and **T**, however, further complication is inevitable; and a relation of mateship (suggested by the Australian plan) is introduced to permit cross-over from 1 to 0 values and vice versa."

37. ———. 1984. "Relevantism, Material Detachment, and the Disjunctive Syllogism Argument." *Canadian Journal of Philosophy* no. 14:167-188.

"Relevantism, as a matter of definition, rejects classical logic as incorrect and adopts instead a relevant logic as encapsulating

correct inference. It rejects classical logic on the grounds that the rule of Material Detachment, from A and not A or B to infer B , (that is, Disjunctive Syllogism considered as an inferential principle), sometimes leads from truth to falsity. Relevantism - although promoted by some relevant logicians (Routley and Routley), and an integral part of ultralogic (i.e. universal, all purpose, ultramodallogic; cf. [1], [8]) - has recently encountered heavy, but interesting, criticism from relevance logicians themselves (from Belnap, Dunn, and Meyer). Though the discussion that follows accordingly involves some reporting of internal wrangling among relevance logicians, it is feuding of major importance as regards the question of choice of logical theory. For, firstly, if relevantism is right, then orthodox choices of logic, such as classical or intuitionist choices, are wrong. Secondly, the issue is by no means as parochial as relevant logic, but concerns the matter of serious choice of paraconsistent logic as correct, and as working logic (on paraconsistent logics see Arruda [7]). For Material Detachment is inferentially equivalent in a relevant setting to the Duns Scotus principle ($A, \sim A \rightarrow B$, from A and not A to infer B), the rejection of which separates paraconsistent logic from classical (and intuitionistic) logic. The wider issue generated is then: to what extent, and when, can a *paraconsistent theory correctly, or legitimately, make use of classical reasoning?*" (pp. 167-168)

Introduction to a special number dedicated to the paraconsistent logics.

"The papers in this volume are all on the subject of paraconsistency.

This introduction locates the papers in their context and also provides a survey of the general area." (p. 3)

(...)

"The important fact about paraconsistent logics is that they provide the basis for inconsistent but non-trivial theories. In other words, there are sets of sentences closed under logical consequence which are inconsistent but non-trivial. This fact is sometimes taken as an alternative definition of 'paraconsistent' and, given that logical consequence is transitive, it is equivalent to our definition. For this reason we call inconsistent but non-trivial theories *paraconsistent* .

The equivalence indicates one reason why paraconsistent logics are worthy of study. For there are important inconsistent theories which are non-trivial. Any analysis of their logical structure must therefore be done

using a paraconsistent logic. Clearly, to adopt an explosive logic such as Frege/Russell or intuitionist logic would trivialise them." (p. 3)

41. Sylvan, Richard. 1984. "How Science and Myth and Fiction Step Beyond the Actual and Sometimes Beyond the Possible." *Research Series in Unfashionable Philosophy* no. 1:1-33.

Abstract: "Sistology, the general Investigation of all items, Is explained. It Is contrasted with its dwarf subtheory, ontology, which is restricted to existent objects. Sistology cannot be recovered from ontology. Sistology, unlike ontology, assigns nonexistent and Impossible objects standing. How this is accomplished logically is outlined; and resulting advantages for linguistics, language and literature are indicated. The theory is then applied to a comparison, in depth, of (failed) science with fiction.

Science and fiction are much more alike than generally supposed. Indeed they do not differ essentially In syntactical ways, and overlap significantly in content. (While they do differ more significantly on technological applications, that is frequently not to sciences credit.) To force what differences there are, a detailed characterisation of *science* is presented, which is then compared point by point with fiction. What emerges Is that science and fiction form merging families, with

deductive closure and qualified confrontation with experience affording main separation features.

What remains of the gap between science and fiction is bridged by myth, which often provides other cultures versions of science. Leading features of myth are explained and two styles of myth roughly delineated, anthropic myths and naturalistic myths. The latter merge with failed science.

The resemblances are exploited both in criticising fashionable accounts of scientific theories and scientific explanation, and in offering new accounts. A scientific theory is a story, which is closed, in particular under deduction, and which suffers qualified exposure to experience, that is, which meets reality requirements. Scientific explanation also fits within the story setting, a covering story replacing the orthodox "covering law" model. The account accommodates what is crucial in much explanation, explanation of what exists by way of what does not exist.

Science is integrally involved not merely with what does not exist, but also with what is impossible. The role of inconsistent theories and other inconsistent objects is indicated, and the emerging theory is applied to certain psychological puzzles concerning thinking the impossible."

This paper is to appear in German, in an issue of *Zeitschrift für Semiotik* entitled *Zeichen und Fiktion*. [Vol. 9, 1987, with the title: "Wissenschaft, Mythos, Fiktion: Sie alle überschreiten die Grenzen des Wirklichen und manchmal gar die des Möglichen".]

42. Routley, Richard, and Routley, Val. 1985. "Negation and Contradiction." *Revista Colombiana de Matematicas* :201-231.

Abstract: "The problems of the meaning and function of negation are disentangled from ontological issues with which they have been long entangled. The question of the function of negation is the crucial issue separating relevant and paraconsistent logics from classical theories. The function is illuminated by considering the inferential role of contradictions, contradiction being parasitic on negation.

Three basic modellings emerge: a cancellation model, which leads towards connexivism, an explosion model, appropriate to classical and intuitionistic theories, and a constraint model, which includes relevant theories. These three modellings have been seriously confused in the modern literature: untangling them helps motivate the main themes advanced concerning traditional negation and natural negation. Firstly, the dominant traditional view, except around scholastic times when the explosion view was in ascendancy, has been the cancellation view, so that the mainstream negation of much of traditional logic is distinctively nonclassical. Secondly, the primary negation determinable of natural negation is relevant negation. In order to picture relevant negation the traditional idea of negation as otherthanness is progressively refined, to

nonexclusive restricted otherthanness. Several pictures result, a reversal picture, a debate model, a record cabinet (or files of the universe) model which help explain relevant negation. Two appendices are attached, one on negation in Hegel and the marxist tradition, the other on Wittgensein's treatment of negation and contradiction."

43. Sylvan, Richard. 1986. "Toward an Improved Cosmo-Logical Synthesis." *Grazer Philosophische Studien* no. 25/26:135-179.

Originally published as "Towards a CosmoLogical Synthesis", *Research Series in Unfashionable Philosophy*, 2, 1985, 42 pages.

"There is a persistent tradition implying simple and unassailable logical foundations - as yet undiscovered - for the whole of cosmology. The tradition, which peaked in modern rationalism, continues strong in contemporary cosmological speculation. Thus, for example, recent rationalistic theories of the universe, ambitiously aimed at mathematico-logical expression and capture of nature." (p. 135)

(...)

"Logic reassumes its ancient role as the fundamental science; the Word expresses a logic recipe.

(...)

The synthesis outlined in what follows fits into this more modest setting. It is achieved by suitably relocating cosmology as a part of semantics (generously construed, for example, to admit contextual

elements)." (pp. 135-136)

(...)

"The underlying idea of the synthesis is simply this: a subspace of neutral worlds semantics is also a suitable framework for cosmology, for an interpretation of the logical theory of the universe as a whole." (p. 136)

(...)

"The setting in terms of objects which do not exist, other worlds especially, is essential. For one reason, the idea grew out of investigation (for UQ) of what is normally taken to be a philosophical question, indeed by some such as Heidegger as the fundamental question of metaphysics, namely 'Why does anything at all exist?'. Reset in world terms this becomes a question of the selection of a world such as that we find ourselves in which contains something existent (us among other existent things) as opposed to an alternative world, which contains nothing- a much more tractable question. But the recasting loses explanatory merit should all the worlds involved be taken to exist. For then the old objectionable circle is simply reentered, explaining existence in terms of more existents." (p. 137)

44. ———. 1987. "A Generous Jainist Interpretation of Core Relevant Logics." *Bulletin of the Section of Logic* no. 16:58-66.

Both of the 'principal philosophical theories' by which Jainism is commonly distinguished(2), relative pluralism (*anekantarada*) and qualified scepticism (*syavada*) involve 7-fold lists. In the first there is a categorization of 7 perspectives, while, under the second, more important here, 7 modes of

predication are marked out. 'About a given object, we may assert [with respect to a given feature, or existentially] (1) "Maybe it is"; (2) "Maybe it is not"; (3) "Maybe it both is and is not"; (4) "Maybe it is inexpressible"; (5) "Maybe it both is and is inexpressible"; (6) "Maybe it is not and is inexpressible"; and (7) "Maybe it both is and is not, and is inexpressible".

The maybe's here are intended to show that dogmatic assertions are out of place ... (Smart, p. 160). Often the maybe's are omitted from lists of the modes of predication, and other variations are found e.g. 'inexpressible' is alternatively translated as 'indescribable', etc.

Thus, given Jainism apparently entailed a correspondence theory of truth (Smart p. 160), for every statement p – (inevitably) or subject predicate form – there are the following assignments of values, all of which may be attained: (1) true, i.e. t , where (maybe) it is; (2) false, i.e. f , where (maybe) it is not; (3) t and f ; (4) inexpressible, i.e. i , where (maybe) it is inexpressible; etc." (p. 62)

(2) To be a little more precise than Smart, those are the main epistemological theories which distinguish Jainism. For Jainist bio-conativism, which anticipates Schweitzer and a reverence-for-life position in contemporary environmental philosophy, is certainly a philosophical theory, and apparently that for which Jains are best Known.

Reply by Jonathan P. Seldin, "A Relevant Invalidity in Curry's Foundations: A Reply to Richard Sylvan", *Bulletin of the Section of Logic*, 16, 1987, pp. 68-70.

"Curry claims that the positive paradox principle, $\vdash A \supset (B \supset A)$ (33) in his elementary statement presentation, 'is valid in any

normal interpretation' ([1], p.173). By previous definition, 'an interpretation of a system

S is a normal interpretation just when the proposition A is true when and only when $\vdash A$ ' (p.172). But his argument to normal validity (and so truth) is interestingly, and relevantly, invalid." (p. 51)

(...)

"This may seem to make, obscurely at that, no more the familiar concession that the positive paradox (33) does not hold for logical (or strict) implication. But given Curry's identification of \supset as the propositional analogue of a conditional, it says much more than that: it says, correctly, that the positive paradox principle does not hold for the conditional.

Nor do matters end there. There are relevant consequences, to be looked at elsewhere, for illative combinatory logic and type-free λ -theory." (p. 53)

46. ———. 1987. "Establishing the Correspondence Theory of Truth and Rendering it Coherent." In *Stephan Körner - Philosophical Analysis and Reconstruction*, edited by Srzednicki, J. T. J., 75-83. Dordrecht: Martinus Nijhoff.

"In his rewarding book, *Fundamental Questions of Philosophy*, Stephen Körner introduces the correspondence theory of truth as seemingly 'the most natural analysis of truth', explains what the theory tries to do, and what it does not attempt, defends the theory against some standard objections, and advances difficulties for rival theories of truth (see p. 101ff.). What follows removes the limitations Körner claims to find on the correspondence theory; it also elaborates upon what Körner has explained, but at the same time makes one or two significant variations, as will appear." (p. 75)

(...)

"Certainly any idealist who finds classical logic the right medium in which to logically set his or her verificationist proclivities - as the logical positivists thought that this was the right medium for verification, with none of this new-fangled intuitionism - should not be displeased. As for us, well, we can have both correspondence and coherence along with Tarski-Bolzano theory duly generalised.(8) And no doubt other theories of truth can be worked into the synthesis too; but that's a task diverging from KBrner and for another day." (p. 80)

(8) Tarski not only saw the semantic theory as complementing a correspondence theory but also was one of the first to explicate maximal consistent sets; he, if anyone, is behind this whole conspiracy.

48. Sylvan, Richard. 1988. "Intuitionistic Logic - Subsystem of, Extension of, or Rival to, Classical Logic?" *Philosophical Studies* no. 53:147-151.

"The short well-known answer to the title question is, yes, all of those. It depends, in large measure, on how we formulate the systems, compare them, and apply them. Formulated as a system in connectives $\{\rightarrow, \vee,$

$\&, \sim\}$, Lewis modal system S_3 is a subsystem of classical logic S , similarly formulated, which results (for instance) by adjoining Peirce's implausible law. But with S recast as a system in connectives $\{\&, \sim\}$ (or

$\{\vee, \&, \sim\}$), S_3 reappears as extension of S , got by adding a modal connective \rightarrow , (interdefinable with \square) and appropriate postulates.

With relevance logics, such as R and E , which are in many respects like modal logics (S_3 is tantamount to $E +$ Antilogism), it is similar: these logics are both subsystems of S and extensions of it. But there is a

most significant difference from the modal situation, which concerns applications. The difference, important for applications to inconsistent and also incomplete theories, turns primarily on the scope of the rule of

Material Detachment MD. A, $\sim(A \& \sim B) / B$." (p. 147)

(...)

"It is of passing interest, then, that intuitionist logics and some of their neighbours can be construed as maintaining classical, truth-functional, behaviour for connectives 'and' and 'not' (or, to start with, absurdity),

while diverging as regards behaviour of 'or' and 'only if'. From this perspective of course, intuitionism and minimalism become, like modal logics, extensions of classical logic, adding to it intensional connectives

of disjunction and implication -- not rivals to it, though not rulepreserving extensions. Thus are many claims in the standard literature upset, not only those of Fitting, but, for instance, scene-setting assumptions

of Haack concerning intuitionistic deviance." (p. 150)

50. ———. 1988. "Radical Pluralism - an Alternative to Realism,
Anti-Realism and Relativism." In *Relativism and Realism in
Science*, edited by Nola, Robert, 253-291. Dordrecht: Kluwer.

"Realism, the dominant 20th century position in Anglo-
American thought, is, in the relevant sense, a one world
position. There exists a unique actual world, or reality, external
to "us", which not only determines

how things are locally and globally, but determines as well
truth, and thus also uniquely fixes correctness in science, the
correct theory being that which corresponds to reality. Anti-
realisms such as idealism

and phenomenism reject, in one way or another, the tricky
externality requirement. Relativism and pluralism, by contrast,
reject one of the uniqueness requirements, but in significantly
different ways. Relativism

resists, in one fashion or another, the imposition of any ranking
better than "equally good" and of any rankings warranting
differential choice, on the multiple interpretations or, very
differently, multiple realities or

worlds disclosed. Pluralism, however, to set down at once the
crucial contrast, permits and typically makes rankings, which
enable choice (including realist and idealist and theist choices,
among many others).

Pluralism thus comes in two distinct forms: theory or meta-
pluralism, according to which there are many correct theories
(especially larger philosophical positions) but at most one
actual world; and radical or

deep pluralism which goes to the root of these differences in
correctness, to be found in things, and discerns a plurality of
actual worlds as well as of theories." (p. 253)

(...)

"Why select sistological pluralism, that is, a pluralism based upon object-theory? A first reason is that some selection is practically inevitable.

(...)

Partly to reduce complexity, then, but also partly because of severe limitations of space and energy, only one main form of pluralism has been outlined, sistological pluralism. It is but one style of pluralism, an apparently novel, radical form. It does not, like wishy-washy orientational or entrepreneurial pluralism operate only at the theory level (or meta-level), somehow abandoning the hard-to-separate world level (or object-level) level to realism and its more puritan rivals. There is excellent reason not to do so. For one, sistological pluralism does not need to rely on an implausible sharp cut-off between levels. For another, it does not simply give a pluralistic veneer to orthodoxy and dogma, such as accompanying object-level "realism" may underwrite." (p. 278)

(...)

"Justification for looking at, studying, presenting or showing off a pretty logic, or an unusual radical theory, does not have to be of pragmatic cast, that it does something, succeeds somewhere, works well. It may just be a fine enough thing in its own right - somewhat as a tract of rainforest may be valuable in itself, and, though rather rich and complex, not particularly well-organised, or useful for humans, or good for this or that, or unique. Sistological pluralism is a fine and rich theory, fun to work and play with, and to contemplate, irrespective of whether it is good for much - which, as it fortunately happens, it is. (p. 285)

51. ———. 1988. "Relevant Containment Logics and Certain Frame Problems of AI." *Logique et Analyse* no. 121-122:11-25.

Abstract: "Relevant containment logics, which combine relevant logics with content containment requirements, are motivated and explained. Semantics for some of these logics are introduced and shown to be adequate. In the light of the semantics the logical theory is improved, and other directions

for elaboration are indicated. Finally, the logics are applied to one significant part of the vexatious frame problems of AI , and a route to implementation is suggested."

53. Sylvan, Richard, da Costa, Newton, and Carneiro, Alfonso. 1988. "Cause as an Implication." *Studia Logica* no. 47:413-427.

Abstract: "An appropriately unprejudiced logical investigation of causation as a type of implication relation is undertaken. The implication delineated is bounded syntactically. The developing argument then leads to a very natural process analysis, which demonstrably captures the established syntactical features. Next relevantly-based semantics for the resulting logical theory are adduced, and requisite adequacy results delivered. At the end of the tour, further improvements are pointed out, and the attractive terrain beyond present developments is glimpsed."

"The notion of cause, having fallen from favour in the heydays of logical positivism, has enjoyed a contemporary resurgence. But despite its fashionability now, especially as a major foundational element in epistemology, the logical and structural properties of causation remain quite insufficiently examined. In this situation, who knows whether the foundations will carry the philosophical castles being built (they are never complete, and invariably ramshackle)? Our preliminary investigation of causal implication suggests they will not; like structurally and materially short-supplied high-rise buildings, they will come tumbling down." (p. 413)

54. Sylvan, Richard, and Goddard, Lenn. 1988. "Reasoning I. Reason for, and also Against." *Journal of Symbolic Logic* no. 53:334.

55. Sylvan, Richard, and Priest, Graham. 1988. "Answering Another Alleged Dilemma Destroying Dialetheism." *Bulletin of the Section of Logic* no. 17:42-52.

"To leave matters in no doubt, we obligingly assert that the Russell class R , i.e. $\{x : x \notin x\}$, both belongs to itself and also does not belong to itself; in short, we assert $R \in R \ \& \ \sim (R \in R)$. To be quite explicit, we assert the contradiction $r \ \& \ \sim r$, where r abbreviates $R \in R$. Thus, in convenient symbols, $\vdash_{\delta} r \ \& \ \sim r$ where δ is the group of dialethicians comprising (at least) Priest and Routley. Now Goldstein asserts not, or not just, that we should not do what we have naughtily done, but that we cannot; it "is not that people should not assert contradictions, but that they cannot, even though they may purport to do so" ([1], p. 11).

Goldstein offers a neat, but nonetheless fallacious, argument to support his assertion that we, along with distinguished dead dialetheicians (Fichte, Hegel and Peirce are cited), cannot do what we purport to have done, asserted a contradiction." (p. 42)

(...)

"The problem with contradictions, on mainstream perceptions, is not that they cannot be asserted, but that they lead, not nowhere, but everywhere.

But no one with a modicum of logical sophistication, not just dialetheicians, would accept this idea, would grant *ex falso quodlibet* and its scruffy mates." (p. 47)

Annotated bibliography of the logical works of Richard Sylvan [*né* Routley] (1989-2020)

Bibliography

1. Routley, Richard, and Brady, Ross. 1989. "The Non-Triviality of Extensional Dialectical Set Theory." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 415-436. München: Philosophia Verlag.

"A uniform dialectical resolution of both the logical and the semantical paradoxes was argued for in earlier work (notably in [9]). But the adequacy of that resolution was by no means established. This paper, which shows the non-triviality of extensional dialectical set theory with a general comprehension axiom, represents a further step in the direction of proving the adequacy of the resolution. The methods of proof used - at the core persistence arguments - extend the methods of [2] and [3]. As pointed out in [5], these methods apply equally in the case of the semantic paradoxes.

It should also be noted that these systemic methods almost exactly resemble the meta-linguistic strategies more recently investigated by Kripke in [6]." (p. 415)

2. Routley, Richard, and Plumwood, Val. 1989. "Moral Dilemmas and the Logic of Deontic Notions." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 653-690. München: Philosophia Verlag.

"1. The paradoxes of deontic logic and the consistency and modal requirements

Especially since mid-century many systems of deontic logic have been advanced, which attempt to explore the logic of such deontic notions as obligation, permission and prohibition, right and wrong. Almost all these systems have been modal systems, which treat deontic notions as modal, i.e. as if strict or provable equivalents are intersubstitutable within them preserving truth(2). All such systems are mistaken in a quite fundamental way. For deontic functors such as obligation and prohibition are not modal functors, but are more highly intensional than modal functors, and so demand a greater degree of propositional discrimination than modal logics can provide.

The damage caused by the mistaken treatment of deontic notions as modal shows up in various ways, but we shall be primarily concerned with only one of these, the consistency requirements and the exclusion thereby of moral dilemmas. Another way in which the modal damage appears is through a series of related paradoxes, such as, directly, the paradoxes of derived obligation, and, less directly, the paradoxes of the Robber and the Good Samaritan.(3)" (p. 653)

(2) This was true even of Mally's pioneering system of 1926 which permitted replacement of logical equivalents within the scope of obligation function α (see F & H, p. 3). Von Wright's seminal work (in 1951), which set the pattern for mainstream deontic logic, was explicitly based on the modal comparison of deontic functors with modal functors, and built modal assumptions in at the bottom of the theory.

The exceptional systems, that break the modal connection, are deontic systems based on relevant logics; on such systems see RLR, chapter 8. (3) These paradoxes are explained, and their modal bases exposed, in 5. On the paradoxes of derived obligation, see further Prior 62, p. 224; and for some of the considerable literature on paradoxes like those of the Robber and Good Samaritan, see the Hilpinen anthologies and especially Vermazen. A detailed uniform treatment of all these and other deontic paradoxes in the framework of relevant logic is given in RLR II.

3. Routley, Richard, and Priest, Graham. 1989. "Contradiction, Assertion and 'Frege's Point'." *Analysis* no. 49:23-26.

"The liar sentence ('This sentence is not true') is both true and not true. The Russell set ($\{x: x \notin x\}$) is both a member of itself and not a member of itself. These and many other contradictions we, the authors, are prepared to assert. Most people would disagree with us - and disagree fairly violently. But there is a minority of people who would refrain from disagreeing on the ground that we have said nothing to disagree with. Though we may have uttered words, no statement is made by them. Explicit contradictions cannot be used to make a statement. This line, though hardly orthodox, has, of course, a distinguished pedigree. It was argued by Aristotle in *Metaphysics* Γ 3, and since then has resurfaced from time to time in the cancellation view of negation. (See Routley and Routley [5].) Most recently, it has been advocated by Laurence Goldstein [2], who has produced a novel argument for it. The purpose of this note is to refute the argument. As we shall see, this is not difficult; the discussion, however, raises some points of independent interest." (p. 23)

(...)

"In general, and normally, to assert a conditional is not to assert its consequent; in particular cases, however, it may be. (6) This is, we think, a main lesson of Goldstein's argument." (p. 26)

(6) Similarly for disjunctions. Normally, to assert $\alpha \vee \beta$ is not to assert α or β . But for certain instances of $\alpha \vee \beta$ (e.g. $\alpha \vee \alpha$) it may be.

Paraconsistent Logic: Essays on the Inconsistent, edited by Routley, Richard, Priest, Graham and Norman, Jean, 3-75. München: Philosophia Verlag.

"Although the notion of system was brought into prominence by Leibniz,(1) it is only in contemporary times that a clear conception of a formal or semantical system has developed. Thus recent definitions of paraconsistency(2) through such systems-in terms of systems which can tolerate some inconsistency without trivializing-are not strictly or directly applicable in a historical quest. Evidence of paraconsistent approaches in earlier times has accordingly to be more circumstantial.

There are however several good indicators of paraconsistent approaches of one sort or another which can be reliably used. For example, admission, or insistence, that some statement is both true and false, in a context where not everything is accepted or some things are rejected, is a sure sign of a paraconsistent approach-in fact of a dialethic approach. It involves not merely recognition of a non-trivial inconsistent theory, as with a (weaker) paraconsistent position, but the assumption that that is how things are, that, in effect, the world is inconsistent. A concession that both a statement, A say, and its negation, $\sim A$, hold, works in a similar way, clearly revealing a strong paraconsistent approach. So does the concession that some statements A and $\sim A$ hold in a nontrivial theory or position, thereby revealing a weaker paraconsistent approach.

But often evidence is less direct. For instance, an author may not explicitly say that both A and $\sim A$ hold, or hold in a given theory, but what is said obviously implies that they do, and the author can be assumed to be aware that they do, or a case can be made that the author is aware of this. In such cases the approach is still explicitly paraconsistent. But an author may not be (clearly) apprised of what his or her position (obviously) implies, in which event the position will be either implicitly paraconsistent or else trivial, depending on the underlying logic adopted." 5. ———. 1989. "An Outline of the History of (Logical) Dialectic." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 76-98. München: Philosophia Verlag.

"7. Summary and prospects

It will be clear that dialectic, as befits a theory of development, has developed markedly over two and a half thousand years of philosophy. We have isolated two major phases: Classical Greek philosophy and Modern German philosophy. Although they are very different, one is the development of the other, and there is an important parallel between the phases. Both started off concentrating precisely on contradiction within the setting of (perplexing) arguments. Both then developed into a theory of development in which contradiction plays the central role. Finally, both went into a period of decline when the specific essence of dialectic, literal contradiction, was forgotten, and consequently dialectic became a subject of high generality but little content. All this we have documented.

Of course the evolution of dialectic will continue and we think that we are at the start of a new phase of growth, during which symbolic logic will play a fundamental role. It will again start with a concentration on contradiction itself within the framework of argument procedures, especially convincing arguments which lead to contradiction. To an extent this has already happened with the matter of logical paradoxes and of paraconsistent logic.

However it is also evident that a correct understanding of the history of dialectic is essential for further progress. To this end an analysis of the history of dialectic, and particularly Hegel's dialectic, using the techniques of modern logic is essential. From what has been said it is obvious that such an analysis will have to accommodate the notion of a true contradiction.

Thus paraconsistent logic will be essential here too.(94) This analysis has already started, but remains in its earliest stages. (95) Where the whole modern study will take us, we can only speculate." (p. 92)

(94) It follows that the few attempted formalizations that have appeared which use classical logic are doomed to failure. Some of these can be found in Marconi, 1977.

6. ———. 1989. "Systems of Paraconsistent Logic." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 151-186. München: Philosophia Verlag.

"Let \models be a relation of logical consequence. \models may be defined either semantically ($\Sigma \models A$ holds iff for some specified set of valuations, whenever all the formulas in Σ are true under an evaluation, so is A) or proof

theoretically ($\Sigma \models A$ holds iff for some specified set of rules, there is a derivation of A, all of whose (undischarged) premisses are in Σ), or in some other way. \models is explosive iff for

all A and B , $\{A, \sim A\} \vDash B$. It is *paraconsistent* iff it is not explosive. A logic is *paraconsistent* iff its logical consequence relation is. If a logic is defined in terms of a set of theses it may have more than one associated consequence relation. For example, $\{A_1 \dots A_n\} \vDash B$ iff $\vdash A_j \dots \wedge A_n \rightarrow B$ or $\vdash A_j \rightarrow (\dots \rightarrow (A_n \rightarrow B) \dots)$ or $A_1 \dots A_n \vDash B$ (the last representing the theorem-preserving or weak inferential connection). In this case all its associated consequence relations should be paraconsistent.

Let Σ be a set of statements. Σ is *inconsistent* iff, for some A , $\{A, \sim A\} \subseteq \Sigma$.

Σ is *trivial* iff for all B , $B \in \Sigma$. The important fact about paraconsistent logics is that they provide the basis for inconsistent but non-trivial theories. In other words, there are sets of statements closed under logical consequence which are inconsistent but non-trivial. This fact is sometimes taken as an alternative definition of 'paraconsistent' and, given that logical consequence is transitive, it is equivalent to the original definition. The proof is this: If Σ is an inconsistent but non-trivial theory then obviously the consequence relation is paraconsistent. Conversely, suppose that $\{A, \sim A\} \neq B$. Let Σ be the transitive closure of $\{A, \sim A\}$ under logical consequence. Then Σ is inconsistent but $B \notin \Sigma$. Because of the equivalence we also call any inconsistent but non-trivial theory *paraconsistent*, and derivatively, any position whose deductive closure provides a paraconsistent theory.

Why should one be interested in paraconsistent logics? Among the many reasons are proof theoretic and semantic ones." (p. 151)

7. ———. 1989. "Applications of Paraconsistent Logic." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 367-393. München: Philosophia Verlag.

"1. Introduction: the variety and types of applications

The most important application of paraconsistent logics is their application to possibly inconsistent theories. However one

needs to interpret "theories" here fairly liberally, as any body of doctrine, statements, axioms etc. which can be thought of as inferentially closed. The theories can be historical, current, embryonic or merely entertained. Of course the formalization of such theories often requires much wider logical apparatus than the mere first order deductive logic discussed in the introduction to Part Two of the book. This may include probability, inductive logic, the logic of various modalities and other intentional notions such as belief, and so on. Such things, or at least some of them, have been considered by logicians. But, by and large, the logical theories produced have been tuned to classical or at least intuitionist logic. This is singularly inappropriate since as often as not, the material to which the logical apparatus is applied is inconsistent, as we shall see. Accordingly the ideas of paraconsistency need to be applied to the logical theories of modality, probability, etc. themselves to produce adequate logical machinery. In this essay we will consider first some interesting inconsistent theories, some of them in some detail, and then move on

to consider the remodelling of various logical theories. It should be stressed that the studies of many applications mentioned are in their infancy, and we can often do no more than make suggestions for the directions of future research." (p. 367)

8. ———. 1989. "The Philosophical Significance and Inevitability of Paraconsistency." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 483-539. München: Philosophia Verlag.

"Paraconsistency strikes at the root of principles which are fundamental to, and entrenched in, much philosophy. It is therefore bound to be philosophically problematic and to have important philosophical ramifications. In this introduction we will try to chart and analyse some of these issues. By its nature, this will require us to deal with a number of separate and not otherwise connected issues. However, we will start by looking at some important points raised by the arguments for paraconsistency in chapter V [*], section 1 above.

We will then go on to investigate some of the philosophical consequences of paraconsistency." (p. 483)

Contents: Essays by Richard Routley: I. First Historical Introduction: A Preliminary History of Paraconsistent and Dialethic Approaches (with Graham Priest) 3-75; II. An Outline of the History of (Logical) Dialectic (with Graham Priest) 76-98; V. Systems of Paraconsistent Logic (with Graham Priest) 151-186; XIII. Applications of Paraconsistent Logic (with Graham Priest) 367-393; XV. The Non Triviality of Extensional Dialectical Set of Paraconsistency Theory (with Ross T. Brady) 415-436); XVIII. The Philosophical Significance and Inevitability of Paraconsistency (with Graham Priest) 483-539; XXIII. Moral Dilemmas and the Logic of Deontic Notions (with V. Plumwood) 653-690.

"This book had its conception in a bar in about 1978, though the exact date escapes our collective memory. We had both been working in the field of paraconsistent logic for some years and were aware the subject was gradually gaining momentum. Yet the movement was still a diffuse one. This was, and still is, for two reasons. First, though many people were involved, they were spread fairly thinly over the globe, and communication was not particularly good. Secondly, the major papers that had been published on the subject were published in a variety of journals, some of them fairly inaccessible. It seemed to us that a focal point for work in paraconsistency was necessary, and would be provided by a suitable book.

We could have published a collection of already published essays but decided against it. Instead we wrote to those whom we knew to be working in the area who in turn informed those whom they knew: the book comprises papers that were sent to us in response. (We obtained however more papers than we could use: a number of the others have been published in an

issue of *Studia Logica* devoted to paraconsistency and edited by us. (1)

All the papers in this collection are published here for the first time and some of them are undoubtedly of the first importance for the future of the subject.

Researchers should also find the bibliography of paraconsistency helpful.

Paraconsistency will still be an unfamiliar and fairly esoteric topic to most people. We therefore decided to write a number of introductory essays on various aspects of paraconsistency, and these can be found at the beginning of each section of the book. (2)" (p. XIX)

(...)

"The word "paraconsistent" (meaning "beyond the consistent") was coined by Mira Quesada [*] to apply to the study of theories that are inconsistent but not trivial. In working on this book, however, we found that another piece of terminology was desirable. This was to express the idea that some paraconsistent theories are true. After exhausting all the dictionaries at our disposal (including Greek, Russian and Gaelic), we decided that no extant word would express this idea. So we were forced to coin one. A true contradiction is a Janus-faced creature which faces both truth and falsity.

The word 'dialetheia' ("two-way truth") seemed a fairly appropriate way of expressing this idea. Correspondingly dialethism is the view that there are dialetheias, true contradictions. We use these terms (with a little embarrassment) throughout our essays.

As with the variant spelling of "dialeth(e)ic" and its cognates, so even more with variant notation and referencing, and more still with the spread of heterodox ideas, there is in this book no stifling uniformity." (p. XX)

(1) *Studia Logica*, volume 43, 1984.

(2) These introductory chapters first appeared in *On Paraconsistency*, Research Papers of the Logic Group, No. 13, Philosophy Department, Research School of Social Sciences, Australian National University. A few changes have been made due to comments by Newton da Costa, Charles Daniels and Lorenzo Perra, to whom we are grateful.

10. Sylvan, Richard. 1989. "Relational semantics for all Lewis, Lemmon and Feys' modal logics, most notably for systems between $S_0.3^\circ$ and S_1 ." *Journal of Non-Classical Logic*:19-40.

A main object of the present exercise is to provide relational semantics for weak strict modal logics strictly between $S_0.5$ and S_2 , relational semantics for other systems of the great system pioneers being textbook stuff. A relational semantics evaluates modal functors in terms of a (two-place) relation between situations or worlds: not, as in the much less revealing "neighbourhood" semantics, in terms of a relations between worlds and sets of worlds (thus relational semantics are in a sense "first order", by contrast with such neighbourhood semantics). The relational semantics for S_1 and S_1'' , in particular, are markedly superior to earlier neighbourhood semantics; they fit the systems better, and are more informative and they directly supply interpretable matrices for the logics and attractive algebraic analyses. With the provision of these semantics, furthermore, the supplying of such relational semantics for all the modal sentential logics presented and studied by the great pioneers, Lewis, Lemmon and Feys, is completed(2).

(2) Of course Lewis, Feys and Lemmon were by no means the only important pioneers of modal systems - von Wright and Prior were among others - or always the earliest. Leibniz is now said, in Germany, to have outlined system S_2 , and MacColl, whose modal systematisation remains neglected, delineated a

system in the vicinity of S2. But the cited pioneers did much systematisation and taxonomy of systems; to them primarily we owe present main galaxy of modal systems.

11. ———. 1989. "Philosophical and Linguistic Inroads: Multiply Intensional Relevant Logics." In *Directions in Relevant Logic*, edited by Sylvan, Richard and Norman, Jean, 269-304. Dordrecht: Kluwer.

"Many English sentences contain not just one intensional connective but several.

Philosophical discourse and argument contain a particularly high concentration of intensional connectives, indeed of ultramodal connectives, those beyond the reach of modal logics. For it is not just that the fundamental argument relations of deducibility, implication and conditionality are intensional, indeed themselves ultramodal. So furthermore are central topics of philosophical investigation, such as: knowledge and belief; evidence, confirmation, and explanation; pastness and futurity, and the notions of tense, change and action; value, right and obligation; to begin with a listing. They are one and all intensional, and generally more highly intensional than the modal notions of possibility, necessity and contingency, or of provability and classical probability. The upshot is that any logical theory fit to pass initial adequacy conditions for the formalisation of associated discourse - and especially of philosophical arguments - will have to consider intensional connectives, indeed highly intensional connectives, and not just one at a time, but multiply. But virtually all previous theories fail to accommodate ultramodal notions. This is enough to motivate the present enterprise, that of adding many further, appropriately controlled, connectives to the

implicational systems so far studied in relevant logic investigations (e.g. in the studies surveyed in RLR). Not too surprisingly, however, the further connectives singled out for special study are those that have attracted much philosophical discussion and have, for the most part, already been investigated, much less than satisfactorily, in applications of modal logic." (p. 269)

"The thesis that philosophy is the logical syntax and semantics of language, that, more comprehensively, the task of philosophy is semiotical analysis, though sponsored especially by Carnap, was adopted by Russell before him and Montague and many others after him. The thesis foundered, so it came to be thought, like "Montague semantics" and "illocutionary logic" after it, on various immovable rocks, a major one being the inadequacy of the semantical framework in terms of which the thesis was to be made good, an inadequacy which left it unable to accommodate and account for much intensional discourse. A chief deficiency

of the framework was, in fact, the restriction to the possible - to possible worlds and possible individuals, in short to possible items, worlds being a sort of item. An important by-product of general semantics for relevant logics is that they have shown how to remove, in a nontrivial way, the restriction to possible worlds (and thereby too that the restriction to possible individuals can be lifted and with it associated restrictions militating against incomplete, vague, and other supposedly recalcitrant items: see JB p.348ff.). We can move out of the modal dark ages." (p. 328)

13. ———. 1989. "Conclusion: Further Directions in Relevant Logics." In *Directions in Relevant Logic*, edited by Sylvan,

Richard and Norman, Jean, 399-437. Dordrecht: Kluwer.

"There is a great deal to be done, as always. For one thing, research papers commonly open at least as many questions as they resolve. Moreover, as has always been the way with minority research interests, there are few doing the work, especially compared with the numbers defending or propagating dominant "classical" logic and its complex epicycling.

Early in its rise to ascendancy classical theory encountered a heavy variety of paradoxes and anomalies quite sufficient to have grounded it, had workable alternatives been available.

There were none with comparable scope. Alternatives have been slow to emerge, dominant positions blinkering discernment of rivals; these alternatives are still few, and none yet has wide appeal. Meanwhile classical theory has been able to fortify its position, to assemble a ring of defences, to pretend, for example, that the paradoxes and anomalies that come with it are inevitable or facts of life. Now with the advent of the two-valued Boolean computer age, it appears that limited skirmishes have been decisively won for the time being by the classical hordes, with the fair and the true roundly defeated by the tough and the crude. All of which is bad news for all subjects, like philosophy, involving reasoning, where two-valued classical logic has done much more harm than good.(1)" (p. 399)

(1) The points are documented in several places; see especially UU, or JB p. 898 ff.; also RLR.

From this angle, the various schools who have refused the enticements of classical logic and tried to persist with an expanded traditional logic (e.g. J. Anderson and the Sydney school) were not entirely wrong. But in avoiding propositional logic, for example, except as distorted through dubious reductions, they gave themselves a severe handicap.

14. ———. 1989. *Bystander's Guide to Sociative Logics: A short interim edition*. Canberra: Department of Philosophy. Research School of Social Sciences. Australian National University.

"In a *sociative* logic, premisses and conclusion of an argument, or correspondingly antecedents and consequent of a valid implication, are associated; they characteristically have enough to do with one another. To that extent any such logic is broadly relevant. But what have become known as relevant logics, the best known of which are the relevance logics largely forged in dirty Pittsburgh, comprise only a quite proper subclass of the broader class of sociative logics, many kinds of which have a much longer and more substantial history than relevant logics. If the story elaborated in this guide is correct early sociative logics did not arise in reaction to noxious irrelevant products; these logics were the original logics. The oversimplification and excessive power of irrelevant systematisation only came later; and then especially in the later middle ages and contemporary times when such systematisation came to dominate, there was a due, though substantially ineffectual, reaction against it.

What the later sociative logics that developed in reaction have in common is primarily the aim to avoid the most obvious paradoxes of dominant logical theorising. The plurality of logical theories and sketches that now make up sociative logics share little else however. There is no common commitment, for instance, to supply an account of entailment, or a theory of relevance, or a technical story of the use of premisses in argument, though there are bound to be commitments to some more central logical enterprises or other, such as elaboration of

a theory of argument or inference, an account of reasoning, explication of conditionals, and so on.

What these different commitments were and are, and ought to be, will begin to unfold as the story proceeds." (Preface, p. II)

Chapter by Richard Sylvan: Preface (with Jean Norman) VII-VIII; Introduction: Routes in Relevant Logic 1-21; Chapter 19: Philosophical and Linguistic Inroads: Multiply Intensional Relevant Logics 269-304; Chapter 22: Semantics Unlimited I: A Relevant Synthesis of Implication with Higher Intensionality 327-376; Chapter 24: Conclusion: Further Directions in Relevant Logics 399-437.

"Relevance logics came of age with the one and only International Conference on relevant logics in 1974.

(..)

We thought that the collection of essays was still (even after more than six years in the publishing trade limbo) well worth publishing, that the subject would remain undeservedly esoteric in North America while work on it could not find publishers (it is not so esoteric in academic circles in Continental Europe, Latin America and the Antipodes) and, quite important, that we could get the collection published, and furthermore, by resorting to local means, published comparatively cheaply. It is indeed no ordinary collection. It contains work by pioneers of the main types of broadly relevant systems, and by several of the most

innovative non-classical logicians of the present flourishing logical period.

We have slowly re-edited and reorganised the collection and made it camera-ready.

While we have retained all the completed essays from the Conference sent to us with the exception of essays that have, in the interval, been published elsewhere, we have not limited ourselves to these essays but have, so far as space permitted, invited newer essays. As well we have included overviews, which provide introductions to current directions of research on broadly relevant logics and to many general problems in the area." (Preface, P. VII)

21. Sylvan, Richard. 1990. "On Making a Coherence Theory of Truth True." *Philosophica (Belgium)*:77-105.

"In the last half century the coherence theory of truth has largely fallen into disuse and disrepute. While there is now some flirting with coherence approaches, as each approved version of the majority position, the correspondence theory, duly founders, and holism gains in fashionability, still coherence has but few committed friends. Granted, it has had friends of a sort: most notably Rescher, who has made significant contributions, on which others may profitably build. But Rescher, while advocating what he calls a 'coherence theory' has twisted the theory into what it is not, a modified "self-evidence" theory, and has also warped it into a methodological pragmatism that would have made straight old-timers like Bradley and Blanshard blanch. As well the major virtues of the theory - if only it could be got to work, which unfortunately it can't - have been appreciated by isolated explorers of the wide truth terrain, such as Blackburn (see esp. his pp. 237-8). The present exercise supplies one way of enabling the theory to work, without undue warping. That way does not pretend to be an authentic historical way, only an historically controlled and informed way. For the primary purpose here is not historical explication; it lies rather in the development of

coherence theory *beyond* its previous and varied historical settings, to render it somewhat more adequate and more coherent, and to begin to display some of its further virtues." (p. 77, notes omitted)

22. ———. 1990. "Variations on da Costa C Systems and Dual-Intuitionistic Logics: I. Analyses of C_w and CC_w ." *Studia Logica* no. 49:47-65.

Abstract: "Da Costa's C systems are surveyed and motivated, and significant failings of the systems are indicated. Variations are then made on these systems in an attempt to surmount their defects and limitations. The main system to emerge from this effort, system CC_w , is investigated in some detail, and "dual-intuitionistic" semantical analyses are developed for it and surrounding systems. These semantics are then adapted for the original C systems, first in a rather unilluminating relational fashion, subsequently in a more illuminating way through the introduction of impossible situations where and or change roles. Finally other attempts to break out of impasses for the original and expanded C systems, by going inside them, are looked at, and further research directions suggested."

25. Sylvan, Richard. 1991. "Existence II: Existence and Nonexistence." In *Handbook of Metaphysics and Ontology*, edited by Burkhardt, Hans and Smith, Barry, 261-263. Munich: Philosophia Verlag.

"While the topic of existence ought to be a central concern of philosophy, the fundamental notion of ontology, the notion in fact remains remarkably underinvestigated because of certain ancient prejudices, such as referential assumptions embedded deep in mainstream philosophy. Most important among these is the ontological assumption, according to which whatever is a (logical) subject, whatever is genuinely talked about, exists.

(The assumption appears in various different guises, e.g. as narrowed to what is truly talked about, and also in derived forms, e.g. as restricted to quantifiable talk, a form sloganized as 'to exist is to admit of construal as a value of a bound variable' and the like.) Accordingly, then, discourse that is apparently about what does not exist must be reduced, in one way or another, to proper (logical) form, namely that conforming to the above assumption.

The mainstream result is a grand (but misguided) reduction programme for many types of problematic language, especially that about fictions, i.e. fictional items generally, and that about universals, abstractions, and theoretical items. The so-called 'riddle of existence' (or 'Plato's beard') derives from the same assumption. The puzzle is: how is it possible to make true statements, such as 'Pegasus does not exist', about the nonexistent, since the statement yields both that the subject (Pegasus in the example) exists, by the assumption, and that it does not, because that statement is true? The received resolution involves both an analysis, or removal of 'Pegasus' from the class of genuine names and logical subjects, and circumscription of the 'predicate' 'exists' (and of course its associated negation) under the dogma that existence is not a predicate.

Under the alternative object-theory approach, still a minor philosophical stream but one systematizing much traditional philosophical and everyday practice, all this analytic and reductive activity is avoided. For example, 'Pegasus does not exist' is admitted to be what it appears to be, a grammatically satisfactory subject-predicate statement, without existential commitment; it is a statement about (or signifying) a non-existent object, Pegasus, and ascribing to it the property of non-existence. So existence, too, is a predicate, indeed a rather distinguished one, of which it would be reasonable to expect some suitable philosophical characterization. Neither it nor non-existence is especially puzzling, or beyond characterization and therefore discussion; nor is it without criteria because it is not a feature of everything nor is it distributed everywhere.

(...)

The assumption-undermining object-theory alternative does not carry any commitment to traditional doctrines concerning essence, long entangled (in priority and other disputes) with questions of existence. For characterization is a wider, less loaded notion than essence. Characterizations may be fuzzy, not tied to necessary and sufficient conditions but to looser specifications; they themselves are further non-existent items. Nor do they 'precede' existence, though elements of them are needed in order to ascertain whether something exists or not.

(...)

Although defining existence is a controversial affair, the notion is not entirely uncontrolled; there are fairly uncontroversial bounds. It is generally taken that such material things as sticks and stones, which can hurt, do exist, but that mere names, as distinct from sounds and marks on surfaces, do not; nor do impossible objects or the characters of pure fiction or imagination or speculation.

But in between are extensive controversial areas. As policy in arriving at an account of existence we could do worse than to heed Ockham's razor, not to multiply what exists beyond necessity, which translates into: begin with those items which obviously exist, not-controversially, such as medium-size material objects, and close under enlargements produced by unavoidable extensions thereof, such as compounding or summation and dissection or analysis. But exclude unnecessary items, such as illusions, imaginary items, dream characters, and unnecessary operations, such as abstraction, idealization, fictional variation, and so forth. The route to an appropriately minimalist definition of existence is now evident. An item exists if it stands in suitable physical relations to the paradigm existents. (Such a definition is refined and synthesized with other accounts of existence in Routley 1980, Chapter 9.)" (pp. 261-263)

28. ———. 1991. "Relevant Logics." In *Handbook of Metaphysics and Ontology*, edited by Burkhardt, Hans and Smith, Barry, 787-789. Munich: Philosophia Verlag.

"Relevant logics are both philosophically and mathematically motivated: but in both cases, a prime objective is to avoid paradoxes or incoherence, of one sort or another, a feat accomplished through restored or improved connections, especially relevant connection in implicational and inferential linkages. Relevant implications, the focus of most research, are those whose components (A and B in implication $A \rightarrow B$) are relevant to one another, i.e. have enough to do with one another. Broadly relevant, or sociative logics assert none but relevant implications; all implicational theses of such logics are relevant implications. Under a technical explication (of weak relevance), relevant implications and logics are explained in the following way: a logic or logical system is relevant if its propositional part contains no theorems of the form $A \rightarrow B$ where A and B fail to share a parameter. So any system which includes or validates paradoxes of implication - such as that contradictions imply everything and anything implies what is necessary (e.g. in standard symbols of the literature):

$A \& \sim A \rightarrow B, B \rightarrow. C. v \sim C. A \& \sim A \rightarrow. C \& \sim C$, etc.

is irrelevant. Mainstream logics, such as classical and intuitionistic systems, are irrelevant.

(...)

"All these types of sociative logics have historical roots, most reaching back at least to medieval times. For example, semantical reasons for the serious qualification of Disjunctive Syllogism were anticipated in the 15th century by the Cologne School and Domingo de Soto; for they realized that where both A and $\sim A$ hold (as in non-trivial inconsistent theories and many kinds of intensional situations), A does not exclude $\sim A$,

A's negation, so B's holding is in no way guaranteed. Generally, however, the historical connections were rediscovered later, after contemporary investigations had begun. In particular, technical studies of the best known of these sociative types, relevant logics proper, were well advanced before it was realized that some of the ideas (e.g. that relevant implication explicated genuine deducibility) were not quite so new, and that popular arguments against the theory appealing to the logical tradition could be matched by rival traditional arguments from dissenting schools. But certain recently neglected features of logical tradition - notably the requirements of preservation of relevance and necessity in an implication - were early seized upon by Anderson and Belnap (1975), who made these requirements central to their elaboration of entailment, as encapsulated in the system *E* (of 'entailment'). To them we owe both the title 'relevance logic' and the main systems of relevance logics, a subclass of properly relevant logics in the vicinity of *E*, a system itself adapted from the (theorem-wise equivalent) system of 'rigorous implication' of W. Ackermann (1896-1962), who really initiated contemporary technical studies in 1956." (pp. 787-788)

"Our modest aim is to show how, within a suitable relevant logical framework, all the paradoxes of confirmation vanish - not merely those Hempel and Carnap adduced, but those uncovered by Good, Goodman, Glymour, and others. But, naturally, even removing these paradoxes wholesale still leaves much logical work to be done, work we shall not try to complete here. What we shall indicate however, in the final section, is convergent work undertaken independently by Paul Weingartner and collaborators, which resolves paradoxes in an analogous fashion." (p. 5)

(...)

"To arrive at relevant logic and accompanying semantics of confirmation, we shall try to proceed from what is more secure (such as intersubstitutivity principles) to what is less (such as converse consequence conditions discussed by Hempel). In brief, we build up from weakness (as was the main Taoist-Cartesian methodological stratagem of RLR) rather than adopting the more difficult, if theorem wise intertwining, classical procedure of cutting down from damaging strength. The goal is, of course, a relevant logical theory free from paradoxes. Nonetheless, a subsidiary aim is to achieve substantially a *logical* theory, to accomplish as much as we reasonably can with logic alone, without undue appeal to outside distinctions or information (which may however enter in applications): in particular, without undue appeal to types of samples, or classes of conditionals or hypotheses, or "theoretically barren contexts" with no illicit background information, or "total available information." 35. Sylvan, Richard. 1992. "On Interpreting Truth Tables and Relevant Truth Table Logic." *Notre Dame Journal of Formal Logic* no. 33:207-215.

Abstract: "Contrary to common mythology, the two-valued truth tables do not yield classical logic. *Many* contestable assumptions are required to reach classical logic. Indeed *some* assumptions are required to get anywhere logically.

In between, and in other directions, lie several other logics. For, even logically, there are many ways in which the truth tables can themselves be interpreted.

In particular, they can be variously read inferentially, in one direction or two, or they may be variously read semantically. Along inferential lines, Tennant's one-way reading is reconsidered. It is argued that the tables

do not lead to the logics Tennant claims to reach but can lead to various other decidedly weak logics. Along more orthodox semantical lines, it is shown how the truth tables themselves do not exclude nonclassical situations but can allow for incomplete and inconsistent set-ups. So considered, they provide the framework for a four-valued relevant logic. A four-valued implication is grafted onto this framework, simply by generalising upon two-valued material implication artifice, to deliver the familiar system *FDE* of tautological entailment. Finally, for comparison, a less contrived semantics than pure truth tabular, a semantics due to Dunn, which now admits of ready higher degree extension, is supplied for *FDE*."

FDE = First Degree Entailment

"Len Goddard not only initiated wider logical research in Australia, but further he had a major influence on the character and ethos of that investigation; for example, its easy, free-wheeling, unauthoritarian, undogmatic character. He encouraged features of what would now be regarded as logical pluralism of a relaxed and far-reaching kind. Not only were there many logical systems and frameworks worth investigating, some of course of more philosophical or technical merit than others; but more, he freely conceded that there may not be a unique correct one, or absolutely right way, among them. Nor, by contrast with common practice elsewhere, did he discourage heterodox logical work, even such unorthodox thought as that prevailing classical ways might be seriously defective, even downright wrong. To the contrary, he early thought that satisfactory resolutions of a range of paradoxes and puzzles should be sought outside entrenched ways; but he did not try to impose his own ideas or interests. In his own research at the time, which was (rather un-Australianly) nonconfrontational, he was certainly looking for resolutions of logical and semantical paradoxes outside formal classical logic - though by way of what had long stood at the peripheries of British logical investigations (from Mill through Russell and Ryle), namely significance theory and its contextual enlargements. More generally, there was no attempt, with Goddard as guide and director, to pull or push researchers into some standard line; on the contrary, they were encouraged to roam." (pp. 6-7)

37. ———. 1992. "Process and Action: Relevant Theory and Logics." *Studia Logica* no. 51:379-437.

Abstract: "While *process* and *action* are fundamental notions, in ubiquitous use, they lack satisfactory logical treatment in two critical respects: in analyses of the fundamentals themselves and in logical development. For what treatment they have so far received, under classical systematisation, leaves significant

lacunae and induces much paradox. A relevant logical relocation, carried through in detail here, removes such problems, and provides solid ground-work for a satisfactory treatment.

Firstly, as to fundamentals: processes should be explicated, so it is argued, as certain sorts of (time) directed functions (from inputs to outputs); thus they can be represented through certain ordered pairs of relations. Significant logical structures they can enter into are investigated: notably, process lattice and coupled logics, and a generalized category theory (tolerating nonassociativity of composition).

Actions are types of processes, agent-ascribed process. As stock analyses of the differentia, operators and agency, through intentionality, rationality and so on, demonstrably fail, new causal analyses are proposed.

Secondly, as to logical developments: for the most part, the apparently diverse offering of process and action logics to be encountered in the literature are but multiple modal logics: modal logics enriched with further functors of interesting modal sorts. Some, for example, like advertised "process logics" are dynamic logics (themselves basically multiple modal logics) enriched by tense logical functors, themselves modal in character. In a way that is now becoming nonstandardly standard, these modal enterprises can be reworked on relevant logical bases. A main point to such exercises resembles that of other relevant reworkings: namely, the search for correctness, for adequacy to pre-analytic and linguistic data, and therewith removal of paradoxes and anomalies that accumulate under modal analyses.

Logical components from a properly expanded Humean model of action are supplied with relevant logics and semantics, in particular doing, trying and striving, intention and motivation. The difficult question of formalising practical inference is then addressed.

Relevant dynamic logics, paralleling modal developments, are built up piece by piece, relevant theory change is considered

within a dynamic framework, and work on relevant temporal and process logics of programming cast, including functors such as before, during and throughout, is initiated. The present state of logical play is assessed."

39. ———. 1992. "Blending Semantics for IF as a One-Place Assertive With Semantics for the Conditional." *Bulletin of the Section of Logic* no. 21:67-71.

"According to the interesting theory of Miguel de Castro [2], the word 'if' is not - what conventional logical theory sees it as - a two-place connective coupling a pair of sentences (e.g. even mildly deviant logicians like Belnap and Anderson take this line; see [1], p. 481). It is rather - what it often seems to be { a one-place functor, like its near relative *suppose* and like *would that*, *one wonders whether*, and many *wh*-expressions. Let us restrict consideration to the one-place *connective*, i.e. where *if* is sentence forming, so that, like \sim (for *not*), where *A* is a sentence so is *if A*.

Under the one-place theory, the conventional form *if A (then) B*, symbolized $A > B$, plainly derives by compounding, through the two-place connective, *;* or *,then*. To make reading more straightforward, we shall assume then insertion (as argued for, in a distinguishing role, in [4] chapter). The formation rule for *,then* is accordingly: where *A* and *B* are sentences (or wff) then so is *A, then B*. Thus $A > B$ admits of syntactical analysis as: (if *A*), then *B*.

What is demonstrated here is that this analysis can be extended smoothly to the semantical theory." (p. 67)

40. Sylvan, Richard, and Priest, Graham. 1992. "Simplified Semantics for Basic Relevant Logic." *Journal of Philosophical Logic* no. 21:217-232.

"When Anderson and Belnap pioneered relevant logic, they proposed a number of systems (E , R , etc.) in proofs theoretic form. When suitable world-semantics for these systems were produced, it became clear that these systems were but the tip of an iceberg.

Moreover, in the light of the semantics, it became clear that the basic (affixing) logic was none of those that Anderson and Belnap had suggested, but the system now called B (or BM if we drop all constraints

on $*$). This had the most general semantics: other (affixing) systems being obtained by adding extra conditions on the ternary relation, R ." (p. 217)

(...)

"In the first part of the paper we will consider the basic positive logic, B^+ . In the second half we will consider negation-extensions of B^+ . There are two strategies for handling negation in relevant logic: one uses the Routley $*$ -operation; the other uses four-valued semantics (Routley *et al.*, *loc. cit.*). We consider both approaches. The extant four-valued semantics for relevant logics contain a complication over and above constraints on R : they require two ternary relations (one to state truth conditions; the other to state falsity conditions). A feature of the present semantics is that only a single ternary relation is needed. Thus, the four-valued semantics are doubly simplified. Moreover, an interesting divergence emerges here. All negative systems add De Morgan laws to B^+ . The basic negative system with the Routley $*$ adds, in addition, contraposition; that for the four-valued semantics adds, instead, double negation. (B itself, adds both.)

We concentrate in this paper on the semantics of the basic affixing relevant systems. It is clear that simplified semantics

for all (affixing) relevant logics, along the lines given here, are to be expected. But since details are not as straightforward as might be expected, we leave this topic for another occasion."

Abstract: "Although puzzles surrounding vagueness are ancient, they have been much intensified since the rise of standard "classical" logic. A main trouble is that standard logic proceeds to "validate" both ancient defective arguments (sorites paradoxes) and modern defective arguments (modal paradox analogues). But much evidence has recently accumulated as to the severe philosophical inadequacy of standard logic. Plausibly then ways out of such logic-induced puzzles which work elsewhere, relevant ways which work well, will succeed with puzzles of vagueness also. So it proves, by letting the puzzles constrain the logic, so producing their own demise, we reach elegant logical resolutions with the "very" logics adopted elsewhere for removing other logic-induced problems."

42. Sylvan, Richard, and Urbas, Igor. 1993. "Paraconsistent Classical Logic." *Logique et Analyse* no. 36:3-24.

Abstract: "The objective is to reformulate classical (propositional) logic, preserving all theses, so that the spread rule $A, \sim A / B$, is avoided. There are many ways of doing this - some less, some more satisfactory, all exact formulations no doubt an improvement on standard classical logic. So results a cluster of paraconsistent classical logics. These systems are surveyed and rudimentarily classified, several of them separated, and some exhibited and discussed in more detail. Among the pure systems of the cluster are Hiz' s logic H , a Hilbert-style reformulation of Arruda-da Costa logic J_3 , a cut-free formulation of Schütte's system K_1 and various normal-forming logics. Some of these pure systems fit Brazilian and Belgian criteria for paraconsistency very neatly, and significantly better than any Brazilian or Belgian systems."

44. Sylvan, Richard. 1995. "Re-Exploring Item-Theory. Object-Theory Liberalized, Pluralized and Simplified but Comprehensivized." *Grazer Philosophische Studien* no. 50:47-85.

Reprinted in R. Routley (Author), M. Eckert (ed.), *Exploring Meinong's Jungle and Beyond*:

The Sylvan Jungle — Volume 1 with Supplementary Essays, (2018), pp. 546-561.

Abstract: "Re-explored are certain item-theory theses, major problem zones, and newer puzzles and, together therewith, prospects for liberalizing and pluralizing item-theory. Undoubtedly item-theory may be further liberalized, partly by further dissociation from object-theory and the restrictions *object* imposes, but primarily through substantial deregulation of the styles of characterisations permitted. Then almost anything goes; nonetheless what results is a sufficiently well-organised smooth-running sistological anarchism.

Characterisation is dispersed through a federation of regions: only in old central city regions do the characterisation postulates of older object-theory regularly hold; in the expanding suburbs characterisation by local assumption and postulation (as in neutral postulate-theory) is a distinctive mode, while out in the country implicit intentional characterisation (including ostension and perception, dreaming and imagining) is a common mode. Put differently, there is a rich variety of sources yielding item specifications; only in places like the old city do structural descriptions of items enjoy formerly-imagined priority, but elsewhere alternative characterization principles may operate.

However what holds in situations as a result of such local or regional characterisation may be far removed from what is actual. Characters may be only make-believe or suppositional presented character may differ from more genuine articles, and so on. Bringing the items involved into central evaluation

markets, where truth value is assessed, may require preparation of the items, with pruning or regularisation of their properties. Here, at this semantical stage, full pluralization offers further freedom, that is pluralization of truth, with a plurality of actual worlds. A single assignment of truth, *the* truth at the actual world, is no longer *de rigueur*; a truth net may be differently cast, different assignments may be adopted, and a selection among alternatives perhaps made. Within this liberalized pluralized setting, resolutions of puzzles induced by certain problem-making items are ventured."

45. ———. 1995. "Freedom Without Determinism: Decent Logics of Relevance and Necessity Applied to Problems of Free Will." *Acta Analytica*:7-32.

Abstract: "Arguments for determinism do not enjoy the sound logical health that has been attributed to them. The main older argument is fallacious, indeed classically invalid, while a new "rectified" form is relevantly invalid (relying on modally covered form of disjunctive syllogism). What is more, there is no satisfactory way of repairing this form of argument so that it does yield a credible determinism. Other arguments for (non-vacuous) determinism are also dispatched, through a divide-and-dissolve technique, which operates by distinguishing types of determinism (such as logical determinism, which depends on another modal fallacy) and kinds of arguments for determinism (such as rational choice arguments, which inadmissibly assume maximization, and reductionistic arguments, which inadmissibly assume full reduction of choice and deliberation succeeds). In the largest of three appendices (the other two concern logical developments), a reasonable libertarianism is discerned and defended."

From the Note by Nicholas Griffin:

"When Richard Sylvan died in June 1996 the manuscript of this book was already complete. It is true, to take up one of the themes put forward in its pages, that `complete' in this context is not an absolute term: while one typescript was with his publisher at the time of his death, another, bearing further revisions, was with his typist. The changes he made at this time, however, were minor and only the bibliography and references have required much attention from me." (p. XIV)

Contents:

"General description of Form and Content of *Transcendental Metaphysics*.

There is not merely a plurality of correct theories and of more or less satisfactory world-views: there is a corresponding plurality of actual worlds. Plurality penetrates deeper in full

plurallism than linguistic surface or than conceptual or theoretical structure, to worlds. There is no unique actual world such as realism postulates, but many worlds; there is no single fact of the matter, there are facts and matters. Full plurallism itself bifurcates, into two main forms; radical pluralism, which rests with multiple actual worlds, and *deep* plurallism, which 'completes' this multiplicity with a unifying ultimate item, the *Wholle*, of which the multiplicity comprises various worldifications. Much of the text is devoted to the theoretical elaboration and defence of deep plurallism, both directly and by comparison with past positions.

Overall structure of the book (which is as shown by its short content) is, in brief, as follows: The basic theory is introduced and explained, and several confusions offset. Arguments against the radical theory are deflected and then many arguments for it are advanced. Following that detailed stage, deep plurallism and other pluralisms are further elaborated, in part through a detailed investigation of key notions, both of full plurallisms and also from traditional and religious pluralisms. Next the full theory is set in place through a series of comparisons: firstly with the other standard philosophical positions in realist-idealist-relativist and related debates, and secondly with connected development of many worlds theories and transcendental metaphysics of other philosophers. There too it is demonstrated that deep plurallism is not merely a metaphysics, but one that is transcendental, and various arguments against transcendental metaphysics are repelled. Finally full plurallism is put through its paces, in showing its power in resolving or relocating major philosophical problems, and further in dislodging powerful prevailing ideologies. In a brief epilogue, full plurallism is linked to practice. For instance, its decided merits as regards liberality and tolerance are explained.

Considered one way, the basic theory defended and developed can be seen as a plural realism, with central thesis that actuality is plural, more concretely that there are many actual worlds, not a unique one. Radical plurallism, which is pluralism at this actual world stage, not merely at a theoretical or conceptual

scheme level, thus resembles realism, simply as (what is strictly impossible) pluralized. Deep plurallism does more, as it includes at least a nonworldly nondescript transcendental item in addition. From such world pluralism, however augmented, plurality of many other critical notions follows, notably of truth and evidence, truth for instance amounting to what holds at an actual world (of which there are very many).

However the basic theory can be alternatively seen not as a realism at all, because many apparently central themes of both ordinary realism and scientific realism are repudiated (e.g. respectively, uniqueness of the external world, and that that world is substantially as dominant science asserts, with all the existential trappings it alleges and none other). Alternatively again, it may be viewed as an antirealism, because for instance of its rejection, along with contemporary anti-realism, of the stock realist theme that there is a unique recognition-independent reality (or, on a lesser count, because of its questioning of classical bivalence and other truth-value principles). Nonetheless such an assimilation has, like others, limited plausibility, because full plurallism acknowledges many recognition-independent (perceiver and mind transcendent) actual worlds. Alternatively again, full plurallism may be regarded as mere relativism, because of its commitment to - what is less than relativism - relativity principles, for instance that truth is relative to actual world, and therefore is structurally relative. Whereupon it may be wrongly supposed that plurallism, like indiscriminating relativism, is self-refuting. Again, however, such a relativistic comparison is seriously defective - unless quite atypical, much more discriminating relativisms are envisaged. For by no means all positions are admissible, still less equally good. In plurallism there remain both internal and external checks upon adequacy and correctness: but, checks and balances that do not effect unique semantical selections.

Central to pluralistic enterprise (as opposed to fashionable relativism) are arguments, and therefore matters of logic and rival logics. Main arguments for full plurallism begin from plural logical theory, which is pivotal to all rational inquiry.

Several different arguments are advanced for the plurality of correct theories; and it is argued from there through correspondence, or directly, to the plurality of actual worlds. Several coupled arguments from methodology are also developed. Stock arguments from rival one (actual) world positions are duly disabled.

Deep plurallism has large corollaries, for intellectual theory and practice, both inside and outside philosophy. To take one example: as it affords a comparatively easy way between the rocks of realism and relativism, so it affords a way between acceptance and rejection of science, of rationality, and more generally of the Enlightenment Project. There is no unique correct Science such as that the Enlightenment postulated; but there are various sciences, where not everything goes.

In place of certified logic stands not no logic, but a plurality of logics, including more than one correct logic. Similarly in place of reason and rationality stands not nothing, not a rejection of reason and rational methods, but a pluralization of them (with prominent correct methods rejecting received modern maximization and consistency imperatives). In place of the truth stands not nothing, nihilism, no court of appeal regarding correctness, but several: pluralistic truth. In place of the Enlightenment stands not a return to earlier (and subsequent) dark ages, but a plurallistic flowering, into enlightenments." (pp. XV-XVI)

56. ———. 1997. "Relevant Conditionals, and Relevant Application Thereof." In *Logic, Language and Computation*, edited by Akama, Seiki, 191-244. Dordrecht: Kluwer.

"All that is required for validity of an implication in classical logic is that it be impossible for all the antecedents to be true and the consequent false. (Similarly, with terminology adapted, for validity of inferences.)

This requirement makes all implications with inconsistent antecedents valid. According to relevant logic, more should be required. That more can be explained in various equivalent ways. One is a classical look-alike; that the antecedents be genuinely inconsistent with the negation of the consequent.

According to another look-like, truth should be preserved everywhere (including in impossible situations), that is, in whatever situation the antecedents hold so should the consequent. Another, perhaps more revealing, is as follows: not only should it be impossible for the antecedents to be true and the consequent false in a valid implication, but the antecedents and the consequent should also have something in common, or, in other words, the antecedents should be in some way relevant to the consequent. Whence the name relevant or relevance logic.

Relevance itself means, firstly: bearing upon the matter in hand or the point at issue. A statement, a consideration, or the like, that is said to be relevant, must be understood to be relevant to something, i.e.

relevance is always relational. Relevance matters in a wide variety of settings: in statistics (where a defective explication of relevance in terms of alteration of probability is regularly advanced); wherever evidence

is assessed, as in law; in rules of relevance for conduct of meetings; in procedures for selection, as in organisation, where what is selected should enjoy relevant features. As well, relevance has recently assumed

importance in linguistic and pragmatic investigations as to discourse and communication, owing partly to the Grice's widely accepted directive for admissible discourse, Be relevant!, and partly to the associated

theme that most, even all, connectives of ordinary discourse exhibit relevance (i.e. for connector C, where pCq then q is relevant to p)." (p. 192)

57. Routley, Richard, and Copeland, Jack. 1999. "Beyond the Universal Turing Machine." *Australasian Journal of Philosophy* no. 77:46-66.

Two of our heresies--in the dictionary sense of 'opinions contrary to the accepted

doctrine on any subject'--are these)(1)

Proposition 1. The so-called Church-Turing thesis is false.

The so-called Church-Turing thesis purports to draw a borderline between computability and non-computability and is, it seems, pretty well universally accepted among computer scientists, cognitive scientists, and philosophers of mind. In point of fact neither Turing nor Church endorses, or even states, this thesis. Their theses, proved equivalent by Turing, concerned the functions that are in principle computable by an

idealised human being unaided by machinery. Careful authors do use the term 'Church-Turing thesis' to refer to one or other of the various equivalent forms of the theses that Church and Turing themselves put forward. Proposition 1. concerns not that equivalence class of theses but a claim lying outside the class and widely but improperly termed 'the Church-Turing thesis'. We distinguish this thesis from members of the

equivalence class by the use of riders such as 'so-called'. The so-called Church-Turing thesis is the claim that the class of well-defined computations is exhausted by the computations that can be carried out by Turing machines.

Proposition 2. Computability is a relative notion, not an absolute one.

There is no such thing as the class of well-defined computations. The extent of the computable functions is resource-relative." (p. 46)

(...)

"In the present paper we focus largely on proposition 1. although much of what we say also bears intimately on proposition 2. Proposition 2. receives further discussion elsewhere (Sylvan and Copeland 199-)." (p. 47)

(1) Richard Sylvan did not live to see this paper written. He contributed a draft of section VIII and fragments of sections I, II and IX. Our collaboration began in August 1994, when Richard became interested in my descriptions of machines forbidden by the so-called Church-Turing thesis, and I in his ideas concerning the extent to which one's notion of

computability is relative to one's logic (the topic of Sylvan and Copeland 199-).

58. Sylvan, Richard. 1999. "What is that Item Designated Negation?" In *What Is Negation?*, edited by Gabbay, Dov and Wansing, Heinrich, 299-324. Dordrecht: Kluwer.

"Regrettably current logical orthodoxy is astray on negation, perhaps more seriously astray about negation than elsewhere. Unfortunately most of the advertised logical and linguistic alternatives to or elaborations upon classical orthodoxy are wrong also. A more engaging story needs to be told, upon which what follows represents some sort of stumbling beginning.

Negation is an item, an operation which is both one (one determinable which, though widely used, is far from orthodox) and many (having many determinates).

A prime determinate (which proves adequate on its own) is a relevant negation which applies both to sentences and to their unsaturated parts such as predicates.

By contrast, the classical sentence negation of orthodoxy represents but a degenerate determinate, not widely used in normal discourse (for such discourse does not sustain irrelevant inferences, such as from a pair A and not-A to any statement whatsoever, etc.)." (p. 299)

59. Hyde, Dominic, and Priest, Graham, eds. 2000. *Sociative Logics and Their Applications: Essays by the Late Richard Sylvan*. Aldershot: Ashgate.

On the title: "Much searching went into trying to find a satisfactory term to distinguish these logics. The eventually adopted term, *sociative*, derived through French from the Latin *sociare*: 'to combine, unite, etc.' and *socius* 'companion'. It now

means 'expressing or denoting association, conjunction, union': see *Oxford English Dictionary*. Occasionally, the now obsolete English noun, verb and participle, *sociare*, will also be deployed." (Note 31, p. 29)

"Chapter 5. A Preliminary Western History of Sociative Logics

This essay originally appeared in 1989 as chapter 4 of BG.
[Editors]

Contemporary logical investigations enjoy the advantage of vastly improved logical technology as compared with all earlier terrestrial times. Yet, by comparison with earlier periods of high logical activity, the twentieth century is anomalous in its heavy mainline concentration upon classical logic, and, as a result, appears stodgy and unadventurous. For the deadening effect of the wide educational imposition of a narrow and intellectually disastrous dominant logical paradigm, classical logical theory, has (again) destroyed much logical expression and adventure. Rival logics have become very much a minority and esoteric activity, not even incidental to the serious affairs of life; no longer do even the city crows converse over logical issues. The full flourishing of sociative logics, in their rich variety, has yet to occur.

So far as we know, there have been three main periods in the long history of Western logic when the central issues of logic, as to what makes an argument valid, when deducibility obtains, and whether these connections can be captured in true or necessary conditionals, have been vigorously discussed. The periods are these: around the third century BC when Stoic logic flourished, in the medieval period, especially the twelfth century AD, and in the present century.

The logical investigations carried out in these three significant periods are, thus far, substantially independent. The Stoic enterprise of the third century exerted little or no influence on medieval thought, and indeed details (such as they are in Sextus Empiricus) were not available until after the seminal work of Abaelard's school and rival schools had already been accomplished. Of the main contemporary strands of sociative

logic, only connexive and nontransitive logics have clear historical representation, and even there main investigations have proceeded substantially independently of historical inputs. When history has been appealed to in support of relevance logics, for example, it has been rather peripheral and, too often, historically dubious.

Though the main historical settings for sociative logic presupposed a heavy consistency assumption (in particular throughout medieval times), and though paraconsistent logics tend to be missing in expected areas of application (such as treatment of semantical paradoxes), nonetheless the history of sociative logics is deeply interwoven with that of paraconsistent logics. One major reason for the intertwining is of course that a crucial issue for sociative logics is what-by contrast with strict and classical spread and collapse-happens with impossible premisses and assumptions. How is loss of connections to be avoided there? A special section of the theory of obligationes (or suppositional reasoning and commitment) was devoted to this issue in the Middle Ages; and a similar division of research, plainly parasitic on classical logic however, can be seen in contemporary North American research (such as that of Rescher and Brandom and of Woods and Walton). These pretty unsatisfactory ways of shunting off, and sidetracking, significant logical problems fortunately by no means exhaust feasible lines of approach, as the rich history of paraconsistent logics helps disclose. That history has already been documented, admittedly also in a very preliminary fashion, elsewhere (especially in PL [*Paraconsistent Logic*, 1989] and its extract OP [*On Paraconsistency*, 1983], which should be read in conjunction with this material - conversely, this material enriches *Paraconsistent Logic*, which is scanty on several topics of relevant interest). The entertaining story, which overlaps and complements the history of sociative logics, will not be repeated, but elements of it will be drawn upon where appropriate (and readers who seek a fuller picture to begin upon their own investigations should consult that story, as well as, of course, but cautiously, standard texts)." (pp. 53-54)

60. Brady, Ross, ed. 2003. *Relevant Logics and Their Rivals: Volume II. A Continuation of the Work of Richard Sylvan, Robert Meyer, Val Plumwood and Ross Brady*. Aldershot: Ashgate.

With contributions by Martin Bunder, André Fuhrmann, Andéa Loparic, Edwin Mares, Chris Mortensen, Alasdair Urquhart.

Contents: List of Contributors VIII; List of Figures IX; Preface XI; Prologue by Ross Brady 1; 6. Non-normal relevant systems by Richard Sylvan and Val Plumwood 10; 7. Multiplying connectives and multiply intensional logics by Richard Sylvan, Robert Meyer and Val Plumwood 17; 8. Operational semantics by Richard Sylvan and Val Plumwood 38; 9. The algebraic analysis of relevant affixing systems by Richard Sylvan, Robert Meyer, Ross Brady, Chris Mortensen and Val Plumwood 72; 10. The more general semantical theory of implication and conditionality 141; 11. Recent developments I by Ross Brady 192; 12. Recent developments II by Ross Brady 231; 13. On quantified relevant logics by Ross Brady 309; Appendix: Extensional reduction II by Robert Meyer and Richard Sylvan 352; Bibliography 408; Index 421-425.

"The main writing work, for the two volumes, was done by Richard Routley, making essential use of work of Meyer, Plumwood and Brady in the process. The second volume was also to include Chris Mortensen at least for his work on the algebraic analysis of relevant affixing logics. Moreover, Richard remained the driving force behind the *Relevant Logics and their Rivals* volumes, providing the layout and material for an integrated work. During the time of writing, Richard had sent most of the chapters to a number of people for comment. However, some of these chapters, earmarked for the second volume, were more complete than others, and four of the tentative chapters (i.e. chapters 10 and 13-15), being fairly incomplete, were not sent out at all.

However, subsequent to the publication of the first volume, there was quite some delay in getting the second volume together, mainly because Richard Sylvan was heavily involved in environmental philosophy and had other interests, both

academic and non-academic. Richard made a number of attempts to restart the book, usually by contacting the other authors, but these contacts did not reap much progress. In 1985, he had more or less given up on the chapters of the tentative contents. Richard had subsequently persisted with the idea of rewriting the second volume to bring it more into line with his recent thinking, since the early work of the 1970's was starting to date in relation to more recent advances. He made a start on this revision around 1988-9, producing a number of short separate pieces, which were hard to connect to the chapters previously sent round for comment. Thus, it would be hard to make much use of these pieces in this book, if one relied on the chapters of the tentative contents for guidance.

Unfortunately, Richard died unexpectedly in 1996, at the age of 60, leaving a plethora of unfinished work.

(...)

Upon initial examination of Richard's chapters 6-15, including his relevant archival material, I found that while a lot of it was in good shape for publication, much of the remainder was incomplete, sketchy or inaccurate. This is not entirely unexpected, given the circumstances. Nevertheless, I was put into the dilemma of either trying to complete it as best as I could, in accordance with the tentative contents, or inserting more up-to-date material. The main difficulty about the first approach is the age of the material, since it was done during a period of greater logical experimentation than seems appropriate nowadays, together with the advent of newer developments in the relevant logic area.

So, I have generally proceeded with the second approach by extending Richard's material into some new directions which cover the period from the time of publication of the first volume to the present. Given that Richard was interested in updating the original chapters 6-15 anyway, I feel this second approach is not entirely inappropriate nor against his wishes. I have also been ably assisted in this task by Martin Bunder, Ed Mares, Andre' Fuhrmann, Chris Mortensen and Alasdair Urquhart,

who have given me some accounts of their recent work for inclusion.

In this way, much of Richard's work and that of his co-workers, whose Work was interwoven into Richard's material, will be maintained for posterity as an important contribution to logic, upon which others may choose to build." (pp. XI-XIII)

61. Sylvan, Richard. 2003. "The Importance of Nonexistent Objects and of Intensionality in Mathematics." *Philosophia Mathematica* no. 11:20-52.

With a foreword by Nicholas Griffin (pp. 16-19).

This "is a reprinting, with as little change as feasible from the original typescript, of most of Chapter 10 and the introduction and first section of Chapter 11 of Richard Routley (who changed his name to Sylvan in 1985), *Exploring Meinong's Jungle and Beyond: An Investigation of Noneism and the Theory of Items*, published by the Philosophy Department of the Research School of Social Sciences of the Australian National University, Canberra, 1980, and still available from it (ISBN 0-909596-36-0)."

"The more comprehensive case for the importance of nonentities includes, as especially significant, their role in mathematics and their roles in the theoretical explanations of science-the whole business, that is, of appealing to ideal simplified objects, which suitably approximate real objects, in problem solving and theoretical explanation. More generally, the theoretical sciences are seriously nonreferential, both in having as their primary subject matter nonentities, and in being ineradicably intensional. This thesis runs entirely counter to empiricist philosophies of science, which have long dominated the subject (to its detriment), according to which the language of science is, or ought to be, referential. Empiricist thinkers have, until very recently, regarded the citadel of science as exclusively theirs: and the main goals of philosophy, as they conceive them, have been determined by the defense and extensions of the citadel to increase its power over the intellectual landscape. Thus they have taken the language of science, properly refined referentially of course, as the ideal of

language, to which much ordinary language is at best a shabby first approximation; and they have characteristically seen philosophy as the handmaiden of science, as like a servant clearing away rubbish in the way of scientific progress or questioning scientific practice and values, or as a subsidiary scientific activity of conceptual analysis and reconstruction aiding the defense or advance of total science. A basic assumption in all this, without which much of the superstructure collapses, is that both the language of science and scientific theories conform to empiricist canons: the assumption is false—so at least it is now argued. The case begins by considering mathematics, which forms an integral part of much theoretical science."

68. Beall, Jc, Brady, Ross, Dunn, J. Michael, Hazen, A. P., Mares, Edwin, Meyer, Robert K., Priest, Graham, Restall, Greg, Ripley, David, Slaney, John, and Sylvan, Richard. 2012. "On the Ternary Relation and Conditionality." *Journal of Philosophical Logic* no. 41:595-612.

Abstract: "One of the most dominant approaches to semantics for relevant (and many paraconsistent) logics is the Routley–Meyer semantics involving a ternary relation on points. To some (many?), this ternary relation has seemed like a technical trick devoid of an intuitively appealing philosophical story that connects it up with conditionality in general. In this paper, we respond to this worry by providing three different philosophical accounts of the ternary relation that correspond to three conceptions of conditionality. We close by briefly discussing a general conception of conditionality that may unify the three given conceptions."

"This paper emerged from some working sessions at the University of Melbourne in 2009.

Beall, Brady, Hazen, Priest, Restall, Ripley, and Slaney were involved *on the ground*. The work of Dunn and Mares kept coming up during the sessions, and the paper greatly benefited from their joining the effort after the event. Looming even larger in the initial discussions were two others: despite their deaths, much of the early work of Sylvan and Meyer was heavily represented. While we can't speak for the current views of Bob (Meyer) or Richard (Sylvan), we wanted to honor them for their starting this ternary-relation idea in the first place. Hence, we include them as authors. While not all of us (authors) agree on all ideas herein, we do agree with the main thrust of this paper: namely, that, despite first appearances, the ternary-relation

approach to conditionality is very much philosophically plausible as capturing an important aspect of conditionality." (p. 595)

69. Routley, Richard. 2018. *Exploring Meinong's Jungle and Beyond: The Sylvan Jungle — Volume 1 with Supplementary Essays*. Cham (Switzerland): Springer.

Edited by Maureen Eckert.

"Thus Sylvan argues that his neo-Meinongian, so-called "noneist" (pronounced *none-ist*), theory at the heart of the *Jungle Book* casts new light on supposed long-standing problems like the problem of universals, perception, intentionality, substance, self, and values. Chapters are devoted to metaphysical and associated epistemological problems that emerge in the philosophy of mathematics and philosophy of science, to developing a satisfactory epistemology more generally, to providing an adequate semantic account of fictional discourse, to an analysis and rejection of Russell's theory of descriptions and of Quine's objections to broadly-Meinongian approaches, and so on. The book's size matches its ambitions. And the book's author was a man of considerable intellectual ambition. (pp- XIII-XIV, Introduction by Dominic Hyde)

70. ———. 2018. "Semantic Analysis of Entailment and Relevant Implication: I (1970/1)." *Australasian Journal of Logic* no. 15:211-279.

Transcription by Nicholas Ferenz of an unpublished manuscript.

"Semantical analyses are provided for several intensional logics, in particular for (substantial parts of) the systems R of relevant implication, \Box R of relevant implication with necessity, P of ticket entailment, and E of entailment, and what is the same theory as E the system Π of rigorous implication. The analyses provided are used to provide semantical completeness results and decidability results for the main systems discussed,

and are applied to settle some of the open questions concerning E and R and their fragments." (p. 212)

71. ———. 2019. *Ultralogic as Universal? The Sylvan Jungle — Volume 4 with notes and commentaries*. Cham (Switzerland): Springer.

Edited by Zach Weber.

"Ultralogic is important not least because it boldly advances the value of inconsistent theories, especially in mathematics. Routley urges that consistency is not always the ultimate arbiter of correctness, that some contradictions can be true, a thesis now known as dialetheism. While Priest's works have become the canonical texts for dialetheism, without Routley, dialetheism would not be what it now is. It was the happy meeting of Priest and Routley in the 1970s that looks to have been the spark." (*Editor's Introduction*, p. XIII)

Edited by Domini Hyde.

"With the perspective afforded by time, Richard Sylvan, nè Routley (1935-1996), will, I believe, come to be seen as the most important Australasian philosopher of the 20th Century. This is not at all to denigrate his currently better known compatriot contemporaries: a number of these made highly significant contributions to philosophy. But what set Richard apart was the originality he deployed and the scope of his vision. He made original contributions to logic, metaphysics, the philosophy of language, value theory, environmental philosophy, political philosophy. Moreover, though he never wrote anything that integrated all of these, it is clear to those who know his work that his views on all these matters formed part of an overall and

systematic philosophical picture." (*Introduction: some personal reflections* by Graham Priest, p. XIII)

Bibliography

1. Besoli, Stefano. 1984. "Convergences and Diversities between Noneism and Gegenstandstheorie." *Grazer Philosophische Studien* no. 21:133-153.

"The problems that give rise to the conceptual system developed by Routley(1) are largely those suggested by the proposals contained in Meinong's *Gegenstandstheorie*. By taking up these themes again Routley wishes to legitimate an ideal resumption, a radicalization and an expansion of a number of theses peculiar to Meinongian doctrine. Starting from this remark, he is then led to deal explicitly with the limits of the internal presupposition of classical logic, putting forward, by contrast, the advantages of a recomprehension which attempts to bring to light the logical/ontological topics generally neglected or, rather, reductionalistically interpreted within the framework of a Russellian theory of logic. The author's constant appeal to a neutral ontology which is close, but not identical, to Meinong's range of *Außersein* permeates his entire work and supports the emergence of an idoneous theory of items. The *Leitfaden* is the refutation of Standard Reference Theory (RT) which is the paradigmatic core common empiricism, idealism and materialism, but which also underlies extensionally quantified orthodox logic.

Reference Theory (RT) requires, as an essential condition, that truth and meaning are rigid functions of reference. The original aim of Routley's analysis is to eliminate the prejudice in favour of immediate actuality which is inherent in every referential

view. Accordingly, it must be possible to make semantically relevant the occurrence of non-referential statements.

Meinong's philosophical work, together with the influential theories of Th. Reid, suggests the inescapable clauses for a gnosiological alternative which will not relapse into platonism." (p. 133)

(1) We refer mainly to Routley's *Exploring Meinong's Jungle*, Canberra, 1980, where he gives an enlarged draft of conceptual trends established long ago.

2. Brady, Ross T. 1980. "Two Remarks on *The Logic of Significance and Context* ." *Notre Dame Journal of Formal Logic* no. 21:263-272.

"I wish to make two remarks on two points that Goddard and Routley made in Chapter 5 of their book, *The Logic of Significance and Context* [6].

The first remark is that the Brady disjunction, 'V',(1) does have applications in ordinary discourse, in answer to the doubts about this expressed by them on pp. 344-5 of [6]. I will defend this position, which I originally made in [1] on p. 30, and also in [2], pp. 172-3, by showing that each of four examples can be interpreted in a way which requires 'V' to be used in its formalization. The second remark is that the need for a functionally complete significance logic such as their system S_5 (or S_6) seems very limited. I show this by examining each of their five arguments for a functionally complete system on pp. 348-351 of [6] and by showing how their weaker significance-complete (for definition, see [6], p. 326) system S_3 (or S_4) will suffice, except in exceptional circumstances, to express what they suppose a functionally complete system is needed for." (p. 263)

(1) The symbols and terminology for this paper are taken from Goddard and Routley [6].

3. Bradley, Michael. 1978. "On the alleged need for nonsense." *Australasian Journal of Philosophy* no. 56:203-218.

"The theory, stemming from Russell, that there are grammatical sentences of English, containing only recognised English vocabulary, which are nevertheless meaningless is a familiar landmark of contemporary Philosophy.

(...)

In recent years, however, the case for the non-significant has been taken up again. In a series of closely argued papers Ross Brady, Leonard Goddard and Richard Routley have urged the necessity for nonsense, and the latter two authors have developed (in [3]) a logic of significance whose justification is largely the supposed need for nonsense. In this paper I examine their reasons for alleging the need, and conclude that they have not established a case.

Because of the extent of the collaboration and agreement between the authors cited it is often pointless to refer a view to one rather than another. In such cases I use the phrase 'our authors'. In other cases where more accuracy seems called for, one or two of them are referred to by name.

Our authors call 'falsidal' those theories which treat sentences such as 'Virtue is square' and 'I likes dancing' as false ([1], p. 213; [11], p. 368). They describe and criticise various versions of the falsidal approach, and find all of them deficient. What I wish to propose is a non-arbitrary and epistemologically satisfactory falsidal theory which escapes the difficulties of other versions. I shall only try to assess the arguments given by our authors so far as they seem or are claimed to bear on the falsidal theory which I am

going to propose. These arguments are scattered through a number of places and often conjoined with material not germane to the present task. I have tried to abstract the strongest and clearest exposition of all material I think relevant. Not all the relevant writings by our three authors are mentioned in my bibliography, but only those drawn on. Others will be found detailed in the bibliography to [11], and further relevant material in the notes to [1] and [10]."

Abstract: "Richard Sylvan (né Routley) was one of Australasia's most prolific and systematic philosophers. Though known for his innovative work in logic and metaphysics, the astonishing breadth of his philosophical endeavours included almost all reaches of philosophy. Taking the view that very basic assumptions of mainstream philosophy were fundamentally mistaken, he sought radical change across a wide range of theories. However, his view of the centrality of logic and recognition of the possibilities opened up by logical innovation in the fundamental areas of metaphysics resulted in his working primarily in these two, closely connected fields. It is this work in logic and metaphysics that is the main focus of what follows."

5. Kielkopf, Charles. 1974. "Critique of the Routley's First Degree Semantics." *Australasian Journal of Philosophy* no. 52:105-120.

"R. and V. Routley's 'The Semantics of First Degree Entailment' (1) is a clear, careful, but relatively non-technical presentation of a semantics for Anderson and Belnap's so-called tautological entailments. Their paper is a valuable introduction to a treatment of negation in semantics for relevant logics and entailment systems. However, the Routleys' paper is primarily an attempt to build a case for accepting as valid only the first degree inferences warranted by the tautological entailments instead of the much larger class warranted by the tautologies of classical propositional logic. I adapt terminology of the Routleys' to call the tautological entailments, and the first degree inferences warranted by them, *FD* logic. The Routleys' semantics for *FD* logic is a special case of semantics for relevant logics(2) whose first degree fragment is the

tautological entailments. In my argument, I shall only sketch the basic idea of their semantics for *FD* logic since I shall not be concerned with technical uses of the semantics for results Such as completeness. I shall argue that the Routleys' semantics for *FD* logic does not justify switching from classical to *FD* logic. However, I shall recommend using their semantics for uncovering tautologies needed, in a special sense of 'needed', in classically valid inferences." (p. 105)

(...)

"Indeed, I hope that I have shown that the Routleys, despite their intriguing semantics and illuminating discussion of suppression, have given no good reasons for switching from classical to *FD* logic." (p. 120)

(1) *Noûs* 6 (1972) pp. 335-59. All references, unless otherwise specified are to this paper.

(2) See R. Routley and R. K. Meyer's 'The Semantics of Entailment, in H. Leblanc (ed.): *Truth, Syntax and Modality* , (1973) pp. 192-243; 'The Semantics of Entailment-II,' *Journal of Philosophical Logic* (1972) pp. 53-73; 'The Semantics of

Entailment-III,' *ibid.* pp. 192-203. Section 5 of R. Routley's 'A Semantical Analysis of Implicational System I and of the First Degree of Entailment', *Mathematische Annalen* 196 (1972) pp. 58-84, is especially helpful for showing that the set-up semantics to be considered here are semantics for the tautological entailments.

6. Lewis, David K. 1990. "Noneism or Allism?" *Mind* no. 99:23-31.

Reprinted in: D. Lewis, *Papers in Metaphysics and Epistemology*, Cambridge: Cambridge University Press, 1999, pp. 152-163.

"Some few entities - present, actual, particular, spatiotemporal, material, well-bounded things - exist uncontroversially. Scarcely any philosopher denies them. Other alleged entities are controversial: some

say they exist, some say they do not. These controversial entities include past and future things, the dead who have ceased to be and those who are not yet even conceived; unactualized possibilities; universals,

numbers, and classes; and Meinongian objects, incomplete or inconsistent or both. An expansive friend of the entities who says that all these entities exist may be called an *allist*. A tough desert-dweller who

says that none of them exist may be called a *noneist*. In between come most of us, the pickers and choosers, *some-but-only-someists*.

Richard Routley declares himself a noneist.⁽¹⁾ If we may take him at his word, he holds that none of the controversial entities exist. But do we take him at his word?" (p. 23)

"In short: we dispense with existence - but heed what this means and what it does not. Of course we do not dispense with the word 'exist' as one of our pronunciations for the quantifier. Neither do we dispense with a trivially universal predicate of existence, automatically satisfied by absolutely everything. But if 'existence' is understood so that it can be a substantive thesis that only some of the things there are exist - or, for that matter,

so that it can be a substantive thesis that everything exists - we will have none of it." (p. 31, a note omitted)

(1) Richard Routley, *Exploring Meinong's Jungle and Beyond: An Investigation of Noneism and the Theory of Items* (Australian National University, 1980). For short: *Jungle*. Routley, as he then was, is now Richard Sylvan, but I shall refer to him by the name under which the book was written.

7. Meyer, Robert K. 1998. "In Memoriam: Richard (Routley) Sylvan 1935-1996." *The Bulletin of Symbolic Logic* no. 4:338-340.

"Besides free logic and his work on Meinong, Sylvan was an important contributor to the development of paraconsistent ideas, already in the first degree semantical work with Val Plumwood cited above. This work led him into important collaborations with other logicians, as did his work on relevant logics and on a number of other subjects. Besides those mentioned elsewhere in this note, among Sylvan's important logical collaborators were Nicholas Griffin, Graham Priest, Ayda Arruda, Dominic Hyde and Jean Norman.

Richard continually applied (and was continually turned down) for promotion to full Professor at ANU [Australian National University]. It is probably not irrelevant that, in all his enterprises, he almost never chose the easy or popular course. His enthusiasms—logical, intellectual and political—were for the alternative. To get the counter-suggestible Sylvan to defend some view, a good move was to remark that the view was now utterly discredited.

So Richard Sylvan is gone. It's hard to believe; it would be in character for him to be fooling us, spreading the rumour of his death for some deep Sylvanesque purpose. I personally miss him very, very much. When my own career was in ashes, it was Sylvan's invitation to come Down Under in 1974 that brought it back to life. And now logic and philosophy have suffered a great, great loss. Greater than they know." (p. 340)

8. Paolini Paoletti, Michele. 2013. "Commentary: Exploring Meinong's Jungle and Beyond: an Investigation of Noneism

and the Theory of Items by R. Routley." *Humana.Mente Journal of Philosophical Studies* no. 25:275-292.

"I cannot give here an exhaustive account of Routley's whole investigation of noneism (i.e., the theory according to which, roughly, there are items that do not exist, or, in other words, that not all the items exist). Considering the structure of the book, it is possible to individuate: a brief presentation and defense of noneist theses (pp. 1–73); a critique of classical logic and the introduction of a revised, neutral (i.e., not existentially committed) logic grounded on the theory of items (this long part includes, among other things, some important remarks on the Characterisation Postulate, on identity, existence, possible worlds, inconsistency, definite descriptions, intensional contexts) (pp. 73–360); a defense of a Meinongian and presentist metaphysical theory of time (pp. 361–409); some replies to Quine's article *On what there is* (in the short paper *On what there isn't*) and to other objections (pp. 411–488); the contiguity between noneism and common sense (pp. 519–536); noneist theories of fiction (pp. 537–606), of existence (pp. 697–768), of mathematical and theoretical knowledge (pp. 769–832) and of other topics (e.g., universals and perception) (pp. 607–696); Routley's interpretation of Meinong's work (pp. 489–518) and the differences between Routley's noneism and other theories of items (pp. 833–890); the paper *Ultralogic as universal* in the Appendix (pp. 892–959).

In this brief commentary, I shall focus on Routley's denial of the Ontological Assumption and on some theses, such as the Characterisation Postulate and the distinction between characterising and non-characterising properties. Furthermore, I shall present and discuss Routley's Meinongian Presentism and his theory of fictional items." (pp. 275-276)

9. Parsons, Terence. 1983. "Review of Exploring Meinong's Jungle and Beyond. by Richard Routley." *The Journal of Philosophy* no. 80:173-179.

"This book is an anthology of interconnected papers by the author. Some have been previously published, but some, including the title essay (Chapter 1, 259 pages), have not

previously appeared in print. The theme of the book is a development and defense of a Meinongian theory of objects (called "items" by Routley), coupled with attacks on the "empiricist, reductionist, anti-Meinongian" world view that is now a prevalent theme in Anglo-American philosophy. Routley's views are in many ways closer to Meinong's than are those of any other current writer, and this alone would make the work of interest. The book is highly programmatic; in this review I will not try to forecast the ultimate fate of the program, but instead will try to indicate what I take to be its major themes." (pp. 173-174)

(...)

"This book touches on scores of topics that have not been mentioned here, including the definition of existence, existing at a time, relations, fictional objects, common-sense philosophy, second-order logic, mathematics, and scientific theories, plus an appendix on what the author calls "ultralogic," which is a logic that applies correctly in all situations, even impossible ones. The discussion is often provocative and almost always highly programmatic. Routley has explored portions of Meinong's jungle, and this edition is a fascinating diary of his journey. We still await a detailed map of the terrain." (p. 179)

10. Priest, Graham. 1997. "Sylvan's Box: A Short Story and Ten Morals." *Notre Dame Journal of Formal Logic* no. 38:573-582.

Abstract: "The paper contains a short story which is inconsistent, essentially so, but perfectly intelligible. The existence of such a story is used to establish various views about truth in fiction and impossible worlds-"

"Fictions are certainly not the only context in which impossible worlds—in whatever sense one takes to be correct—arise. Such worlds are also required to evaluate the truth of counterlogical conditionals.

(...)

Another possible place in which impossible worlds may turn up is in an analysis of belief. Suppose that you were naive enough to have believed my story, as a child might have done. You

would then have believed that Sylvan had possessed a box that was both empty and nonempty, but you would not have believed that he had a cow that both did and did not lay eggs. If we parse 'x believes that s' as a relation between a

believer and a proposition, we may then take a proposition, in very orthodox fashion, to be the set of worlds/situations in which s is true. This gives the required result.

(Despite this, I doubt that impossible worlds are of much use in an analysis of belief; actual belief seems to have no determinate logical structure at all.)

The final point is less of a moral, more of an observation.

(10) An impossible world, as characterized above, is one where a logical truth is false, that is, its negation is true. There is nothing in this definition that precludes the actual world from being logically impossible. (All the logical truths may still hold there.) And once one agrees that there are impossible worlds, the question obviously arises as to how one can be so sure that the actual world is not one of them. There are, it seems to me, no good a priori reasons to suppose that it is not." (p. 581)

11. ———. 2003. "Meinongianism and the Philosophy of Mathematics." *Philosophia Mathematica* no. 11:3-15.

"Part of the beauty of meinongianism—or at least of Richard's approach to it, spelled out at length in *Exploring Meinong's Jungle* [1980]—is its technical simplicity. To do the idea full justice you need to have inconsistent and incomplete worlds, but these you have anyway, at least if you subscribe to some version of relevant logic. But the main technical trick is just thinking of one's quantifiers as existentially neutral. ' \forall ' is understood as 'for every'; ' \exists ' is understood as 'for some'. Existential commitment, when required, has to be provided explicitly, by way of an existence predicate, E , which, pace the way that Kant is often—and erroneously—interpreted, is a perfectly normal predicate. Thus, 'there exists something such that' is ' $\exists x(E x \wedge \dots x \dots)$ '; and 'all existing things are such that' is ' $\forall x(E x \rightarrow \dots x \dots)$ '. The action of the theory is mainly, therefore, not at the technical level, but at the philosophical level." (p. 4)

12. Rapaport, William J. 1984. "Critical Notice of *Exploring Meinong's Jungle and Beyond* , by Richard Routley." *Philosophy and Phenomenological Research* no. 44:539-552.

"*Exploring Meinong's Jungle and Beyond* is a lengthy work (over 1000 pages) of wide scope, its cast of characters ranging from Abelard to Zeno. The nominal star is Meinong, of course, yet the real hero is Reid.(2) Topically, Richard Routley presents us with a virtual encyclopedia of contemporary philosophy, containing original philosophical and logical analyses, as well as a valuable historical critique of Meinong's work." (p. 539)

(...)

"If Meinong and Reid are the heroes of this work, then the "Reference Theory" (RT) - the theory that "truth and meaning are functions just of reference" (i) - is the villain. Routley sees his task as offering a different paradigm, noneism, which "aims at . . . a very general theory of all items whatsoever.(5). Where RT and its classical logic fail to provide solutions to problems of non-existence, intensionality, deducibility, significance, and context (ii), the noneist Theory of Items will - it is claimed - not only solve all of these, but also enable philosophers to treat adequately for the first time problems from the history of philosophy (including Reid's philosophy, Epicureanism, nihilism, sophism, fatalism, the Third Man), the philosophy of religion, the logic of perception, quantified tense logic, the problem of universals, and more (8-11). Noneism is Routley's patent medicine for all philosophical ills." (p. 540)

(...)

"Conclusion

There is much to admire in Routley's compilation, as well as much to ponder, to question, and to criticize. The book would have been better had it been more coherent (in all sense of that word), but the effort required to plow through it is often rewarded." (p. 551)

13. Seldin, Jonathan P. 1987. "A Relevant Validity in Curry's Foundations: A Reply to Richard Sylvan." *Bulletin of the Section of Logic* no. 16:68-70.

"Thus, in terms of Curry's definitions, the positive paradox principle is valid in terms of the metatheory of elementary formal systems (which is what Curry is talking about on p. 173 of [1]). Curry's claim about the

positive paradox principle is thus that it is valid in a particular context in the formal metatheory of elementary formal systems (as he has defined it).

As the last paragraph on p. 173 of [1] shows, he is not claiming that it is true generally." (p. 70)

14. Slater, B.H. 1992. "Routley's Formulation of Transparency." *History and Philosophy of Logic* no. 13:215-224.

Abstract: "Routley's Formula says, for instance, that if it is believed there is a man then there is something which is believed to be a man. In this paper I defend the formula: first directly, but then by looking at work by Gensler and Hintikka against it, and at the original work of Routley, Meyer and Goddard for it. The argument ultimately reduces to a central point about the extensionality of objects in Routley, Meyer and Goddard's intensional system, i.e. in its formulation of transparency."

"In 'Routley's Formula'

$O(Ex)Mx \supset (Ex)OMx$

'O' is an intensional operator on $(Ex)Mx$, such as 'it is believed that', and 'M' is an ordinary predicate, such as 'is a man'. So the formula says that if it is necessary, permitted . . . known, or supposed that there is a man, it follows that for something it is

necessary . . . or supposed that it is a man. Now the formula has ground against many philosophers' intuitions. Indeed, it is invalid in all the standard systems of modal and general intensional logic, except the epsilon calculus system of Routley, Meyer and Goddard (Routley, Meyer and Goddard 1974 (hereafter referred to as Routley et alii), Routley 1977). On one view of 'intensional' objects they are world-bound or mentally private objects. On that view, other minds and worlds are like other places and times. So what is there may bear little relation to what is here.

And yet, as we shall see, the formula is true. For, on another view of the matter, if anything is on one's mind, it is a public object, and anything in another world is bound to be in this. Certainly it need not be conceived as it is publicly, or actually, but it is definitely the same object. Indeed the behaviour of 'it', in that last sentence, substantiates the very point which is made in it.

But many systems of logic do not capture the behaviour of such pronouns. And so doubts about Routley's Formula quite often arise. In the full defence of the formula, therefore, it becomes especially important to consider it both formally and informally. Exactly which aspects of Routley et al's system allow the formula to be validated, when all the others invalidate it? And does its very exceptionality, and the range of intuitions against it, not reduce its plausibility entirely?

I shall conclude, in the end, that Routley's Formula survives the current arguments against it, and can be given an increased rationale from that provided when it was first defended."

(...)

16. von Solodkoff, Tatjana, and Woodward, Richard. 2013. "Noneism, Ontology, and Fundamentality." *Philosophy and Phenomenological Research* no. 87:558-583.

Abstract: "In the recent literature on all things metaontological, discussion of a notorious Meinongian doctrine—the thesis that some objects have no kind of being at all—has been conspicuous by its absence. And this is despite the fact that this thesis is the central element of the noneist metaphysics of Richard Routley (1980) and Graham Priest (2005). In this paper, we therefore examine the metaontological foundations of noneism, with a view to seeing exactly how the noneist's approach to ontological inquiry differs from the orthodox Quinean one. We proceed by arguing that the core anti-Quinean element in noneism has routinely been misidentified: rather than concerning Quine's thesis that to be is to be the value of a variable, the real difference is that the noneist rejects what we identify as Quine's "translate-and-deflate" methodology. In rejecting this aspect of Quinean orthodoxy, the noneist is in good company: many of those who think that questions of fundamentality should be the proper focus of ontological inquiry can be read as rejecting it too. Accordingly, we then examine the differences between the noneist's conception of ontology and that offered by the fundamentalist.

We argue that these two anti-Quinean approaches differ in terms of their respective conceptions of the theoretical role associated with the notion of being. And the contrast that emerges between them is, in the end, an explanatory one."

17. Witherall, Arthur. 2000. "Lewis and Sylvan on Noneism." *Grazer Philosophische Studien* no. 58-59:181-202.

"Several years ago David Lewis wrote a paper titled "Noneism or Allism?"(1) in which he attacked the idea that Richard Sylvan's (alias Richard Routley) rehabilitation of Meinong's theory of objects was truly what it was supposed to be. Lewis argued that Sylvan was not really a noneist, and that he should be interpreted as claiming that all of the objects that philosophers consider controversial actually exist (rather than none of them, as the name "noneism" implies). This is a drastic re-interpretation of Sylvan's work, and if it were true it would mean that he did not successfully rehabilitate the theory of objects at all.

(...)

Unfortunately, Richard Sylvan died in 1996, without having constructed a reply to Lewis. Although it is therefore difficult to say what kind of a reply he would have made, I believe that I can offer some significant criticisms of my own. I do not claim to represent Sylvan as such, but I claim to be sympathetic to his project, and in this respect I can do something towards refuting Lewis' claims. This is an important defensive task to perform for a Meinongian, because although Lewis' argument does not assail the details of Sylvan's philosophy, it threatens to restore the old orthodox view of Meinongian metaphysics as 'committed' to an unreasonably bloated ontology, and thus to re-instate a serious misinterpretation of the whole enterprise.

In assessing Lewis' paper, it must be kept in mind that *he does not address any of Sylvan's arguments* . He is only concerned with whether Sylvan should be seen as a true noneist or as an allist, with respect to the question of which controversial items exist. Nevertheless, in neglecting Sylvan's arguments, Lewis is deflecting

attention away from the substance of his position, and casting him as the defender of something unintelligible. I will show why this attack ultimately fails." (pp. 181-182)
